A clandestine pleasurescape, the rave has been described as “an overwhelming yet depthless barrage of the senses that transforms the dancefloor into a magical megasurface” (Hutson 1999: 58). While consistent with experiences occasioned by traditional underground or even “club” events, the description becomes especially applicable to “raves” celebrating celestial events and seasonal transitions (e.g., moon cycle, solstices) held in outdoor locations (where dance floors are positioned in bushland, forest, beach or desert), facilitated and attended by Pagans, travellers and other practitioners and affiliates of earthen spirituality. This is certainly the case for “Trance Dance” or “psytrance” (psychedelic trance) events, themselves influenced by traveller’s full moon parties held in Goa, India, during the 1980s. Trance Dance rituals may incorporate fluorescent décor, fractalized mandala projections, altars, chai tents, totemic installations, sacred geometry, earthworks, large speaker stacks positioned at the cardinal points and “trance” music – a metronomic four-quarter beat overlaid with exhilarating arpeggios, infused with “ethnodelic” samples (e.g., didgeridoo, djembe, sitar). Sonorous and sensual, such events are celebrated as “no spectator” style odysseys with a celebrated climax (“rebirth”) at sunrise.

While raving and techno-music culture became subject to commercialism and government regulation from the early 1990s, anarcho-spiritualists have consistently advocated the interfacing of technology, ecology and spirituality. Editor of *Evolution* magazine (originally *Encyclopedia Psychodelica*) and founder of the London dance club Megatripolis, Fraser Clark, was particularly influential in articulating this convergence. Having coined the term “zippie” (Zen Inspired Pagan Professional) to describe “a new kind of hippy who rejected the sixties Luddite pastoralism and embraced the cyberdelic, mind-expanding potential of technology,” Clark evangelized rave as “the expression of a new Gaia-worshipping ecocentric spirituality. The free outdoor rave-TAZ became a new commodified dancescape for the exploration of psychedelic spirituality. The free outdoor rave-TAZ became a new tech-savvy anarcho-liminal utopia wherein inhabitants claim to achieve that which resembles a peak experience, or union, with co-liminaries and *nature*. Throughout the nineties, numerous inspired *techno-tribes* emerged in Europe, North America and Australia to pursue the desired “revival” through the facilitation of such events. A future-primitivism was early exemplified by London “terra-technic” sound system, Spiral Tribe, who believed they were connected to prehistoric nomadic tribes and that techno was the new “folk music.” The Spirals believed free parties were shamanic rites, which using the new musical technologies in combination with certain chemicals and long periods of dancing, preferably in settings with spiritual significance, could reconnect urban youth to the Earth with which they had lost contact, thus averting imminent ecological crisis (Collin 1997: 203–4).

These strands impacted upon the development of a global “techno-pagan” or cyber-spirituality movement for whom the rave assemblage would facilitate the return to “forgotten tribal roots.” It was well received in San
Francisco, where experimentation into the psychedelic-spirituality-technology interface was particularly advanced. There, Full Moon parties and events operated by the New Moon collective and other rave communities were prevalent throughout the nineties.

In Australia, “bush doofs” were early facilitated by the likes of Electric Tipi on the northern coast of New South Wales, and later GreenAnt in Victoria and Dragonflight in Queensland. In a proactive and reconciliatory atmosphere, Australia has also seen a strengthening alliance between radical environmentalism, ecospirituality and rave culture manifested in dance activism. Popularly dubbed “Free NRG,” this post-rave movement has seen youth rise to challenge mining and forest industries, and defend sacralized landscape (“country”) threatened by natural-resource developers. Emerging in 1995, anarcho-spiritual techno-tribe Ohms not Bombs, became alarmed by current levels of non-renewable energy consumption and patterns of Earth destruction. A key objective of “Free NRG,” they argue, is “tuning technology with ecology, DJing our soul-force into the amazing biorhythms of nature” (www.omsnotbombs.org). Furthermore, with “co-created magic,” they have declared

this land is returned to the ancient and magical indigenous chain of wisdom. If we unite our purpose a massive healing can be set in motion . . . Help institute a sound system for all, join the Earthdream, support Aboriginal sovereignty, and help dance up the country in rave-o-lution (www.omsnotbombs.org).

An annual “tech-nomadic” carnival of protest touring through Central Australia, Earthdream (www.beam.to/earthdream) emerged in 2000 as the proactive millenarian event of the techno-spiritual movement. Over a period of four or five months during the winter, a series of free party “teknvinals” and intercultural anti-uranium mining protests are held on Aboriginal lands – with the full cooperation of traditional owners – including a major event held on the winter solstice. Exemplifying a contemporary strategy of reenchantment, Earthdreamers actively participate in native landscapes.

Earthdream exemplifies the immanent communing potentiated by the geo-dancescapes of the rave/post-rave. Participating in the dancescape – through dancing, through ecstatic (“raving”) – is a means of temporary inhabitation, rendering possible an enduring relationship with place. Commentators expound upon the spiritual potential of Trance Dance as a ritual of communion. For instance, psy-trance pioneer Ray Castle asserts that outdoor trance events “celebrate an experiential celestial electro-communion – a participation mystique – with the numinous oneness and interconnectivity of all creation” (Castle 2000: 146). According to proponent of Chaos Magick, Kathleen Williamson, while sounds produced by the likes of Castle constitute “the new epic poetry,” Trance Dance “is the ‘coming of age’ ritual which Western culture has long forgotten.” According to Williamson, “tekno anarcho-activists” understand “the power of the gnosis of trance,” using techniques to “direct the energy of the dance.” While music is significant in achieving “transcendence” or “inner-knowledge” in such contexts, trance artists have also “buried crystals under dance areas” and have investigated “the symbology and iconography of ancient magickal and spiritual traditions.” Moreover, in “reviving lost traditions,” the dance rite constitutes an answer to modern distancing from natural world rhythms:

Our convenient industrial cultures have practically negated our direct relationship with the earth and its seasons and cycles, and it seems that there is less and less reason to rely on, let alone investigate our instinctual being. Our experiences with sound, psychedelics and the dance ritual are the stirrings of communicating via the ebb and flow of the earth’s rhythms and letting it seep into our collective emotions (Williamson 1998).

In tracing the collective paroxysm of Trance Dance to its putative Pagan or “tribal” origins, Australian fluorescent “rainbow warrior” Eugene ENRG (aka DJ Krusty), revealed a chthonic dimensioned dance philosophy. Characteristically, it is believed that “energy,” located in and channeled from the Australian landscape, is responsible for the ecstatic states associated with Trance Dance. For Krusty, a dancer’s body can “become a conduit for energy”:

I think there’s a sense of the spirit of the land. [For instance] this land we now call Australia has a real spirit to being stomped. And if you’ve ever watched Aboriginal dance, its very much about stomping the earth . . . And if you watch techno . . . It’s very much about stomping the earth . . . [It] brings energy into the body, Earth energy into the body (interview with the author, 30 December 1997).

Moreover, within contemporary trance discourse, beyond the “homeopathic” consequences for the individual and the community said to derive from both sound and landscape, it is believed that such dancing performs a somatic connection to, and enables a spiritual relationship with, the natural world.

Raymo, Chet (1936–)

Chet Raymo was born 17 September 1936 in Chattanooga, Tennessee, and became Professor of Astronomy at Stonehill College in North Easton, Massachusetts. Beginning in 1985, Raymo wrote a weekly science column for The Boston Globe. He has also published more than a half dozen books addressing the connection between spirit and science.

Although Raymo’s upbringing was religious, he found himself increasingly drawn to the beauty of science, finding the features of the universe more readily understood in terms scientific than religious. As a child, he was often wakened in the middle of the night by his father. They would go together into the dark yard to study the starry night skies; he would later characterize these midnight excursions as having a profound influence on his life as his youthful scientific curiosity came into conflict with his religious upbringing. Yet while science offered him knowledge and understanding, it did not offer the comfort and tradition he had found in religion. Only through his exposure to such mystics as Julian of Norwich, Thomas Merton, and Teilhard de Chardin was a world revealed that he had found in religion.

Place is central in Raymo’s books, beginning with The Soul of Night (1985). By 1999 he had come to understand that the teachings of science could not contradict his religious faith; that faith is based not on dogma but on love; and that “knowledge is a prerequisite for love” (1999: xv). Further, he argues, science allows us “to participate in an evolutionary drama larger and richer than ourselves, in which the human soul awakens in the course of deep time to a new season of consciousness and intelligence” (1999: 46). He notes, for instance, that as a trained astronomer he fully understands the make-up of a comet, can plot its course around the sun, its trajectory across the sky. But none of that knowledge can diminish his spiritual joy in the presence of the comet. “Knowledge and wonder and celebration,” he writes, “went hand in hand: the archetypal religious experience” (1998: 239).

Raymo writes of his life as a continual process of “re-learning how to pray” (1999: ix). Rejecting the self-centeredness of his childhood prayer – “the vain repetition of ‘me, Lord, me’” (1999: xiv) – he prefers to meditate upon natural phenomena as a catalyst for his spirituality. His is not a ritual-bound spirituality, though; Raymo lives well outside the New Age. Nor does he follow Stephen Jay Gould’s imperative that science and religion ought always to remain entirely separate realms of understanding. In the world as Raymo understands it, God and nature serve one another; the kind of knowledge offered by science does not impede, but rather enhances, a religious or spiritual experience of nature. Both in his books and in many of his weekly columns, Raymo seeks to show the mystery of the natural world; thus while he does not write explicitly about “the environment,” he guides readers into that natural mystery in the understanding that by doing so they will come to value nature for its own sake.

In exchanging the dogma of his childhood religion for a mature vision of spirit as an elemental part of the natural world, Raymo echoes two writers with whom he is most often compared: Loren Eiseley and Annie Dillard. Raymo speaks, though, with a unique voice, one informed by the ancient stars in the night sky, the differently ancient stones of the Irish coast and the long traditions they represent – a voice content in the knowledge that science and religion have equal roles in the cosmos and in his own life.

Reclaiming

“Reclaiming” is an ecofeminist Witchcraft community and spiritual organization. While the Reclaiming tradition is a specific feminist branch of contemporary American Pagan Witchcraft, the Reclaiming community refers both to the local Witchcraft community in the San Francisco Bay Area of California and to the women and men, primarily in North America and Western Europe, who identify with this tradition. The tradition arose from a teaching collective within the San Francisco community, founded in 1979 by the Jewish author, feminist and activist Starhawk and her circle of friends. In 1980 the collective, which by then ran an ecofeminist “school” in Witchcraft, decided to name its work Reclaiming – A Center for Feminist Spirituality. Within a few years Reclaiming became a well-established institution on the Pagan scene in Northern California. Twenty years later, Reclaiming has recruited more than fifty teachers/leaders and probably has adherents in the tens of thousands.

According to Reclaiming Witches, the values of their tradition stem from an age-old “magical consciousness” that sees all of life as sacred and interconnected, and any living being as a dynamic composition of matter, energy and spirit. The natural world is venerated and ultimate spiritual authority is believed to reside within each and every person. Reclaiming works with both female and male images of the divinity, although the goddess symbol is usually preferred. To name life-generating powers “Goddess” is meant to be a continual reminder of what they value the most, namely life brought into the world, and not an act in which gender narrowly is attributed to divine reality.

Reclaiming’s deep spiritual commitment to the Earth and to the well-being, justice and equity of all people has attracted people to the community who seek to combine spirituality with political activism – often with a strong ecological mission and a desire to convert Witchcraft into green activism. Although a “metaphysics of interdependence” is manifest in this Witchcraft community, there are aspects of their worldview that also are critical of much green “deep ecology” spirituality and activism. They do, for example, claim a radical notion of power that includes both ecological and social structures: even though all beings have a share in the same life-generating powers and therefore are equally valuable in terms of their “power-from-within,” people are valued as having a higher worth than worms. Also, political action is regarded as impossible without rating and choosing one alternative before another. To take the name “Witch” is itself an act of choosing, of ethically separating out from immanent reality an identity more preferable than another. Furthermore, religious devotion involves more than political activism to a Witch: there are mystical and initiatory aspects of practicing Witchcraft that challenge every person to mature and grow.

In 1994 Reclaiming incorporated as a nonprofit religious organization and in 1997 it reorganized to accommodate its membership that had grown by then to several thousand followers in the U.S., Canada and Europe. The San Francisco Reclaiming collective dissolved itself and was replaced with a local “Wheel” and a transnational “Spokes Council.” A statement of core values, the “Reclaiming Principles of Unity,” guided the process of reformation. A Reclaiming tradition was thus defined for the first time, not in terms of a theology, but in terms of a worldview and methodology. By this careful move, Reclaiming came to augment the position that feminist Witchcraft is not necessarily a new religion, but perhaps rather a new spiritual (and magical) practice.

Even though the old Reclaiming community in San Francisco has a new organizational heart, the ideological continuity between 1980 and today is clear. When Reclaiming was founded, Starhawk and friends interpreted Witchcraft in terms similar to those of Z Budapest: as the claiming back (re-claiming) of an ancient, goddess-worshiping religion in which nature was viewed as sacred and women believed to hold honorable and powerful positions. But unlike Budapest’s lesbian and separatist Dianic interpretation, Starhawk wanted to introduce a feminist version of Witchcraft to both genders and emphasize its environmental and political implications. From the very beginning and in alignment with their brand of feminist-anarchism, the collective decided to organize in independent working cells in order to teach classes or publish a newsletter, and to make all decisions through a consensus process. They also decided to teach within the structure of ritual and always keep at least two teachers in every class. This was meant to give the students an ideal experience of how a small ritual unit, a coven, might function and to make transparent how a community of equals ideally might work.

The primary work of Reclaiming is to empower individuals and communities with visions of a new culture and new magical-practical tools to help bring it forth by means of classes, workshops, summer programs (“Witch-camps”) and public rituals. They are announced regularly in the Reclaiming Quarterly, Reclaiming’s own magazine for Witchcraft and magical action (printed in 2000 copies). Three core classes have been taught since 1980. The first class, “The Elements of Magic,” teaches how humans are interconnected with the natural world and how ritualizing basically means interaction with the four elements (air, fire, water and Earth) in terms of moving energy. In the second class, “The Iron Pentacle,” the students work with a notion of the human body as a microcosm mirroring a larger macrocosm and how bodily energies can be used for healing purposes. In the third class, “The Rites of Passage,” the students learn to see the human life-course as a sacred manifestation of birth, growth, initiation, repose, death and decay. In all Reclaiming classes, students also learn
about Goddess spirituality, the ethical foundation for the practice of magic, and how to create their own rituals. The three core classes are a prerequisite to become initiated – an event which in Reclaiming is customized to the individual seeker. A hallmark of the Reclaiming tradition is that initiation does not lead to any sort of entitlement. Neither is it required for teaching, running a coven or officiating at public rituals.

Reclaiming offers public rituals to celebrate the Witches eight high holidays (sabbats) in a so-called Reclaiming-style – ecstatic, improvisational and with many priests and priestesses that take different roles at rituals – and the community has in particular become famous for the annual Spiral Dance ritual. Starhawk wrote the ritual script herself to celebrate and promote her first book (with the same title) in November 1979 and the event has, since then, become a permanent institution. The ritual celebrates and mourns the intertwining of life and death, and the ritualists pledge to remember those who have died from violent deaths in order to fight for peace and justice. The Spiral Dance is regarded as Reclaiming’s annual gift to the larger San Francisco Bay Area Pagan community, and draws 1500–2000 celebrants.

A major reason for the growth of the Reclaiming community both inside and outside of San Francisco has been Starhawk’s influential writings – in particular The Spiral Dance (1979), which in 2000 had sold more than 300,000 copies – and the spread of “Witchcamps.” These have been offered to students outside San Francisco since 1985 and their curriculum is usually a condensed version of the three core classes mentioned above. Issues such as community building and sustainable living may be raised, as well as training for nonviolent direct political action. Reclaiming tradition Witchcamps are today organized throughout the U.S. (Georgia, California, Florida, Michigan, Missouri, Pennsylvania, Texas, Vermont, Virginia), Canada (Vancouver) and Western Europe (Germany and England). Between fifty and a hundred people attend each of these Reclaiming-identified camps. This means that more than a thousand people go through Reclaiming’s “educational system” every year without becoming members of the San Francisco community, being part, rather, of radical environmentalism’s diverse sub-cultures.

Reclus, Elisée (1830–1905)

Elisée Reclus, a leading nineteenth-century French intellectual, was one of the foremost geographers of his age and a major figure in anarchist political thought. He is most widely recognized for his New Universal Geography (1876–1894) a massive 19-volume, 17,000-page work that has been called the greatest individual achievement in the history of geography. His final work, L’Homme et la Terre (Man and the Earth) (1905–1908), a 5-volume, 3500-page synthesis of geography, history, anthropology, philosophy, and social theory, is perhaps his most enduring contribution to modern thought. Beginning with the statement “Humanity is Nature becoming self-conscious,” [my translation] it is a sweeping account – a kind of anarchist “Grand Narrative” – of the history of both humanity and the Earth, and shows Reclus to be one of the most important precursors of contemporary ecological thought, and of social ecology in particular. Reclus is most widely known today for his place in the history of both geography and anarchist theory. However, through his influence on Kropotkin, another famous anarchist geographer, and on later thinkers such as Patrick Geddes and Lewis Mumford, he has remained a significant figure in regionalist, decentralist and communitarian thought.

There are two sides to Reclus’ story of humanity and the Earth. One is his depiction of the process of human self-realization in dialectical interaction with nature. He showed how the natural world shaped human development as humanity transformed and contributed to the unfolding of nature. Reclus contended that historical progress has resulted from mutual aid and social cooperation. Accordingly, he believed that the full self-realization of humanity will depend on a social revolution that embodies such practices in a free, egalitarian, anarcho-communist society. Moreover, he held that the fate of the Earth will hinge on humanity’s ability to establish social institutions that express a deep concern for the natural world and for all living beings on the planet.

The other side of Reclus’ narrative focused on the long history of domination that has impeded human progress, alienated humanity from nature, and increasingly devastated the face of the Earth. Although he devoted much attention to the domination of human beings through such institutions as the centralized state, capitalism, patriarchy, and racism, he was unusual among social theorists of his era in making the human domination of nature one of his central themes. He was an early critic of the ecological devastation resulting from ruthless industrialization and
technological rationalization, he deplored the destruction of ancient forests as early as the 1860s, and he was a tireless advocate of ethical vegetarianism and of the humane treatment of animals.

Reclus’ survey of human history included extensive discussion of religion and its effects both on society and on humanity’s relationship to nature. He traced the origins of religion to tribal societies in which the shaman was both a teacher who conveyed knowledge based on observation of the real world and also a priest who expressed fantasies concerning an illusory world. He contended that as a result of this heritage, society’s traditional outlook has been a confusion of myth and reality, truth and falsehood. He held that as knowledge of society and nature progressed, science and religion increasingly diverged, and in the modern period entered a period of conflict for one another. Reclus believed that in this struggle science must ultimately triumph and reveal religion to be a relic of past ignorance and superstition.

Reclus stressed the influence of nature on the development of the great world religions. In his view, the monotheism of the Ancient Near East reflects in part the austere character of that region, with its geographical uniformities, its hot, dry climate and its harsh sunlight. He contrasted this unifying vision to the unity-in-diversity expressed in Indian religion, contending the latter reflects the sub-continent’s vast ecological diversity of forests, mountains, and rivers, and its extremes of climate. The history of religion is thus for Reclus a clear expression of the dialectic between humanity and nature.

Reclus believed the founders of the great religions often had metaphysical and moral insights that conflicted starkly with later religious institutions. He argued that throughout history, religion has been transformed into an ideology at the service of forms of domination such as patriarchy, statism, militarism, capitalism, racism, and repressive morality. He saw Buddhism as the classic case of such a transformation. He contended that the Buddhist teaching of compassion for all sentient beings had revolutionary social implications, and that the Buddhist appeal to direct experience was a radical challenge to all ideologies and institutions. These liberatory dimensions of Buddhism were lost, however, when its practice was reduced to a code of personal morality, the Buddha was declared a god, and the dharma became an official state religion. A similar process, he said, was used later by Constantine to “kill” Christianity. He noted an even more extreme conflict between ideology and practice in the case of the Jains, observing that their respect for nature, and indeed for all forms of life (which would today be called “biocentric egalitarianism”) did not prevent them from becoming an elite group that exploited the masses.

Despite Reclus’ professed atheism and secularism, there is an implicit, but very significant, religious undercurrent in his work. He sometimes wrote in a pantheistic vein of the experience of nature as involving a loss of the ordinary sense of selfhood and a merging with the surrounding environment. In some works (for example, his History of a River, 1869), he expressed not only an intense love of nature, but also something close to the experience of union with nature typical of nature mysticism. Furthermore, at times he referred to his own philosophy as a kind of humanistic religion based on the pursuit of the good of the whole. He held that such a commitment to a larger good was the positive core of ancient religions, and that, although it has been largely betrayed by institutionalized religions, it is still put into practice by their more enlightened and compassionate adherents of these traditions.

Reclus thus saw religion as significant in three areas. First, he looked upon institutionalized religion as a negative social force insofar as it has been a powerful ideological support for systems of domination of humanity and nature. Secondly, he held that religions have had a positive dimension to the degree that their founders and some of their followers have expressed values based on feelings of solidarity and a concern for a greater whole. And finally, Reclus himself expressed a certain religious impulse founded both on his ethical concern for the larger good of humanity and nature, and on his immediate experience of a kind of spiritual union with nature.

Redwood Rabbis

The redwood forest of America’s Pacific Northwest is one of the ecological and spiritual treasures of the world. In the 1820s, settlers of European descent encountered two million acres of dense forest and pristine waterways. At the turn of the millennium, only 4 percent of that primeval ecosystem remained, islands of old-growth reserves in a vast sea of second- and third-growth timberland frequently subjected to clear-cutting, burning and herbicide use.

[Redwood Rabbis]
Jewish settlers made their way north from San Francisco to remote Mendocino and Humboldt Counties in the early nineteenth century, and by the 1980s the region had become home to a small progressive Jewish community, culturally predisposed to environmental activism. Many of the region’s environmental organizers, scientists and attorneys are of Jewish descent.

In 1985 MAXXAM Corporation of Texas acquired Pacific Lumber, a timber company whose 200,000-acre holdings included nearly 20,000 acres of virgin old-growth, the largest remaining unprotected stands of ancient redwoods, among them the Headwaters Forest. MAXXAM tripled the rate of logging ancient groves, rapidly felling some of the largest and oldest living things on Earth to make luxury products – premium lumber for siding, decking and hot tubs. For nearly twenty years the redwood forest has been the locus of public demonstrations, litigation, legislative initiatives, and direct-action civil disobedience. Public concern extends beyond loss of the majestic trees themselves to degradation of the ecosystem caused by loss of forest canopy and root strength, leading to increased soil erosion, landslides, aggradation and pollution of streams, and destruction of fish habitat. In 1997 a mudslide originating on MAXXAM clear-cuts destroyed several homes downslope and numerous residential wells have been befouled by sediment; lawsuits brought by residents have been settled out of court.

Working together as the Redwood Rabbis, the three Jewish religious leaders in the region invoked the Talmudic principle of bal tashchit that forbids destruction of resources. In rabbinic legend Adam is told: “Do not spoil and desolate My world, for if you do, there will be no one after you to repair it” (Midrash Ecclesiastes Rabba 7:28).

In September 1996 Rabbis Lester Scharnberg and Naomi Steinberg addressed approximately 8000 people rallying at the edge of Headwaters Forest; the rabbis were among over 1000 people arrested for acts of nonviolent civil disobedience.

In January 1997 Rabbis Margaret Holub and Naomi Steinberg organized Tu BiShevat in the Redwoods, an observance of the midwinter full moon New Year of the Trees. Over 250 people braved rainstorm and flooding to gather at a local Grange Hall to hear environmental presentations and a teaching by eco-theologian Rabbi Arthur Waskow. A break in the storm allowed participants to travel to a nearby park to celebrate the traditional New Year of the Trees seder (ritual meal) of tree-borne fruit while seated on the ground beneath ancient trees. As the ritual ended, the rain resumed and more than ninety participants drove to the outskirts of Headwaters Forest; the rabbis were among 250 people who risked arrest for the protection and restoration of the redwood forest. The Redwood Rabbis’ efforts have been reported in Jewish and non-Jewish press in the United States and Israel.

Jewish ethics include the obligation of tokhechah, delivering rebuke to wrongdoers. The Talmud states that the obligation of rebuke extends not only to individuals, but also to the community, and even to the whole world; if one does not fulfill the commandment of rebuke, one accrues the guilt of those that might have been reformed (Shabbat 54b). In this spirit, the Redwood Rabbis have engaged in years of effort to communicate with MAXXAM owner Charles Hurwitz, a generous donor to the Jewish community in his native Houston, Texas. The rabbis have appealed to the timber tycoon through correspondence, telephone, private and public meetings. In an open letter in California and Houston Jewish press, the Redwood Rabbis called on Charles Hurwitz to make a t’shuvah sh’leymah, a complete change of direction, and dedicate himself to sustainable forestry practices and restoration efforts. The rabbis added words of encouragement from nineteenth-century Chassidic master Rabbi Nachman of Bratslav: “If you can spoil, you can fix.” Although Pacific Lumber has been cited for approximately 400 violations of the Forest Practices Act since 1995, MAXXAM absorbs the minimal fines and has not acknowledged responsibility for environmental damage. In The Jerusalem Report columnist Gershom Gorenberg observed...

...the Redwood Rabbis are right to treat their cause as a Jewish one. Arguing “I own it,” Charles Hurwitz posits the absolute sovereignty of the individual, and the complete license of private ownership, limited at most by the law of the land but not by ethical demands. But in Judaism, the individual is not sovereign. God is. He owns the earth. Human beings have, minimally, the duty of tenants to care for the Landlord’s property. More stringently, they bear the obligations of caretakers, put in this world – as is said of Adam and the Garden of Eden – “to till it and guard it.” A caretaker doesn’t destroy the Landlord’s rarest treasures, doesn’t stand and watch it happen (The Jerusalem Report, 14 November 1996).

In September 1998 an Earth First! activist was killed near Headwaters Forest when an irate logger felled a tree in the young man’s direction; one of the Redwood Rabbis delivered a eulogy at the young man’s funeral. Two other lives have been lost in “tree-sit” accidents in the bioregion.

In addition to drawing attention to the plight of the forest and streams of northern California, the Redwood Rabbis bring forward the following questions in Jewish and interfaith discussion: are religious communities morally obligated to take an active role in environmental...
environmentalism. first born there in 1977, quickly followed by seven or eight together, one day we met in council. My son Bodhi was the vehicles. One day a week we sat in silent meditation our own babies, and built our dwellings. We shared pure water of our creek. We planted fruit trees, delivered the sun, we worked naked in the gardens and bathed in the gardening, social action, and looking after each other. It has been living lost all its meaning and appeal and I followed an overwhelming urge to start afresh with a clean slate. Suddenly the life I had been living up till then, out of a failed marriage and my job as a systems engineer at IBM. It was as if I had been plucked from my human throne and suddenly found myself a commoner, a plain member of the biota as Aldo Leopold called it, with a burning desire to awaken humanity to the folly of sawing off the branch that we are sitting on, unraveling the biological fabric from which we too are woven. If we enter the rainforest and allow our energies to merge with the energies we find there, I found, a most profound change in consciousness takes place. As I wrote in Thinking Like a Mountain (a book I wrote with Joanna Macy, Arne Naess and Pat Fleming in 1986), I realized that our psyche is itself a part of the rainforests. “I am protecting the rainforest becomes “I am part of the rainforest recently emerged into thinking.”

It took a number of years, countless demonstrations, press conferences, leaflets, and many people willing to sit in front of bulldozers and go to jail. But eventually 70 percent of the people of New South Wales came to agree with us, and the government established a series of national parks. To protect the remaining rainforests in 1981 we formed an organization, the Rainforest Information Centre (RIC).

From the Rainforest Information Centre to Earth First! In response to our success, however, Australian logging companies began to look offshore, and in 1983, community representatives from the Solomon Islands contacted RIC for aid in resisting the same logging companies we had fought, as well as Malaysian and Japanese companies. In the years that followed, RIC volunteers provided technical, financial, and political support to defend forests and communities in the South Pacific, Asia, South America, and Russia.

In 1981 North American poet Gary Snyder visited Australia and we took him for a walk through Terania Creek.
As he learned about our actions in defense of the rainforests he said he was reminded of a new group that had formed in the United States called “Earth First!” Armed with Gary’s introduction I contacted Earth First! Founder Dave Foreman and was soon writing for their journal.

In 1984 I was invited by Earth First! activists to the U.S. With Foreman and another of Earth First!’s founders, Mike Roselle, we spent two months bouncing around in the back of an old Volkswagen bus, conducting “road show” performances made up of music and storytelling, promoting our biocentric vision and direct-action resistance to deforestation. We ended our tour in San Francisco at a venue where Gary Snyder read a poem about Terania Creek and Randy Hayes announced the formation of a new international organization, the Rainforest Action Network.

The years that followed were full of activity: direct action to save forests and wilderness, boycotts of Mitsubishi and other transnationals, support for indigenous people in their struggles. Yet it was clear that the planet could not be saved one forest at a time. For each forest we were able to spare, a hundred were lost. The Earth is not a rock with resources growing on it; the Earth is alive, and to try to protect it by preserving a tiny patch of wilderness here and there is something like trying to keep humans alive by preserving representative samples of skin here and there.

Consciousness Change and Re-Earthing Ritualizing
To protect the Earth, to protect ourselves, we had to change the way we saw both the Earth and ourselves. We had to change our consciousness. Unless we could address our underlying spiritual disease, no forests would be saved for long. But how, I wondered, are we to identify and understand the spiritual malaise that leaves modern humans so lonely and isolated and no longer able to hear the glad tidings of the Earth which is our home? How are we to heal the great loneliness of spirit that finds us unable to feel loyalty and gratitude to the soil, which has fed and nourished and supported us without pause for 4000 million years?

Searching for an answer, I turned to the indigenous people who lived more or less in harmony with the Earth for hundreds of thousands of years. When we look at indigenous cultures, we may notice that without exception ritual affirming and nurturing the sense of interconnectedness between people and nature plays a central role in the lives of these societies. This suggests that the tendency for a split to develop between humans and the rest of nature must be very strong. Why else would the need for such rituals be so universally perceived? It also suggests the direction we must search for the healing of the split: we need to reclaim the ritual and ceremony which were lost from our culture a long time ago, and to our amazement we find that this is incredibly easy to do. Working with the Buddhist activist Joanna Macy, we developed a ritual to address our contemporary situation. The Council of All Beings, as we called it, began with mourning for what has been lost, the acknowledgement of rage and anger. Using guided visualization, movement, and dance, we reexperienced our entire evolutionary journey. We made masks to represent our animal allies and give voice to these voiceless ones, invoking the powers and knowledge of these other lifetimes to guide us in appropriate actions and empower us in our lives. We see that the pain of the Earth is our own pain and the fate of the Earth is our own fate.

The Council of All Beings was just the first of the “re-Earthing” rituals that we developed in the years that followed, searching for processes that resonated for modern humans while fulfilling the function that such ceremonies had done for all indigenous cultures without exception since the beginning of time.

In the Council of All Beings we remember to speak on behalf of the animals and plants and landscapes with whom we share the Earth. In another of our new processes, “The Timeline of Light,” we recapitulate our entire evolutionary journey, the five billion years since the Earth was born and before that, the eight or nine billion years since the birth of the universe itself. When we enact this story as our very own creation myth, when we recall that every cell in our bodies is descended in an unbroken chain from the first cell that emerged on the Earth, then a wonderful new perspective opens up in our lives and a fierce loyalty for life may arise that cuts through the conditioning and habits that trap us, and empowerment may blossom to serve the Earth.

Staying Connected
It takes a certain discipline, of course, to stay connected, to continually hear the Earth’s voice. For many years, it had been my custom to seek guidance from the Earth. I would lie down in the forest and cover myself in leaves and say, “Mother, I surrender to you,” and then I would deliberately allow all my energies to sink into the Earth. In 1992, the instructions I received in response to my prayers and meditations changed, and from that point onward, all that I received went like this: “John, finish what you’ve started. Don’t start anything new. Leave space for me, Gaia.” Sometimes this message would come while I was sitting quietly in nature. At other times, at the end of a weekend workshop, the last exercise would be for each of the participants (including myself) to write a letter to themselves which started “dear (your name), this is your mother, Gaia,” after that the instructions were just to keep writing without stopping, without thinking and just see what came out. Previously I had received all kinds of practical advice about projects to undertake, or new directions for my work. Now, this was all that came through: “John, finish what you’ve started. Don’t start anything new. Leave space for me. Gaia.” I felt that Gaia was telling me to take time to...
seek deeper answers to my questions about how the perennial spiritual thirst of humanity could be aligned with the need to address the ecological crisis. It was time to purify myself. It was time to visit some of the projects that I had helped initiate and support but had never seen with my own eyes. It was time to visit my beloved India and weave once again the spiritual warp and ecological woof of my life.

With all the projects that were underway, it took me about three years to hand over the last pieces of my work and return to India, my spiritual home, in search of nourishment and vision. Meanwhile, all the psychological aches and pains, which had mysteriously vanished when my Earth service was all-consuming, now returned. I finally had time on my hands again.

So I returned to India in 1995 searching for some resolution to the spiritual crisis that had begun for me a few years earlier. I decided to spend some time with the 86-year-old Advaita teacher, Poonjaji. I was hoping that meditation and satsang dialogues with him would help me to understand the connection between my work to save the planet and spiritual work. I felt a great need to join my activist side with my contemplative side, and I hoped Poonjaji could help me. He had found enlightenment fifty years before as a disciple of Sri Ramana Maharshi, perhaps the greatest Hindu sage of his century, on the sacred mountain Arunachala in the southern Indian state of Tamil Nadu.

Poonjaji, or Papaji as he was affectionately known, had many Western devotees who believed that he was also a fully enlightened master. Some 200 of us from all over the world crowded the hall Satsang Bhavan four mornings a week. Behind him on the wall were portraits and photos of Ramana. We handed him letters (his hearing was failing) with our spiritual questions which he would read and answer. I was interested in exploring with Papaji the relationship between the human spiritual quest and the ailing Earth. I had been wondering how, as long as people look on the Earth as maya, illusion, and as an obstacle to realization, as is generally the case in religions originating in the East, we could find the intense spiritual will necessary to make the tremendous changes in our values, lifestyles, and institutions, and in our very consciousness, that would prevent the continued destruction of the Earth?

Lucknow seemed an unlikely place to search for enlightenment. Noisy, highly polluted, and hardly conducive to a spiritual quest. Still, some of my closest friends had reported that a great opportunity existed there while this great sage was alive. There I would hang out with the other seekers, listening to stories from people from around the world. Once I visited the sad remnants of a forest nearby and prayed for direction, for renewal, for Gaia to call me once again, but I felt frustrated and full of doubt.

I found myself fascinated by Shiva, the Hindu god of creation and destruction, and tried to find out as much about him as possible. For Shivaratri, the anniversary of Shiva’s wedding, I caught the train to Varanasi where that wedding had taken place. Millions of pilgrims crowded the festive city, and I watched the naga babas naked, ash-covered, dreadlocked sadhus carry their tridents down to the Ganges to purify themselves.

While there I came across an interview with Vandana Shiva, the Indian feminist ecologist and writer, who spoke about the river goddess Ganga and Shiva. She said that the power of the goddess was so strong that if she landed on Earth she would just destroy. It is symbolic of the way we get our monsoon rain. It comes so strong, that if we don’t have forest cover, we get landslides and floods. So the god Shiva had to help in getting the Ganges down to Earth. And Shiva laid out his hair, which was very matted, to break the force of the descent of the Ganga. Shiva’s hair, Vandana concluded, is seen by many in India as a metaphor for the vegetation and forests of the Himalayas.

When I returned to Lucknow three days later, I wrote to Papaji twice about these concerns. The first time his answer was mostly mysterious to me and left me unsatisfied. So I plucked up my courage and wrote again a couple of weeks later:

Dear Papaji, Lakshmana Swami once said that, since God had chosen to manifest as the world and everything in it, one could worship God by having respect for the world and all the life forms it contains.

For many, many years, Papaji, it has been my privilege and joy to worship God in this manner, to feel the living Earth play my life like a musical instrument. A couple of weeks ago, when I first wrote to you at satsang, you said this: “To the man speaking of Mother Earth I say: To help Mother Earth means you stand and shout at the top of your lungs.”

I have shouted long and hard, Papa. I shouted in front of bulldozers and was thrown in jail. I made films and a book, which was translated into 10 languages, and conducted workshops around the world, donating the proceeds to the work, raising hundreds of thousands of dollars for the protection of Nature from the Amazon to New Guinea.

For the last 15 years Papa, the Earth worked through me and I was tireless and full of joy, but eventually the impurities of ego and the conditioned mind began to rise again until, a couple of years ago, the Earth asked me to hand over what I had been doing to others and purify myself for the next task that she has for me. And here I am.

This time Papaji looked directly at me and said in his deep voice:

When you take care of your mother then you will get
What a blessing it was to feel Papa rekindle the flame inside me which had been wavering and doubtful. I could not yet know how, but I knew that from this turning point it would begin to flare forth once more.

And indeed, over the following years my work was renewed: fundraising on behalf of activists and cutting-edge projects around the world; in Ecuador to protect the Amazon headwaters from the ravages of the oil industry; a film I produced with David Attenborough and Olivia Newton-John to help protect the endangered forest species on New South Wales and the reforestation of Arunachala.

Shiva’s Mountain
My retreat with Papaji was drawing to a close, but there was still one place I had to visit: the great mountain Arunachala, in Tiruvanamalai, 18 hours south by train.

Nearly ten years before, in 1987, I had received a letter from Apeetha Arunagiri, an Australian nun residing in the Sri Ramana Ashram at the foot of Arunachala. She wrote that when Ramana had arrived there, the holy mountain was clothed in lush forest and one might even meet a tiger walking on its flanks. Now little grew there but thorns and goats. Terrible erosion trenched Shiva’s sides, and torrents of mud attended each monsoon. She had heard about our work for the forests. Could we please help her to reclothe the sacred mountain?

I had composed a reply to Apeetha, encouraging her in her efforts but pleading that we had no competence in reforestation or the rehabilitation of degraded landscapes – our mission was the protection of intact ecosystems. But it was no use, I couldn’t send the letter. Ramana’s smiling face, which I had first seen smiling from the back of his book Who Am I? in London in 1970, kept popping up before me. So we raised some money and sent it to Apeetha. Through her efforts a local NGO was born, the Annamalai Reforestation Society. The following summer solstice I was facilitating a Council of All Beings workshop at John Button’s shack at Sundari community in northern New South Wales. John was a permaculture designer and tree-planter who was heading for the deserts of central Australia to become involved in a tree-planting project. For some reason I asked him if he would like to try this in the deserts of Tamil Nadu instead. He asked for details, and when I mentioned Ramana, his face turned pale and he told me that he was a long-time devotee of Ramana.

Since that time, John and his partner, Heather Bache, helped organize the rehabilitation of Arunachala. The space between the inner and outer walls of the vast 23-acre temple complex has been transformed from a wasteland into the largest tree nursery in the south of India. Hundreds of people had received environmental education, and a 12-acre patch of semi-desert was donated to the project and transformed into a lush demonstration of permaculture and the miraculous recuperative powers of the Earth.

Hundreds of Tamil people have now been trained in reforestation skills – tree identification, seed collection, nursery techniques, watershed management, erosion control, sustainable energy systems. Shiva’s robes are slowly being reweoven. Furthermore, hundreds more have been trained in the techniques of permaculture, inspired by the Annamalai Reforestation Society’s model farm.

The train finally rolled into Tiruvananalai and I was able to visit Arunachala myself and see the tremendous work that had been done to revegetate the sacred mountain. Upon my arrival I discovered that many people there believe that to walk around the base of Arunachala is the fastest way to enlightenment. Each full moon, tens or hundreds of thousands of devotees and pilgrims do so. It upset me to see the indifference with which most of these folks regarded our work. Most were oblivious, but some even complained that the newly planted trees interfered with their view of the sunset. A great deal had been accomplished by the Annamalai Reforestation Society, but how much more could be achieved if only the pilgrims would realize the unity of the spirit and the Earth!

What if their worship of Shiva included devotion to his physical body, Arunachala? Imagine if they lent a hand to the planting and maintenance of the trees as part of their devotion? The greening of the mountain would be accelerated. I was giving talks and lectures in the town and I began to challenge the ecological indifference I found and to propose to the pilgrims that surely the act of worship and respect of watering the young saplings that were weaving themselves into robes to cover his nakedness was an even faster route to liberation than circumambulating the mountain.

A week later I was stricken with remorse. How could I be so presumptuous as to make such claims without having even asked Shiva? So one morning I climbed the mountain and found a quiet place among the trees to meditate and pray and apologize. After some time I opened my eyes to a noise. Some monkeys had appeared from the young forest. Slowly they filed past and stood...
guard while scores of their tribe came into view, and then they began to relax.

They groomed each other, they made love, mothers breast-fed their babies, children played and cavorted, utterly unself-consciously living their everyday lives in my astonished and grateful presence. I saw a new-born infant cautiously explore the ground, leaving the safety of her mother’s body for what seemed to me the first time, and leaping back and climbing her fur at the slightest noise or disturbance. I had never felt more accepted by the nonhuman world. I knew that Shiva had answered my prayer, had acknowledged my efforts, and was giving me his sign of approval.

It doesn’t really matter what symbols we use – Shiva, Gaia, Buddha, God. What we need now is for the followers of all faiths to turn their allegiance to the Earth. What matters is that we refuse to be drawn to one or the other of the great polarities: spirit and Earth. We must neither reduce everything to spirit, from where it appears that the material world is some kind of illusion, nor reduce everything to the material, so that it looks as if spiritual seekers are abdicating responsibility to care for the creation.

Reichel-Dolmatoff, Gerardo (1912–1994) – and Ethnoecology in Colombia

Gerardo Reichel-Dolmatoff, anthropologist, ethnographer, archeologist, ethnecologist, ethnohistorian and ethnoastronomist, carried out extensive research in Colombia (South America) among the Amerindians of the Amazon (Vaupes), Caribbean coast (Uraba, Guajira, Sierra Nevada), Pacific Coast (Choco), Andean and inter-Andean areas, and in the savannah area of the Llanos.

Reichel-Dolmatoff was one of the founders of Colombian anthropology and archeology. As an ethnographer he lived for decades among indigenous peoples and was a staunch defender of Amerindian peoples. The author of over 20 books and 300 articles on prehistoric and contemporary Amerindians, Reichel-Dolmatoff also was a member of scientific institutions such as the National Academy of Sciences of the United States, the Academy of Sciences of Colombia, the Third World Academy of Sciences, and the Linnean Society of London, among others.

Reichel-Dolmatoff’s anthropological work contains detailed ethnographies on dozens of Amerindian cultures and contributes significant theories and methodologies. For example, he analyzed indigenous shamanism, cosmologies and worldviews as templates for socio-environmental analysis and conservation, and related these to specific religious systems, modes of subsistence, socio-political structures, medicine, art, philosophies, and ethics that are used by communities to achieve long-term environmental and social well-being. He largely documented this among the Tukano Indians of the Northwest Amazon (Vaupes) and among the Kogi Indians of the Sierra Nevada de Santa Marta on the Caribbean coast.

Reichel-Dolmatoff pioneered archeological research in many Colombian regions and produced the first interpretive overviews of the millenarian cultural evolution of Colombia. He discovered, among others, early formative sites in the Caribbean area, which documented the (then) most ancient pottery of the Americas that was related to the origins of sedentary subsistence and agriculture tribal societies 6000 years ago.

In addition, he analyzed the symbolism of material culture, and particularly of goldwork, crystals, basketry, ceremonial items, and vernacular architecture – such as the Amazon maloca communal longhouse or the Kogi temple – advancing new theories on the shamanism and the cosmologies underlying such objects and artifacts of memory. His work emphasized the great values of
indigenous cultures for their wise, respectful, and ethical modes of balancing community well-being with socio-environmental sustainability. He contrasted these to ecocidal and ethnical non-indigenous cultures and insisted that they halt the destruction of Amerindian societies.

Life and Work
Reichel-Dolmatoff, who became a Colombian citizen in 1941, was one of the founders of Colombian Anthropology in the 1940s under the direction of French ethnologist Paul Rivet. During the 1940s and 1950s Reichel-Dolmatoff was a member of the National Institute of Ethnology, creator and Director of the Magdalena Ethnological Institute, a professor at the University of Cartagena and founding member of the Colombian Institute of Anthropology. During those two decades he carried out ethnographic research among the indigenous groups of the Guahibo, Pijao, Yuko, Chimila, Chami, Kogi, Ika, Sanka, Embera, Noanama, Cuna and Guajiro, among others. He also engaged in archeological excavations in the Andean, Atlantic and Pacific regions and lower Magdalena area.

In his two-volume monograph, published in 1949 and 1951, of the Kogi Indians (Chibcha speakers) of the Sierra Nevada de Santa Marta, and a series of other publications, he investigated Kogi spirituality from an emic (insider/vernacular) perspective through concepts such as “sewa,” “yuluka,” and “aluna” that indicated the profound indigenous understanding of nature and society in cosmological context and their application for sound socio-ecological management. Because the Kogi hold that their society is part of a world that lies between four skies and a netherworld of four underworlds in a multileveled and interconnected cosmos created by the Great Mother, he analyzed how the use of natural resources involves ritually “asking permission” to the supernatural Guardians, Owners or Lords of the resources, as well as an effective “payment” in “Thought” and in action to restore ecosystem balance. Reichel-Dolmatoff underlined how the “Mama” shaman-priests guided these agricultural mountain individuals and collectivities to reach a “balanced” life within nature, and he described Kogi life as sober, dignified and respectful of the environment and communal conviviality. He studied dozens of other indigenous cultures which shared many of these features, though the struggle of the Kogi to maintain their traditional cultures he found unique.

Linking his archeological, anthropological and ethno-historical investigations of the Sierra Nevada region, Reichel-Dolmatoff made the first regional and diachronic analysis of the area to investigate biocultural dynamics among indigenous peoples and mestizo (1961) peasant communities. He contrasted the modes by which they conceived, used or abused nature. Indians respected nature, underused resources or replaced them, and balanced resource extraction with population control or sustainable conservation, while making material and spiritual “payments” to the Guardian “Owners” of nature. Non-Indians, he found, generally exploited and destroyed nature and other peoples, and specifically despised Indians and their forms of resource management.

Reichel-Dolmatoff not only made the first stratigraphic excavations in the area, but also established chronologies and typologies and interpreted the cultural dynamics occurring in mountain, desert, rainforest and coastal ecosystems of northern Colombia. He created and directed a museum in Santa Marta where he highlighted the great value of the prehistoric and contemporary Amerindian cultures and their social and ecological wisdom. This was unprecedented in Colombia.

In 1963 he founded and chaired Colombia’s first Department of Anthropology (Universidad de Los Andes, Bogota). During the 1960s he engaged in fieldwork in the Vaupes area of the Amazon among the Desana Indians (Eastern Tukano speakers) and other Amazon peoples. His publications on Desana cosmology, shamanism, social organization, ethnoastronomy, ethnobiology, art, narcotics and hallucinogens (or entheogens), vernacular architecture and the symbolism of “maloca” longhouse; and on native concepts of territory and entheogens, pioneered a new era of Amazonian structuralist anthropology.

In 1973 he became affiliated with the University of California Los Angeles as Adjunct Professor. Between the 1970s and 1990s he continued ethnographic research and developed ethnecology as a category of interpretive anthropology requiring intercultural and interdisciplinary research. Among the Kogi and the Desana (Tukano) Indians he expanded analyses on socio-environmental management, ethnecology, shamanism, cosmology, worldview, ethnoastronomy, mythology, art, material culture, ritual, and on neurocognition, ethnopsychology, ethnomedicine, pharmacology, and environmental anthropology. He studied the role of hallucinogens and narcotic plants in shamanism (1978b, 1975) within their social and religious contexts to reinforce ecological decision making, and he analyzed the myths, rituals, and altered states of awareness they engaged. He examined the hallucinatory imagery during the ritual intake of Banisteriopsis and indicated how the visualization of phosphenes (universal optical perceptions) were interpreted with shamanic cultural codes to correct socio-ecological malfunctioning. He made exceptional analyses of the modes by which shamans guided communities in their use of narcotics, hallucinogens, altered states of awareness and experience of the sacred in order to reenchant biosocial existence within a grander cosmic context in such a way as to promote respect for all forms of being and sentence.

Based on a paradigm that Reichel-Dolmatoff termed “Cosmology as Ecological Analysis” (1976) in the Huxley Memorial Lecture, he examined Amerindian cosmologies as templates that are used to generate updated ecological
analysis and accountability, and which are applied for sustainable resource use. He related cosmologies to subsistence patterns, environmental management strategies, population density, dispute-settlement mechanisms, and to an ethos of shared responsibility among neighboring cultures to control socio-environmental imbalances and lead a peaceful coexistence. Portraying the Desana as pragmatic peoples and profound thinkers who are efficient planners with highly adaptive behavioral rules to manage rainforest ecosystems, and who recreate effective institutions and coherent belief and value systems to do so, Reichel-Dolmatoff explained the importance of their ecological eidos and ethos, indicating the importance of the coherence of their socio-political, economic and religious systems.

Between the 1970s and 1990s Reichel-Dolmatoff developed the field of ethnoecology and demonstrated the importance of indigenous ecological knowledge and traditional ecological skills. He emphasized the importance of apprehending the Indians’ own concepts and understanding of their ecological practices and beliefs.

He demonstrated how Amerindians consider their universe or cosmos to be composed of a network of skies, Earth, and underworlds which are interconnected by common forces of energy, "Thought," spirit, or matter, deemed to exist in a finite quantity and which require permanent and careful management. Each of these levels of the universes is believed to have supernatural Guardians who are “Owners” of parts of nature and of resources with whom shamans negotiate human existence by exchanging, or not exchanging, quotas of these finite forces. Thus, for Reichel-Dolmatoff, the conceptual dualism or opposition between nature and society is not extant among Amerindians such as the Kogi and Desana, and this cultural awareness that echoes the laws of nature, he concluded, is common wisdom among other indigenous societies in spite of their threatened cultures and territories.

Reichel-Dolmatoff conducted his research in collaboration with his Colombian wife, anthropologist and archeologist Alicia Dussan. He died in Bogotá in 1994 after dedicating more than fifty years to studying the religious and ecological values of Amerindian peoples, and to disseminating the relevance of the indigenous cultures of Colombia.

Nature and Society among the Kogi and Desana
Reichel-Dolmatoff’s research among the Kogi Indians of the Sierra Nevada mountains, and among the Desana and Tukano Indians of the Amazon rainforest, pioneered research methodologies and theories of relevance for ethnoecology, shamanism, cosmology and worldviews, and he indicated how their communities used these to live balanced lives based on sound social and environmental management. While analyzing how these Amerindians consider that their society is embedded within nature, the world, and the cosmos, he explored the relevance of the indigenous ethics of care and respect for all forms of existence. He highlighted that this awareness was the result of acute observations and millenarian experimentation upon the ecosystems and of human activity within these.

Reichel-Dolmatoff held that the Desana’s beliefs and practices are grounded in their cosmologies and worldviews. He demonstrated how cosmologies are used by shamans to monitor human activities in particular rainforest ecosystems in the Amazon and he analyzed the indigenous concepts, terms, symbols, principles, practices, and socio-ecological codes to do so. Interpreting how shamans seek to make calibrations between the microcosmos and the macrocosmos in rituals throughout the year and in individual rites of passage, as well as in subsistence practices such as foraging or agriculture, or in medicinal practices and in conflict management, Reichel-Dolmatoff showed how Desana shamanism correlates seasonal socio-ecological dynamics within the larger ecological, climatic, meteorological, astronomical and cosmic refers to monitor the place of human agency within. These cosmic linkages engage a three-leveled universe (sky, world, underworld) composing a closed system that is connected by circuits of limited energy, spirit and matter where the birth or death of one being affects others. In the shamanic geography and topography, these linkages are projected in sacred sites (hills, caves, rapids, spaces demarcating founding acts in cosmogenesis and ethnogenesis), in the borders and centers of ethnic territories, and in sacred spaces in each maloca longhouse.

Desana Indians reiterate their care of and respect for the beings and forces that compose the world and cosmos. Through shamans and elders they “ask permission,” and pay the Masters (Jaguar-Shamans) or “Guardian Spirits” of the animals, plants, soils, winds, waters, and of seasons, skies, earths, and underworlds, to use resources and to harmonize their lives with new seasons, years and eras.

Thus before the Desana Indians hunt tapis or deer, for example, the shaman “asks” the Guardian Spirits or Master of the Animals for “permission” to hunt. The shaman ritually negotiates with the Master in their abodes deliberating how to replace the predatory activity, though it is termed also as a form of courtship and exchange. The shaman, consuming coca, tobacco, or hallucinogens, also “flies” across the different levels of the cosmos and across diverse ecosystems as a bird, or may roam as a jaguar or some other predator to negotiate with the Owners of nature and the universe in order to “retrieve” lost souls of sick or dying people, or to punish other humans for overutilizing resources.

The shamans “repay” the Owners of nature for any resources that are to be exploited, and they seek to replace the “energy” or “spirit” in exchange for human lives of people who are to be sick or die, while promising to
prevent the future overutilization of resources by all the people of his community who are held to constitute a single unit of socio-ecological responsibility. The shamans continually induce the community, which lives together in a maloca longhouse, to respect the limited availability of matter, energy and spirit, and they permanently seek to solve conflicts over resource use, while collectively men and women do so along gender lines. According to Reichel-Dolmatoff, the symbolism of the maloca communal longhouse also reflects the architecture of the interconnected three-leveled cosmos to remind each community that it is a sentient part of the world and universe. The Desana thus consider their societies to be a part of nature, and that all ecosystems are embedded within the planet and the cosmos, according to Reichel-Dolmatoff (1971, 1976, 1978a, 1979, 1986, 1989, 1981, 1990, 1996a, 1996b, 1997).

All ecosystems are correlated to grander cycles of the world, skies and underworlds, deemed to be affected not only by the energy of the sun and by climatic and astronomical changes, but by the forces of ancestors and spirits. The territories that belong to ethnic groups are also categorized in cosmological terms, and their rivers, mountains, and sacred sites, have cosmological connections to the skies and underworlds.

The different neighboring groups who share environmental responsibility are likewise inscribed into the symbolism of their territories, and the structure of pan-tribal organization and of marriage alliances and of reciprocal exchange of goods and services are reflected in the symbolism of the landscape to engage kin and allies in joint resource management.

The Desana’s own categories and classificatory codes pertaining to ecosystem structure and function are coded according to energy levels and to sensorial categories such as color, smell, shape, or such, and through the imagery of a sexualized polarity, according to Reichel-Dolmatoff. Territorial boundaries that refer to the six phratries (kinship groups) that compose the twenty Tukanoan tribes, and the three exogamic units (one is the Desana) are related to the imagery of hexagonal crystals that correlate to the sky, Earth, and underworld, and to astronomical referents (delimited by Pollux, Procycon, Canopus, Achernar, T3 Eridani, and Capella with Epsilon Orion in the center). Altogether this shamanic topography codifies specific cultural behaviors in demarcated spaces to avoid socio-environmental malfunctioning, though the cosmos implies an enchanted universe. Using these shamanic references, the Desana men and women manage resources at local and pan-regional scales, recreating their semi-sedentary life as foragers and shifting cultivators through the concerted conservation, use or redistribution of goods, services, or marriage partners among allied groups intent on enhancing communal coexistence, restricting the mis-management of natural resources, reducing social violence and fomenting environmental conservation for future generations.

Among the Kogi of the Sierra Nevada mountains, Reichel-Dolmatoff analyzed how their cosmology and worldview permeates both ceremonial and daily life and their wise and austere use of natural resources. He investigated their concepts of the universe to understand the overall scheme through which they managed biocultural resources within their religious systems, and the symbolism of cosmogenesis and ethnogenesis.

The shape of the Kogi cosmos is believed to be composed of nine layers (four skies above, four underworlds below, and this world in the middle – the latter is the flat disc of the spindle used by the Great Mother to demarcate Kogi territory). The skies, Earth and underworlds are believed to be affected by the path of the sun between solstices and equinoxes, and by the path of the moon and other astronomical phenomena, as well as by meteorological, climatic, hydrological and other environmental dynamics which the Kogi monitor while alluding to their communication with the Lords, Masters, Fathers and Mothers of the universe, resources, and to their ancestors.

This model of the cosmos is reiterated in the symbolism of the Kogi territory, and it is also expressed in the layout of villages, in lithic astronomical observatories, in the architecture of their village temples, as well as in certain objects of material culture and in the symbolism of the human body. These mnemonic devices are used by the Kogi as “polymetaphoric thought patterns,” according to Reichel-Dolmatoff (1987: 78), to interpret how to achieve a life of “completeness” or to achieve spiritual depth and high-ranking. “Mama” priests and elders use them as references to counsel individuals and communities to achieve a transcendent existence. With ritual ceremonies, divinatory practices, pilgrimages, confessions and meditation, they guide people toward an austere and balanced life.

Reichel-Dolmatoff analyzed how the model of the Kogi cosmos is projected in the symbolism of the architecture of their temples. The four skies are represented in the four rafters of the roof, and the world is represented in four hearths that indicate a sacred square that is delimited by the path of the sun between solstices and equinoxes (since the temples are also used as astronomical observatories). According to lineage affiliation, each Kogi sits by one of the four hearths to discuss the “laws of the ancestors,” changing places throughout the year. A series of invisible and inverted temples are held to exist in the dark underworlds (with a black sun), which represent invisible but important realities.

Reichel-Dolmatoff demonstrated that this symbolism projects the form of the cosmos with key features of astronomy, geography, ecology, and social and political organization, linking past, present and future generations. According to Reichel-Dolmatoff, the symbolism of the
Kogi weaving loom corresponds to that of the temple, linking the structure of the cosmos to that of Kogi territory within the Sierra Nevada mountain environment and to the intermarrying Kogi lineages, and past with present and future generations, reminding the Kogi to reject material accumulation and promote the acquisition of wisdom, and the goal of socio-environmental sustainability in the short, mid- and long term.

The deep religious tradition of the Kogi and their quest to master the “balance” of mind and spirit and a balanced life, and their self-reference as the “Elder Brothers” who are the custodians of the world and universe because the white peoples or “Little Brothers” have forgotten their responsibility toward nature, led Reichel-Dolmatoff to investigate the many lessons the Amerindians have for the contemporary world. He urged Colombians and international forces to respect the cultures, lands, spiritualities, cosmologies, and modes of life of Amerindians such as the Kogi who are truly engaged in sustainable development and in concert with the laws of nature. According to Reichel-Dolmatoff, the “ideological foundations of Kogi culture and society” (1987: 75) are exemplary and he states:

I truly believe that the Kogi, and many other traditional societies, can greatly contribute to a better understanding and handling of some of our modern dilemmas, and that we should consider ourselves fortunate to be the contemporaries of a people, who, perhaps, can teach us to achieve a measure of “balance” (1987: 112).

Reichel-Dolmatoff’s last three books, The Forest Within (1996a), Yurupari: Studies of an Amazonian Foundation Myth (1996b), and Rainforest Shamans (1997) offer an overview of his understanding of the Amazon Indians in relation to nature. For the Kogi Indians, this overview appeared previously in his monograph on the Kogi and notably in articles such as “The Loom of Life: A Kogi Principle of Integration”; “Some Kogi Models of the Beyond”; “The Great Mother and the Kogi Universe”; and “Cultural Change and Environmental Awareness.”

Conclusion
Reichel-Dolmatoff pioneered anthropological, archeological and ethnocultural research in Colombia. He analyzed the modes by which Amerindian social, political, economic, religious, philosophical, medical, artistic, and ethical systems were used by diverse indigenous societies to sustainably manage biocultural resources and live in community-based bands, tribes and chiefdoms. He indicated how Amerindians planned resource use, demographic density, land and water use, and managed residence and subsistence patterns for sustainable resource conservation, and he indicated that these dynamics could only be understood within their cosmological and shamanic contexts.

According to Reichel-Dolmatoff, Amerindian conservation of resources is calculated within short-, mid- and long-term frameworks, and engages collaboration between local, regional and pan-regional contexts that are sentient of the interdependent linkages among all living beings and forms of existence across humanity, the biosphere, world, and cosmos. The Amerindian calibration of resource-use follows a millenarian shamanic tradition that avoids ecocide and foments communal conviviality, and these practices echo the Amerindian understanding that they form part of nature, and explain why they deem ecosystems to be linked to forces in the skies, Earth, and underworlds in order to foster sustained resource conservation. Reichel-Dolmatoff demonstrated that among traditional contemporary indigenous cultures there is no concept of a separate existence or opposition between nature and society nor motifs to dominate or exploit a subordinate domain of nature and peoples, and he analyzed the role of these lessons of Amerindian shamanism, cosmologies and worldviews in the making of the biological and cultural diversity in Colombia, while defending the indigenous peoples’ rights to their cultures and lands.

Reichel-Dolmatoff was one of the first scholars to recognize and interpret what is now called “Traditional Ecological Knowledge,” “Indigenous Knowledge Systems” and “Ethnoecology.”

SP A Religio–Ecological Perspective on Religion and Nature

If the study of religion is a science, as the German term religionswissenschaft posits, then some of its methods should allow a degree of predictability. One such approach is that of religio-ecology. The method was developed by the Swedish scholar, Åke Hultkrantz, who pioneered a social scientific comparative study of religion. The approach was stimulated by the anthropological method of cultural ecology, developed by William Sanders, as a means to study the evolution of Mesoamerican urbanism from its earliest roots.

In essence, religio-ecology is an approach to the study of religion that considers religion in the context of a culture's ecological gestalt, including the various relationships between humans (social, economic, political, etc.), as well as the relationships of humans to animals, plants, climate, terrain, geography, etc. Although religio-ecology was initially used to examine Native American religious traditions, especially those in gathering-hunting and horticultural-hunting situations, if the methodology is valid, then it should be applicable to all cultures in all stages of development, including contemporary societies.

To demonstrate this hypothesis, as well as the possibility of generalized predictability, a half-dozen religio-ecological paradigms will be briefly examined with regard to the religious and other understandings of nature, with a focus on animals: gathering-hunting, horticulture-hunting, herding, agricultural, industrial, and post-industrial cultures.

Among contemporary humans maintaining gathering-hunting cultural traditions, the entire cosmos is understood to be numinous (having an aura of sacredness), including animals and plants, particularly those on which human life, in various ways, depends. These understandings may, to a degree, be read back into the earliest human cultures, as they accord with Paleolithic art in their representation of animals and, rarely, humans. Such cultures understand that the world is a family in which humans are inferior members. Every encounter with a nonhuman being is with an entity that is simultaneously a natural and a spiritual being. Sought after animals and plants, gifts of the Earth mother, in various guises, must be supplicated to offer their individual lives so that pitiable humans may live. Every act of hunting larger animals, as well as gathering plants, sea creatures and smaller animals is ritualized. Predatory animals are spiritual models for the human hunters, and the dog is a hunting companion, whose sacrifice, as well as that of the human-like bear, is essentially a substitute for human self-sacrifice to the numinous realm. Shamanistic trance enables humans intimately to interact with theriomorphic spirits (spirits in animal form).

When plants are domesticated with the development of horticulture, the gathering-hunting religious understanding of the cosmos continues. The domesticated plants, however, understood as daughters of Earth, gain ritual preeminence over animals, as do the roles of females, who primarily carry out the gardening. Those animals that are domesticated are no longer understood to be spiritual entities superior to humans, but members of the human community ranging from quasi-children to pets, whose every slaughter is a ritual sacrifice. Hunted animals continue to be supplicated and treated with considerable
respect as in the gathering-hunting religio-ecological niche. But the shift from semi-nomadism to semi-settled living-patterns leads to a closer relationship with the matrilineral-matrilocial family and clan dead. This begins a transition from theriomorphic and plant spirits to anthropomorphic spirits (spirits in human form). Outside of the Americas, this led to a shift from shamanism to mediumism, as the living members of the clan sought the advice of the clan dead.

Semi-nomadic gathering-hunting cultures that domesticate migratory herding animals, most recently occurring among reindeer hunters of northern Eurasia, underwent a major shift in the religious conception of the particular animal or animals on which their economy depends. No longer individual numinous entities, the domesticated herds as a whole are understood to be a gift from their female numinous superior. Gifts of sacrificed animals from the herd are in turn offered to her. The human hunter shifts to the role of the “good shepherd.” Animal predators are no longer spiritual role models for human hunters but enemies of the herded animals, for whose welfare humans are responsible. As hunting activities shift to herding, those ritual activities associated with shamanism are no longer generalized among the population as an essential aspect of hunting and gathering but become concentrated among ecstatic religious specialists.

The horticultural-hunting religious understanding of animals and plants continues with the rise of agriculture, but there are significant socio-economic transformations. The majority of males shift from hunting-raiding-trading roles to farming, while females continue their gardening-nurturing roles. With the average male no longer expert with hunting weapons, warrior specialists supported by surplus agricultural productivity tend to become the hereditary elite of a stratified social order, and the matrilineral-matrilocial pattern tends to shift toward a patriarchal-patrilocial pattern in consequence of the increased importance of the male roles. When warriors become the rulers, this patriarchal pattern tends toward patriarchy. Warriors also become ritual specialists, or a separate caste of female and male priests develops. The spirit realm now consists of ancestors, divinized ghosts, and/or anthropomorphic deities who were not previously human. These deities are understood in hierarchies modeled on the now-stratified human socio-political order. An offshoot of this development, which occurred in one culture, becoming the basis for Western civilization, is for the male chief of the divinities to be considered the sole divinity of the culture, the “king of kings.”

With a patriarchal social stratification between elite males who use weapons and the majority of males who wield farming implements, hunting of large animals becomes the prerogative of the elite as ritualized practice for warfare, also ritualized. Hence, undomesticated animals continue to be slaughtered solely in sacrificial rituals, but these rituals tend to be carried out by professional ritual specialists who are separated from the raising of the animals, no longer understood as quasi-children. Save for the Religions of the Book (Judaism, Christianity, and Islam), aristocrats play a major role in these sacrifices, which comprised primarily the offering of food and alcoholic beverages to the spirits. But the aristocrats tend to distance themselves from the actual slaughtering of the animals for the meat dishes; the killing and butchering being left to professionals. Remnants of this pattern continue in Western culture in the Jewish and Islamic ritualized slaughter of animals by religious specialists.

The concentration of hunting activities among the elite as an avocation serves to create a disjunction among the general populace from the undomesticated world, leading to the concepts of wilderness and wild animals. Culture distinguishes humans from animals, as well as humans of different cultures, now understood as “wild” humans or barbarians. Humans no longer relate to wild animals as sacred beings but as savage beasts to be tamed and/or killed. Spanish culture maintains a resplendent version of both these archaic perspectives – taming and killing – in the highly ritualized corrida des toros, although the modern ritual in itself is not of great antiquity.

With agriculture, the relationship between humans and animals falls into four distinctive categories. For the elite, animals are 1) pets, either playthings or facilitators for human hunting; 2) working domesticants, particularly the horse, used for warfare and hunting, that become romanticized along with warriors toward the ends of these periods; 3) domesticated animals for ritualized consumption; 4) or wild beasts, often found in royal hunting parks, ritually hunted with the same weapons used in warfare. The peasants raise the domesticated animals, ritually slaughtered and eaten by the elite, although peasants rarely have the opportunity to eat these animals themselves. As they are responsible for the elite for their welfare, predatory animals are feared by the peasants for their predations and killed when possible. Game animals (notice our language in this regard) are forbidden to them, being reserved for the elite; peasants who are caught hunting these animals are liable to be executed. The middle class fall somewhere in between, of course, depending on their status.

In the transition from horticulture to agriculture, the understanding of plants changes from revered spiritual relatives to desired entities whose sole purpose is the nourishment or other uses of humans, or undesired entities, such as weeds, which hinders the growth of the farmed plants. Similarly, animals also change from revered spiritual relatives to entities whose sole purpose is to feed or be of other use to humans, entities who threaten those animals, or entities that can be killed for practice in preparation for
warfare. Of course, there are many cultural variations and moderate exceptions to this pattern.

In India, for example, cows became a special case, due to the unusual, virtually exclusive, dependence on them for animal protein (milk and milk products), edible oil (clarified butter), traction (draft animals) and fuel (dried dung). Hence, the concept of cows in India is closer to the understanding of animals in horticulture-hunting traditions than agricultural societies. But in India, hunting still tends to be reserved for the hereditary aristocracy or the new aristocracy modeled on the former British colonizers, save for remnant pockets of horticultural-hunting villages in the interior mountains.

Further changes in socio-economic structures leads to increasing distance from the earlier human patterns in these relationships. As industrial manufacturing desacralized metals, clay and wood, so the spread of industry over agriculture led to the desacralizing of Earth, plants and animals in every regard. It is to be noted that this process begins in Christian cultures that had long since limited the numinous to the male Sky and understood the female Earth, as well as human females, to be the locus of evil. Industrial manufacturing and the spread of industrial practices to agriculture also led to the increasing urbanization of the population, further distancing the average person from an intimacy with domesticated plants and animals, save for pets, which tend to be understood as quasi-humans rather than animals, and ornamental plants. Agribusiness factory production of meat and grain leads to animals and grain plants no longer understood as beings, let alone as relatives or gifts from the sacred realm. Undomesticated animals now are neither sacred entities nor respected enemies but anthropomorphized, desacralized fantasies: the “Bambi” syndrome.

Only among the anachronistic remnants of the European aristocracy or their industrial-era replacements (factory owners, etc.) does hunting continue combined with respect for and acknowledgement of a special nature of hunted animals (who cannot be accorded numinous status in monotheistic traditions). Non-urbanized Euro-Americans, lacking a hereditary aristocracy, maintain hunting as a ritual of Americanism which renews their connections with a mythicized “pioneer” past and wilderness onto which is projected a sacred aura of pristine purity.

In the post-industrial world, where virtual reality is increasingly replacing normative reality, the traditional real world is becoming transformed into a realm of fantasy, and experience in nature qua nature is being replaced by actual (e.g., dirt bikes and “personal water craft”) and vicarious thrills. Animals become valued with no understanding of their life cycles and ecological situations and are understood to be utterly divorced from food. Cellophane-wrapped meat is not understood, from either the emotional or the religious standpoint, to come from living animals, just as factory-manufactured, cellophane-wrapped bread or pasta is not understood to come from living plants. The various traditional ritual relationships with animals and plants completely disappear to be replaced by concepts of “cuteness”; wild animals are perceived no differently than non-working pets. Hence, campaigns are mounted against hunting in general, regardless of potential disastrous consequences for non-competitive herbivores in terrains where natural predators have been exterminated, and hunters become the epitome of evil.

The distancing of humans from animals, plants, and Earth in post-industrial cultures becomes absolute. Theriomorphic and plant spirits, once replaced by anthropomorphic spirits, are for an increasing number of contemporary Westerners now replaced by alien spirits from cosmically distant sacred realms. The North American spiritual journey into romanticized wilderness has been superseded by fantasized alien abduction.

Religious Campaign for Forest Conservation

The Religious Campaign for Forest Conservation (RCFC), established in 1998, is a coalition of religious persons primarily identifying themselves as members of Christian or Jewish faith traditions who seek a “right relationship” with forests and the promotion of “religious values” in regard to forest conservation. The campaign is coordinated by Fred Krueger in Santa Rosa, California and is managed by a steering committee of members associated with local congregations in many parts of the United States and with
prominent environmental, religious, academic and commercial institutions, such as the Commission on Environment and Jewish Life, Christians Caring for Creation (Los Angeles, CA), the Religion, Environment and Economics Project (London), the Franciscan Environmental Network, Department of Earth Literacy of St. Mary of the Woods College (St. Mary of the Woods, IN) and Larand International, to name a few.

“Right relationships” are said to entail an apprehension of responsibility understood as the exercise of “correct dominion” in regard to forests specifically and the whole of creation generally. “Rightly understood,” the RCFC argues, “dominion binds the person back to God and requires justice, humility, stewardship, wisdom and concern for Creation’s ultimate end. To understand dominion as an unbridled right to domination is wrong.” “Correct dominion” is further appreciated as an embodiment of one’s duty to God. As the RCFC summarizes, “The forests belong first to God; we are its stewards” (creationethic- s.org, 9 January 2002). In this regard, the definition of “correct dominion” follows closely several other elaborations, particularly those offered by James Nash and Eric Katz, among others.

The RCFC argues that the “excessive material and financial focus,” which is prevalent in Western society at large and which has promoted forest degradation, corresponds to a “deadening of spiritual sensitivity” that has become embodied as a failure to exercise “correct dominion.” It argues that this “deadening of spiritual sensitivity” has become increasingly prominent since the Enlightenment. Further, “commercial activity,” primarily logging, is said to be “unraveling the integrity of forest systems.”

The RCFC insiststhat while wood products are clearly needed, harvesting of timber should not occur “at the expense of the integrity of Creation [or] the health of its life support systems.” To this end, the RCFC advocates harvesting timber on private property and rejects doing so on federal lands and in state forests. It calls for the reform of management practices on private lands by advocating an end to the cutting and harvesting of old-growth forests, an end to clear-cutting, an end to logging in riparian zones and on “steep or unstable slopes” and an end to practices that convert natural forests to “monoculture plantations.” It also calls for the use of 100 percent post consumer recycled paper, a reduction in packaging and modifications in construction methods so as to ease the demand for forest products. Justice is seen as working toward “not only corporate profits, but also decent, health-giving jobs and the long-term survival of our biodiverse forests” (Krueger 2000a: 15) in a manner consistent with “correct dominion.”

The RCFC emphasizes and values the role that forests play in regard to the maintenance of clean water, the regulation of carbon dioxide levels and climate, the opportunities forests provide for eco-tourism and the spiritual/psychological benefits that are provided to persons by forests. Moreover, forests are seen as a source of “wisdom” and inspiration.

The RCFC has made significant contributions in regard to forest conservation. It has actively supported various legislative initiatives and has engaged in extensive lobbying campaigns, both in Congress and with senior administration officials particularly at the Departments of Agriculture and Interior. Additionally, the organization coordinates a program titled “Opening the Book of Nature,” a series of retreat experiences held at various locations designed to assist participants in experiencing and articulating the spiritual significance of forest conservation. The RCFC also reports that its own intensive work with World Bank officials has resulted in the granting of a significant loan to Mexico for reforestation. As a result of its efforts, the RCFC anticipates additional World Bank reforms that are consistent with forest conservation. Assessments of the reasons for the organization’s success are a matter of speculation, but it can be said that its appeal to tradition plays a major role.

While the RCFC affirms a sense of “interconnectedness and interrelatedness” (Krueger 2001: 35) within the whole of creation, the notion of “correct dominion” is nonetheless maintained as an integrating paradigm. Consistent with the conception of “correct dominion,” the RCFC emphasizes, “Wilderness is a system of knowledge by which we are led deeper into an understanding of God’s truths” (Krueger 2001: 34). Given that forests are then appreciated instrumentally as a vehicle for the apprehension of wisdom by human persons, an affirmation of natural law, in some sense, seems to be implicit in their work. If so, this affirmation suggests a reformulation of how natural law can be conceived, perhaps in a manner akin to that which has been recently suggested by Nash, a reformulation that entails moving away from anthropocentrism and, correspondingly, involves the understanding that “moral responsibilities are discovered by reflecting not only on human nature but also on our interactions with the whole of nature” (Nash 2000: 228).

The RCFC has clearly met with success as an activist organization in regard to the conservation of forests. To this end, its apprehension and articulation of “correct dominion” has played a central role. That conception, however, invites important questions which relate to how “right relationships” can be understood among persons in relation to God, to nonhuman entities in the created realm and to one another. As Elizabeth Johnson suggests, differing paradigms may effectively incorporate an awareness of past understandings within the Christian tradition in both positive and negative ways so as to prompt a rejection of hierarchal paradigms that, following Johnson, limit the apprehension of “another kind of godly order structured according to genuine interdependence and mutuality” (2000: 12), a structural understanding that as she suggests,
seems more consistent with the certain observations from contemporary science. Johnson’s emphasis on “genuine interdependence and mutuality” is consistent with contemporary understandings such as the “partnership ethics” of Caroline Merchant (1995: 217) and ecofeminist philosophical insights such as those expressed by Val Plumwood among others. Differing paradigms of this sort may also provide an effective platform from which to engage in Christian environmental activism and may prompt further investigation in regard to the notion of “right relationships” within the whole created realm as well.

The Religious Environmentalist Paradigm

In environmental studies it has commonly been assumed that there exists a fundamental connection between a society’s management of natural resources and its perception of nature. With the publication of “The Historical Roots of Our Ecologic Crisis” (1967) Lynn White was among the first to focus more narrowly on the relationship between the state of the environment and religion, postulating a direct linkage between the two. He blamed mainstream Christianity – in particular Judeo-Christian cosmology of man’s mastery of nature – for the environmental ills facing the world today.

Since the publication of White’s paper it has become fashionable to read ecological insight into religious dogmas and practices. Within much of the environmental movement there has been a tendency to appeal to traditional, religious ideas and values rather than to ecological science and technology in the face of environmental problems. Religious ideas and values have come to play prominent roles in environmental discourse. The Danish anthropologist Poul Pedersen has termed this approach the “religious environmentalist paradigm” (1995).

One early example of this approach was the meeting held in Assisi (Italy) in 1986 to mark the 25th anniversary of the World Wildlife Fund (later renamed the World Wide Fund for Nature), ending with the Assisi Declaration (WWF 1986). More recent examples are the series of conferences on religion and ecology held at the Center for the Study of World Religions at Harvard University, the associated “Forum on Religion and Ecology” as well as many entries to this encyclopedia.

Two sources have particularly inspired scholars and laymen alike in the construction of the religious environmentalist paradigm, namely East and South Asian
Western religions: in the subtitles given to the Harvard volumes on non-Western religions is, for example, clearly expressed with interconnectedness and integrated within nature. This preoccupation with interconnectedness has been to the latter. But, unlike a narrow, scientific understanding of “ecology,” TEK is intimately connected with religious beliefs and values. For good reasons the human ecologist Fikret Berkes called his book on TEK and indigenous resource management Sacred Ecology (1999).

Asian and indigenous concepts of nature are not less complex than their Western counterparts, and it is therefore dangerous to generalize. Nonetheless, whether looking at indigenous traditions or Asian religious creeds, scholars of such worldviews have almost invariably stressed that they are what Christianity allegedly is not, namely, ecocentric and monistic, promoting a sense of harmony between human beings and nature. Christianity in contrast is portrayed as anthropocentric and dualistic, promoting a relation of domination rather than harmony. By focusing on how these traditions are different from Western ones, non-Western religions meet the demand for new ecological paradigms that unite man and the environment as parts of one another.

Everything is Interconnected

One of the most common and enduring stereotypes in environmental literature on non-Western religions is that they are organic-holistic where everything is interconnected through cosmic webs. Human beings are not seen as something outside and above nature but as interconnected and integrated within nature. This preoccupation with interconnectedness is, for example, clearly expressed in the subtitles given to the Harvard volumes on non-Western religions:

- Hinduism and Ecology: The intersection of earth, sky, and water
- Buddhism and Ecology: The interconnection of dharma and deeds
- Confucianism and Ecology: The interrelation of heaven, Earth, and humans
- Daoism and Ecology: Ways within a cosmic landscape
- Jainism and Ecology: Nonviolence in the Web of Life
- Indigenous traditions and ecology: The interbeing of cosmology and community

But . . .

- Christianity and Ecology: The well-being of Earth and Humans
- Islam and Ecology: A Bestowed Trust

Judaism and Ecology: Created World and Revealed Word

This idea of interconnectedness is expressed somewhat differently in various non-Western traditions, but they are all claimed to be ecocentric rather than anthropocentric and nondualistic or monistic rather than dualistic. People are seen as intimately united with nature.

Scholars of Indian religions often quote from the Bhagavadgītā that the person of knowledge “sees no difference between a learned Brahmin, a cow, an elephant, a dog or an outcaste,” and in East-Asian Buddhism the distinction between the animate and inanimate has gradually been erased to the extent that mountains, stones, mist and the sound of blowing winds have become sentient beings, and thus in possession of Buddha-nature (dharma). In Japanese Shinto one talks about kami, i.e. a divine power or spirit that resides in anything which gives a person a feeling of awe or spiritual experience, a notion shared with many indigenous traditions around the world. As everything may have Buddha-nature or has the potential of harboring divine powers, all creatures, animate and inanimate, are – at least in some contexts – on the same level. There is thus not a sharp line, as in much of Judeo-Christian thinking, between humans and the rest of nature. Here we encounter worldviews where “nature” corresponds to the cosmic whole, i.e. the totality of existing phenomena. In such views nature and the “universal principle” might be inseparable and intrinsically linked.

Jainism tells us that everything possesses jīva or life-force, and in Chinese cosmology the notion of qi (chi’i) or vital force not only permeates everything from rocks to heaven, but may even be seen as the very substance of the universe. Qi is thus seen as the cosmological link between all beings and all events, giving rise to the Chinese notion of “cosmic resonance” (kan-yang), whereby otherwise independent events are mutually influencing one another.

The interconnectedness has also a temporary aspect, through the laws of cause and effect (karma). Common to Buddhism, Hinduism and Jainism is the notion of reincarnation. In Jain thought all are souls entrapped in different states of karmic bondage, a notion that may lead to an ascetic life and a reverence for everything. But whereas Jainism holds that plants and animals must first be reborn as human beings before entering a state of eternal, blessed solitude, kevala, Eastern Buddhism holds that even plants can escape the suffering of rebirths and enter directly into nirvāna. Beliefs in reincarnation can also be found among indigenous hunters, as among the Cree Indians of North America who believe that killed animals will be reincarnated if rituals are properly performed.

Few, if any, of the above claims are controversial. But what many religious environmentalist writers have done is to clothe these observations, and many more, in the language of ecology and environmental ethics. According to
some of the participants at the Harvard conferences, the notion of karma, for example, is taken to entail an environmental moral responsibility, often seen as binding individuals to the environment. To locate human beings with animals, plants and stones is in this discourse supposed to foster a deep reverence for nature, encouraging us to think “like a mountain,” a notion borrowed from the American ecologist Aldo Leopold. And seeing the universe as a dynamic, ongoing process of continual transformation is, according to one of the editors of the Harvard series, precisely the “organic, vitalistic worldview which has special relevance for developing a contemporary ecological perspective” (Tucker 2003: 218).

Critical Voices
However, many observers have questioned the truth of the myths of the ecologically noble Other, whether they are savages or Orientals. The Indian sociologist Ramachandra Guha (1989) objects to attempts to turn Oriental religions into ecocentric religions. He views this Western appropriation of oriental religions as yet another expression of the need of Westerners to universalize their messages and to uphold a false dichotomy between the rational and science-oriented Occidentals and the spiritual and emotional Orientals. Others have argued that the concepts “ecocentric” and “anthropocentric” themselves are creations of the Cartesian worldview with little relevance to non-Western traditions, which may be one or the other depending on the context.

Many skeptics have pointed out that traditional practices are not necessarily benign to the environment. Historical ecology has indicated that indigenous peoples both in Polynesia, Europe and North America may have hunted a number of endemic species to extinction. Native North Americans have been reported to kill indiscriminately, although their environmental values are based on humanistic notions and morality toward nature where animals have intrinsic value. And early agrarian civilizations in, for example, China and Japan experienced serious deforestation and erosion long before industrialization, despite allegedly “environmental-friendly” religions such as Daoism, Buddhism and Shinto. The Chinese and Japanese managed to correct the situation, whereas the prehistoric Maya and Indus civilizations seem to have been unable to halt depletion of their forests. Hence it is certainly far too simplistic to blame all ills in non-Western societies in terms of Westernization and modernization.

We need to tread cautiously when inducing ecological practices from philosophical traditions. Discrepancies between theory and practice are common, as L. Holly and M. Stuchlik argued in 1983 and the geographer Yi-Fu Tuan asserted in his critique of the Lynn White’s thesis in 1968. Tuan warned us not to assume a priori that people’s attitudes and norms toward nature are mirrored in their actual behavior. This is important not only because we, as those before us, often are ignorant of the effects of our practices, but also, as Eugene Hargrove has reminded us, because “moral principles and precepts are normative, not descriptive. They do not, in other words, describe how people actually behave; rather they prescribe how people – again often generally and obliquely – ought to behave” (1989: xx). Moreover, attitudes and norms do not merely serve as guides for our behavior, they serve to rationalize and legitimate behavioral choices already made.

Skeptics have accused religious environmentalist writers for selective readings of religious texts and practices and for ignoring beliefs and practices potentially harmful to the environment. But, writing about the situation in South Asia, Lance Nelson (1998: 5–6) asserted, “the negative outcomes of religious teachings that can be used to rationalize environmental neglect are probably greater than the positive influence of those that encourage conservation and protection.” Russel Kirkland made a similar point regarding Daoism. This situation is probably equally true for the whole of East and Southeast Asia, and most likely with all religious teachings. Worldviews and cosmologies are in this perspective not seen as coherent constructions but full of contradictions, making them vulnerable to interpretation and reinterpretations. It might be argued that it is precisely this ambiguity that makes religions versatile and adjustable to changing circumstances.

That worldviews are ambiguous and harbor contradictory views and values on nature, and that there are discrepancies between people’s attitudes toward nature and their actual behavior, ought not to surprise anybody. It is probably less trivial that the organic-holistic perspective, where everything is seen to be interconnected and changing, in itself might be part of the problem rather than the solution many advocates of the religious environmentalist paradigm want us to believe. Several arguments have been offered to this effect.

First, it has been argued that an organic-holistic view implies that there is no clear distinction between nature created by gods and artifacts created by people. In other words, artifacts and nature are not opposed, and nature becomes everything around us whether it is a river or teapot, a mountain or heap of garbage. Litter or a vending machine is just as much a part of nature as a crane or a pine tree. They may all harbor Buddha-nature, be potentially the abode for a spirit, be permeated by qi or possess jiva. Writing about Japan, the French geographer Augustin Berque stated that there “it can be natural to destroy nature” (1997:143). In more general terms, without some distinction between nature and humanity, we can hardly be held responsible for the adverse effects our activities may have on the environment. This does not inhibit human intervention in nature but rather opens the way for a utilitarian approach to it. Thus, an organic worldview that explicitly recognized the unity of the natural and social worlds may fail to give rise to sound environmental
practices and may even contribute to the environmental problems.

Second, seeing nature as dynamic implies that it is not regarded as something unchanging or absolute but as a process of something becoming, or entering into, a certain state. Nature is situational or contextual, and this view allows for multiple concepts of nature to coexist: the wild and threatening nature which sometimes plays havoc with people and landscape, or nature in its most cultivated form: a garden, a dwarfed tree (bonsai). It is argued that it is in this latter idealized form that nature is most appreciated, at least in East Asia. It is appreciated because it is cultured, which means that it is brought into people's social universe. It has been argued that human assistance is often necessary in order for things to appear in their real “natural” state, and even that the important thing is not the manifestation of nature itself but the idea about nature.

Third, the notion of karma, which underlines the dynamic character of many Asian religions, is intimately connected with a search for liberation from an endless cycle of death and rebirth. In viewing nature as a process, where everything decays and dies only to give birth to new lives in an endless cycle, one may arrive at the conclusion that natural objects acquire little value in and of themselves. In Hinduism, Jainism and Buddhism there is a strong tendency to withdraw from the world of suffering (samsāra) to escape into some kind of blissful void (kevala, nirvāṇa), and many scholars have therefore stressed the world-denying features of Asian religions that encourage people to turn their backs on the world. In such a perspective nature becomes irrelevant, which is hardly the best starting point to address the issue of environmental destruction.

Finally, it has been argued that when nature is seen as immanently divine, as it is in animism, this leads to a “love of nature” relationship. But the close relationship between people and spirit also enables people to entice spirits to move from their abodes in order to utilize the locations in question for other purposes. Before the construction of a house can commence, for instance, ground-breaking ceremonies can be performed. Moreover, it is recognized that it is the nature of things that one organism feeds upon another, creating relations of indebtedness in the process. Human beings are considered to become indebted to nature when exploiting it, but can “repay” harm that has been inflicted upon nature, animate or inanimate, through offerings. Memorial rites have been reported for Japanese as well as indigenous hunters throughout the world. A divine nature is, therefore, by no means a guarantee against environmental degradation, as has often been claimed.

If its critics are right, why then, one may ask, has the religious environmentalist paradigm acquired such a prominent position within the environmental discourse? There may be several answers to this question. Images of the Other do not only help us define ourselves but also serve as a powerful, internal cultural critique. Kay Milton has even claimed that such images are fundamental to the radical environmentalist critique of industrialism (1996: 109). The paradigm can, moreover, help people to carve out new roles for old religions. This is true not only for Western eco-theologians who are busy searching the Bible and other Christian texts for ecological insight, but even more so for non-Westerners. Pedersen suggests,

By offering to the world what they hold to be their traditional, religious values, local peoples acquire cultural significance. When they speak about nature, they speak about themselves. They demonstrate to themselves and to the world that their traditions, far from being obsolete and out of touch with modern reality, express a truth of urgent relevance for the future of the Earth. This achievement, with its foundation in appeals to imagined, traditional religious values, represents a forceful cultural creativity which would not have worked by the invocation of “pure” ecology or environmentalism (1995: 272).

This opportunity to acquire cultural significance should no doubt be applauded and encouraged. Two warnings are nonetheless in place. First, the religious environmentalist paradigm’s notion of the ecologically noble Other has occasionally contributed to chauvinism and even nationalism among indigenous peoples themselves. Second, and more important, by using images of the Other in cultural critiques of modernity, it becomes imperative to stress what the Other is not, namely modern. Only by being “authentic” – that is “ uncontaminated” by modern ways – are they noble and worth our consideration. Corrupted by modern ways they become fallen angels. In the hands of some environmentalists, as Beth Conklin and Laura Graham concluded in their study of ecological politics and Amazonian Indians, the notion of the ecologically noble Other locked them in an “ethnographic present” of more idyllic pre-modern days.

Religious Naturalism

A working definition of religious naturalism was developed online in 2003 by members of a religious-naturalism internet discussion group on religious naturalism. The statement, a modification of the Campion statement of self-understanding generated by the Institute on Religion in an Age of Science, is as follows:

We find our sources of meaning within the natural world, where humans are understood to be emergent from and hence a part of nature. Our religious quest is informed and guided by the deepening and evolving understandings fostered by scientific inquiry. It is also informed and guided by the mindful understandings inherent in our human traditions, including art, literature, philosophy, and the religions of the world.

The natural world and its emergent manifestations in human creativity and community are the focus of our immersion, wonder, and reverence. We may describe our religious sensibilities using various words that have various connotations – like the sacred, or the source, or god – but it is our common naturalistic orientation that generates our shared sense of place, gratitude, and joy. We acknowledge as well a shared set of values and concerns pertaining to peace, justice, dignity, cultural and ecological
diversity, and planetary sustainability. We may differ on how these concerns are best addressed, but we are committed to participating in their resolution.

Several of the terms and concepts included in this statement are described in more detail below.

Naturalism

“Naturalism” is most commonly used to describe a philosophical lineage that starts from the framework of materialism – the universe is constructed from matter and energy – and articulates philosophical propositions within that framework. Given that our scientific understanding of the material world has undergone a vast expansion since the naturalism project was launched, and since philosophical responses are framed in cultural contexts, much of the thought that would be included in a historical treatise on naturalism would not resonate well with present-day understandings (this is true as well, of course, of other philosophical traditions). To release the term “naturalism” from its historical constraints is not to release it from the fundamental impulse of the naturalism project, however, which is to perceive and construct meaning systems based on what is known of the natural world.

What is known of the natural world has generated a recent and profound transition, moving from facts-about-physics (quanta) or facts-about-biology (genetics) to a sweeping integrated story – the Epic of Evolution – that deeply informs us about who we are (symbol-manipulating primates, social, mortal, creative, members of ecosystems) and how we got to be here (the Big Bang, nucleosynthesis, biological evolution, brain evolution, emergence). This shift has in turn enlarged the scope of the naturalism project: the challenge is not only to construct meaning systems based on a knowledge of, say, quantum uncertainty or genetic specification, but also to construct meaning systems that emerge from the new meta-narrative itself.

Religious Naturalism

Loyal Rue defines a religious orientation as that which offers personal wholeness and social coherence, and suggests that this is accomplished in traditional religions via metanarratives that indicate how-things-are and which-things-matter. The adjective religious can be said to encompass three spheres of human experience. 1) The interpretive sphere (akin to theological) describes responses to the big questions raised by the narrative (e.g., Why is there anything at all rather than nothing? Does the universe have Plan? Purpose? How do we think about death?). 2) The spiritual sphere describes inward responses to the narrative, responses such as gratitude, awe, humility, and reverence, responses that for some are best accessed in community with others. 3) The moral sphere describes outward, communal responses to the narrative such as compassion and fair-mindedness and respect.

Religious naturalism is best thought of as a generic term for mindful religious approaches to our understandings of the natural world. As such, it does not represent a detailed system of religious beliefs. Instead, the specificity shifts to, and resides within, the religious naturalists themselves.

Religious Naturalist

Religious naturalists are anchored in and dwell within their understandings of the natural world. They find their primary religious orientation within that narrative/perspective and develop mindful religious responses to it – interpretive, spiritual, and moral. These responses are then transfigured into emergent valuaciones that are called religious orientations and beliefs. Importantly, these valuaciones and beliefs may deeply overlap with those espoused by existing ethical and religious traditions: the substitution of one meta-narrative for another does not necessarily alter the human impulse toward common spiritual and moral sensibilities; rather, it influences how we get there.

Religious naturalists holding shared orientations and beliefs may go on to associate as more focused communities, albeit this possibility has not yet become widespread. These communities may, for example, develop art and ceremony that honor and celebrate their understandings of the sacred, and may commit to engagements in social and environmental activism. Such communities may coalesce within existing faith traditions, or they may come to stand alone. Examples include the World Pantheist Movement (www.pantheism.net), the Teilhard Association (www.teilhard.cjb.net), and the religious naturalism interest group of the Institute on Religion in an Age of Science.

Religious Studies and Environmental Concern

The establishment and growth of Religion and Ecology as a new area of study can be attributed in part to its instigation by scholars who feel morally and ethically compelled to address serious environmental problems. That religion itself has been implicated as a catalyst of environmental decline has prompted such scholars to examine the relationships among human cultures, religions, and environments. The Encyclopedia of Religion and Nature is, of course, one manifestation of the effort to understand such relationships. But it is hardly the first example of interest in religion and ecology among religious studies scholars, and some of this interest is more than analytic, it is itself religious. Indeed, especially since the mid–1960s, there has been intense scholarly interest in the relationships between human cultures, religions and environments, not only among religious studies scholars, but also among philosophers who have been pioneering the field of Environmental Ethics. Some anthropologists have also focused attention on Ecology and Religion and have been developing a field known as ecological anthropology. A good starting point for the study of religion and nature is to review the range of scholarly approaches to understanding the relationships between cultures, religions, and environments. Here we focus on the role played by religious studies scholars in religion-related environmental studies and activism.

Religion and Ecology in the American Academy of Religion

In 1989 and 1990 David Barnhill (then a professor of Buddhism and Environmental Studies at Guilford College) and Eugene Bianchi (a professor of Christian Theology and specialist in Roman Catholicism at Emory University) teamed up to propose a religion and ecology “Consultation” to the American Academy of Religion, an important academic association devoted to the study of religion. The consultation was approved and held its initial sessions in 1991. The Christian process theologian Jay McDaniel, and the Buddhist scholar and deep ecology activist Stephanie Kaza were among the group’s earliest supporters, both of whom were engaged in their own scholarly and activist work toward environmentally friendly religion. Demonstrating strong interest from Academy members, in 1993 the Consultation became a “Group,” a status which it has maintained to this writing.

The religion and ecology initiative represented a concerted effort to focus scholarly attention on the religion variable in human/ecosystem interactions. Some of the scholarly work presented there clung strictly to historical or social scientific analysis. The majority of the group’s presentations, while they might have been involved in or taken such work as their starting point, have also had a normative, ethical dimension.

Some participants explored how the world’s dominant religions could be “mined” or “reconfigured” to promote environmentally sustainable lifeways. Others, influenced by perspectives articulated during the emergence of environmental ethics and radical environmentalism, promoted the revitalization of cultures and religions they considered to be environmentally benign (such as indigenous, pagan and animistic ones), but that had been declining in the face of what the presenters considered the world’s dominant, imperial religions (especially the monotheistic ones). Still others proposed or endorsed recent religious innovations (such as the “Universe Story,” “Epic of Evolution,” ecofeminism, and various new religious movements including Wicca) as correctives if not antidotes to anthropocentric religions that view the Earth instrumentally and consequently degrade it. Yet others advanced an Earth Charter in order to capture and deploy religious ethics in a way that would promote a new environmental ethics, one that would consider the preservation of biological diversity a sacred duty, while simultaneously valuing cultural and religious diversity.
Within the wider American Academy of Religion, critics of the religion and ecology group have argued that religion and ecology scholars are more engaged in green religion and “missionary” work than in scholarly analysis. Such criticisms are likewise addressed to others ethically or religiously engaged groups in the AAR and reflect a wider fissure within it. For some scholars of religion, religious studies should promote religious tolerance and thus a more humane world, and therefore to promote the “greening” of religion, or to participate in it, would be appropriate modes of academic engagement. For others, such as Donald Wiebe (1999) and Russell McClutcheon (2001), who analyze in complementary ways the religiosity animating much of what is called “religious studies” today, the task of the discipline is properly to analyze religion rather than to defend or engage in it.

The conflicting responses of those in the religion and ecology group reflect this fissure. Some are apparently not involved in religious production or environmental ethics. Others unapologetically defend the normative religious or ethical dimension of their work and the group’s attention to it, arguing that the world cannot afford to have scholars sit on the sidelines in the struggle for sustainability.

The differing approaches and tensions reflect the plural identity in the religion and ecology field to date, which has scholars engaged in both analytic and normative work. This said, most participants and observers of the AAR’s Religion and Ecology Group would acknowledge that much of the work of its affiliated scholars is animated, at least in part, by environmental concern. And some of the participants would certainly understand themselves to be “engaged scholars” involved, in one way or another, in the struggle to “green” religion and ethics. The driving force behind this conference was Steven Rockefeller, a Middlebury comparative religion scholar with a Ph.D. from Columbia, who also happened to be a practicing Buddhist born of one of America’s wealthiest and most politically prominent families. No doubt Rockefeller’s background and connections help explain the success of the conference. More importantly, the conference was successful because it reflected and captured a growing environmental concern among a wide variety of religious individuals and groups, and it evoked and inspired more of the same. The conference was capped by a similarly titled American Public Television broadcast and widely distributed video (produced by the well-known journalist Bill Moyers), and a book (Rockefeller and Elder 1992). All three “spirit and nature” manifestations promoted the idea of nature protection as a fundamental religious duty.

The driving force behind this conference was Steven Rockefeller, a Middlebury comparative religion scholar with a Ph.D. from Columbia, who also happened to be a practicing Buddhist born of one of America’s wealthiest and most politically prominent families. No doubt Rockefeller’s background and connections help explain the success of the conference. More importantly, the conference was successful because it reflected and captured a growing environmental concern among a wide variety of religious individuals and groups, and it evoked and inspired more of the same. The conference was capped by an interfaith religious service that included the voices of whales and other creatures, brought to the congregation through the medium of Paul Winter’s music, itself an expression of contemporary nature religion.

In the subsequent years, Rockefeller and a number of other religious studies professors would become even more deeply involved in promoting a fusion of environmental concern and religious ethics.

The “Religions of the World and Ecology” Conferences

The next most significant development along these lines occurred as the disciplines of environmental ethics and conservation biology got off the ground. But two events deserve to be singled out for dramatically increasing public and especially religious attention to environmental ethics.

The first, in 1986, was inspired in part and influenced by religion scholar and Roman Catholic priest Thomas Berry, and held at the Basilica di S. Francesco in Assisi, Italy, during the World Wide Fund for Nature’s twenty-fifth anniversary celebrations. Leaders of the five world religions who had been invited issued the “Assisi Declarations on Religion and Nature,” which set forth religious obligations to nature and spurred additional discussion and statements among and from other faiths in the subsequent years.

The second was a “Spirit and Nature” conference held at Vermont’s Middlebury College in 1990. It featured the Dalai Lama and a number of prominent religious leaders and scholars who had previously focused attention on religious responsibilities toward nature. The conference was followed by a similarly titled American Public Television broadcast and widely distributed video (produced by the well-known journalist Bill Moyers), and a book (Rockefeller and Elder 1992). All three “spirit and nature” manifestations promoted the idea of nature protection as a fundamental religious duty.

The driving force behind this conference was Steven Rockefeller, a Middlebury comparative religion scholar with a Ph.D. from Columbia, who also happened to be a practicing Buddhist born of one of America’s wealthiest and most politically prominent families. No doubt Rockefeller’s background and connections help explain the success of the conference. More importantly, the conference was successful because it reflected and captured a growing environmental concern among a wide variety of religious individuals and groups, and it evoked and inspired more of the same. The conference was capped by an interfaith religious service that included the voices of whales and other creatures, brought to the congregation through the medium of Paul Winter’s music, itself an expression of contemporary nature religion.

In the subsequent years, Rockefeller and a number of other religious studies professors would become even more deeply involved in promoting a fusion of environmental concern and religious ethics.

The “Religions of the World and Ecology” Conferences

The next most significant development along these lines was a series of conferences, hosted by The Center for the Study of World Religions at Harvard University with support from diverse environmental, religious, and animal welfare groups. Entitled “Religions of the World and Ecology,” the conferences occurred between 1996 and 1998. Like the “Spirit and Nature” conference, these were followed by publications. Between 1997 and 2004, ten
Critical Perspectives on "Religions of the World and Ecology"

Since its inception, the issue of “engaged” scholarship has been a focal point for intense debate within the field of Religion and Ecology. The sharpest criticism has come from those who charge that scholarship incorporating ethical concerns and thus an “environmental agenda” ultimately compromises the critical acumen associated with distanced scholarship. These are not idle concerns, but they were not easily resolved, nor were they foremost in my mind when in 2001 I was asked to evaluate the Harvard book series during a Religion and Ecology Group session at the American Academy of Religion meeting in Denver, Colorado.

After first acknowledging the monumental contribution of the Harvard Series, I expressed a number of reservations about the way it was framed and some of the tendencies found in the published articles. Three of these are worth repeating here, for they reflect some of the concerns that led to this encyclopedia project, which is itself an exercise in religious studies, and was designed to remedy lacunae in the inherited “religion and ecology” field as it had unfolded in its initial decades. The first criticism was that the “Religions of the World and Ecology” enterprise was not as inclusive as it sounded, for its main conferences and book series focused only on those religions labeled “world religions.” To their credit, the series included indigenous religions, which until recent decades had not been studied as a related religious type in venues like this. But the “world religions” category is problematic in itself and any list of religions so labeled will be difficult to maintain against criticisms. Scholars increasingly recognize that the contemporary multi-religious world increasingly fits into tidy and conventional religious categories such as “world religions.” Moreover, the conferences and books drew primarily on scholars and figures closely associated with, if not committed to, the traditions under scrutiny. This left much nature-related religiosity out of sight, including individuals and groups engaged in nature-focused spirituality, such as many environmentalists who are not involved in any formal, established religion but who often consider nature to be sacred in some way, as well as Pagans, Wiccans, and some New Age devotees, who consider a perception of nature’s sacredness to constitute the very center of their religious worldview.

Although such lacunae were pointed out to the conference organizers early enough to remedy the oversight, and despite a sympathetic hearing and a recognition by them that there were significant gaps, nothing was done to make the conferences and book series more inclusive. Many scholars and religionists aware of this episode traced it to anti-Pagan bias and/or a desire not to offend mainstream religions, especially the conservative monotheistic ones that have typically ridiculed Earth-based religions and sometimes even repressed their practitioners. Even if a lack of funding made rectifying the oversight difficult, leaving the original decision in force represented a choice, one that reinforced the original omission. A second criticism was that embedded in the series was not only a clear bias toward mainstream traditions but also one favoring the mainstreams of these traditions. The “World Religions” format established a structural and conceptual hurdle that made it difficult to attend fully to the critically important dynamic of religious bricolage. On the one hand this obscured the important dynamic of hybridization in the contemporary greening of religion. It also undermined the desire for “creative revisioning” that was set out as a goal in the “Series Foreword” by (Tucker and Grim 1997: xxii) by casting implicit suspicion over such hybridization, seeing it as somehow impure compared to the existing traditions. This kind of tone was present in many of the contributions in the series, largely because so many of them were entrusted to scholars who were experts in their tradition’s texts; even when critical, they tended to remain loyal to what they took to be the text’s original meanings. Some of the authors ridiculed those engaged in what they considered inauthentic religious innovation, that is, at least, when they did not ignore popular religiosity and social movements altogether in favor of textual and worldview analysis.

In short, the series, by privileging the mainstream in its choice of its speakers and contributors (with a significant exception in the Indigenous conference and book, which paid substantial attention to contemporary grassroots engagements, and a few other notable exceptions) did not consistently look to the margins, where religious innovation tends to be most intense, arguably providing more fertile ground for new religiosities, including greener ones. Even when such religious production was charitably evaluated as possibly of some environmental utility, it was clear that many of the scholar-elites writing in these volumes considered such innovations to be “misunderstandings” and “misappropriations.” This may have well served “political correctness” or religious orthodoxy, implying that only people with a certain background can or ought to interpret a tradition, but it was not good religious studies. Critical religious studies recognizes the critical role that hybridity and boundary transgression plays in the history of religion and that for non-devotees, ethical judgments about such transgressions will have to rely on concerns other than faith-based belief regarding what constitutes a “pure” strain of an extant tradition. In summary, assumptions that often accompany textual and worldview analysis often

Continued next page
discount popular, nature-oriented spirituality, making them invisible, and this kind of analysis has been the priority of the Harvard series, and indeed much of the religion and ecology field.

A third criticism was the idealistic (namely idea-focused) premise of the entire enterprise. Tucker and Grim in their series foreword insisted, quoting Lynn White, that “human ecology is deeply conditioned . . . by religion” (in Tucker and Grim 1997: xvi). But this claim unfortunately assumed that which needs to be a central conundrum and subject of a scholarly inquiry into the relationships between religion and nature. It would have provided a better starting point for the religion and ecology series to turn this premise into a question: “Is environmental action conditioned by religious attitudes about nature?” Then, if an affirmative action were to follow, we could then push deeper, “If environmental behavior is so conditioned, how does this work within the immensely complex ecological and political systems in which we are all embedded?” Certainly many of the entries in this encyclopedia question the idealistic premise of this series and the majority of the inherited “religion and ecology” field. Some of these suggest, on the contrary, that it is environments which decisively shape religions, not vice versa, and that over the long run, the only religions that will endure will be those proving “adaptive” within their earthly habitats.

In these areas of criticism – underdemonstrated idealism combined with a narrow focus and privileging of religious mainstreams – and in a number of other problematic assumptions conveyed by this series and much of the “religion and ecology” field, two differing approaches to the field can be discerned. One is activist in its priorities and chief orientation. It seeks to turn religions green while being careful not to offend religious majorities and mainstreams. For an activist, even a scholar-activist, this is an understandable choice, for to the extent that religious worldviews influence behaviors and thus impact ecosystems, the ones held by more people will be the most important environmentally. Another approach places the priority on simply understanding the relationships between Homo sapiens, their religions and other cultural dimensions, and their livelihoods, environments, and so on – which is no simple task! This effort may also be motivated by environmental concern and it is certainly not value-neutral – many of its scholarly practitioners hope that the answers to such critical inquiry can help guide both environmental activism and public policy. But the approach endeavors to bracket value assumptions in an effort to prevent them from occluding understanding of the role of religion in nature.

Although these can be distinct approaches, in the real world these approaches, and those engaged in promoting them, sometimes, inevitably, intersect. Tensions between these approaches can even operate synergistically, helping to illuminate together the religion and nature terrain better than either would in isolation. Nevertheless, it is time for scholars involved in this interesting field of inquiry to exhibit greater self-reflexivity and transparency with regard to the approach they are engaging in, alerting the reader to when they are engaged in this approach, and their rationale for such choices. This would lead to greater clarity and would help guarantee that the inevitable tensions that accompany scholarly inquiry will be creative and productive as the field evolves.

Harvard University Press books appeared, constituting an impressive series bearing the same title as the conferences. The volumes explored what the series editors decided were the world’s major religious traditions: Buddhism, Christianity, Confucianism, Daoism, Hinduism, Indigenous Traditions, Jainism, Judaism, Islam, and Shinto.

The conferences were organized and the book series edited by two Bucknell University Religious Studies Professors, Mary Evelyn Tucker and John Grim, both of whom had been inspired by the work of Roman Catholic theologian Pierre Teilhard de Chardin, as well as by Thomas Berry and his protégé [philosopher and mathematician] Brian Swimme, who together became the most influential religionists promoting the consecration of scientific and evolutionary narratives, which they called The Universe Story (Swimme and Berry 1992). They and others moved by these narratives have been involved in crafting these new sacred stories onto existing and new religious forms, sometimes monotheistic ones (such as when Christians celebrate the “Universe Story” linking it to creation through ritual performance), sometimes not (such as can be found in ritualizing of the Epic of Evolution, and in the Council of All Beings as presented in the work of Buddhism scholar/activist Joanna Macy and the deep ecologist John Seed).

Tucker and Grim have been instrumental in promoting the Universe Story through their long service as Vice President and President (respectively) of the American
Teilhard Society. The Society was founded in 1964, Thomas Berry himself serving as its president during the 1970s. Grim assumed the presidency in the early 1990s, and continued well into the twenty-first century. Tucker called the Society the “Seedbed for Thomas Berry” in a 2003 interview (31 January in Bucknell, Pennsylvania; this paragraph and its quotes are gleaned from this same interview). Tucker and Grim, her husband, were well placed to know, for they had facilitated the society’s role in this regard. For example, Tucker assembled a number of Berry’s essays and presented them to a publisher in the early 1970s, which led eventually to the publication of Berry’s influential The Dream of the Earth (1988), which would sell over 70,000 copies. For another example, the new journal Teilhard Studies (winter 1978) devoted its first issue to Berry, entitled “The New Story: Comments on the Origin, Identification, and Transmission of Values.” Tucker and Grim were also been active in the AAR’s Religion and Ecology Group and instrumental in the development of the journal Worldviews: Environment, Culture, Religion, which commenced publishing in 1997, providing additional venues for promoting a sacramental sense of the Universe’s evolution. They have worked to draw the broader religion academy’s attention to the Earth Charter as well, which also conveys such spirituality.

As important as an inspiring universe or other religious worldviews might have been in fostering the emergence of “religion and ecology” as a sub-field of religious studies, the field was driven as much by an apocalyptic reading of the current state and likely near-future of the planet. Tucker and Grim, for example, began the series foreword of “Religions of the World and Ecology” with a strikingly apocalyptic tone:

Ours is a period when the human community is in search of new and sustaining relationships to the earth amidst an environmental crisis that threatens the very existence of all life-forms on the planet . . . As Daniel Maguire has succinctly observed, “If current trends continue, we will not” (Tucker and Grim 1997: vii).

Although some may think the extinction of Homo sapiens is a real, near-term possibility, few scientists share such a view, let alone fear that “all life-forms on the planet” will go extinct. This suggests that the framing of these volumes may be grounded more on an apocalyptic faith than biosphere science. Scientists increasingly do, of course, express alarm about the extent and rate of environmental degradation. It should be no surprise that this would fuel apocalypticism. Indeed, some future scenarios do envision the end of the world as we know it, even suggesting this has already occurred, as Bill McKibben problematically did in his best-selling The End of Nature. He did so by conceptually extracting humans from nature, for humans can only end nature if they are not a part of it. This illogical feat McKibben accomplished with little criticism, which was made possible by the apocalypticism of the age. We might, nevertheless, have wished for a more judicious framing of McKibben’s book, which had much otherwise to commend it, as well as the Harvard series, which despite such framing, will properly be understood as a benchmark for a certain type of engaged religion and ecology scholarship. And on a human level, the apocalyptic framing is understandable, for soberly presented ecological prognostications are certainly frightening enough to warrant such fears.

What is even more important to the current religion and nature discussion is the claim by Tucker and Grim in the introduction that the environmental crisis is grounded in defective religious perception, “We no longer know who we are as earthlings; we no longer see the earth as sacred” (1997: xvii). This implies not only that the Earth is sacred, but that earlier humans had a different and superior religious sensibility toward nature than modern humans.

Whatever the truth of such assumptions, they certainly make comprehensible why Tucker and Grim, and the other scholars who share such presuppositions, have labored so assiduously in developing the “Religion and Ecology” field. They hope to rekindle a sense of the sacredness of the Earth, which they consider a prerequisite to restoring ecological harmony. Indeed, a fundamental premise of most of the ferment occurring under the “Religion and Ecology” is a global, green-religious reformation.

The introduction to the Harvard series made this clear: Religious studies scholars could contribute significantly to the quest for sustainability by identifying and evaluating

\[
\text{[the distinctive ecological attitudes, values, and practices of diverse religious traditions . . . Highlight[ing] the specific religious resources that comprise such fertile ecological ground: within scripture, ritual, myth, symbol, cosmology, sacramental, and so on (Tucker and Grim 1997: xxiii).}\
\]

The objective of the conference series was thus to establish a common ground among diverse religious cultures for environmentally sustainable societies, while treating individual traditions as resources to be mined for the envisioned religious reformation. Many if not most of the scholars writing for the Harvard Series seemed to share the objective of its editors, striving to uncover and revitalize the green potential of the religions they were analyzing.

This encyclopedia provides many examples of scholars deeply involved in this process. Perhaps one of the more interesting is that of J. Baird Callicott, a protégé of Aldo Leopold, and one of the world’s pioneers of the field of environmental ethics. As if taking a cue from Leopold’s above-mentioned lament that philosophy, ethics, and religion have had little to do with conservation, Callicott
has tramped worldwide pursuing cultural and religious resources for Leopoldian land ethics. Perhaps the foremost expression of Callcott’s religion-related work is *Earth’s Insights: A Survey of Ecological Ethics From the Mediterranean Basin to the Australian Outback* (1994), a project he pursued although, as he discloses in *Natural History as Natural Religion* in this encyclopedia, he regards most religions as superstitious. He nevertheless hopes they can be made to promote conservation ethics that cohere with ecological science.

**"Culminating Conferences" and Targeting the United Nations**

After the World Religions and Ecology conferences at Harvard that focused on religious traditions, two “culminating conferences” were held, producing or contributing to three significant trends: 1) the spreading of spiritualities in which the evolution of the universe and life on Earth is considered a sacred story; 2) the wider extension of green forms of mainstream religions; and 3) the greening of international institutions.

The first culminating conference, “Religion, Ethics, and the Environment: An Interdisciplinary Dialogue,” occurred on 17–20 September 1998 at Harvard University. The focus of this conference was cosmology, environmental ethics, and the world religions. Speakers included Thomas Berry, the entomologist and biodiversity advocate E.O. Wilson, and J. Baird Callicott, all of whom have in their own ways promoted the consecration of scientific narratives. Steven Rockefeller also spoke. Since the Vermont “Spirit and Nature” conference, Rockefeller had become a critically important facilitator of the Earth Charter process. The Charter, intended for United Nations ratification as a sustainability strategy, is a remarkable document claiming that all life has intrinsic value and expressing reverence for the miracle of life, while calling the nations to understand, in one way or another, that preserving the Earth is a “sacred trust.”

The second culminating conference took place on 21 and 22 October 1998, and brought the themes of the earlier conferences, including the sense of the sacredness of the universe, right to the United Nations (the second day was held at the American Museum of Natural History). This conference illuminated the role of religious studies scholars in the Earth Charter initiative, and indeed, one of the sessions was devoted specifically to “charting the course” for the Earth Charter.

One of the speakers was Oren Lyons, a professor of Native American Studies at the State University of New York at Buffalo, and the “Faithkeeper” of the Turtle Clan, Onondaga Nation, one of the traditional nations of the Haudenosaunee Confederacy. In 1991, Lyons himself had participated in another important extension of nature spirituality into the culture’s mainstreams, through a Bill Moyers public television program based on a conversation with Lyons. Mary Evelyn Tucker was another speaker at the United Nations, bringing the message she was taking from the overall conferences, that religions were indeed turning green, sometimes in dramatic and decisive ways. Her experiences of this perception she discussed several years later in *Worldly Wonder: Religions Enter Their Ecological Phase* (2003). Thomas Berry and Brian Swimme were also presenters, bringing their reverence for the universe directly to the conference, and kindling substantial interest. The first day at the United Nations drew an overflow crowd including many United Nations employees, and 1000 people attended the sessions at the Natural History Museum.

Perhaps even more importantly, a number of prominent figures associated with the United Nations spoke and endorsed the overall effort to green religion and ethics, including Maurice Strong, who reportedly first hatched the Earth Charter idea while serving as the Secretary-General of the United Nations Conference on Environment and Development. This conference was held in 1992 in Rio de Janeiro and became known simply as the “Earth Summit.” Adnan Amin, the Executive Director of the United Nations Environmental Program, also articulated his support for the overall effort to promote a global environmental ethics and politics congruent with it. A few years after this meeting at the United Nations, in 2002, on the occasion of the United Nations’ World Summit on Sustainable Development in Johannesburg (which was the official follow-up meeting to the Earth Summit), Steven Rockefeller played the leading role in promoting the Earth Charter. The Charter received respectful mention from a number of world leaders, but no formal attention on that occasion.

This discussion has demonstrated that ideas and initiatives, incubated if not birthed by religious studies scholars, have played important roles in the greening of religion and environmental ethics. They are, moreover, beginning to influence global environmental politics, bringing to them an important and sometimes innovative religious and ethical dimension.

**The Forum on Religion and Ecology**

Mary Evelyn Tucker and John Grim developed the conferences to encourage scholarly work in the service of greening the world’s religions, to promote a sense of the sacredness of the universe and evolutionary narratives, and to support related ethical initiatives including the Earth Charter. To continue such efforts they also used the conferences to spawn a long-term initiative, which they called the “Forum on Religion and Ecology.” Known to many by its acronym, FORE, the organization was, according to its website, established to help develop “religion and ecology as an academic area of study and research in universities, colleges, seminaries, and other religiously affiliated institutions.”

A number of religiously affiliated colleges and seminar-
ies have been developing religion and ecology as specialties, and in 2003, the University of Florida, a state-sponsored, secular institution, inaugurated the first “Religion and Nature” emphasis as a central part of its new Ph.D. program in Religion. Such developments—occurring both in religious and secular institutions—suggest that the field of religion and ecology began emerging from its infancy in the early years of the twenty-first century. The differing approaches, confessional/ethical on the one hand, and historical/social scientific, on the other, will sometimes be in tension, but this is likely to be a creative one. Sometimes the differing approaches will be blended in creative scholarly hybrids. Taken together, the various approaches will produce diverse kinds of scholarly work as the field is further constructed.

**Restoration Ecology and Ritual**

Ecological restoration is the active attempt to return a landscape or ecosystem such as a prairie, a wetland or a lake to a previous condition, usually regarded as more “natural.” This is done through the alteration of soils, topography, hydrology and other conditions, the introduction of extirpated or otherwise missing species of plants and animals, and the elimination or control of species not present in the historic, or model landscape.

Although restoration has existed in its modern form since early in the twentieth century, for most of that time it was merely a curiosity represented by only a scattering of projects, and playing no significant role in conservation thinking or practice. Only since about the mid-1980s have conservationists begun to take restoration seriously. This development has been accompanied, or perhaps to some extent driven, by the growing recognition of the value of restoration as a conservation strategy, a technique for basic ecological research, a way of experiencing and learning about landscapes and ecosystems.

At the leading edge of this ongoing discovery of
Restoration are practitioners who have begun to explore its value as a context for the creation of ceremonies and rituals to explore and celebrate the relationship between humans and the rest of nature. The value of restoration as a basis for performance, ritual and other forms of expressive action arises from its essentially active nature.

Preservation, for example, despite its importance as a conservation objective, entails an essentially non-active relationship with the landscape, and offers few opportunities for expressive action in direct relationship with the land and other species.

Restorationists, in contrast, participate in evocative activities such as the gathering and sowing of seed and the reintroduction of animals, which provide occasions for celebration. They also participate in psychologically problematic activities such as the burning of vegetation and the “control” – that is, usually, the killing – of unwanted species, and in the contamination of “nature” by these and other intentional human activities.

The negative feelings aroused by activities of this kind are no doubt one of the reasons why environmentalists ignored and even resisted restoration for so long. But they are also the reason why restoration is so valuable as a context for exploring and defining the terms of our relationship with the rest of nature in a non-sentimental, psychologically and spiritually comprehensive way.

One way to explore the potential of restoration as a performing art, or as a context, occasion, or basis for ceremony, ritual and other modes of expressive action is to consider parallels between the “act” or “story” of restoration and other performative genres. Of these, perhaps the most obvious is dramatic reenactment. Restoration is, after all, a kind of time travel, which may be undertaken and understood variously as an attempt to reverse, repeat, alter or obliterate history. Thus the practice of restoration has been imaginatively linked with historical reenactments in events such as the annual Trail of History days at Glacial Park, site of a landscape-scale restoration project near Richmond, Illinois.

Another performative genre that parallels the practice of restoration in suggestive ways is pastoral art, which explores the relationship between humans and the rest of nature through action carried out in the field of tension between them. In classic forms of literary or dramatic pastoral, such as Thoreau’s Walden, or Shakespeare’s A Midsummer Night’s Dream, this usually involves movement across the landscape, typically a double action of withdrawal from civilization (represented by a city, factory, court or the like) in the direction of nature (represented by a garden, or a wilderness, natural area or pastoral landscape) and then an ultimate return. The restorationist, however, performs this pastoral “experiment,” in a very different way, not by moving from one place to another, but by attempting, in effect, to remove culture from nature by modifying a single place. This variation on the pastoral design has important environmental implications, not least because it dramatizes the possibility of the redemption of the city, and also because it provides a constructive alternative to the essentially consumptive use of the natural landscape modeled by “retreatants” such as Thoreau or Edward Abbey.

Restoration also offers close parallels with traditional rituals of initiation. In particular, the task of copying – rather than imaginatively imitating – the model or “given” landscape provides an occasion for the radical self-abnegation or setting aside of the will characteristic of some traditional rituals of initiation (see, for example, Grimes 2000). When properly developed, this may serve as an opportunity for achieving membership in the biotic

---

**New Academy for Nature and Culture**

The New Academy for Nature and Culture is a school without walls being developed to provide college-level training for leaders of community-based conservation efforts. Conceived by a consortium of restoration practitioners associated with the Society for Ecological Restoration, the New Academy is taking shape as a network of regional centers each comprising a number of partners, including environmental and civic organizations and at least one college or university, which provides basic courses, leading ultimately to a degree with a certificate from the New Academy.

Based on the idea that most of the resources needed to accomplish its mission already exist, both on and off campus, the New Academy is being developed primarily to identify these resources and to bring them together in behalf of a coherent, mission-driven program of study and reflective experience working with both the human and the biotic communities. Its aim is to help participants develop the skills they need to help others derive full value from conservation efforts in the physical, intellectual, psychological and spiritual as well as the purely ecological dimensions of value. These values, then, can serve as the value-base for the formation of communities, or “congregations” based in watersheds or other ecologically or culturally significant units, and for paying fees, or tithing to support the leadership needed to coordinate the effort.

The first regional center of the New Academy was established in 2001 in the Chicago area in partnership with Loyola University, Northeastern Illinois University and a number of non-academic partners. Development of a related program at the junior-college level, based at Merritt College in Oakland, California, has been underway since the early 1990s, and will probably become a regional center within a year or so, and there are also centers of interest at universities in Texas, Arizona and Michigan.

*William R. Jordan III*
community, a paradigm of relationship long favored by environmentalists. At an even deeper level of engagement, restoration provides a context for confronting the most problematic aspects of life, including the killing of plants and animals and the exercise of a kind of hegemony over entire ecosystems. Since it opens up the possibility of offering back to nature some recompense in nature’s own kind for what we have taken from it, it also opens up the possibility of a kind of redemption in our relationship with nature through a ritual offering back to it, rather in the manner of the institution of ritual sacrifice characteristic of many traditional and pre-modern cultures.

At the present time, restorationists have made some progress toward the realization of these imaginative possibilities. Ritual in the context of restoration efforts currently ranges from the informal and minimally self-conscious bagel breaks and sharing of stories during workdays to more ambitiously conceived forms of ceremony and ritualization. In Lake Forest, a suburb of Chicago for example, the burning of brush piles resulting from the clearing of exotic species in rare oak savannas has become the occasion for an annual festival featuring a parade of bagpipes, linking the city’s cultural history with its biotic past and future. Other restorationists, like the San Francisco practitioner Amy Lambert or the Mt. Horeb, Wisconsin environmental artist Barbara Westfall, have used restoration projects as the occasion for the creation of installations or performances designed to explore and enhance the meanings generated by these projects (see Restoration & Management Notes 10:1 [1992], 59).

Others have used restoration projects and events as occasions for special ritual events such as weddings, or seasonal events such as solstices or equinoxes, illustrating ways in which meanings inherent in the task of restoration resonate with those of traditional events such as certain holidays, festivals and occasions of life-crisis and transition.

These developments are of special importance for environmentalism because they represent the value of reflective action rather than deduction and argument in the development of meanings and other environmental values. Since environmentalism, regarded as a religious endeavor, has arguably been rather “top-down,” or “theological” in its approach to the formation of values and attitudes, an emphasis on ritual as a source of values and a context for conscience formation may prove to be of fundamental importance in the development of an environmental religion based on values that truly emerge from the experiences of groups of people in particular places.

Restoring Eden

Restoring Eden is a nonprofit organization working to reestablish nature appreciation and environmental stewardship as a core value within the Christian community. Headed by Peter Illyn, an evangelical Christian minister, Restoring Eden creates simple, heartfelt messages that target Christians in churches, universities and communities in an effort to raise up grassroots environmental advocates.

Illyn became an environmentalist during a 1000-mile llama trek through the Cascade Mountains of Oregon and Washington. As he recalls the experience,

One night, while camping in an alpine meadow, I watched a herd of elk come to graze. As I stood in the moonshadow, I saw a bull elk raise his head, snort and then bellow out a loud rutting call. I was overcome by the primal wildness around me. I finally understood, though dimly, the scripture in Genesis where God, after creating the wild animals, stated that it was “good.” But two days later my llamas and I followed the trail into a massive clear-cut. There were no trees left standing, no birds flying, no elk rutting. It had the quiet desolation of an abandoned battle field.
According to Illyn, while sitting there on an ancient fir stump, doing his daily Bible reading, he came upon Proverbs 31:8, which states that we should “speak out for those who cannot speak for themselves.” Brokenhearted by the devastation he saw from horizon to horizon he prayed, “Lord – who speaks out for your forest, your elk, your salmon?” “It was at that moment,” he tells his audiences, “two days after seeing the elk, that I decided to become a voice for creation.”

Illyn states that he went into the mountains a minister but four months later came out as an environmentalist, committed to preaching the biblical call to love, serve and protect God’s creation. To further that commitment, in 1996, he founded Christians for Environmental Stewardship, to identify and network a church-based grassroots movement. In 2001, the organization’s name was changed to Restoring Eden.

A cornerstone of the work is assertive outreach efforts. According to Illyn: “Our goal is to be unapologetic, yet winsome in our advocacy. Our message is simple, ‘God is a good God, God made a good Earth, God calls us to be good stewards.’” Illyn and the others drawn to Restoring Eden recognized that the agents of change in the Church are seldom the pastors in the pulpit, but instead are the lay-leaders in the pews, and they focus on their potential.

The goal is to organize these lay-leaders into a grassroots voice willing to speak out about the goodness of creation in Church and in the political arena. Restoring Eden representatives’ table at Christian rock festivals, start environmental clubs in Christian colleges, and host student lobby-training events in Washington, D.C. They have come to the defense of protecting endangered species, protecting wild forests from road building, and have lobbied to prevent the U.S. government from permitting oil drilling in the Arctic Refuge.

Through this activism, Restoring Eden has developed important partnerships with indigenous Christians working to protect their tribal land and subsistence economies and cultures. These partnerships have taken Illyn on speaking tours of tribal communities in Papua New Guinea and Alaska. He held workshops there with tribal leaders to confirm that a true biblical land ethic is similar to their traditional tribal land ethic – take only what you need, be thankful for all you have and see the connections and interdependencies. Often referring to themselves as “belly-button” Christians, these tribal communities still see their umbilical cords connected to their “mother,” the Earth. This is contrasted with a commonly held land ethic within the modern Church that believes God made the Earth for us, so take as much as you can, as fast as you can.

On these speaking tours, Illyn operates within the Christian tradition as a traveling evangelist. Prior to his mini-crusades, Restoring Eden volunteers and local environmentalists arrange for a meeting hall, contact media, and place posters up throughout the community. Billed as “The Theology of Wild,” Illyn creates a biblical message of nature appreciation, environmental stewardship and political activism. The sermons advocate for native habitats, wild species and the rights of indigenous cultures.

According to Illyn, Scripture is clear that humans have been given both the privileges and the obligations of stewardship. While we have the right to eat from the fruit of creation, we do not have the right to destroy the fruitfulness thereof. It is our sacred duty to love, serve and protect the rest of God’s creation. We are foolish and narcissistic to think this creation was all about us.

Restoring Eden’s goal is to establish a three-part strategy to make hearts bigger, hands dirtier and voices stronger. To get the heart involved it uses the traditional, but forgotten, spiritual discipline of nature appreciation to help people see the wonder, wisdom and whimsy of God revealed in nature. It gets hands involved through environmental restoration service projects and inventorying their lifestyle choices. Finally, the organization’s voice becomes stronger through public advocacy and political activism.

Illyn finds that getting Restoring Eden’s message can be difficult for some. The occasional negative reactions are usually based on differing political and religious understandings. Among the absurd but too common political responses he has heard are assertions that environmentalists are part of a conspiracy by supporters of the United Nations to create a one-world government and take over land in the United States. The religious arguments include claims that Christians need not be concerned with this Earth, because, as Illyn remembers hearing them, “God is unconcerned about the state of nature”; “God made the Earth for humans – he expects us to use the Earth and the sooner we use it up, the sooner Christ will return”; “God can re-create any species that go extinct”; “the Earth is not our home – I’m heaven bound!”; and perhaps most commonly, “Preaching the salvation message is the only important work of Christians – all else is a distraction.” Sometimes an apocalyptic expectation plays an important role in devaluing environmental concern, “My Bible predicts that things are going to get worse, no matter what we do.” Such assertions are often accompanied by claims that environmentalists “worship the creation instead of the Creator” and promote un-Christian “New Age” or “Pagan” worldviews.

Reflecting on the challenges, in 2003 Illyn stated, while our work is still controversial and viewed with suspicion by some, we are winning the argument that environmental concern is appropriate for the
church. But so far we’re losing the argument that such concern for creation should be a high priority.

Many Christians have been taught that evangelism is all that matters. But according to Illyn, “the Great Commission found in the Gospel of Mark is to preach the good news to all creation. Habitat destruction and species extinction is not good news for creation.” Illyn passionately speaks out for the goodness and integrity of nature and believes that Restoring Eden can help Christians realize that environmental stewardship is an important Christian duty. According to Illyn, “If you love the Creator, you must take care of creation.”

Rewilding

The long-term preservation of nature depends on a sustainable shift in the way we perceive and thus act upon the world around us – the return to conscious, authentic being, which I call “rewilding.” Wildness could be described as a condition of dynamic wholeness and authentic expression. In our case this means oneness with our bodies, needs, desires, sensations, instincts and dreams . . . and with the natural world of which we are an integral part. Rewilding is the intentional restoration of wholeness: the integrity of entire ecosystems as well as the integrity of our individual beings.

In wilderness restoration we intentionally work to repair the torn ecological fabric, remove the invasive and the artificial, encourage the flourishing of every native form, protect against its dismemberment or destruction, and contribute to a state of continuous flux and balance. In personal rewilding we do much the same, mending our individual ecologies, the connections between our bodies and souls, hearts and minds. We purge any lies our societies may have taught, and those illusions that fear has wrought, while learning to express every aspect of our essential native selves. We do what we can to protect against distraction and dissolution. We strive for balance in our lives, and in our relationships to both the human and more-than-human world.

Alexander Marshack described humanity as a “persistent flowering of an ancient reality.” The rewilding of the self is neither a retreat to the past nor transformation into something new. Instead, it is a re-formation, the renaissance of original form. It is being who we really are: the act of simply being. It is the uncomplicated if difficult cessation of all pretense, artifice, conditioning, labeling, distraction, manipulation, domination, preoccupation with the future, suppression and repression. Rewilding is both a beauteous flowering and an essential coming into self.

The rewilding of the self begins with the rewilding of the body: reimmersion in the sensorial field, engaging every aspect and element of the world around us – and every experience – with every one of our atrophied senses, refamiliarizing ourselves with the feel and function of our flesh. The senses take us into ourselves, even as they reach out and thereby enlarge us. The wild body is fueled by passion, the passion to experience miraculous, finite life. Its rewilded sexuality is an ally of immediacy, moving us beyond objectification and back into the intensity of the moment, responding directly to fete or foe, task or poem. The rewilding of the psyche involves the reawakening of primal mind, restoring the sense of wonder and awe to its rightful place as a determinant of the human/nature relationship. As such, rewilding is a socio-religious experience as much as a personal epiphany or practice. It results not only in awakened ecocentric spirituality but also in social and political action.

The rewilded person is resonant with, protective of, and responsive to the natural world. Such persons act as activists and advocates for wilderness, which they recognize as our original home, the playground of evolution, and the formative context for a wilder humanity. Only since the 1900s has wilderness been looked at as a place to visit, a sequestered island of undeveloped Nature surrounded by a developed and depleted landscape. For most of our upright existence, humankind has lived with/in the flesh and flux of wilderness. As an extension of inclusive nature, we are a product of it. Our species was shaped by the nourishment and challenges of a wild life, responding to the constantly changing situations of a natural world. The way adrenalin speeds our heart and fuels our muscles when we sense danger, and the way love jerks us around whether we’re ready for it or not, are both dynamics developed in our wild past. For several hundred thousand years we were integral rhythmic elements in the wilderness concerto. Judging by the attitudes and behavior of both our primate relatives and many existing "primitive" peoples, humans were likely blissfully engaged in the sensorial field whenever not hungering or actively being preyed upon. And whether we were ecstatic nature mystics or not, we were natural elements of a well-functioning whole – contributing to both the flowering and balance of what remains an incredible, evolving composition. We must bear in mind that the entire world, in all its wholeness, was not so long ago wilderness. And out of that authenticity, vibrancy and wholeness we were born. A wild Earth may yet be a necessary condition for the highest manifestation of human and nonhuman potential. It is the sacred source, the cauldron of creation on whose behalf the “wilder” makes his or her stand.
Like a growing number of anarchists, deep ecologists and indigenous peoples, author Derrick Jensen finds nothing absurd about either the possibility or necessity of dismantling the existing structures and paradigms of our techno-industrial civilization. "It just seems like a lot of hard work, done by a lot of people in a lot of places in a lot of different ways," he tells us. What's absurd is "the possibility of allowing this inhuman system to continue" (Jensen 2002: 588). Certainly, the dichotomy between wilderness and civilization is not a quandary to be solved, but rather, a choice to be made. Everyone, at some point in their lives, makes a deliberate decision to desensitize in a deal for comfort, to live in confinement rather than face the uncertainties of nature, to acquiesce to outside powers in order to avoid the demands of responsibility, to allow the destruction of wilderness and human wildness in exchange for the techno-gratification of our times. It's a matter of how we judge what is truly valuable in life. To determine something's worth a "wilder" asks: Is it freely and gracefully embodying its own nature? Is it real, authentic, and intensely itself? Does it contribute to diversity, wholeness/holiness, interdependence and balance? Does it sing, laugh, resonate? And can you dance to it?

Inspirited Gaia whispers in every river and shouts from every granite peak: reclaim and reinhabit! Revere and resacrament! Resist and reshape! Re-member ... and rewild! And we respond, with both our bodies and souls. For all the difficulties of rewilding in this day and age, it is a shift that provides immediate rewards. Life presents all its flavors only to the wild, only to those who dare. In our reconnection to self and place, Earth and Spirit, we function as will-full conduits for the ancient ways, conscious receptors and transmitters of Gaian consciousness. In this great manifesting and gifting, we become the new-conscious receptors and transmitters of Gaian consciousness.

This ongoing flow of time contains brief eternities. In "May Day," he contrasts his vision to workings of the men of power who "are pushing all this pretty / Planet . . . / . . . nearer and nearer to / Total death." Despite his apocalyptic view, he can affirm to his daughter that "we have our own / Eternity, so fleeting that they / Can never touch it, or even / Know that it has passed them by" (1966: 331).

Rexroth’s nature poetry emanates a this-worldly mysticism in which the natural world is itself sacred, a view reinforced by his interest in Tantric Buddhism. "The holiness of the real / Is always there, accessible / In total immanence" (1966: 248). To apprehend this sacrality, one needs to drop the cravings, aversions, and delusions of the ego and realize the contemplative flame that burns in each of us. His mysticism is also erotic: the body too is sacred and sexual love is one of the principal means of realizing the holiness of the real. Some of his finest nature poems are also intense love poems.

His sense of an interrelated and sacred world was the foundation for a deeply moral vision and engagement in radical social movements. He combined the traditional Buddhist critique of normal consciousness with a condemnation of the devastating power of social structures that manifests and reinforces the distortions of the ego. In particular he denounces the hierarchical, authoritarian

Rexroth, Kenneth (1905–1982)

Kenneth Rexroth was an American poet, translator, and cultural critic. Raised in the Midwest, he settled in California where he became a major figure in the San Francisco Renaissance and influenced the development of poets such as Gary Snyder and Allen Ginsberg. Three of his distinctive contributions are his blending of Catholic and Buddhist spirituality, a sweeping knowledge of world literature, and his affirmation of the interrelatedness of nature, mysticism, the erotic, and the political. This complexity resulted in some of the most compelling and socially significant nature poetry in the English language.

Central to his vision of nature is a deep sense of radical interrelatedness within a vast universe. He frequently drew on Huayan Buddhism’s image of Indra’s Net, in which all phenomena are likened to mirrors reflecting each other. "Doubled Mirrors" concludes with the narrator discovering the source of many tiny points of light:

"Under each / Pebble and oak leaf is a / Spider, her eyes shining at / Me with my reflected light / Across immmeasurable distance" (1966: 224).

Equally important is his realization of the flux of life. This theme exemplifies both the traditional Buddhist emphasis on impermanence and the Japanese aesthetic of aware, a bittersweet realization of the ephemeral nature of all that is beautiful. This sensitivity is evoked when he exhorts his daughter to "Believe in all the fugitive / Compounds of nature, all doomed / To waste away and go out" (1966: 241).

Rexroth’s nature poetry emanates a this-worldly mysticism in which the natural world is itself sacred, a view reinforced by his interest in Tantric Buddhism. "The holiness of the real / Is always there, accessible / In total immanence" (1966: 248). To apprehend this sacrality, one needs to drop the cravings, aversions, and delusions of the ego and realize the contemplative flame that burns in each of us. His mysticism is also erotic: the body too is sacred and sexual love is one of the principal means of realizing the holiness of the real. Some of his finest nature poems are also intense love poems.

His sense of an interrelated and sacred world was the foundation for a deeply moral vision and engagement in radical social movements. He combined the traditional Buddhist critique of normal consciousness with a condemnation of the devastating power of social structures that manifests and reinforces the distortions of the ego. In particular he denounces the hierarchical, authoritarian
politics and acquisitive economic systems of the modern nation-states. The state “lives by killing you and me” (1966: 241) – i.e., by extinguishing our contemplative flame and severing our organic relatedness to the natural and social worlds. In numerous poems he combines exquisite sensitivity to nature and an incisive awareness of human suffering and evil.

Rexroth’s ethical mysticism was formed early in life by his commitment to social justice, a Quaker-influenced ideal in a free community of responsible persons, his readings in Christian mysticism, and his view of Christ as a model for feeling “unlimited liability” for the ills of the world. Later in life his social and ecological concerns became increasingly influenced by the Mahayana Buddhist ideal of the bodhisattva, who vows “I will not enter Nirvana / Until all sentient creatures are saved” (1968: 292–3). Unqualified compassion enables the bodhisattva to hear “the crying of all the worlds” (1968: 292) and effortlessly move to help those in distress – an ideal most subtly developed in his masterpiece, Heart’s Garden, Garden’s Heart (1967), a long poem written in Japan.

Ritual

By some accounts ritual behavior is utterly natural, “hard-wired” into the structure of the brain and nervous system, a function of our biological or animal “hardware” rather than of our cultural “software.” Even if one tries to escape explicit rites, tacit ritualization nevertheless emerges unhidden. So, for instance, if we do not initiate youths into adulthood, they will, perversely in all likelihood, initiate themselves. By this account, all habitual behavior, perhaps even all social behavior, is ritualized. Ritualizing and dramatizing are universal, given in human nature. Our very biosocial being is dependent upon these twin foundational activities. Even if people avoid formal rites and refuse to attend stage plays, they cannot escape ritualizing and dramatizing. They permeate human actions the same as they do the mating and aggressive behavior of birds and fish.

By other accounts, however, ritual is a most unnatural activity, not at all the sort of behavior one cannot help doing. Ritual is not like eating, sleeping, digesting, and breathing, or even copulating and speaking. Ritual is optional – one can choose not to engage in it. Whereas being alive requires eating and sleeping, it does not require ritualizing. Even if one claims that humans and other animals exhibit an inherent urge to ritualize, responding to that urge is optional, and because it is optional, ritual is cultural rather than natural.

The dichotomy, cultural versus natural, is familiar. It is a staple of Western thought, typical of its dualistic tendencies. And ritual is not the only human activity to be hoisted onto the horns of this perennial dilemma. But the dilemma is easy to overstate, thus rendering it a false dualism. There are ways around the problem; a third, less polarized view is possible. For instance, one might argue that it is perfectly natural for humans, given their upright postures and large brains, to be cultural. Or one might observe that cultural activities, when sustained for a sufficient time in the right environmental niche, can have genetic, which is to say, evolutionary, consequences. In other words, even though a noticeable cultural/natural divide characterizes much human behavior, this great divide is not impassable. It is a membrane rather than a wall. The distinction between things cultural and things natural, in this third view, is relative rather than absolute, making it conceptually possible that ritual, like language (but unlike digestion) is both natural and cultural, a cultural edifice, if you will, constructed on a natural foundation.

If this is the case, the question, then, becomes: what is this natural foundation? If brains and tongues and ears lay the groundwork from which human languages sprout and then diversify, what is the bedrock upon which human rites are built? The question is really two: 1) How essential is ritual to being human? and 2) By what basic biosocial means does ritual operate? Is ritualizing just one activity among many others, and doing it or not doing it like the decision to wear green rather than red, or like opting to ride bikes rather than paddle canoes as one’s hobby? Is the choice merely aesthetic, a matter of taste or personal preference? Or does something larger, grander, and greater depend on the choice to ritualize or not?

Examined historically and crossculturally, the consensus answer to the question would seem to be that participation in certain specific rites is an indicator of whether one is truly human or not. The view that ritual is merely optional or only decorative is anomalous in human religious and cultural history. It is an attitude mostly recent and largely Western. The questions: Who is truly human? and What is truly natural? have often been
Ritual drives and instincts or the older gods and spirits did. DNA do not account for "encoded" in the genes, the DNA. But, of course, genes and rent way of speaking of something as built-in is to say it is behavior issues from an urge, instinct, or drive. The curiously out of scientific fashion to talk as if human necessity, or lack of it, to ritualize? First of all, it is serious and inhuman. Do it or die.

This equation generates a peculiar torque in our thinking about rites. On the one hand, a rite is a cultural human construction. People make it up, revise it, and evaluate it. Politics and economics swirl about it as they do about any other human activity. On the other hand, the gods delivered it or the ancestors bequeathed it. A rite is not a work of fiction. It has no author, and no one dreamed it up out of his or her imagination. The popular mind-rites, especially religious ones, are above critique and debate. Those who evade the revealed sacred liturgy are unnatural and inhuman. Do it or die.

The contemporary form of the ritual conundrum is slightly different from the more historic form. The older form was: Which rite (thus which tribe, which nation, which tradition, which people) is the right one? The question seldom posed a real option. If you were a so-and-so, you knew your own ritual system was the right one.

The newer form of the ritual question is: To ritualize or not? Being born into a society with a divinely given rite is no longer the norm. Instead, this rite and that one seem equally plausible (or equally implausible). Besides, who wants to fight and die for a way of performing cultural ideals, all of which are relative anyway?

Rites typically (although not always) express associated cultural myths, predications of what is real and not, what is worthy and not. For cultures in which the question is, "To ritualize or not?", the dominant myth is scientific and technocratic. Scientists, it is believed, study nature, things as they really are, not supernature, things as they might, or should, be. So we who are steeped in such cultures look to theory, fact, and evidence to warrant our decisions and evaluations. We resist labeling these "myth" even though they work in much the same way as more obviously mythic myths do.

And what does current scientific myth say about the necessity, or lack of it, to ritualize? First of all, it is seriously out of scientific fashion to talk as if human behavior issues from an urge, instinct, or drive. The current way of speaking of something as built-in is to say it is "encoded" in the genes, the DNA. But, of course, genes and DNA do not account for everything any more than the old drives and instincts or the older gods and spirits did.

Environment and natural selection are today's other co-star actors. Together, DNA, environment, and natural selection make us who and what we are. And we are embodied, be-brained, mammalian, bipedal homonoids. Some of us ritualize and some do not. So the question is not 'Do we ritualize?' but 'Should we?' The ritual question is morally and practically driven. The long form of the current existential ritual question, then, is: Should humans ritualize in order to be attuned to nature and thereby avoid planetary destruction?

Why would it ever occur to anyone to pose the question this way? There are two reasons: 1) ethnographic social science is presenting rich traditions in which rites are understood to be the primary means of being attuned to the environment; and 2) psychological and anthropological science is tendering theories which claim that ritual activity synchronizes the halves of the brain, thereby diverting human tendencies to make war on their fellow "conspecifics," thus making us better stewards of the Earth's deep structure.

The import of the ethnographic testimony is that ritual participants the world over believe their rites enable them to live in synchrony with the natural world, especially animals and plants, sometimes even rocks, mountains, bodies of water, and specific places. This ritual sensibility is not characteristic of every ritual system, but it is typical of many of them, especially the local, smaller-scale ones. In these, people behave with humility and receptivity. They are, they confess, not more powerful than other creatures, and the human task in life is not only to use the creatures but also to be receptive to their teachings. In the ritualized world presented by ethnographers, what we in the West think of as nature (as opposed to culture) is peopled. Animals and plants and places are people too. So the nature/culture divide either does not exist or it is much less pronounced. In rites, animals and plants and places are addressed with respect as equals or even superiors.

The ethnographic evidence is that ritual participants believe they attune themselves with rites to the natural-supernatural world. Some non-participants believe this too, and they wish the Western technocratic world were more ritually saturated than it is. But – and this is an important "but" – animals and plants are also treated in ritually rich cultures as food. Albeit with apology, song, and prayer, they are killed or harvested, then distributed and eaten – either that or avoided altogether. Animals, like exceptionally generous people, give themselves to hunters, and hunters are the kin of animals. But hunters also track, stalk, study, and strategize. The ritual attitude, then, does not preclude a pragmatic attitude. Prey are persons, but they are also targets for arrows.

The ethnographic evidence, then, reminds us that rites are not foolproof; the game become angry, which is to say, the game are sometimes shot out and the fields over-harvested. Although rites attune, they do not do so
perfectly or completely. Thus, not all native people in every place and time have been “natural ecologists.” Rites not only attune participants to nature, they insulate people from nature. Rites can become ends in themselves or tools for wreaking environmental and social havoc. Everything depends on which people at which times in which specific places of nature are engaging in which kind of ritualizing.

In the current Western scientific and technocratic world, true believers, of course, look with some skepticism on the claims of ethnographically presented ritualists. At best, their testimony is soft rather than hard evidence. At best, ethnographic reports present stories, beliefs, descriptions, occasionally even hypotheses, or theories, but not proven facts, which is to say, demonstrated and replicable ones. So the best one can claim, and still honor the sacred tenets of scientism, is that certain ritual practices may have survival value. They may enhance the adaptability and thus the longevity of the human species on the planet Earth.

We must reiterate the “may” as long as we have not eliminated the alternative, namely, that deeply ritualized human life can become more one-dimensional, stereotyped, and inflexible than non-ritualized human life. In short, rites may make us humans maladaptive. If “stereotypy” (to use a term explicitly used in one theorist’s definition of ritual) were ever a ritual virtue in some other place and time, it is, in the Darwinian universe that most encyclopaedia-readers inhabit, most definitely a vice. Loss of postural and gestural diversity and flexibility would not stand us in good stead with Natural Selection, the reigning deity of the current, almost inescapable Darwinian myth. Loss of bodily flexibility, like loss of cultural and biological diversity, would jeopardize human health and longevity. If ritualizing implies rigidifying, we are courting earthly extinction rather than planetary salvation by engaging in it. So the answer to the question, “To ritualize or not?” depends on how we define ritual, or, if not that, then on which kinds of ritualizing we practice and which kinds we forgo.

Anthropologist Charles Laughlin and psychologist Eugene d’Aquili, along with their colleague John McManus, have articulated some of the strongest theoretical arguments in favor of ritual’s adaptive import. If they are right, ritualization is more natural (in the sense of having more survival value) than non-ritualization. In their view ritual, which emerged evolutionarily along with encephalization, is crucial for both the control and the transformation of consciousness. Rites employ various driving mechanisms such as drumming, chanting, dancing, ingesting, ordeals, and privations as means of retuning, or returning balance, to the autonomic nervous system. Ritual activity facilitates the entrainment (penetration and embodiment) of symbols into the human system.

More specifically, ritual practices facilitate simultaneous discharge of the excitation (ergotropic) and relaxation (trophotropic) systems. Laughlin and company posit a drive toward wholeness in all biological systems, and consider rites a primary means for achieving both social and neuropsychological wholeness. They stop short of claiming that rites are the only means. Since they say many of the same things about both play and contemplation as they do about ritual, it seems that ritual is not the exclusive agent of wholeness, unless, of course both play and contemplation are conceptualized as kinds of ritual. In any case, for Laughlin and associates it is neither the “natural” nor the “supernatural” that takes precedence but rather the holistic. In the end, Laughlin, d’Aquili, and McManus espouse a wedding of what they call “mature contemplation” (in my view, a species of ritual activity) and neuroscience as the most holistic (in an older vocabulary, “natural”) form of consciousness.

Their claims are less appropriate to some kinds of ritual and more appropriate to others, especially those at the top and bottom end of the scale, for example, trance dance and meditation. These require, respectively, either sustained exertion or else the stilling of physical and mental activity. More than mainline worship and liturgy, these kinds of ritual activity evoke the extremes of the autonomic nervous system, thus facilitating the “crossing over” that these theorists treat as the primary virtue of ritual.

Another anthropologist, Roy Rappaport, is intent to restore ritual’s authority, hoping it can close the maws of several great beasts: desertification, ozone depletion, species extinction, and environmental degradation. Against the Goliath of quality-denying, “monetized” epistemologies rooted in cost-benefit analysis, which he clearly considers maladaptive, he marshals the slingshot of ritual, hoping its emphasis on complementarity and reciprocity can displace the forces of disintegration. Rappaport is more willing than most anthropologists to admit that the very idea of ecology is as much a religious conception as it is a scientific hypothesis. Ecological ideas encourage the preservation of the world’s wholeness in the face of pernicious fragmenting and dissolving forces. For Rappaport, the idea of an ecosystem, not just as a scientific hypothesis but as an active intervention, is a guide for how to behave in the world. He actively calls for ritual performance grounded in the concept of the ecosystem. For him, ritual performance is not merely a means for humans to illustrate ideas about the world. Rather, ritual is the way the world itself tries to ensure its own persistence.

But much ritual is in the custody of the so-called world religions. They claim to have a repository of wisdom, much of it ritualistic, that can help save the planet from ecological destruction. But the large-scale, multinational faiths have been slow to mobilize, and they are typically saddled with environmentally hostile or indifferent myths, ethics, and rites.

Religious leaders are now scouring the scriptures in
search of images that might inspire ecologically responsible behavior. The big religions are defending their traditions against attacks that blame them for the sorry state of the environment. In self-defense, they launch criticisms of economic greed and human failure to exercise stewardship of the land.

The monotheistic traditions bear a large share of the blame, because of their entanglement in Western ideologies of natural domination and dualistic separation. The truth is that none of the large-scale religions has resources adequate to the crisis. None of the “world” religions is an Earth religion. The non-local religions are in no better shape than the multinational corporations. Because so much pollutes the spiritual environment, cleaning it up is every bit as urgent and challenging as cleaning up the physical environment.

Assuming religious leaders were to take a more creative and critical ritual initiative, what might an eco-rite look like? Clear-cutting in Thailand has become so extensive that monks began preaching about the suffering of trees and land. In the 1970s, after his ordination, Phrakhu Pitak noticed the deforestation around his home and the consequent damage to watersheds and local economies. He started to preach against the destruction but found that the villagers, even those who believed him, went home from temple services only to continue clearing the land. Moral admonition was not enough. So in 1991 he ordained a tree, wrapping it in monk's robes. To down an ordained tree would be to kill a sentient being and incur religious demerit.

At first the monk led people in sprinkling holy water on the trees. Later he upped the ante by requiring village leaders to drink holy water in front of a statue of Buddha by a tree. This way, community leaders ritually enacted their identification with the tree, and thereby pledged themselves to its protection. Sometimes, posted on an ordained tree would be a sign saying, “To destroy the forest is to destroy life, one’s rebirth, or the nation.” Sincere Buddhists do not want to tamper with their rebirth.

This improvised ritualizing is now attracting upstanding citizens. As a result, the Thai debate is no longer purely political but also moral and religious. The metaphorical act of ordaining trees has made it so. If trees have Buddhist nature, to saw one down is to slice yourself in half. Now, it costs moral and religious capital to lay low the ancestor teacher trees. Ritual is a primary means of ensuring that moral behavior does not become merely moralistic, that instead, it is embodied and enacted.

Ritualizing and Anthropology

Ritual is a term rooted in nineteenth-century Western scholarship on the anthropology of religion that has been used to categorize and describe certain types of religious behavior. There is no single, universally agreed-upon definition of ritual. Nineteenth- and early twentieth-century scholars tended to define ritual as a patterned set of actions intended to bring about changes in the relationship between humans and supernatural agents, such as gods or spirits. In the late twentieth century, scholars began to view ritual more as a process than an object: a formalized response intended to bring about change that religions and cultures apply to a particular situation. Rituals are an important part of cultures and religions, and mark secular as well as sacred occasions.

Types of Rituals

French ethnologist Arnold Van Gennep identified two principal types of rituals, both tied to natural cycles: rites of passage and rites of intensification. Rites of passage involve transformations in the life cycle of an individual. They typically occur around times of personal transition, such as birth, puberty, marriage and death. Initiation rites for shamans, healers, priests and priestesses are also considered rites of passage. In some religions, rites of passage
Rituals serve as important transitions in the life of a community. There are two types: calendrical or year-cycle rites and rites of crisis. Year-cycle rites center around important times in a community’s seasonal calendar which often coincide with environmental changes – for example, the transition from winter to spring. They often mark crucial agricultural events such as harvest and planting times, or the seasonal migration of herd animals. Calendrical rites repeat yearly, and often involve a prolonged period of celebration which includes secular as well as religious aspects. There may be music, dancing, feasting and dramatic performances that enact myths associated with the seasonal cycle. Often, these celebrations are thought to be necessary for the continuation of the natural cycle. Rites of crisis, in contrast, are held in response to a crisis in the community, such as a drought, plague or other drastic event. In many religions, these events are often understood as being the result of disharmony between humans and nature. Rites of crisis serve to restore the relationship to a state of balance.

All rituals communicate through symbols, and many of these are rooted in the natural world. They act out important stories or ideas, often by bringing together a number of symbolic opposites in culture in a meaningful way. Participation in rituals helps communicate these concepts to the community, and brings the community together in recognition of their shared values. Because rituals enact important values, they can also become points of contention and strife, especially when religions are undergoing rapid change. Some rituals reverse social norms through a process called symbolic inversion, in which important symbols are literally turned upside down or mocked. Ultimately, though, even such rites of reversal tend to uphold the existing social system by demonstrating its limits.

Ritual and Nature

Since the early nineteenth century, scholars have recognized a relationship between rituals and the natural world. Among the earliest observers of ritual was the German linguist Max Müller (1823–1900), who theorized that rituals originated as poetic dramatizations of natural and celestial phenomena, especially what appeared to early peoples as the movement of the sun in the sky. Since early humans depended on the sun as a source of light and heat, and feared the darkness, Müller hypothesized that they developed rituals as a way of attempting to control these natural phenomena. Later, anthropologists such as Edward B. Tylor argued that rituals were rooted in the belief that natural objects had a soul and could interact with humans, a notion he called animism. Tylor’s disciple James G. Frazer (1854–1941) argued that rituals in all cultures enacted the death and resurrection of the divine king, whose life was connected to the fertility of the crops and herds and the prosperity of his people. Frazer’s theory led to the emergence of the myth-ritual school, a group of early twentieth-century scholars who applied Frazer’s idea of death and rebirth not only to rituals, but also to many forms of folklore such as folktales, myths and legends, folk drama and even children’s games, which they thought had derived from rituals. For the myth-ritualists, almost all forms of expressive culture enacted the seasonal cycle of death and rebirth of crops and vegetation. Despite many scholarly criticisms of Frazer and the myth-ritual school, these theories continued to hold sway until well into the mid-twentieth century.

By the 1960s, scholars were becoming more aware of how cultures were uniquely adapted to their environments. This led to the emergence of new ways of interpreting the relationship between rituals and nature. Anthropologist Roy A. Rappaport pioneered the idea that rituals could regulate cultures’ relationships to their environment. In his study of the Maring-speaking Tsembaga in New Guinea, he found that a complex ritual cycle involving warfare with neighboring groups, the raising of pigs and the cultivation of gardens helped to maintain ecological balance, ensured a fair distribution of land and protein among people living in a territory, limited the frequency of fighting between neighboring tribes, and helped create alliances between groups. Rappaport’s work inspired a generation of scholars to examine rituals’ function not only in creating social cohesion, but also in ensuring that
human groups did not exceed the carrying capacity of their ecosystems. For example, Gerardo Reichel-Dolmatoff examined the hunting rituals of the Tukano Indians of the northwest Amazon basin, in Colombia and Venezuela. He concluded that many of the prohibitions and rites surrounding hunting actually restricted hunters’ activities in a way that ensured that the Tukano would not exhaust the supply of game in their ecosystem, and would be able to continue to survive within their territory without causing environmental degradation. The Tukano did not see themselves as existing apart from nature, and their myths and rituals ensured that humans could maintain a certain quality of life only if other organisms in their natural environment were also permitted to live and develop. In yet another study, O.K. Moore found that the divination practices of the Naskapi of the upper Labrador peninsula served to ensure that these arctic peoples hunted throughout their territory, rather than concentrating their efforts in only a few areas and thus overhunting the herds. These studies and many more like them helped to change anthropological perspectives on the relationship between nature and ritual by examining the ways rituals actually function in the material world. While scientists believe they may not function in the way their practitioners believe they do – namely, by regulating relations between humans and the supernatural world – they may, in some cases, have quite specific ecological and economic functions that maintain the balance between humans and their environment.

It is important to note, however, that not all myths and rituals function to maintain harmony between humans and their ecosystems, nor do all pre-industrial peoples ritually regulate their relationship to their environment. The Bible, in which Yaweh gives human beings “dominion” over nature, has been criticized as justifying the voracious exploitation of nature that has characterized the emergence of colonialism and capitalism in the West. And archeologist Mark Raab has demonstrated that Indians living along the southern coast of California before colonial contact overhunted fish and shellfish to the point of causing their own famine and near-extinction. Therefore, the relationship of each ritual system to nature must be carefully examined before drawing conclusions about ritual’s function vis-à-vis the natural world.

Rock Art – Australian Aboriginal

Aboriginal people of Australia have a rich heritage of carving and painting on rocks, extending back well more than 20,000 years. Rock art, Australia’s oldest surviving art form, expresses the Aborigines’ social, economic and religious concerns through the centuries. In the form of petroglyphs (carvings) and pictographs (paintings), rock art is found across the continent. It served a variety of functions, and provides the earliest illustration of Aboriginal beliefs, technologies and activities. Australia is a particularly rich region for rock-art research because it is one of the few areas where the art is still being produced, which has facilitated the work of anthropologists in collecting some of the myths and meanings associated with the art. We know that as humans, our relationship with the world is deeply affected by the images we use to understand and express our place in nature and the cosmos. By combining ethnographic field research and archeological findings we can begin to interpret the cultural significance of prehistoric rock art in Australia.
Various regions developed particular styles of art, and Aboriginal rock art is often classified by these main regional types. Continuity of motifs within regions and across time is attributed to the extreme conservatism of Aboriginal religion. Some of the earliest known Aboriginal rock art lies underground, in the limestone caves of the southern portion of the continent. Perhaps the best-known depository of parietal designs is Koonalda Cave, where the markings consist of finger meanders (made by sets of parallel finger strokes executed on the soft and pliable areas of the cave wall) and incised lines scratched into the harder surfaces. The prehistoric use of torches in Koonalda resulted in deposits of charcoal near dense concentrations of the finger flutings. Associational dating with the charcoal indicates that this artistic development in Australia occurred about 20,000 years ago.

Another common type of rock art in South Australia is called Panaramitee after a site containing many petroglyphs of this classification. Panaramitee rock engravings are also found in portions of the Northern Territory, New South Wales, Tasmania, and Queensland. They were made by pecking away the dark, patinated outer surface that forms on exposed rocks, to reveal the lighter, unweathered rock underneath. Circles, tracks, tectiforms, and meanders predominate.

The Kimberley region in northwestern Australia offers interesting examples of the relationship between rock art and mythology. Aborigines claim that some of the paintings in the central Kimberley district contain the spirits of the Ancestral Beings known as Wandjina, the preeminent Ancestors in the religion of this region. When a Wandjina completed his Dreamtime actions he turned himself into a picture containing his spirit and power. Each clan in the Kimberley region has a number of totemic species or objects associated with its Wandjina. Hence, in addition to paintings of Wandjina, many of the caves contain representations of kangaroo, eagles, fish, and various plants. A significant component of the Wandjina cult was the duty of each clan to retouch the paintings in its caves, thereby ensuring a supply of the natural species represented there.

The Pilbara region of Western Australia has the largest concentration of petroglyph sites in Australia – perhaps millions of individual figures. The large numbers of human figures at these sites show a highly stylized and developed art form, and a great degree of creativity. Some are fairly accurate representations of humans with well-proportioned bodies, while others are biomorphs; part human and part animal, apparently representing Dreaming beings.

The rock shelters of sub-tropical Arnhem Land hold an abundance of varied and skillfully executed examples of rock art. The two most general pictograph styles in Arnhem Land are the X-ray and Dynamic (sometimes called Mimi) paintings. Both tend to be basically naturalistic, yet their differences in form and subject matter are striking.

The Dynamic style is generally simpler in design than the X-ray art, yet its elegance is remarkable. The anthropomorphs depicted in the Dynamic art are Mimi spirit people, the beings responsible for teaching the Aborigines to paint. Dynamic-phase figures are often slender and shown in action – dancing, fighting, hunting, and running. They are monochrome paintings, and are said to have been made by the small Mimi spirits. X-ray pictographs, generally larger and polychromatic, are usually representations of people and animals, and unlike the Mimi paintings, are essentially static pictures. The X-ray art is so called because it illustrates not only the body of a subject, but some internal organs and skeletal features as well; the heart, lungs, stomach, and backbone of an animal are often depicted. One of the most pervasive and distinctive contexts in which this art was created was through the practice of increase rituals at sacred sites.

The pigments used to create these and other rock paintings throughout Australia were primarily derived from pulverized minerals, often mixed with a natural binder such as tree resin or animal fat. Various shades of red and yellow ochre were utilized, as well as white pipeclay and black manganese. Charcoal was used often, as were brushes, probably made of human hair, bark, feathers, or a twig chewed at one end to loosen the cellulose fibers.

Many of the rock shelters of Arnhem Land contain painted images considered of vital religious importance to the Aborigines. Since it was believed that the act of creating or retouching a painting could release the spirit of the subject, these acts were often considered a necessary component of ritual. The practice ensured the preservation of the paintings, but with the breakdown of many aspects of traditional Aboriginal culture repainting has ceased, and the designs are slowly fading away. There have been some historical examples of rock-art production in the region, and the artists claimed that the placing of clan designs in rock shelters is an assertion of rights over the site, as well as an effort to keep religious tradition alive.

Scattered around the vicinity of Laura in the southeast Cape York Peninsula of far northern Queensland are some of the best-preserved pictograph galleries of the world. Hundreds of adorned shelters and caves are scattered throughout the hills and valleys of this region. The majority of the Cape York rock paintings are human and animal motifs representing totemic animals, mythological beings, game animals, and an assortment of human figures.

In the Carnarvon Ranges of south-central Queensland, the stencilling of hands and cultural material objects was a highly developed rock-art technique. The stencils are often arranged in intricate patterns, which form large murals of a dozen or more paintings within a single composition. They were made by pressing a hand or object against the rock and splattering paint around it to produce a negative imprint. The expression of physical and spiritual connection appears to have been an important feature of this art.
Thousands of petroglyph sites occur near Sydney, where numerous exposures of sandstone form large, horizontal rock pavements. The petroglyphs depict humans and animals, mythical beings, tracks, weapons, and various non-figurative motifs. The most unusual feature of this art is its scale. The large, flat rock surfaces enabled the Aborigines to depict their subjects life-size or larger; there are human figures and kangaroos measuring over seven meters, eels over ten meters long, and full-size whales. The huge scale suggests that some of these engravings may portray mythological Dreaming beings.

Rock art in Australia was once a prolific expression of social and material culture and religious thought. Through rock art, the Aborigines communicated ideas and concepts that were at the center of a complex set of cultural beliefs. While symbolism is inseparable from Aboriginal art, it should be understood that rock art was essentially utilitarian; it was one medium through which the powers of the Dreaming were brought to bear upon everyday affairs.

Rock Art – Batwa/Pygmies (Central Africa)

The central African hunter-gatherer rock-art zone has been termed the “Schematic Art Zone” by J. Desmond Clark. Nearly 3000 hunter-gatherer rock-art sites have been found within this zone and some 90 percent of these comprise superimposed layers of massed, finger-painted, geometric designs. The other 10 percent of sites comprise highly stylized and distorted animal forms plus rows of finger dots. Both seem to have a history extending back many thousands of years.

While the geometric art always dominates, the two traditions go together as a pair: they co-occur across a huge area and are regularly found close by, but in only a handful of cases can they be found together in the same site. They seem to be kept near, but apart. Both are found in the same overall distribution, in an area that encircles the central African rainforests and includes: Angola, Zambia, Malawi, northern Mozambique, the Democratic Republic of Congo, southern and western Tanzania, western Kenya, Uganda, Congo and the Central African Republic. The dominance of geometric rock art makes this area immediately distinctive from the other hunter-gatherer rock-art regions in Africa all of which, by contrast, contain a high percentage of brush-painted animals, humans and human-animal conflations. Little research has been conducted on this art tradition and it is therefore still poorly understood by comparison with hunter-gatherer rock art in other parts of Africa.

Throughout most of central Africa, the pre-farmer hunter-gathering populations have gone and they exist today only in the archaeological deposits and in oral traditions. Modern central African Bantu-language speakers remember these people as the Batwa (a word that is used widely in eastern, central and southern Africa to refer to any autochthonous hunter-gatherer people). They are described by many groups, and across a wide geographic area, as “short-statured, dark-skinned and hairy.” In those areas close to southern Africa they are remembered as being immediately distinctive from the San (or Bushmen). The rock art supports this division: it is entirely different from San rock art. The dividing line between southern African San rock art and central African Batwa rock art follows the Zambezi River and the Anglo/Namibia border. The archaeological remains also show strong divergence along this same line. The later Stone Age lithic technologies vary to such an extent that they have been given different names: those in southern Africa are known as the Wilton/Smithfield whereas those of central Africa are known as Nachikufan. The cultural distinctions between central, southern Africa hunter-gatherers are thus profound.

The only surviving groups of central African Batwa are the so-called forest “Pygmies.” Genetic studies appear to confirm the archeological division between the ancestral heritage of these groups and that of the southern African San. Geneticists suggest great antiquity to the division between the San and the Pygmies, perhaps with a divergence in excess of 40,000 years. Pygmy groups are known to have occupied many sections of the central African “Schematic Art Zone” even into historical times, and it is probable that the full former distribution of these groups can be recognized from the distribution of the art. Certainly, elements within recorded Pygmy traditions help us to understand central African rock art.

Pygmy traditions, such as those recorded by Colin Turnbull amongst the Mburi, are dominated by two major ceremonies. The Mburi call these molimo and elima. Molimo is organized by men and elima by women. Both ceremonies traditionally take place in a clearing in the forest and involve singing around camp fires for night after night, sometimes for as long as a month. Molimo is often held after the death of an important member of the group or in the case of a violent argument; elima usually marks important women’s occasions such as coming of age. Turnbull describes how the songs in both ceremonies seek to bring out the spirit of the forest. In molimo the spirit of the forest literally comes out and its unearthly song can often be heard encircling the campfire in the darkness (the song is in fact sung by a boy through a special molimo pipe).
Turnbull argues that the purpose of calling out the spirit of the forest in these ceremonies is to restore harmony within the camp and the forest. He argues that the Mbuti see this state of harmony as essential to allowing the dead to be released back to the forest and to giving heath and fertility to the girls. Smith and Blundell argue that it is these same concerns that underlie central African Batwa rock art. The stylized animal depictions mark the symbols and concerns of the ceremony of molimo (specifically the calling of the spirit of the forest) and the geometric designs represent the symbols and concerns of elima (specifically fertility and rain divination). They argue that this is why the two arts are found locally separated, and yet are together within the landscape. The arts were made by different groups within the same society and, together, they form a conceptual whole.

Rock Art – Chewa (Central Africa)
The ancestors of the Chewa and Nyanja peoples of central Africa were among (and adjacent), the most prolific of Africa’s Bantu-speaking farmer rock artists. More than 400 Chewa rock-art sites have so far been found spread across central Malawi, eastern Zambia and neighboring areas of Mozambique. Nearly 70 percent of the known sites fall within the Dedza-Chongoni hills of Malawi and it seems that this was a core area for Chewa art.

Chewa rock art divides into two separate art traditions: the art of nyau and the art of chinamwali. As is typical of rock-art traditions made by Bantu-speaking peoples, the primary color used is white and this is applied thickly by daubing. In rare instances where the art is especially well preserved, black finger-painted decoration may be seen executed over the primary white design. The white pigment is a form of powdered clay, which can be dug out of most riverbeds in this area. The same pigment is used in traditional house decoration today. The black pigment is powdered charcoal. Both pigments seem to have been mixed using only water, as neither is tightly bonded to the rock surfaces. Rock engravings (also known as petroglyphs) are unknown in these traditions.

The art of nyau is a tradition belonging to Chewa men. Nyau rock art is comparatively rare and fresh-looking when compared with chinamwali rock art. Only a few dozen sites are known. It depicts a range of masked men and, in particular, larger animal basketwork figures. These are readily recognizable as the elaborate masked characters that still perform in the ceremonies of the nyau. The art went out of use when the suppression of nyau ended and initiatives could once again learn by making and using the real structures. The need for the rock art was thus removed.

It has been argued that the nyau art tradition belonged to the specific historical context of the nineteenth and early twentieth centuries, a time when nyau was forced to become an underground movement because of its suppression by Ngoni invaders, missions and the colonial government. According to this explanation, the art served as a mnemonic device, helping to teach young initiates about the construction and meaning of large nyau structures that could not be made in this troubled time. The art then went out of use when the suppression of nyau ended and initiatives could once again learn by making and using the real structures. The need for the rock art was thus removed.

The art of chinamwali is far more numerous and, judging by the many layers of superpositions – more than a dozen at some sites – it is a tradition that has a far greater antiquity than nyau art. It seems likely that this tradition of art has been passed down from the time of the earliest ancestors of the Chewa in this region, more than one thousand years ago. This, therefore, is traditional Chewa rock art. This art has been linked to Chewa women and to the girls’ coming-of-age ceremony: chinamwali. The painted symbolism is thought to revolve around concepts relating to water and fertility. It contains many instructive messages that teach and remind those attending chinamwali how to behave and conduct themselves.

Similar designs to those in the rock art are modeled in clay and used in chinamwali and similar ceremonies in a number of places within central Africa. These designs each have a name, a dance and an instructive song and the image helps the young girls to remember the varied and complex teaching of the ceremony. The subject matter of these designs and their form suggest close parallels with Chewa rock art. It seems likely that the images in the rock art were also linked to song and to dance. Chinamwali...
rock art is no longer created today, but some of the shelters containing this art are still used for chinamwali ceremonies. There are indications that the secret meanings of many of the designs are still understood, but there has been no published confirmation of this to date.

Rock Art – Hadzabe/Sandawe (Eastern Africa)

Within central Tanzania is a localized tradition of brush-painted hunter-gatherer rock art that stands apart from the predominantly finger-painted geometric rock art of other parts of central Africa. The southern boundary of this art follows the southern limits of Kondoa and Singida districts and the northern boundary is Lake Eyasi. The length and breadth of this distribution does not exceed 200 kilometers. This art is by far the most regionally confined of all African hunter-gatherer rock arts. Within this same region is a finger-painted rock-art tradition executed in yellow/white. This art was made by Bantu-speaking farmer groups within boys’ initiation ceremonies. (I am concerned here only with the older hunter-gatherer art.)

The brush-painted hunter-gatherer art of this region has been known since the early 1900s, but was made famous by the work of Ludwig Kohl-Larsen, Henry Fosbrooke, Eric Ten Raa and Mary Leakey. The art contains depictions of a wide variety of animals and a few birds and reptiles. It is painted in an unusually varied collection of manners of depiction ranging from outline, through linear, dotted and gridded fills, to partial and fully filled forms. Humans are depicted in these same manners in a range of standing, bending and “floating” postures, sometimes with bows, and often with large and bizarre head forms that may or may not reflect the wearing of headdresses. A few humans are painted with animal heads. Early researchers tried to sequence the manners of depiction, but more detailed recent studies by Fidelis Masao and others have found that the proposed sequences are flawed. There are too many conflicting overlays when one collects together the evidence from a large number of sites. It now appears that variety in manner of depiction is one of the characteristics of this art tradition.

The distribution of this art matches closely the historically known distribution of the only two click-speaking groups in eastern Africa: the Hadzabe and the Sandawe. It is widely believed by researchers and claimed by the groups themselves, that it was the ancestors of the modern Hadzabe and Sandawe that made the rock art. There has been much debate on the relationship between these groups and the southern African click-speakers such as the San (Bushmen). Linguists now see the languages as highly divergent and recent genetic evidence suggests that these groups may have diverged as long ago as 70,000–100,000 years before the present. These are therefore two of the oldest populations on Earth and the fact that they both speak click-languages is suggestive about the nature of the first languages.

As with most African hunter-gatherer rock arts, it appears that the art was part of traditional religious practice. Ten Raa, working among the Sandawe, records three instances in the mid-twentieth century when he witnessed Sandawe people creating rock art. Through this personal experience he connects some of the art with hunting magic and some with an ecstatic cult called simbó. In simbó, dancers use vigorous movement and hallucinogenic beer to attain an ecstatic state. In this state the Sandawe say that people become lions. David Lewis-Williams has argued that many of the bizarre head forms, many of the postures, such as the floating posture, and the depiction of therianthropes (animal-people) link much of the central Tanzanian rock art to this ritual experience of altered states of consciousness.

**Rock Art – Northern Sotho (Southern Africa)**

In addition to its celebrated hunter-gatherer rock art made by the San (or Bushmen), southern Africa has a number of later rock-art traditions made by Bantu-speaking farmers. The most extensive of these traditions in terms of area covered and number of sites is the rock art of the Northern Sotho. This art is found spread across the greater part of northern South Africa.

Northern Sotho rock art is easily distinguished from San rock art both by its color and by its form. It is predominantly executed in white and was applied thickly onto the rock by finger (in contrast to the polychrome brushwork paintings of the San). Occasionally, red and black pigments are also used, usually as decoration over the primary white design. The white used is a form of powdered clay found in many riverbeds in the area. The choice of white as the dominant color is characteristic of rock-art traditions belonging to Bantu-speaking agriculturists. Reflecting this, these arts have become colloquially known as the “late whites.”

Northern Sotho art is found in its greatest concentration in the more remote hill areas of Limpopo Province, South Africa. Areas particularly rich in this art include the Soutpansberg and Waterberg mountains as well of the Maghabeng plateau. In total, nearly 300 sites with Northern Sotho rock art are currently known.

The art divides into an earlier and a later period. The early art depicts a range of wild animals such as elephant, zebra, lion, rhino, kudu, hyena and hippo, but the dominant subject is the giraffe. Almost all of the art is concealed in large rock shelters in remote and secluded mountain areas. These places are the traditional venues for the secretive Northern Sotho boys’ initiation practices. Elders in some areas acknowledge a link between this art and tradition initiation practices, but they state that, while some of the painted sites are still used for initiation ceremonies today, the tradition of creating rock art has ceased.

It seems that each painted animal carried a particular instructive and symbolic message within the boys’ initiation ceremony and indications as to how this symbolism operated survive in the continued use of animal symbolism within modern initiation practices. Within the modern initiation lodge, for example, the fire is sometimes referred to as the lion cub, the magic tree as the giraffe, the cairn of stones as the hyena and the structure under which food is placed as the elephant. Many of the instructive songs learnt by the initiates are also concerned with these same animals. The secret teachings in these songs are often unclear to the initiates, but concealed within this complex structure of animal imagery are social messages that become progressively understood through life with age and experience.

In the latter half of the nineteenth century, the rock art underwent a dramatic change. The intrusion of white settlers into the region brought taxes, land clearances and conflict. A series of wars to subdue Northern Sotho traditional leaders left many homeless and destitute. At this time whole communities fled to the hill areas. Many of the old initiation sites became refuge settlements. A new form of rock art developed at this time dominated by depictions of steam trains, soldiers, settlers and guns. The images capture a people’s tragedy, but served a more important purpose. They poked fun at the troublesome new intruders and through this pointed humor served to overcome some of the terrible stresses of the times. The art marks the origins of protest art in northern South Africa – ordinary people protesting their right to land and self-determination, and fighting the destruction of their traditional structures and cultural values.

**Rock Art – Sintu**

Throughout much of south-central and southern Africa there extends a finger-painting tradition associated with Bantu-speaking groups. In the countries of Zaire, Zambia, Malawi, Angola, Botswana, Zimbabwe and South Africa, this art form most often occurs where there are rocky outcrops on boulders and in shelters and caves. An expression of a primal religion, this art form can be considered a cultural complex, which is both religious in character and strongly linked to nature. In this artistic tradition we find highly schematized depictions of abstract zoomorphic and anthropomorphic figures, fantastic beings, abstract symbols, signs and smears which can be linked to human sexuality and procreation. It is also associated with traditional rulers, rainmaking, initiation, diviners, secret societies, and to society in general. The overriding concern,
however, is for the fertility of man, beast and land, all of which impinge directly upon human society and welfare.

This artistic tradition differs greatly from Khoisan rock art in execution, intent and meaning, having been painted with a finger, or perhaps a stick, unlike Khoisan brushwork. It also has a much wider distribution extending from East Africa down to the northern South Africa, with isolated examples evident as far south as the Eastern Cape, yet it is less understood and far less researched. Early dates of 1800 BP have been suggested for the oldest depictions, but they may be older.

Sintu rock art is highly symbolic, reflecting and reinforcing ritual action, group structure, beliefs regarding nature and the wider cosmos. The manner in which the motifs and symbols are perceived and manipulated reflect people’s attempts to manage natural and supernatural forces that impinge upon their physical and conceptual worlds.

In many parts of Africa caves and shelters are favored by ritual specialists for rainmaking and other religious activities, and many of those shelters given ritual status are decorated with paintings. This is almost certainly linked to widespread beliefs in Bantu-speaking Africa that holes, hollows and rock shelters are entrances to the ancestor-world and that, through these special points, communication with the ancestors and deities is possible. Supernatural beings are held to control the elements, and so it is here that appeals are made and offerings offered. Painted shelters are often used for rainmaking, thus linking sacred points with climatic phenomena.

Naturalistic and abstracted zoomorphic symbols, such as crocodiles and snakes, are associated with concepts of kingship, divinership, initiation and rainfall, but most importantly, with fertility and procreation. Many such motifs not only occur in the finger paintings but are also used as educational diagrams during initiation.

Bantu-speaking groups stress institutionalization of passage in which initiation is an elaborate affair emphasizing fertility. Not only do finger paintings form part of this iconography, but so also do schematic and naturalistic figures, masks and costumes of fantastic beings. In these societies, greater emphasis is placed upon hunting than among patrilineal cattle-complex groups. Here the killing of prey is associated with male sexuality, indicating that wild animals, as a communal concept in finger paintings, are yet another expression of fertility.

As a rule, African worldviews are unified, phenomena within them fading into one another, creating a holistic structure of both the physical and conceptual worlds, so that each becomes indistinguishable from the other.

The art expresses a liminality of interaction among the principles that govern the mundane world. Here, in shelters and caves, fantastic beings live and are represented in the rock art and iconography, often with exaggerated features, such as exceptionally elongated necks, as an expression of their liminal status.

Diviners are prominent figures in finger paintings. They perform the rainmaking and fertility ceremonies and are the masters of initiation. They communicate with the ancestors in caves and shelters. Like the initiation event, and like the shelters, diviners are liminal, and it is their very ambiguity that entitles them to control the elements through the ancestors.

It is significant that the finger-painting tradition is widespread among groups who depend upon hunting and upon the fertility of game. The preeminent threats to hunting-based agrarian economies are drought and other natural disasters that reduce animal and plant populations. The positive expression of fertility may be seen as the ultimate symbol of well-being, and a manifestation that the social and natural order are operating smoothly. These conceptual associations permeate throughout different levels of society, and are believed to be reflected in the fertility of males and females entering adulthood.

Rock Art – Western United States

Scattered across the immense and often empty expanses of the desert southwest in North America is a vast collection of imagery pecked, rubbed, or scratched (commonly
referred to as petroglyphs) and sometimes painted on stones: the legacy of a people long gone. These ancient, mystifying images, collectively termed rock art, are the portrayal of a world we can now only faintly imagine, a representation of the experience of America’s first human discoverers, the hunter-gatherers of prehistory.

Although the Bering Strait theory of migration is anathema to certain tribes of Native Americans, evidence continues to surface to support this idea; also, the very likely ocean routes by boat must be more strongly considered. The indisputable fact is that people did come, many great waves of them, by land, by sea, from many different origins. The various waves of migration streaming across the land bridge brought with them not only their tools for survival and their meager possessions; they also brought their ideology, their customs and beliefs, and their ancient forms of religion: animism couched within a framework of shamanism. Many of their rock-art images, though not all, were related to shamanistic themes, and images of birds are especially conspicuous; “...birds are the most common and most obvious symbols of shamanic transformation and magical flight” (Hedges 1976: 84). And in this myriad of imagery, if we pause and look closely, we can see the expression of “art and religion, twin mirrors of human thought” (Turpin 1994: 76).

Bird images in particular stand out in the iconography of shamanic rock art, whether in the explosive beginnings of Paleolithic cave art or the prehistoric rock art of the hunter-gatherers of North America. From the “bird-on-a-stick” image in Lascaux cave to the Egyptian ba, to the paintings along the Pecos River, the bird has appeared repeatedly as a metaphor for the human soul, and “There is no other symbol of the shaman’s power of flight, his most essential magic capability, as logical and powerful as that of the bird” (Wellman 1976: 101).

These early people wandering across North America were completely immersed in the natural world; it sustained them and it destroyed them, and from its deeper dimensions they acquired their magic and their power. Religion, magic, and spirituality were expressions of the same thing.

The close relationship between men and animals, and the shaman’s ability to share in the occult powers of the animal world is one of the major messages of shamanism in general... Birds in particular symbolize shamanic flight. Becoming a bird allows one to take the ecstatic journey to sky and beyond, and in many places in the world, bird elements are commonly incorporated into shamans’ costumes. In rock art, birds fly over and around the heads and toward and away from the bodies of the anthropomorphic forms (Schaafsma 1994: 53).

Some of the rock-art styles, especially the older, painted ones, are noticeably replete with bird imagery, often in conjunction with snakes. (The overworld and the underworld.) This is especially true of the Barrier Canyon style of south central Utah and the Pecos River paintings of southern Texas and Northern Coahuila, Mexico. Other styles, such as the petroglyph images in the Wind River Range, Wyoming, are noted for their “owl-men” or “bird-men,” and the Basketmaker II rock art of the early Anasazi (Colorado plateau, 200 B.C.E.–400 C.E.) has hundreds of images of anthropomorphic figures with ducks on their heads, or, more commonly, ducks as heads.

These bird images can be so prevalent in certain styles that they become the central theme.

One of the core beliefs of modern shamanism, the “bird-like flight of the soul” (Furst 1977: 2) is a major theme of the Archaic Pecos River pictographic style, an elaborate body of polychrome art painted by hunters and gatherers that occupied the arid lands of southwestern Texas and northern Mexico. Depictions of ascending, descending, and soaring anthropomorphic figures are augmented by a number of flight metaphors, such as birds, wings and feathers ... These many illustrations of magical flight confirm the importance of religious ecstasy in Pecos River ritual ... In fact, it can now be said with some security that magical flight, derived directly from the trance experience, is the dominant theme in Pecos River style art (Turpin 1994: 73, 82).

Among the petroglyphs of Pueblo peoples of New Mexico are numerous portrayals of the roadrunner, and sometimes just its odd, elongated, X-shaped footprint is displayed as a metaphor for the whole bird. “The mere presence of the roadrunner track in prehistoric rock art was strongly indicative that the roadrunner and/or its track had religious significance in the prehistoric southwest” (Schaafsma 1989: 26).

Owls, parrots, cranes, ducks, roadrunners, turkeys, eagles, quail, herons, woodpeckers, hummingbirds, hawks, to name only a few, were part and parcel of the prehistoric pantheon. And while “birds of all kinds were associated with shamans,” (Whitley 1994: 25), certain birds held particular significance to specific groups of people. The duck, for example, continues to be revered in the Pueblo world as a messenger to the spirit world. Likewise, the prehistoric Pueblo world held the duck in great esteem, as is evidenced not only in the many images for ducks per se, but notably in the Basketmaker II anthropologic images known as “duck heads.”

The duck is a magical being and a great shape-shifter (these figures often have distended hands and feet, an indication that shape is being transformed); it can walk on land, lay eggs in the rushes at water’s edge, and tend to its
nest in an earthly way. It can also fly up into the sky where
the cloud-beings live, its power of flight so easy, so natu-
ral. And, most magically of all, not only can it swim and
float on water, it can also dive under the water – and come
back up again! To a people who likely saw puddles and
ponds as an entryway to the underworld, this must have
seemed the epitome of magic.

Other water birds such as cranes or coots or herons (or
their footprints) are also widely represented in the pre-
historic rock art of the desert southwest, not surprising in
cultures that were trying to eke out an existence in places
where the rainfall was often far below the prerequisite 14
inches a year that are considered minimum for human
survival. With the idea of supplication for rain, it is no
wonder that water birds images are so prevalent, as are
those of clouds, frogs, tadpoles, and fish. Images of turkeys
were often associated with rain also, as these birds tended
to reside in the mountains where there was more water,
next to springs and streams, just as they do today.

It is a logical extension of bird imagery that bird fea-
thers and bird parts served as a metaphor for the whole
bird, and there is a long tradition brought forward into the
present of using bird feathers in connection with sacred
ceremonies, altars, prayer bundles, dances and rituals, and
shamanic costumes. “Of all life forms found as decorative
motifs in Pueblo art, the bird has undoubtedly enjoyed the
most widespread use. Bird designs occur abundantly on
prehistoric and historic culture materials from the Pueblo
region” (Wellman 1976: 97).

Bird imagery in the Rio Grande style rock art is quite
often generic (depending on the site); that is, the idea of
birds is presented, though no effort has been made to sug-
gest a specific kind of bird. And just as often, a specific
bird image may dominate a site, such as raptors in Tenabo,
New Mexico, the duck-men of the San Juan River area
in southeastern Utah, the star-faced birds of prey in the
Galisteo Basin in north central New Mexico, or the

And there are some sites that are wonderfully and
inexplicably anomalous, such as the premier rock-art site
of Three Rivers, in southern New Mexico. This remark-
able site, with its many thousands of petroglyphs pecked into
the basaltic lava along a hogback rising above the desert
floor, hosts at least fourteen separate, identifiable species
of birds, as well as birds with eggs in their bodies, bird
migrations, seasonal portrayals and even a bird embryo,
where the oval shape of the rock forms the egg. Most of the
images are portrayed alone, and a few seem to have an
overt shamanic context, though certainly the wide variety
of images has generated numerous, often conflicting
interpretations.

Unraveling the mystery of the many different bird spe-
cies represented at Three Rivers is an appropriate meta-
phor for the study of the larger world of rock art. Not only
by learning to live with the mystery without having to
explain it rationally on our own terms, but also by accept-
ing it as the essence of the magic inherent in rock art, and
learning, each in our own way, how to celebrate (and pro-
tect) that mystery, may we come into a true contact with
the many people who left them there so long ago.

**Rock Climbing**

Can rock climbing be understood as a religion? As a prac-
titioner and a scholar, I think it can. Surely it entails a
sensation of transcendence, an experience of raw nature,
and calls forth a kind of reverence. Climbing offers a
respite from the constraints of the horizontal world, recre-
at ing the *axis mundi* with each new ascent. While such
sentiments convey aspects of what I feel when I climb,
they serve only to obscure what I see as a scholar. As much
as I’m prone to romanticizing my choice of leisure pur-
suits, here I want to approach climbing with a critical eye,
still under the broad category of religion. This entails a
shift to ritual. If we view climbing as ritualized behavior,
we move beyond platitudes and speculations about the
“beliefs” of climbers to analyze the social processes and
practices they perform.

Climbing is almost wholly ritualized. This will become
readily apparent to anyone who attempts to invent the
sport *de novo*, as I did in my hapless early teenage years.
Armed with a bike lock, leather gloves, and an old sailing line, my friend Dan and I decided to “go climbing.” Before we had much of an opportunity to kill ourselves, Dan and I were approached by some “real climbers” who, while chuckling the we-know-better laugh, took us under their wing and initiated us into the esoterica at the heart of the sport. In language and gestures meant to close the gap between our ignorance and their “reality,” we were taught about the acquisition and use of proper ritual paraphernalia (ropes, carabiners, and anchors), appropriate regalia (climbing boots, designer clothes), ritual speech (“on belay”), sacred texts (guide books and various “how to” texts written by “founding fathers”), ongoing revelation (climbing magazines), sacrificial rituals (leisure blood letting by way of cuts and bruises – “badges of honor” – and the occasional involuntary corpse offering), salient ethnic distinctions (sport climbers, traditional climbers, alpine climbers), relevant ancestors and deities (local heroes), heretics (heroes from somewhere else), and most importantly, levels of salvation (grades of difficulty) and ethics (aesthetics – “good style”). More than this, we learned that “real climbing” is established around certain pilgrimage sites (Yosemite being Mecca and Jerusalem both), and only the apostate (independently minded climbers) or the visionary (sponsored climbers) venture beyond the sanctioned and sanctified cathedrals. However, meeting the needs of practitioners who can’t always and everywhere engage “pure tradition” (going climbing), climbers have invented traditions to match their late capitalist predilections (climbing gyms with espresso bars and interactive websites that successfully reproduce the social milieu – which is garden-variety, pecking-order calibration – of the websites that successfully reproduce the social milieu – that renders climbing the social phenomenon it is.

Turning to the sharper edge of my critical knife, I want to address the relationship of climbers to nature by way of exposing one particular class of rituals to analysis: the first ascent. Climbers most often take the first ascent to be the epitome of the sport. It represents the “best and purest” form of climbing. Adventurous, bold, committed, visionary, self-less: these are common ways first ascensionists fashion themselves, and most climbers endorse this discourse through consumption of it. As a first ascensionist myself, I’ve participated in this rhetorical economy, and I think many of the claims and aspirations surrounding first ascents are sincere and harmless. However, I would insist that the quest for the perfect route (climbing’s Holy Grail) by climbers as a whole and the quest for ego gratification by individuals have caused climbing to manifest itself in rather imperial ways. New climbing areas are sought with the fervor of New World explorers, and the consequences to nature (and sometimes natives, as with disputes between climbers and Indians at Devil’s Tower and Cave Rock attest) are similar in effect, but certainly not in scale, to those of their symbolic predecessors. Trails are cut, vegetation is removed, machinery bolts are drilled into the rock for anchors, erosion exacerbated, and litter is left by climbers “developing” new climbs.

I would also call attention to symbolic features of first ascents that strike me as dubious and revealing. These are signaled by the metaphor often chosen by climbers to describe establishing a first ascent: authorship. Climbers speak as if the act of climbing a rock somehow brings it into being – and so it does, for a certain social world. Beyond this, authorship is viewed to convey moral possession of the route to those who established it. In other words, subsequent climbers are to repeat the route by way of the standards of the first ascensionists, and any modification of the route (the addition of new anchors, for example) requires consent from its “authors.” Moreover, first ascensionists very often understand their act as one that confers entitlement in another sense. Quite literally, climbers have a long tradition of claiming the right to naming based on the first ascent. Even if a rock feature had a name before an ascent, climbers will re-christen the rock upon climbing it. And, in ways reminiscent of the Reformation, climbers will, on occasion, dispute the legitimacy of an ascent, registering their view by climbing it themselves and renaming it upon success. Route names enter climbing discourse swiftly and indelibly, eventually becoming recorded in guidebooks, often along with the “author’s” name. In this way, first ascents are perhaps best viewed in terms of apotheosis – human beings reaching for the gods in order to become them. As with so many human projects to transcend our limitations, in the game
of climbing nature often becomes a means to our ends – even while we purport to be worshipping it.

Yet, if we grant certain ego needs and failures to our kind, perhaps we can view climbing – and things like it – as simultaneously muddled and miraculous. On the latter side, climbing, for all of my skepticism, still affords the chance to gain a celestial view from a terrestrial perch. Doing so, climbing allows for an oceanic experience that inspires a caring rather than a conquering attitude toward the rock. And it must be said that within the climbing community there has always been a vocal environmentalist element. These climbers – from the very beginning of the sport – have maintained a “clean” ethic, seeking to leave no trace on the rocks they ascend. Moreover, their sensibilities extend to the broader context of public land use. Such climbers and the action groups they form and support have been instrumental in advancing low-impact approaches to nature.

Rolston III, Holmes (1932–)

Leading environmental philosopher, ethicist, and theologian, Holmes Rolston III is widely recognized as the “father of environmental ethics” for his central role in developing environmental ethics as a modern academic discipline. Throughout his distinguished career, he has helped make explicit the ethics of nature that have been implicit in philosophical and sacred writings since ancient times. Born in the Shenandoah Valley of Virginia on 19 November 1932, Rolston’s multidisciplinary educational career included a childhood spent in contact with nature, an undergraduate degree in physics (Davidson College, 1953), a divinity degree (Union Theological Seminary, 1956), a Ph.D. in theology (University of Edinburgh, 1958), and later a masters in philosophy of science (University of Pittsburgh, 1968). He wrote the acclaimed books Philosophy Gone Wild (1986), Environmental Ethics (1988), Science and Religion: A Critical Survey (1987), Conserving Natural Value (1994), and Genes, Genesis and God: Values and their Origins in Natural and Human History (Gifford Lectures, University of Edinburgh, 1997–1998) (1999). He edited Biology, Ethics, and the Origins of Life (1994), and in 1979, helped found the now-refereed professional journal Environmental Ethics. Additional works include 80 chapters in other books and over 100 articles, a number of which have been used in college courses and have been translated into at least a dozen languages. A founding member of the International Society for Environmental Ethics (1990) and delegate to the United Nations Conference on Environment and Development (Rio de Janeiro, Brazil, 1992), Rolston has lectured on all seven continents, consulted with dozens of conservation groups, received numerous awards including the 2003 Templeton Prize for Progress Toward Research or Discoveries about Spiritual Realities, and currently serves as University Distinguished Professor of Philosophy at Colorado State University, his professorial post since 1976.

For four centuries following the Enlightenment and the scientific revolution in Europe, Western philosophy promoted an almost exclusively anthropocentric focus, perceiving nature as mechanistic and only having value in relation to human uses and preferences. In the early 1970s, Rolston acknowledged that nature had instrumental or use-values for medicine, agriculture, and industry. He went further, though, recognizing that nature had other values – aesthetic, ecological, educational, historical, recreational, scientific, economic, and religious – as well as intrinsic value. Fundamentally, he argued, organisms (including plants, animals, and humans), species, ecosystems, and the Earth have intrinsic value just for the fact that they have evolved and survived for millions and billions of years. Each level also has systemic value (value associated with processes and capacity to produce) that is interwoven with instrumental and intrinsic values. Rolston posits that for all of these reasons and more, humans have ethical obligations to the environment.

An ordained Presbyterian pastor like his father and grandfather, Rolston frequently draws on the Bible, emphasizing in writing and in lectures its implied guidance on environmental ethics. He likes to think of the “swarms of living creatures” brought forth from land and sea (Gen. 1:20, 24) as early references to biodiversity and notes that when God reviewed the display of life he found it “very good.” According to Rolston, the story of Noah’s ark illustrates that God wills for species to continue (Gen. 6:19) and the rainbow is God’s sign re-establishing “the covenant . . . between me and you and every living creature that is with you, for all future generations” (Gen. 9:12–13). In addition to the ecological, intrinsic, aesthetic, instrumental, and religious values implied in Genesis and Matthew 6, Rolston highlights biblical passages that speak to economic and other values, as well as human responsibilities.

Rolston promotes the idea that ethics are for people, but not only about people. To whom much is given, much is required, and humans have a rich and ancient inheritance, the Earth and biosphere, to steward. Rolston says that perhaps we make our deepest error “forever putting ourselves first, never putting ourselves in place in the fundamental biosphere community in which we reside” (2000: 83). Through his writings and lectures, he attempts to instill a more profound sense of civic and environmental
responsibility, calling upon people to live up to their duties as Homo sapiens, the so-called wise species.

Roman Britain

The inhabitants of Britain at the time of the Roman invasion in the year 43 were Celts. Archeological evidence from temple sites coupled with place-name evidence and inscriptions dating from the Roman period emphasize the importance of features in the landscape such as hills, springs and groves of trees, the last associated with the priestly caste of the Druids whose name is thought to have been derived from the oak tree. Although the art of the pre-Roman period was largely abstract, it included striking images of animals, among them horses, bulls, stags, boars, ravens and waterfowl, all of which were evidently held sacred.

The infusion of Roman ideas did not in any way weaken this empathy with nature, for the Roman cult had long peopled the countryside with its own deities of the wild. Thus the sanctuaries kept holy in the Iron Age often continued to be religious centers even if the deities venerated there were now addressed in Latin and assumed a Graeco-Roman appearance. At Buxton in Derbyshire was a temple dedicated to Arnemeta, whose name derives from the word “nemet” which means a sacred grove. There was another “nemet” at Nympsfield in Gloucestershire, where the word has even been preserved in the modern English name; it may have been attached to an Iron Age and Roman-period sanctuary, recently excavated and located just over the parish boundary at Uley. A final example is preserved in the name of a deity venerated at Nettleham, Lincolnshire called Mars Rigonemetos – Mars, King of the Sacred Grove.

The name of Buxton was formerly Aquea Arnemetae, showing that Arnemeta was a goddess of a spring as well. Even more famous was Sulis Minerva of Bath, Aquea Sulis, who presided over thermal springs. Another goddess—nymph, called Coventina, had a more local cult at Carrawburgh just outside one of the forts on Hadrian’s Wall. Sometimes the name of the presiding deity of a spring has been lost but archeology has revealed a complex of temples at Springhead in Kent that attest the same feeling for flowing waters. It is likely that the sources of many rivers had sanctuaries and the actual names of some rivers imply veneration, for instance the River Dee (Devan) in Cheshire, whose name is cognate with the Indo-European word for goddess; the river gave its name to the fortress at Chester.

Many temples lay on hilltops or ridges, including the temple at Uley mentioned above, and those at Lydney, also in Gloucestershire but on the northern side of the River Severn; Maiden Castle, above Dorchester, Dorset; Pagans Hill, Somerset; and Lowbury Hill, Oxfordshire.

Such sites, placing the gods firmly in the natural world, find their reflection in furniture and objects connected with cult, as virtually all deities are connected in some way with the beneficence of nature. Jupiter is often attested by columns that are embellished with scale-like ornament perhaps representing the bark of trees. A capital from one of these, from Cirencester, Gloucestershire, has half-length figures of Bacchus, his consort Ariadne, a Silenus and a figure of Lycurgus with a vine, all emerging from the fronds of the richly embellished Corinthian capital. Another column, represented only by an imbricated shaft from Wroxeter, Shropshire, has inset figures of Bacchus and a cupid. Bacchus was Jupiter’s son and seems to have been regarded as a major power in untamed nature. Here, on the two columns cited, he literally supports the majesty of Jupiter himself.

Mercury, god of flocks and herds, was popular among pastoralists. He was venerated at a number of temples including one at Uley, Gloucestershire, where one image shows him as horned, thus in a sense identifying him with the beasts he looked after.

A similar thereomorphic identification is to be seen in
the case of the deity known as Apollo Cunomaglus, the second part of his name being a Celtic word meaning “hound-prince.” He is mentioned on an altar from Nettleton Shrub, Wiltshire, but seems to be represented in other reliefs from the Cotswold area including Chedworth, Gloucestershire, as well as on a votive bronze plaque from Gloucester, in both cases accompanied by a hound.

Hounds would appear to have been the familiars of Nodens at Lydney, but instead of being identified with Apollo, Nodens was here assimilated to Mars, generally venerated in Britain (except in the official cults of the Roman army) as a protective, countryside deity rather than as a war god. The marine imagery on a mosaic set in the cellar of his temple and on certain pieces of metalwork suggest he may have been connected with the mouth of the Severn below his hill, but he was also closely associated with the iron-rich waters of his healing spring. There may also have been a hunting aspect.

One epithet used for Mars (as on a votive plaque at Barkway, Hertfordshire) is Alator, “huntsman,” and it is likely that Mars Cociidius, venerated at Bewcastle, Northumberland, was likewise venerated as a hunting deity.

Silvanus too had a similar function, and one of the most instructive of altars, from moorland near Binchester, County Durham, is dedicated “to unconquerable Silvanus” by a cavalry officer, because the god had helped him “to take a very fine boar which none of his predecessors had been able to bag.”

A gentler aspect of nature is represented by so-called mother goddesses (Matres), who in many instances are shown holding fruit or bread rather than actually nurturing children. They are sometimes depicted in triads, thus tripling their power, as is the case of the Matres Sullectiae on reliefs from Cirencester, but on occasions a single goddess is shown. A relief at Daglingworth calls her Cuda and it is possible (as suggested by Stephen Yeates) that she was the mother goddess of the Cotswold Hills. On several reliefs she is accompanied by three votaries or minor godlings wearing the distinctive woolen, hooded coat (the birde) composed of a pair of woodpeckers, pecking at a wine bowl whose brimming contents are suggested by an inset composed of a pair of woodpeckers, pecking at a wine bowl whose brimming contents are suggested by an inset composed of a pair of woodpeckers, pecking at a wine bowl whose brimming contents are suggested by an inset of a tree of life, and in three others, a hound chasing a stag, present a striking variant on the Orpheus theme.

Perhaps the most successful and integrated expression of a literary, sophisticated approach to nature in religious cult belongs to the gold and silver treasure from a pagan temple at Thetford, Norfolk, dedicated to Faunus. Faunus was an obscure deity of the wild, from the countryside around Rome (Latium) and he was previously known mainly from Roman poets such as Virgil and Horace. Here, at Thetford, he was given local Celtic epithets inscribed on silver spoons dedicated to him such as Medugenus (mead-bogotten) or Cranus (guardian of buried treasure). As he had animal-like ears he was called Ausecus (prick-eared), and a representation of his head, goat-like and with little horns and large gem-set ears, ornaments the bezel of a gold ring. Faunus’ father was Picus (“the woodpecker”), and it is no surprise that another gold ring has a bezel composed of a pair of woodpeckers, pecking at a wine bowl whose brimming contents are suggested by an inset of a tree of life, and in three others, a hound chasing a stag, present a striking variant on the Orpheus theme.

Roman Catholic Religious Orders

There are references in the New Testament to unmarried men and women who served the local communities in special ways. Later, this celibate tradition continued as some Christians went into the deserts of Egypt and Syria to live their commitment in solitude. These men and women were variously called “hermits,” “anchorites” and “The Desert Fathers.” In the wilderness, they found a peace and tranquility that was conducive to prayer, contemplation and reflection. Saint Anthony (d. 350) said that, in creation, he could read the word of God.

Demonic powers also resided in the desert. The anchorites saw their presence in the wilderness as a process of re-creating an earthly paradise, of reestablishing the dominion over all life that existed before the Fall. The stories of encounters with wild animals illustrated their spiritual power. The monk Florentius had a bear as a companion. The animals taught the hermits what was poisonous.

Their spirituality was to encounter a strange territory and move from conflict to harmony, to merge the natural with the supernatural until the two were indistinguishable. This spirituality influenced Celtic spirituality where the theme of voyage or pilgrimage provided a heightened awareness of the natural environment. Celtic spirituality, in turn, influenced Saint Francis of Assisi.

Some men and women of the desert gathered disciples around them and formed communities. These groups became the “cenobites” and their communities came to be characterized by vows of poverty, chastity and obedience. The members choose not to own anything, to live as celibates and to obey their abbot or abbess.

Today, there are several thousand orders and congregations in the Roman Catholic Church. Many use a rule that has been influenced by one of the four largest orders: the Benedictines, Franciscans, Dominicans and Jesuits. Since the 1960s, the Maryknoll family has developed a particularly contemporary response to environmental issues.

The Benedictine Tradition

The Benedictine view of nature is grounded in the monastics’ commitment to a specific place, their efforts to be self-sustaining and the rhythm of their daily prayer. Early in the sixth century, Saint Benedict of Norcia wrote a series of guidelines for living together as a religious community. The Rule of Saint Benedict was used by his immediate followers and was also adopted by many existing communities. It became the principle guide for most religious orders before the Middle Ages. Saint Scholastica, Benedict’s sister, founded a women’s branch.

The Rule is characterized by a commitment to a specific monastery, a daily order that includes chanting psalms and canticles in the chapel seven times a day, manual labor, private prayer, simplicity, frugality, humility, obedience and hospitality. The routine of prayer and the focus on frugality shaped the monastics’ view of nature.

The collection of psalms and canticles is called “The Divine Office.” The psalms themselves, coming from the Old Testament, contain many images of nature that are meant to express the majesty of God revealed in the grandeur of creation. Chanting the office seven times a day embeds the images of nature in the monastics’ minds and gives a rhythm to their lives. The routine places time against the backdrop of eternity. The Office of Lauds, chanted at sunrise, is constructed to view creation and redemption as two aspects of the same divine activity.

Some time each day is to be spent in labor. The things of the house, buckets and spades; and the things of the Earth, trees and plants, are to be respected. Work is seen as an act of co-creation or ongoing cooperation with the Creator.

The view of nature within the Benedictine tradition reflects a basic Christian position. There is both a natural and a supernatural order. The supernatural order is not opposed to, but is above nature. Devotion to the spiritual life does not destroy but perfects and elevates the natural order. Creation will also be delivered from slavery and corruption. God remains distinct from his creation, but the universe has a dynamic structure. It is dependent on God and is constantly being created by God in conjunction with those creatures who cooperate.

There were also other perspectives in Europe between the fifth and thirteenth centuries. A neo-Platonic view exaggerated the distinction between the spiritual and the natural order to a point where the natural was disdained. From the eighth century on, there was also a rationalism that sought explicit explanations for everything. These trends would have influenced individual Benedictines, but did not affect the basics of Benedictine life.

Hildegard of Bingen (1098–1179) was a Benedictine nun who wrote treatises on theology, philosophy, cosmology and medicine and then wrote music to illuminate her vision. She saw human nature as a microcosm that contains the entire creation within it. Because they are so closely interconnected, the natural elements and humanity affect each other. Because of sin, creation turns against humans. In Christ, we can restore the balance. Hildegard saw music as the highest form of praising God. Through music, we integrate body, mind, heart and spirit and thus celebrate heavenly harmony here on Earth.

The Benedictine monasteries were a major means of preserving and spreading Western civilization in the centuries of transition from the Roman Empire into the Middle Ages. Towns grew up around monasteries. The monastic schools provided one of the few means of education and the monks both developed and taught agricultural techniques. The early development of Europe consisted in cutting back forests and reclaiming wetlands for agriculture. The monks were at the forefront of this movement.
As Europe approached the Middle Ages, a need for reform arose. Feudal lords were appropriating monastic revenues. The recitation of the Office had expanded in length, manual work decreased and the rule was interpreted rigidly. Besides monastic reform, several popes called for reforms on a larger scale within the whole Church. One need was a concern for apostolic life, for the care and education of people.

One monastic reform came through Saint Robert of Molesne (d. 1111) and Saint Bernard of Clairvaux (d. 1153). They broke with the mainstream Benedictines and founded the Cistercian Order at Citeaux in France. By this time, much of Europe had become farmland and the Cistercians moved out into wilder country. Their writings expressed a sense of movement from wilderness to paradise. They still followed the Benedictine Rule.

Whereas the Desert Fathers saw beauty in an unspoiled wilderness, Saint Bernard emphasized the beauty of labor in preparing the fields. There should be a profound harmony between the natural beauty of the site and the monastic life set within it. Once nature has become fertile and purposeful, it takes on the utmost significance. Irrigation channels and waterways within the monastery provide sport and food for fish, refreshment for people, nourishment for gardens and a means of cleansing. Humanity and creation achieve perfection together because of human efforts to tend and organize the environment and creation’s willing response to humanity’s guidance. Creation repays human care by aiding people physically and spiritually. They are partners in a common effort.

Cistercian monastic architecture was medieval and reflected the simplicity and balance of the monks’ lifestyle. The floor plan and the monastery’s position within the environment were meant to reflect the harmony of creation and the presence of the divine within creation. Light, space, shape and texture were used to reflect this sense.

Because the Cistercians became involved in work away from the monastery, a reform within the Cistercian community began in the sixteenth century and developed until 1892 when a group of Cistercians became independent. The new group was centered at La Trappe in France. This reform revolved around a stronger emphasis on contemplation rather than apostolic activities. The group is known as The Order of Cistercians of the Strict Observation. They are commonly called “The Trappists.” Thomas Merton was a Trappist and his writings have greatly influenced contemporary understandings of the relationships between prayer, justice and the environment. Today, there are 1400 communities worldwide who follow the Rule of Saint Benedict.

Over the last thirty years, contemporary currents and attitudes toward nature have influenced monasticism. In an effort to understand present thinking, a survey was sent out to 52 Cistercian and Trappist monasteries in 14 countries. An effort was made to distribute the questionnaire to every third person. 147 questionnaires were returned. What follows is a summary of their responses.

When asked if their sense of the sanctity of creation had grown during their years in the monastery, all but three said it had. Two of the remaining three responded that they had always had a strong sense of nature as sacred.

To the question asking what people or published materials had influenced their view of creation, about half indicated specific books and authors. The Bible was the most frequently mentioned influence, followed by Jesuit Teilhard de Chardin, Trappist Thomas Merton, Franciscan Saint Francis of Assisi, Passionist Thomas Berry, Saint Paul, William Wordsworth, Matthew Fox, Orion Magazine, David Thoreau, Julian of Norwich, Rachel Carson and Trappist Charles Cummings who wrote a book entitled Eco-Spirituality.

To the question, “What do you see in the Benedictine and Cistercian tradition that contributes to an ecological perspective?” the strongest response was the Rule of Saint Benedict itself, especially a sentence that says that the monastic should reverence all things as if they were the sacred vessels of the altar. Living in a natural setting, working the land, experiencing the seasons, and loving the place were also frequent answers. In addition, there were many mentions of their lifestyle and a daily order that stresses simplicity, silence, solitude, prayer, the rhythm of the liturgical year and the liturgy itself.

One question asked, “Would you please detail any concrete action that your monastery is taking that would reflect a concern for the environment?” In response, many mentioned recycling. Most made reference to responsible farming methods that include organic gardening, erosion control and the use of environmentally safe chemicals. Some mentioned significant proactive measures. The Trappist Monastery at Conyers, Georgia, converted 700 acres of land from swamp into wetlands. A Trappist monastery in Australia has dedicated a quarter of their land as a natural reserve. A monastery in Indonesia has replanted five kilometers of river frontage damaged by overgrazing since 1840. The Trappist Monastery at New Melleray, Iowa, publishes a quarterly newsletter with a strong environmental focus. The monks at Vina, California took action against a nuclear power plant and are founding members of Dear Creek Conservancy. The Trappistine monastery at Whithethorn in Northern California was instrumental in stopping a dam on the Mattlole River and preserving 1200 acres of old-growth redwoods as the “Sanctuary Forest.” Members of the monastery sit on the board of directors. While most Trappist monasteries are involved in some farming, the sisters at Whithethorn are more focused on preserving a natural environment. Monasteries in Ireland, New Zealand, Hong Kong, Canada, Iowa, Oregon, Nigeria and Eritrea have undertaken extensive reforestation projects. A monastery in Cameroon is replacing eucalyptus they planted fifty years ago because...
eral have received awards for their work in conservation. Trappists in Utah have been working for 53 years to preserve 120 acres of rangeland. Several other monasteries reported working with local conservation groups and several have received awards for their work in conservation.

When asked if the environment is one of the major concerns of our times, 98 percent said yes. To the question, “Does the Bible clearly call us to a reverence and respect for the earth?” over 90 percent said that it does.

The Franciscans
The Franciscan view of nature flows out of the nature mysticism of their founder, Saint Francis of Assisi. As Western civilization entered the Middle Ages, a new prosperity created capitalism and a middle class. There was also a universal call for reform within the Catholic Church. A significant mode of that reform came in the person of Saint Francis of Assisi (1182–1226) and his founding of the Franciscan Order. The order was approved by edict of Pope Innocent III on 16 April, 1209.

With the Benedictines, very little is known about the personality of Saint Benedict. It is his written rule that has shaped the order, but with Francis, his personality and charisma dominate and is hard to capture in a written rule. The Franciscans became the first of a different type of order. They are friars and mendicants, not monks. Like the monks, they have a distinctive habit (robe) and chant the psalms and canticles of the Bible in common. But unlike the monks, they have a strong emphasis on apostolic work, on preaching and serving people in a variety of ways. They move easily from place to place and are not bound to a particular monastery.

Francis’ father was a wealthy cloth merchant who also bought up small farms and expelled the tenants. Francis reacted dramatically to his father’s lifestyle and attitude. He saw power, prestige and possessions as leading to violence and so he embraced humility, poverty and the cross. Much of his life was spent alone in nature like the Desert Fathers and the Celtic hermits. In this liminal position, he had a direct and mystical experience of God in creation.

What is unique to Francis is that he is the first known person within the Christian tradition to exhibit a nature mysticism. Previous ascetics were ambivalent. They saw the natural world too much as the realm of demonic powers. For Francis, his union with nature became a mode of God’s communication of himself to humanity and humanity’s union with God through a perceived presence in the physical world.

There is a charming fresco by Giotto in the Basilica at Assisi. Here, Francis is seen preaching to birds. The famous incident illustrates the Saint’s sense of the interdependence he saw in creation, an interdependence that called for respect and obedience. The birds praise God with their song. They each have autonomous worth and beauty and yet are brothers and sisters performing their divinely allotted function. The birds respect Francis because he is also a servant of God. Their response encouraged him to sustain his new perspective and to carry his preaching to people. By implicitly humanizing creation through affective links, Francis made it easier for others to share his bond with creation. It was Francis and the early Franciscans who introduced the use of the creche, the manger scenes that dramatize the Christmas event.

The legend of the wolf of Gubbio tells of a hungry wolf that was terrorizing a town. Francis went out and preached to the wolf and then preached penance and peace to the villagers. He was thus able to convince the people that the wolf was simply hungry and needed food. He forged a covenant wherein the people agreed to respect the wolf and provide him with food.

Like the monks before him, the psalms and canticles from the Bible shaped Francis’ expressions. But unique to Francis, is the influence of the songs and lyrics of the troubadours. The troubadours were wandering musicians who composed and sang love songs. Here, Francis spiritualizes the mistral’s interplay of natural setting and human experience, an interplay that elicits love and joy. Francis embraced and expressed the chivalric values of beneficent magnanimity and deference to all.

Like the ascetics before him, Francis also saw nature as allegorical. He had a particular affection for worms because there is a passage in the New Testament where Christ says, “I am a worm and no man.” So Francis would carefully pick worms up off the road and place them in safer places. He saw Christ in the worms. The sun is like God because it is beautiful in itself and it gives light.

The clearest illustration of the Franciscan view of creation can be found in Francis’ Canticle to Creation. The hymn praises the four elements; fire, air, water, and earth, which were seen as the components of all life forms. In the Canticle, he expresses the intrinsic goodness of the created world, the interdependence of all life, and his passion for beauty and peace. Because we call God “Father,” creation becomes our brothers and sisters. He calls for a fraternal model, rather than a model of stewardship. We are to be detached from creatures in order not to possess them. Francis goes so far, at times, as to say that we should even obey animals. The Franciscans were a dynamic argument against the Cathars; a heretical group at the time who held that “the spiritual” had been created by a beneficent divine power and the natural world by an evil one.

Francis forbade his followers to cut down a whole tree. Part needed to be left intact so that new sprouts could bud. Until recently, a Franciscan needed permission from the provincial before cutting down a tree. Francis spent the last years of his life in the wilderness.

Saint Francis represents a watershed in the development of Christian views of nature. Some spiritualities after him flow from him. Others, such as the Rheinland mystics, continue a neo-Platonic tradition.
The Saint of Assisi fulfills Arne Naess’ definition of a deep ecologist because he emphasized the diversity and intrinsic value of creation and because he addresses the need to reform behaviors that threaten to destroy entire ecosystems. On Easter Sunday, 1980, Pope John Paul II proclaimed Saint Francis of Assisi the patron saint of ecology, following the suggestion 13 years earlier by Lynn White, Jr., in his seminal article in *Science*.

Today, Franciscan men and women continue their founder’s work by focusing on the changes of hearts and minds needed to live in balance. Franciscan Keith Warner trained in geography and worked for a reforestation cooperative in the Pacific Northwest that planted over 600,000 trees. He is on the steering committee of the California Sustainable Agriculture Working Group and has lobbied with The Religious Campaign for Forest Conservation. Warner also campaigns against what he calls “Bird-bath Franciscanism,” a superficial and romantic view of Francis depicted in flower-garden statuary. He sees his founder as much more ecologically radical.

Father Richard Rohr, also a Franciscan, founded and is director of The Center for Action and Contemplation in Albuquerque, New Mexico. The center’s aim is to seek a balanced life by bringing together the worlds of spirituality, psychology, social action and environmental concerns.

Former Franciscan Leonardo Boff is a Brazilian and a major figure of liberation theology. In *Ecology and Liberation* (1995) and *Cry of the Earth, Cry of the Poor* (1997), he brings together poverty, ecological degradation and liberation. For Boff, the fate of the rainforest and the fate of Amazonian Indians are inseparably linked.

Franciscan sisters run Michaela Farm in Oldenburg, Indiana, where their aim is to seek and teach skills in organic food production and to foster a lifestyle in harmony with the Earth. Sister Rita Wienken has similar objectives with her Franciscan Earth Literacy Action Center on 500 acres in Tiffin, Ohio.

**The Dominicans**

The Dominican view of nature is based on the fact that they were founded to combat a heresy advocating that the natural world was evil. On 17 January 1217, just eight years after Pope Innocent III approved the rule of Saint Francis, Pope Honorius III ratified the constitutions for the Dominican Order. Like the Franciscans, the Dominicans are friars. They work outside the monastery and were founded to combat the Albigensian heresy.

The Albigenses espoused a form of Manicheism, a cosmic dualism, holding that the devil was actually a rival god who created matter. The soul is imprisoned in matter and the objective is to liberate the soul. Therefore, they discouraged marriage and saw death as the final release. For them, Christ was not the Son of God but an angel with a corporate appearance. The first objective of the Dominicans was to restore a Christian view of creation.

The Dominicans call themselves “The Order of Preachers.” But “preaching” here is not restricted to a discourse on Sunday morning. They see their charism as closely following the Old Testament definition of a prophet as one called by God to speak for God. They say of themselves that their objective is to contemplate and to share the fruits of their contemplation. Like the Franciscans, the first Dominican priests were friars. They worked outside the monastery and were founded to combat the Albigensian heresy. Today, the Dominican family includes sisters and lay people.

Fra Angelico (1400–1455) was a Dominican and a painter who continued the work of Giotto in giving more natural shape and color to works of art.

Dominican Saint Thomas Aquinas (1225–1274) is considered the greatest of the medieval philosophers and theologians. His *Summa Theologica* is built on Aristotle and provided a synthesis of theology up to that point in time. Saint Thomas presents the knowledge we get from revelation, our experience and our capacity to reason as compatible and complementary ways of knowing. He set the stage for the later development of the scientific method.

A recent movement within the religious orders of women in the United States is to convert the lands that once served as novitiates, mother houses and schools into organic farms and ecological learning centers. The Dominican sisters have been at the forefront of this movement and Genesis Farm is their flagship.

Founded by Sister Miriam Therese MacGillis and the Dominican Sisters of Caldwell, New Jersey, the farm focuses on learning and teaching a new cosmology. They also sponsor a large, community-supported biodynamic garden. Their teaching is build around the works of Thomas Berry, Brian Swimme and a section of Saint Thomas Aquinas’ *Summa Theologica*. In Part I, Question 47 of his *Summa*, Aquinas says that God is most fully revealed, not through one species only, but through the whole universe because one creature alone could not adequately represent his goodness.

Genesis Farm uses the structure of a story. The universe is a series of unfolding stories. Humanity needs to listen to the stories and individuals need to see the story of their lives in the context of the universe of which they are a part. MacGillis also uses the image of a punchbowl on a table surrounded by glasses. Each glass is a religious or ethnic tradition that holds some wisdom. When the glasses are emptied into the punchbowl, the wisdom is not lost but enlarged. The families who sponsor the organic garden at Genesis Farm are presently founding a grammar school where their children can progressively learn the stories of the universe.

The Dominican sisters also operate Sophia Garden in Amityville, New York and Siena Spiritual Center in Water Mill, Long Island. They have similar farms and learning centers in Springfield, Illinois; Ponchatoula, Louisiana;
The Jesuits

Saint Ignatius Loyola, the founder of the Jesuits, had a vision, while praying on the banks of the Cardoner River in Eastern Spain, of God’s abiding presence in all of creation. He later had a second vision of Christ carrying a cross for the salvation of the world. Putting the two visions together, he developed a series of meditations and contemplations called The Spiritual Exercises, in which, a person is guided to enter the vision of God’s presence in and for the world. From there, one moves to a deeper realization of where and how God might be calling that person to serve.

The Jesuit order itself was founded on 15 August, 1534 at Montmartre in Paris. Pope Paul III approved their constitutions in 1540. With the Jesuits, a third type of order comes onto the scene. The Jesuits were to have no special clothing and did not pray the Liturgy of the Hours in common. Their lifestyle and daily order was to focus on what one Jesuit writer called “a mysticism of service.”

From their beginning, Jesuits have been involved in education, scholarship and the foreign missions. Early Jesuits were colleagues of Galileo and over thirty lunar formations bear Jesuit names. Athanasius Kircher (d. 1680) was a major link between medieval and modern science. Jirí Kamel, a Czech Jesuit (d. 1706), sent drawings and specimens of insects and plants from Manila to the Royal Society of London. He recognized strychnine in a type of bean and camellia tea is named after him. Christopher Clavius (d. 1612) designed the Gregorian calendar and introduced the decimal point to mathematics. The Jesuits introduced geometry and Western astronomical instruments to China in the seventeenth century.

Teilhard de Chardin (d. 1955) was a French Jesuit paleontologist. He was concerned with the split between his spirituality and what his fellow scientists were saying about the universe’s evolution toward entropy. He developed a schema wherein he saw the possibility that the universe was rather evolving toward a deeper spiritual unification.

Gerard Manley Hopkins (d. 1889) was an English Jesuit poet and artist. He was acutely aware of the beauties of creation and coined the word “inscape” for what he saw as the unique and particular quality of each object in nature. The experience of the particular, of the “deep-down” beauty, leads to an experience of the transcendent. He had a Wordsworthian feeling for nature coupled with a sense of nature as an expression of God. The squalor of industrial towns and the oppression of the working class horrified him. His sonnet, “God’s Grandeur,” begins with the lines; “The world is charged with the grandeur of God. It will flame out, like shining from shook foil; it gathers to a greatness, like the ooze of oil crushed.” He then goes on to describe how the Industrial Revolution has damaged the Earth. But he ends the poem by saying,

And, for all this, nature is never spent. There lives the dearest freshness deep down things. And though the last lights off the black West went – Oh, morning, at the brown brink eastward, springs – Because the Holy Ghost over the bent world broods with warm breast and with ah! bright wings.

He poetically expresses the heart of Jesuit spirituality.

Today, Jesuit John Surette is co-founder of Spiritearth in Arlington, Massachusetts. The educational center is built on the principle that an openness and reverence before the universe allows community to form and justice to flourish. The center would like to see humanity enter an ecozoic era. Another Jesuit, Al Fritsch trained as a chemist, worked for Ralph Nader’s Center for the Study of Responsive Law and then founded Appalachia Science in the Public Interest in Mt. Vernon, Kentucky. The center is devoted to the notion of sustainability and has developed solar-energy applications, organic gardens, artificial wetlands and dry-composting toilets. Members of the center are helping to develop ginseng as an alternative crop to tobacco and extensive lumbering in Appalachia. The center has conducted over 200 assessments in 34 states and consulted in Haiti, Peru, and the Dominican Republic. Fritsch would like to see a 12-step program addressing people’s addiction to material things.

The Jesuits have assisted sixty religious groups in ecological improvements to their property. Jesuits also teach ecology, sustainability and ecospirituality in their many educational institutions.

Maryknoll

The Maryknoll order is a younger group within the Catholic Church and their approach to nature is uniquely modern. They were founded early in the twentieth century as an American foreign missionary society of priests, brothers and sisters. Today, they include lay-people and call themselves the Maryknoll Family.

Working in South America, they experience extensive exposure to liberation theology and as that movement
started “turning green” in the early 1990s, so did they. Maryknoll founded Orbis Press, whose publication list includes books on the environment.

Maryknoll lay-people are involved with CEDICAM in Oaxaca, Mexico. The organization works with Indian campesinos and encourages reforestation and crop diversification throughout the Mixteca Alta region. This group has established tree nurseries in 22 farming communities and has planted more than 150,000 trees.

Maryknoll sisters run the Center for the Integrity of Creation in Baguio, The Philippines. The area is threatened by excessive logging. The Center focuses on education for biodiversity and sustainable development.

Maryknoll Father Herb Gappa runs an anti-erosion and tree-planting project in the Shinyanga District of Tanzania. Maryknollers are also working to conserve green space and diversify agriculture in Barquisimeto, Venezuela. In Chile, they develop ecological education units for high schools in Linares, work in the Spirituality and Ecology Center in San Nicolas, provide workshops on spirituality and ecology in Santiago and develop an awareness of the illegal seizure and logging of native trees in Chol Chol. The logging has led to a drop in the water table. Hazardous chemicals and pesticides have also been introduced.

Other Religious Orders
There is a strong movement today to network, to link and affiliate. A project or center might not be staffed exclusively by members of one order. Individual religious from different congregations join local and national conservation groups. The Maryknoll project in Baguio, The Philippines, includes on its staff members of the Redemptorist and Divine Word orders. The Sisters of Charity, Religious of the Sacred Heart and Passionists have projects and centers similar to those run by the Dominicans.

The Global Education Association is an international network and resource for ecologically related issues. Within GEA, The Religious Orders Partnership includes more than 150 orders. Their aim is to cooperate in using their resources of schools, universities, healthcare facilities, community services, retreat centers and churches to further a concern and care for the Earth. Most religious orders include ecology within their programs for social justice.

**Roman Catholicism in Latin America**

Roman Catholicism has long been the religion of peasant farmers in Europe and Latin America, and thus the tradition’s ritual practices, annual calendar, and many cognitive and moral beliefs are closely linked to natural cycles and landscapes. The Church does not, however, have a long tradition of explicit theological and moral reflection about the natural world. While this is probably true of most branches of Christianity, the strongly humanistic emphasis of Roman Catholic social thought has arguably slowed the development of debates and theory-building within that tradition in comparison, for example, to Eastern Orthodoxy and some Protestant denominations. In the Roman Catholic tradition, God’s work from creation to salvation focuses on human good, and nonhuman nature serves mainly as a backdrop for human action or as a means to human ends. Nature appears to have little intrinsic (non-instrumental) value, but is valuable insofar as it contributes to collective human well-being. This carries the potential risk of justifying almost any exploitation of natural resources that appears to serve human well-being.

Recognizing some of the tensions in the Catholic humanist approach to nature, in recent years Catholic thinkers in the First and Third Worlds have been reworking attitudes toward the natural world. Important differences in perspective and emphasis distinguish Catholic environmental philosophy from different cultures, but they are also united by some overarching themes. First and most important, Catholic thinking about the environment almost invariably contends that God created nature in order to serve human dignity and the common good, not individual profit. Creation is a gift of God, intended for the well-being of all of humanity. Greed, expressed in consumerist culture and unrestrained capitalist economics, leads to overexploitation of both nature and persons, ultimately destroying both human and natural com-
munities. In consequence, people are called to serve as wise and careful stewards of the natural world. Humans are entitled to use natural resources, but this use must be moderate and in the service of the common good rather than individual profit.

These emphases lead to a close link, in most Catholic work on the environment, between environmental and social problems. In Latin America, this means that Catholic thinking about the environment often takes up the themes of social and economic justice. For example, a pastoral letter issued in December 2000 by the Apostolic Vicariate of the department of Petén, Guatemala, titled “The Cry of the Forest in the Jubilee Year: Between Agony and Hope,” asserts that “It is not possible to speak of ecology without taking justice into account. It is not possible to defend the conservation of the forest apart from the advancement and life of the poor” (El Grito de la Selva en el Ano Jubilar, 9).

Bishops in other parts of Latin America have taken up similar themes. In an April 2000 Pastoral Letter, the Bishops of Northern Mexico denounced the socially and environmentally destructive consequences of forest exploitation, concluding that

The protection of the forests requires urgent measures . . . The forest is not mere food for industry . . . The forest is a giver of life for its inhabitants. For these reasons we appeal to the conscience of everyone and urge all Christians to take responsibility for preserving the life on this planet that God has entrusted to our care. All of this makes it our obligation to . . . denounce the ecological devastation we are witnessing (http://conservation.catholic.org/bishops_from_around_the_world.htm).

And a statement from the Church in the Dominican Republic asserts that

Human sins against nature reound always to the detriment of humankind itself . . . It is not right that those who have greater resources, whether countries, cities, groups, or individuals, should lean toward excessive consumption which, in addition to being a provacative insult to the poor, is an evil misappropriation of natural resources necessary for the have-nots of the world (http://conservation.catholic.org/bishops_from_around_the_world.htm).

Similar themes emerge in the environmental writing of Latin American liberationist theologians, such as the Brazilian Leonardo Boff, who gained international prominence in the 1970s and 1980s for his arguments in favor of democratization within the Church, among other themes. In the 1990s, Boff has turned his attention to ecological themes, insisting that, “The very same logic of the prevailing system of accumulation and social organization that leads to the exploitation of workers also leads to the pillaging of whole nations and ultimately the plundering of nature” (Boff 1997: 110–11).

This destructive system must be replaced with “a non-consumeristic type of cultural practice that is respectful of ecosystems, ushers in an economy of what is sufficient for all, and fosters the common good not only of humans but also of the other beings in creation” (Boff 1997: 113). Boff contends that excessive consumption by some harms both the poor and the natural world; the solution requires both more restraint in human use of natural resources and a more equitable distribution of the goods they make possible.

In addition to theological explorations, Catholics in Latin America are addressing environmental problems in grassroots organizations and pastoral projects. Many dioceses and parishes have formed “ecological committees.” These take different forms and emphasize different issues, depending on the setting. In many urban areas, primary concern is with issues of “environmental justice,” such as waste disposal, sanitation, and air and water quality. In rural areas, attention often focuses on problems related to agriculture, such as soil erosion, reliance on chemical pesticides and fertilizers, and exhaustion of water resources. Latin Americans, Catholic and other, devote less attention to issues such as biodiversity and wilderness protection than do environmentalists in North America and Europe. This emphasis stems both from the urgency of social and economic inequities and also from the dominance of a perspective in which environmental problems are significant in relation to human needs and interests. The Roman Catholic tradition has contributed substantially to this humanistic worldview. There is some evidence of the emergence of more “biocentric” ways of thinking, especially in regions with large wilderness areas remaining, but this remains a minority perspective within Latin American environmentalist thought and activism.

Roman Natural Religion

The close association of Roman religion with the natural world is apparent from the various versions of the Roman seasonal calendar ranging from the popular “farmer's
Many aspects of this religion depended on deities who were the personifications of natural phenomena. Ceres, though later equated with the Greek Demeter, was simply the process of growth; Vesta was the controlled fire of the hearth; Jupiter, with his epithet Fulgur, was the thunderer. The most famous and long-lived of Roman festivals, the Lupercalia, celebrated in February, came to celebrate the myth of Romulus and Remus at the wolf’s cave. But the identity of the god to whom the festival was dedicated was no longer really known, though the rites, which included the sacrifice of goats whose skins were put on by otherwise nude runners who would lash out with thongs believed to bring fecundity to the childless, were held in high regard until the end of the fifth century. It was clearly a purification ritual like the April festival of the Parilia, which was concerned with flocks and herds and was symbolized by Pales, a goddess of whom little is known.

Not surprisingly, a grove of trees was often regarded as the dwelling place of a deity, often Mars, who would certainly need to be propitiated if anything were done to it. Cato in his book on agriculture describes the procession and sacrifice that the farmer would have to make if he wished to thin the grove. Evander in Virgil’s Aeneid (viii, 351–2) describes the woods covering the Capitoline Hill as “the abode of some god.” In his Fasti (iii, 295–9), Ovid mentions another wood in Rome, a grove by the Aventine, dark with enormous holm-oats, where the viewer would exclaim, “this is the home of deity.” It is not surprising that later Diana, goddess of hunting, had her Roman home here. Ovid, however, associates the spot with more localized rustic deities, saying that Faunus and his father Picus, who was the woodpecker and son of Mars, often came to drink at the spring here. Springs, sacred to major deities such as Neptune or Minerva, or some more localized water deities, or to the nymphs, were widely venerated throughout the Roman world. Typical examples were the springs of the nymphaeum Arethusa at Syracuse in Sicily, and of Sulis, equated with Minerva, at Bath in Britain.

This identity of the divine and the natural worlds meant that nature was frequently employed to interpret the will of the gods. Thus by observing the song and feeding habits of birds, augurs could foretell the future. A related phenomenon is recorded at Tiora near Reate, where according to Dionysius of Halicarnassus (Roman Antiquities 1.14.5), at an oracle of Mars, a woodpecker tapped-out on a post responses to questions put by the enquirer. Most important was the study of bird flight across the sky, as this could be divided into sections, each with a meaning. The Etruscan art of haruspicy, in which the haruspex (literally the “gut-gazer”) looked at the heart, intestines and liver of sacrificed animals, at first sight could not have been more different from bird-watching but, as is demonstrated by a bronze model liver excavated at Piacenza, carefully marked out in sections, this too could be related to the sky map of the augurs used similarly in divination.

The religious person would look out for omens, which might well be connected with animals, some of which were sacred to specific deities. There are many stories of Jupiter’s eagle giving succor and hope to Roman armies; but Juno’s peacocks and geese, Apollo’s corvine, Minerva’s owl, Mercury’s cockerel, Diana’s deer, the serpent of Aesculapius, the ant of Ceres, the dolphin of Neptune, the panther of Bacchus, and the lions of Cybele, are all familiar in literature and art. Sometimes the animal is so closely associated with the deity that the two are virtually interchangeable, a process known as “theriomorphism.” Dea Artio, the bear goddess attested by a figurine from Berne in Switzerland, has a name derived from that of the name for bear. Another goddess originating in the Celtic world was Epona, who can be identified with the horse. In the case of Aesculapius, serpents and hounds lived in his sanctuaries and helped the healing process of the sick by, for example, licking the sores, wounds and swollen limbs of votaries.

In art, this naturalistic religion was prettified and made polite, providing the basis for the idealized view of nature in so much Western Art where fauns (originally godlings of the countryside around Rome) and satyrs gamboled in woods and fields and where Priapus, who developed from a phallic pillar, became a somewhat risqué symbol of sexual activity. The sacro-idyllic landscape was developed, if not invented by a certain Stidius who lived in the reign of Augustus. In landscape paintings of this time, as well as in other works of art such as silver plate and gems, we find temples and sacred columns as well as images of Venus or Priapus set in idealized countryside. Venus keeps her place as the garden goddess but is now very much identified with the Greek love-goddess Aphrodite. Both aspects are very much to the fore in the elegant fourth-century poem, Pervigilium Veneris (“Venus’ eve”), which celebrates both love and fertility.

Outside the essential domesticity of the estates and gardens celebrated by writers and artists, nature had a darker side, one that needed to be taken by human effort. In myth this is symbolized by the deeds of heroes such as Bellerophon who slew the fire-breathing Chimaera, Perseus
who vanquished the sea monster, and, above all, Hercules who killed savage lions, boars, bulls and monsters in a series of Labors. This attitude to a hostile nature beyond the world of humankind, partially at least, explains one of the contradictions in the Roman psyche between the gentle appreciation of the divine in nature, which had such resonance with pantheist eighteenth-century writers, and the savage barbarities of the Roman arena. The venationes (plays) staged at the Roman Coliseum and other amphitheatres celebrated the dominance of Rome over “the other.” The “ludi” (games!) were part of the annual cycle of religious festivals in the calendar; they were attended by priests and by the Vestal Virgins. It is clear that despite the obvious dominance of popular entertainment, there was an element of sacrifice here: Rome was offering up the fruits of nature to the gods.

It could be claimed that the introduction of the amphitheatre was relatively late in date, not appearing until the late Republic, but the attitude toward nature as essentially savage is to be found in the Lupercalia. It is also apparent in a famous ritual at the grove of Diana at Aricia beside Lake Nemi. This grove was presided over by a priest, a runaway slave who obtained his office by plucking a bough from a certain tree and then challenging the reigning priest to mortal combat. This curious priesthood was investigated by the famous anthropologist, Sir James Frazer, who started him on his magnum opus, The Golden Bough. Although not all of his deductions would now be accepted (for example, his belief that the rites celebrated a single Mediterranean Great Goddess), the cult was almost certainly earlier than its Hellenization and originated in the pattern of death and rebirth which could be observed in nature. The priest, challenged and cut down by his rival, literally died for the goddess, who in classical times was called Diana.

Roman religion cannot be limited to Rome or even Italy, and it is often difficult to decide where Roman religion ends and those of other peoples in the Empire begin. From Britain to Syria the ancient traveler would find many similarities in attitudes to natural features, mountains and mountain passes, rivers, caves and groves, but also local differences. The second-century Greek rhetor, Lucian, describes the superstitions of a Roman senator, Rutilianus, who would only have to see a rock smeared with holy oil or with a wreath laid on it to fall on his face before it. He became the dupe of a charlatan named Alexander, who set up an oracle in which the responses were given by a serpent called Glycon, at Abonoteichos in Asia Minor.

The more or less contemporary guidebook to Greece written by Pausanias was intended for the sophisticated Roman traveler and is full of accounts of a god-filled countryside and rites available to the pilgrim. Nature could be both benign and brutal but it was never regarded as simply secular. At Patras in the sanctuary of Laphrian Artemis, live animals were rounded up and thrown alive onto an enormous bonfire in honor of the deity (Pausanias: VII,18,6). To modern eyes this is incredibly cruel, and a reminder to those who over-idealize the Greeks, that the “Roman” amphitheatre did not signify a unique distinction between the two peoples in this matter. We can also recall that the maenads, servants to Dionysus, tore animals limb from limb in their trances and in doing so were in a sense identified with wild nature. However, other information, for example in Pausanias, has a more gentle charm, describing a countryside of hills, islands and woods peopled with gods who are part of beneficent nature, and which belongs much more to the sacro-idyllic world which we meet in many Latin poets and can observe in depictions on wall paintings, engraved gems, and other works of art.

Religion and Nature in Art
Excavation at Pompeii has found the remains of many gardens, and these, together with frescoes from the Campanian cities and Rome, and engraved gems from throughout the Empire showing the natural world, provide a fascinating body of visual evidence of how ordinary inhabitants of Italy approached the divine around them. It is clear that all landscapes were regarded as having a divine aspect, as does the Christian landscape of southern Europe today with its shrines and churches – everything from the Lararium, which brought the Lares into the front hall, to the garden with its marble figures of Priapus, Venus goddess of gardens, or Mars, associated with Venus in love but also with sacred groves. The peristyle of the House of the Marine Venus, with one painted panel showing the birth of Venus (her physiognomy and coiffure perhaps based on those of the lady of the house) and another a statue of Mars in front of garden plants and birds, was only part playful; these were deities seriously regarded as bringing peace and order to nature.

A panel of landscape on this painting is in fact a “sacro-idyllic landscape,” with shrines interspersed with people. Such landscapes, generally with herdsman, satyrs and nymphs, are highly distinctive and often of high quality, especially in the Augustan period when they were popular as symbols of the return of peace, and are to be found in stuccoes, paintings and marble relief sculpture. One of the carved panels of the screen wall of the Ara Pacis, begun in 13 B.C.E. and completed in 9 B.C.E., shows a figure of Italy suckling two babies in a rich landscape with a stream, a cow and a sheep grazing, and crops ready for harvest. Another depicts Aeneas sacrificing a white sow with her piglets at Lanuvium in a rustic landscape in which there is a temple of his household gods, or Penates. The rich acanthus scrollwork of the pilasters and lower part of the screen inhabited by nesting birds and buzzing insects reinforces the importance of harmony in nature to the Roman ethos. Moreover, on the interior of the screen wall, hanging garlands filled with fruit reinforce the
message of the fecundity of a peaceful nature that Augustus and his advisors wished to convey to the Roman people.

In Classical Greek times, Dionysus was, although powerful, a destructive and menacing god. His satyrs often represented untamed nature and were in consequence themselves wild and menacing. There is a tendency, well shown on Roman-period engraved gems, for Roman satyrs to be genial quaffers of wine or players on pan pipes and thus to exemplify the pastoral ideal; they often appear with offspring and if maenads are shown, the sexual relations between male and female tend to be decorous. Frequently these country spirits make offerings on altars in front of little statues of Priapus or Pan, which must have existed in actuality in garden and parkland settings. Dionysus, generally known as Bacchus in Roman times, presided over the vine and the feast and would also be very much at home in a villa setting as is shown by the famous fresco in the Villa of the Mysteries; here the cult scene is shown as taking place in the house, but connections with the great outdoors were to be found in bacchic symbols in the painting, such as the phallos, the organ of generation, which is being uncovered by one maenad, and the nude female maenad-dancer who brings to mind the wild freedom of the god’s followers in the myths of the god. Moreover, elsewhere in the house, there were panels depicting sacrifice in a rustic landscape.

The very frequent appearance of such themes on personal objects, such as signet rings, is noteworthy. Satyrs, cupids and countrymen making offerings to the gods of the countryside, doubtless reminded the wearer of his or her obligations to the gods and genii loci, who looked after fields and gardens. Popular themes of animal life, groups of cattle, panthers, goats, eagles, deer, dolphins and ants are equally symbols of the complex relationship, secular and religious, between man and the gods, either as sacrifices or as familiars of deity.

Roman Religion and Empire

The great ancient Mediterranean empire of Rome provides examples of the ways in which religion determined attitudes to nature, but also of the tendencies of business and politics to circumvent religious sanctions regarding treatment of nature. The amorphous deities of early Roman religion were considered to govern the domestic activities of household and agriculture, but also the wild natural forces they perceived in the forests, waters, weather, and wildlife. The Romans regarded certain features of the landscape, such as springs, groves, and mountains, as sacred. Their rituals and ceremonies were deeply involved in agriculture and the round of the seasons. In the years between 200 B.C.E. and 200 C.E., the Romans were deeply influenced by Greek attitudes to the gods and nature, so that their ideas of the gods became more anthropomorphic. At the same time, a growing Roman orientation toward practicality and desire for profit and control weakened the traditional sanctions that had given a modicum of protection to the natural environment.

Like Greece, Italy was part of the Mediterranean environmental zone, with a hot summer and relatively mild winter, but with more rainfall on average than Greece. The Roman Empire, however, embraced the entire Mediterranean area and extended beyond it into Western Europe. Such a vast area contained a variety of ecosystems from deserts to high forests.

Roman religion followed its own course even though it shared some sources with Greek religion, and in later times eagerly adopted Greek myths and religious practices. Early Roman gods were formless spirits or presences, sensed as numina, mysterious presences in the natural world, not as anthropomorphic as the Greek gods, although Romans accepted Greek portrayals of the gods from the late Republic onward. Any natural phenomenon could be seen as the result of a god’s operation. Therefore any human activity that affected the environment could be seen as attracting the interest of or provoking the reaction of some god or goddess, and ought to be undertaken with caution.

Since nature was full of gods, natural events could serve as the medium for discerning their intent. To a skilled Roman augur, birds of many kinds, singly or in groups, bearing prey or flying free, on the left or on the right, displayed the plans of gods. In the sound of thunder or the rustling of leaves those who knew how to listen could hear the gods’ words.

Roman gods were extremely numerous. Their hierarchy ran from great deities like Jupiter the thunderer to local
spirits of springs like Juturna. Roman religion had an agricultural flavor, reflecting the observances of farm families who depended on the orderly cycles of nature for subsistence. The Romans possessed gods of the farmhouse and storehouse (penates) and of the fields (lares). A god or goddess was the growing spirit of every major crop, such as Ceres of grain and Liber of wine. Every activity of the farm had a deity to be invoked for its success, such as Vervactor for first plowing, Repacator for the second, Imporcitor for harrowing, Insitor for sowing, and even Sterquilinius for manuring. On the margins lurked Silvanus and other wild gods of the forests. Romans were not without reverence for wild places, and personified mountains like “Father Apennine” as gods, but agricultural themes dominated their religion.

Religious worship and appreciation of natural beauty are reasons given for the ascents of high mountains recorded in Roman times. Rome’s most famous mountaineer was the Emperor Hadrian, who ascended Mount Casius in Syria by night to see the sunrise and to make an offering to Zeus. He narrowly escaped being struck by a bolt of lightning that killed the sacrificing priest. High mountains were places where the gods could be worshipped.

Sacred groves in Italy were as ancient, numerous, and widespread as in Greece. The Latin words for them were nemus (grove), and templum (a space marked out). The latter is the root of the word “temple.” The Romans never forgot the motive that had created them: religious awe. Virgil said that when they saw the old tree-covered Capitoline Hill, the rural folk who lived around it exclaimed, “Some god has this grove for his dwelling!” (Virgil, Aeneid 8:351–52). Seneca remarked,

If you come upon a grove of old trees that have lifted their crowns up above the common height and shut out the light of the sky by the darkness of their interlacing boughs, you feel that there is a spirit in the place, so lofty is the wood, so lone the spot, so wondrous the thick unbroken shade (Seneca, Epistles 4.12.3).

The numerous Roman religious festivals followed the calendar of activities of the ancestral farm, from the hanging of the plow on the boundary marker in the Compitalia in January to festivals of Saturn and Bona Dea, deities of the soil, in December. Sacrifice was usually in the form of the slaughter, cooking, and eating of domestic animals, although wild animals were sometimes offered. Bloodless sacrifices, such as the pouring of wine, oil, milk, or grain, or the presentation of fruit, cakes or cheese, were also made. Sacrifice was a gift to the gods in expectation of benefits, or in thanksgiving for them. The Latin phrase was do ut des, “I give (to you) so that you will give (to me).” The animal or substance sacrificed often represented the god. Since the number of victims was sometimes in the hundreds, the effect on the environment through killing animals, consuming fuel, and releasing smoke must have been considerable. Sometimes sacrifice was used as a way to avoid environmental protections that religion afforded to sacred places. For example, Cato the Elder advised landowners to make a handy prayer “to the god whom it may concern” for permission to cut down trees in a sacred grove (Cato, On Agriculture 139–40).

Pliny the Elder, taking a different view, complained that people abuse their mother, the Earth, but should know better. Lucretius had claimed that Earth was growing older and weaker, and therefore less able to reward human labor. The idea that meager crops could be blamed on an aging Earth was attacked by the agriculturist Columella, who placed the blame for nature’s infertility not on senescence or changing climate, but on poor husbandry. A good farmer knows how to restore soil to fertility, but those who misuse the land should not be surprised when the result is diminishing crops and sterility. Horace scorned landowners who were neglectful of their land.

To what degree did the religious ideas held by the Greeks and Romans about nature affect their practical treatment of the Earth and its living inhabitants? There is no simple answer. Hunters spared some animals, particularly the young, because gods were thought to punish their killers. Prohibitions against cutting trees saved them in sacred groves. Animism provided an enchantment of nature that made people think twice before harming it. However, the undeniable fact that the natural environment suffered considerable damage at the hands of the Greeks and Romans remains to be explained, and it was more than one would expect from people who worshiped gods of nature and regarded much of the landscape as sacred.

Religion permeated all levels of society, and the beliefs of common folk preserved older practices. The environmental orientation of ancient religion was toward preservation of the natural order. Still, it is characteristic of human beings to evade religious prescriptions when it is in their perceived self-interest. It is possible that tree worshippers might have preserved a few sacred trees while they were cutting down whole forests, if they needed wood for fuel. Some of the mystery religions taught the oneness of human beings with the universe and nonviolence toward other forms of life, but they also stressed purity of soul and escape from the physical world, and therefore neglected the natural environment. Religious doubt increased in later classical times, and Christianity weakened the older nature religion.

Ancient religion could have provided constructive environmental attitudes. But these would not have been effective in conservation without knowledge of the workings of nature and the effects of human actions upon it. There were places where a body of practical knowledge of interactions with the Earth, the result of centuries of trial
and error, survived. For example, the practices of subsistence farmers reflected adaptations to the limits of ecosystems they had to live within or perish. They took care of the land as long as their lives were not disrupted by war, which unfortunately they often were. It would have been difficult, however, to decide which practices would bring the best results when an environmental problem first appeared or was exacerbated from a tolerable level to an intolerable one.

It seems, therefore, that the course environmental problems took in the ancient world was not chiefly the result of the religious concepts of the natural world held by the Greeks and Romans. It was also the result of the technology they inherited and developed, the population levels they reached, the agricultural and other economic measures they took to feed, clothe, and shelter themselves, and the patterns of their rural and urban lives. Only through studying the interaction of all these factors will it be possible to gain understanding of the ecological failure that underlies the decline of ancient Mediterranean civilization.

Romanies (Gypsies)
If religion is popularly perceived – as it so often is – to include a place of worship, a clergy and a set of holy scriptures, then it is easy to understand why observers such as Hoyland, Roberts, Morwood, Greenfeld, and others should have reached the conclusions which are quoted below:

I never could meet with anybody that pretended to say what their private faith and religion may be (Hoyland 1816: 25).

They have, as a people, no religion (Roberts 1836: xvii).

The lack of religious ideas, and the want of a peculiar system of worship among the Gipsies, constitute remarkable features in the history of this strange people (Morwood 1885: 281–2).

They cannot be said to have a religion of their own (Greenfeld 1977: 52).

If, on the other hand the usual dictionary definition is adhered to, such as Webster's “belief in a divine or superhuman power or powers to be obeyed and worshiped as the creator(s) and ruler(s) of the universe [and the] expression of this belief in conduct and ritual” (1966: 1228) or Encarta's “particular institutionalized or personal system of beliefs or practices relating to the divine” (1999: 1516), then it is clear that they were wrong.

Romanies, often incorrectly referred to as “Gypsies,” descend from a migration out of India in the early years of the eleventh century. This exodus was prompted by a succession of raids led by Mohammed of Ghazni between 1000 and 1027 in his attempt to spread Islam into Northern India. The Hindu response was to assemble military forces known as Rajputs, conscripted from various language groups, though ones close enough to share the same genetic descent. The linguistic nature of the Romani language strongly suggests that it began as a composite military lingua franca (under the same circumstances that gave rise to the Urdu language), and for which the name Rajputic has been proposed. This only later crystallized into an ethnic mother-tongue when the troops and their camp-followers reached Anatolia and began to marry within the group and produce new generations of children. Because the first written account of the appearance of Romanies in the Byzantine Empire dates from 1054, we can assume that it was reached within fifty years or less of leaving India. If so, it was over two centuries before their descendants finally entered Europe – again because of the spread of Islam, this time toward the West.

It is not difficult to understand why outside observers
were uniformly convinced that Romanies have no religion. Apart from there being no tangible evidence – a sacred text, a temple or a priest for example – Romani society is tightly closed to outsiders, considerably reducing the opportunity to observe cultural behavior at close quarters. Ethnographers attempting to enter Romani households report being kept at arm’s length by various means, even by being met at the door with feigned epileptic seizures or frightening explosions of profanity. But it is one of the aspects of Romani religious belief which keeps that barrier in place.

So entrenched is the idea that Romanies lack religion that it has become a part of European folklore: the story that “the gypsies have little or no, if any, religion . . . their church was constructed of curds or lard and the dogs ate it” (de Peyster 1887: 58) is widespread. Block repeated it half a century later:

the gypsies, it is said, once possessed a church of their own built of cream cheese. On one occasion, however, when they were particularly hungry, they ate the church and for this reason are now without a national religion (1938: 234).

Because Romanies come ultimately from India, it is in Hinduism that the roots of their religion are to be found. However, awareness of this has become lost over the centuries and is only now being relearned by Romanies today. Likewise the daily cultural behavior in which Indian-based spiritualism (called Rromanipen) manifests itself so clearly is not recognized as such; asked what his religion is, a Romani is likely to say Orthodox or Roman Catholic, Mormon, Muslim or Bahá’í or any one of the non-indigenous faiths acquired, voluntarily or not, since arrival in the West.

Woodcock, like so many others, was wrong when he wrote that

The gypsies . . . are utterly without religious impressions . . . they brought with them no Indian idols . . . nor indeed Indian rites or observances, for no trace of such are to be discovered amongst them (1865: 84).

While Kounavine claimed to have found Brahma, Indra, Lakshmi and other Hindu deities continuing to be worshipped by name among Romanies in Russia, this has been shown to be fabricated. Nevertheless other connections with Hinduism are in evidence, although the names of only three deities have survived: Sara-Kali, Vayu and Maruthi. Shiva’s trident, called trishula in Sanskrit, changed its role from Hindu symbol to Christian symbol and has become the Romani word for “cross” (trašul). This probably happened when the migration first reached Armenia; in the Lomavren language trusul means both “church” and “priest.” Similarly, rašaj “(Christian) holy man” represents a shift of meaning from Sanskrit arṣeya “of a (Hindu) holy man.” The word for “God” is Devel, (from Sanskrit deva “divinity,” compare Hindu dev), while the Devil is known as o Beng (from a Munda root meaning a malevolent spirit).

The description here is specifically of beliefs found among the groups of Romanies classified as Vlax (Wallachian), from the dialects of Romani they speak. Vlax Romanies emerged as a distinct group in the Balkans during the five centuries of their enslavement there, where their social and physical isolation enabled them to retain traditions lost elsewhere. While each group maintains more or fewer of these, the present account must not be interpreted as descriptive of all Romani populations everywhere.

Some Romani groups in Europe today appear to maintain elements of Shaktism or goddess-worship; the Rajputs worshipped the warrior-goddess Parvati, another name for the female deity Sati-Sara, who is Saint Sarah, the Romani Goddess of Fate. That she forms part of the yearly pilgrimage to La Camargue at Stes Maries de la Mer in the south of France is of particular significance; here she is carried into the sea just as she is carried into the waters of the Ganges each December in India. Both Sati–Sara and St. Sarah wear a crown, both are also called Kali, and both have shining faces painted black. Sati–Sara is a consort of the god Śiva, and is known by many other names, Bhadrakali, Uma, Durga and Syama among them.

The names of two Indian deities have been preserved in some Romani riddles. Reference to the Vedic god of the wind and the air, Vayu (also called Marut), is retained in a number of these: Kana hulavel peske bal o Vajo, legenisa-bal o çar (“When Vayu combs his hair, the grass sways”), Amaro Vajo hurjal tela savorrenge podji, aj konik našt t’astarel les (“Our Vayu flies under everyone’s petticoats, and no one can catch him”), O pharo vurdon e Vajisko cirdašlo ekke šele grastendar kaj phured ane’l rrunja (“Vayu’s heavy wagon is pulled by a hundred horses blowing through their nostrils”); the answer to each is e balval “the wind.” In Indian theology the task of Vayu’s son Maruti (also called Hanuman) is to tear open the clouds and let the rain fall, and in Romani the expression marutišol o Devel means “the sky [lit. “God”] is growing overcast.” The reference to a hundred horses may also be of Vedic origin; there are several references in the scriptures to the avamedha yajña or “horse sacrifice,” whereby in ancient India the king would release one hundred horses to roam freely through his kingdom. Stopping them or blocking their path was forbidden.

The female spirits or fates, in Romani called the vurištorja, hover in its presence three days after a child is born to determine its destiny and to influence the choice of name the parents will decide upon. They may be compared with the Indian matrika or “little mother” spirits who also possess a baby’s destiny at the time of its birth. The red
thread (the *loli dori*) tied around a new-born’s ankle or wrist and worn for two or three years afterwards to guard against the *jakhalo* or “evil eye” reflects the protective properties of that color, which is also worn or painted on the body in India.

The burning of one’s possessions after death and even, among some populations at least into the twentieth century, the ritual suicide of the widow has striking parallels with *sati* in India.

Time spent in the non-Romani world (the *jado*) drains spiritual energy or *dji*. Sampson (1926: 257) gives the various meanings of this word as “[s]eat of the emotions, heart, soul; temper, disposition, mood; courage, spirit,” comparing it to Sanskrit *jiva*, Hindi *ji*, “life, soul, spirit, mind.” In some dialects it has the additional meaning of “stomach.” One’s spiritual batteries can only be recharged by spending time in an all-Romani environment – in the normal course of events, in family homes. It is in the area of spiritual and physical well-being (*baxt*) that the Indian origin of the Romani people is most clearly seen.

In the preparation of food, and in one’s personal hygiene and deportment, it is absolutely essential that a separation between “pure” and “polluted” conditions be maintained. A pure state is achieved by maintaining spiritual “balance” or what is called *karma* in India (and in Romani *kintala*, or in some dialects *kintari* or *kintujmos*) in one’s life and avoiding shame (*ladžav* or *ladž*), being declared unclean or, in extreme cases, being shunned by the community. Maintaining balance or harmony pleases the spirits of the ancestors (*the mule*), and they are there to guard one and help one to do it, but if they are displeased, they will mete out punishment by way of retribution (*prikaza*). Depending upon the nature of the transgression, this may be mild (e.g., stubbing one’s toe) or so severe as to involve sickness and even death. The consequences of *prikaza* underlie the universal Romani belief that nothing is an accident; that nothing happens without reason.

The penalty for extreme pollution is being banished, or made an outcast, and an out-caste, from the community, which may or may not imply a state of pollution, can be imposed also for other reasons (e.g., disregard for territorial claims). Being in a state of pollution is literally to be “smeared” (i.e., with menstrual blood). This can be contrasted with being “dirty,” but only from physical dirt.

*Prikaza* brings bad luck (*bixart*) and illness (*nasvalipe*), and it can be attracted even by socializing with people who are not *vuž* (*vužo* “clean”). Non-Romani people are not seen as *vuž*, which is why Romanies avoid contact that is too intimate. But this is not an inherited condition of non-Romanies, it is because these cultural practices are not maintained. A non-Romani woman who marries into a Romani family is expected to adopt them, and in doing so becomes in that context *vuži*.

The Ayurvedic concept of ritual purity and ritual pollution, so central to Romani belief, existed in the eleventh-century caste system and continues to exist today; thus members of the same *jati* (sub-caste) may eat together without risk of contamination, for example, but will become polluted if they eat with members of other *jati*; and because the *jatis* of one’s associates might not always be known, contact between the mouth and the various utensils shared with others at a meal is avoided, just to be on the safe side. In conservative Romani culture, liquids are poured into the mouth from a container held away from the lips, so that the rim of the vessel (the *kerlo*) is not touched; smoke from a shared tobacco pipe is drawn through the fist clenched around its stem, again to avoid making contact with the mouth. The surest way not to touch utensils used by others is to eat with the fingers, and every one of these habits is to be found among Romanies today.

Like the Rajputs, some Romani groups divide foods into “ordinary” and “auspicious” or “lucky” (*baxtulo*) categories (the Rajputs’ terms for these two categories mean “cold” and “hot,” though these have nothing to do with either temperature or pepper); this distinction reflects the close relationship between food and health, a particular ingredient being not only beneficial to the physical self but also to the spiritual. “Auspicious foods” include those which are pungent or strongly flavored, such as garlic, lemon, pickles, peppers, sour cream and so on. The use of red pepper in some traditional Romani dishes is typical of Rajput cuisine particularly, and such food is called *ito* or “piquant” in one Romani dialect. Also in common with Indian culinary behavior is the practice of not preparing left-over food. Dishes set for the dead at a *pomana* (wake) table or a *slava* (saint’s day) table are eventually disposed of by being offered to passers-by, never just thrown away. There are very many customs associated with food and eating: potatoes (*kolompipija*) are not eaten at a *pomana*; there cannot be an even number of chairs at a *pomana* table; greens (*zelenimata*) are not eaten while one is in mourning, or expecting a baby, and so on.

Because access to physicians and hospitals is only sought in extreme cases due to their polluting association, safeguarding the health of the community *within* the community is of special importance. Like groups in northern India such as the Banjara, some Romani populations distinguish illnesses which are natural to the group; these are such things as heart complaints, rashes, vomiting, hiccups, insomnia or irritability, from those which are the result of overfamiliarity with the *jado* or non-Romani world. These latter include, for example, all sexually transmitted diseases. For such afflictions, a non-Romani physician needs to be consulted; but for “Romani afflictions,” traditional cures are provided by a *drabarni* or female healer. This is the same as the Hindu *siana*. The root of the word *drabarni* is *drab* which means “medicine” (from Sanskrit *dravya* “medication,” compare the Hindi
word *darb*). It is also the root of the verb *drabar*, which is usually translated in English as “to tell fortunes,” but which from the Romani perspective means “making well.” When speaking English, Romanies prefer to call this skill brought from India “advising” rather than “fortune telling,” for which another verb, *duriker*, exists.

If it is necessary for a person who has contracted a *gadžikano nasvalipe* to be admitted to hospital, relatives and others will go to him, often in considerable numbers, to provide *dji* and help restore balance. “Relatives, their relatives, and friends of a Gypsy flock around his hospital bed because [of] their culture” (Anderson and Tighe 1973: 282); only recently have hospital administrations begun to recognize this as cultural behavior and to accommodate it. Depending upon the nature of the non-Romani affliction, the individual may be declared defiled; not visited in hospital but instead banished from the community. This is invariably the response when this is, for example, syphilis, AIDS, or other such disease. Infections of this kind are a clear indication of a too-personal involvement in the non-Romani world, since it is assumed that they could never be contracted within the ethnic community.

**Romanies and Other Religions**

The journey across the Middle East took place too rapidly for Islam to have had an impact on Romani spiritual belief, as well no doubt because it was the religion of an enemy people. There is no linguistic impact at all directly from Arabic, and none from Persian religious vocabulary. Nevertheless there are hundreds of thousands of Romanies throughout the Balkans and Turkey who are Muslim, having converted, or having been converted, during the centuries of Ottoman rule in the area.

Zoroastrianism existed in northwest India at the time of the exodus at the beginning of the eleventh century, and in Persia through which that migration passed, and a number of writers have suggested that Romanipen has acquired at least some aspects of that religion, particularly its dualism and the significance of fire. It is unlikely that this was the case, however, given the circumstances of early Romani history, the time and location involved, and the fact that these are also characteristics found in Hinduism.

There are numbers of Romanies who profess the Jewish faith, though in each documented case it has been the result of conversion following marriage to a Jewish spouse. Reportedly, during the Second World War several Romani–Jewish marriages took place in a concentration camp (and known as the “marriage camp”) close to the Serbian border, though the fate, and religious persuasion, of any survivors is not known.

Christianity was first encountered in Armenian-speaking Anatolia, at the eastern end of the Byzantine Empire. The Romani words for “Easter,” “co-father-in-law” and “godfather” are of Armenian origin, all concepts specific to Orthodox Christianity. Whether it was adopted at that time or not is unknown; in the Christian Byzantine Empire professing Christianity clearly brought benefits to the outsider Romani population, and later presenting themselves as Christian penitents and pilgrims in Europe was also a means of distancing themselves from the Muslim threat. But in Ottoman Turkey, being Christian was a liability, and the seriousness with which either religion was embraced is open to question.

In Europe, it was often the Church that was most openly hostile to Romanies. In 1568 Pope Pius V banished them from the entire realm of the Holy Roman Empire, and priests in the Eastern Rite church could be excommunicated for performing Romani marriages. Monasteries in the Romanian principalities were reportedly the cruelest of all toward their slaves, and in Western Europe, Romanies were routinely forbidden from entering churches to worship, and had to listen from outside through the windows. Such incidents are not entirely unheard of today.

Some Romani groups in France relate the story of how Christianity first came to their people. Originally, they say, the woman leader of a group of Romani metalworkers who lived along the Rhône and whose name was Sara saw a boat on the river which was sinking. In it were Saint Mary Salome, Saint Mary Magdalene and Saint Mary Jacobi, the three Marys who comforted Jesus as he died on the cross. Sara was expecting this since she had seen it in a dream, and she waded out into the water and threw out her cloak which became a raft, and which enabled the three Marys to reach the riverbank safely. As a reward, they made her their servant, and converted her to Christianity. This story, however, seems to originate in European, rather than Romani, tradition. Generally speaking, the Romani population of an area will claim to follow the predominant religion of that area: Protestant in Protestant lands, Roman Catholic in Roman Catholic lands and Orthodox in Orthodox lands.

In the early 1950s in northwestern France, a Breton evangelist named Clément le Cossec began preaching Pentecostal Christianity to Romanies in that region, and it spread rapidly through France and Spain, then the rest of Europe, and to North and South America. Today, “Born-Again” Pentecostalism is the fastest growing and most widely found religion among Romanies. It has been suggested that there are two main reasons for this: first, that it is a church that tells its congregants that they are loved, a personal aspect not characteristic of more formal churches, and a message not formerly heard by Romanies. Second, that, compared with the Roman or Orthodox churches, it is easy to become a pastor, and to establish a church of one’s own. There are today hundreds of Romani churches, with pastors and congregations who are Romani, who preach in Romani and who even have Romani-language evangelical radio programs and who distribute Romani-language sermons on audiocassette tapes. Significantly, the growth of “Born-Again” Christianity has
caused a split in the Romani population, some of whom believe it is a major factor in the loss of traditional Romani. One successful Pentecostal church in Dallas, Texas, developed a program that has deliberately integrated references to dualism, balance, ancestral spirits and other aspects of Romani, which do not conflict with Christian doctrine, stressing parallels rather than differences.

There are Romanies who have embraced Mormonism, and the Bahá’í religion has acquired numbers of converts, especially in Spain. But with the exception of those completely assimilated to the non-Romani world, whatever religion may be professed, it will exist syncretistically with more or fewer elements retained from the original set of beliefs and practices which find their origins in India.

Romanticism and Indigenous Peoples

Romanticism with regard to indigenous cultures has its roots in the edenic episode wherein nature and culture were rent apart in the generative moment of the Western narrative. As a taxonomic device, this separation has most often functioned in favor of “culture” and its putative bearers: “culture defines the “properly human,” and it is that which allows humans to claim a certain stewardship over nature. Configured historically by way of imperialism, this taxonomy also distinguishes between people of God (saved) and people given over to nature (fallen). Whether we choose to map this relationship according to the coordinates offered by Augustine, Columbus, or Andrew Jackson, for example, the results will largely be the same. Native peoples – cultural and categorical “others” – become the inverse and absence of “civilization.” Lacking spirit, reason, and private property, among other crucial markers, natives are viewed as children of nature. Redeeming them (if indeed they are human and redeemable) entails converting them away from the world, lifting them up, as it were, from their earthly condition.

And yet the very taxonomy put into place by the edenic myth has an historical alter ego. As if unwilling to wait for the apocalypse – the mythological or technological rectification of history – many Westerners have sought to return to the garden by means of a shortcut. Ironically, this path is found precisely through the romantic recoding of the dominant taxonomy. Whether drawn from public discourse or scholarly treatises, we might distill a set of categorical oppositions concerning the relationship between romantic desires and the decidedly less romantic modern condition:

Nature ~ Culture
(source of redemption) ~ (liability, a state of decay)
Past ~ Present
Hunting/agriculture ~ Industry/global economy
Rural ~ Urban
Communal ~ Private

In romantic thought, what is striking about this set of oppositions is the way each term in the right-hand column is understood to be a corruption of the left-hand one. The remedy, then, is to chart a return to the former (if sometimes fictive) state by whatever means available. What is relevant for our purposes are the channels through which this symbolic “return” is navigated. As strong as nostalgic
sentiments might be, actually traversing any of these categories is, at turns, impossible, impractical, or frankly undesirable. What is needed is a stand-in: a scapegoat symbolically and metonymically linked to nature who can perform an eternal return to the garden. Enter the native.

Whether in tandem with real political agitation or in place of it, indigenous peoples have been looked to as an environmental and spiritual panacea by people around the globe in their retreat from the perceived failures and implications of modernity. Surely there are positive aspects to this phenomenon, as there is much to be learned from native traditions, particularly in terms of resilience and creativity. And one might add that it is high time that native peoples be celebrated rather than denigrated. It should be noted, however, that the degree to which Indians were "the first ecologists" is a hotly contested issue. Defining, defending, and denying the Earth ethic of Native Americans has become an academic blood sport. Quite beyond the historical and institutional concerns of this debate, I would call attention to several ideological aspects of romanticism that are problematic. First, romanticism is reactionary and escapist: romantic views of indigenous peoples spring from other peoples' needs and desires, not from an appreciation of indigenous people in their own right. Second, romantic tendencies are predicated on a kind of social evolution model, even while its valuations are ostensibly reversed from the imperial pattern. Native peoples are looked to as an antidote to modernity precisely because they are understood — however uncritically — to inhabit the social past, specifically as anachronistic representatives of an imagined natural past (which explains why Native American exhibits are frequently located in natural history museums). The ramifications of such a view are anything but comforting. Third, romanticism reifies the very traditions it exalts, paradoxically suffocating that from which it seeks inspiration. Romantic images portray tradition as fixed, stable, uncontested and, linking us back to our earlier points, anti-modern. To imagine tradition in this way eliminates the prospect that the people romanticized will be heard when they speak in their own voice — even when it comes to speaking about those things which matter to them most, like the land and nature itself.

The narrative I have painted in broad strokes is, of course, distorted in significant ways. Observing this, we want to acknowledge that most people do not imagine or inhabit the world in ways so divided. Most of all, the dichotomy as stated obscures real political efforts of people and groups to heal and sustain nature in ways that neither depend upon the Western narrative nor the burdening of indigenous peoples as surrogate messiahs. That said, the romanticization of native peoples remains — indeed, it seems to escalate with every year and with each new environmental crisis. Complicating the picture, many indigenous people have willfully engaged this discourse, sometimes as authors.

Romanticism in European History

Romanticism has long been recognized as a major trope in modern environmental thought and practice. Romanticism, however, was a complex, diverse, changing historical movement. Our present conceptions of Romanticism tend to be defined as much by critics and subsequent commentators as contemporary articulations by Romantic figures. Even the representations of Romanticism within academic studies are the products of different readings from different historical and theoretical positions, and seldom free of polemical overtones. As de Man has noted: "From its inception, the history of romanticism has been one of battles, polemics, and misunderstandings: personal misunderstandings between the poets themselves; between the poets, critics, and the public; between the successive generations" (de Man 1993: 4). Contested are not only the meanings of Romanticism, its very boundaries, origins and influences, and who might be considered a Romantic, but also its conception of nature, its relationship to religion and its relevance to modern environmentalism.

An emblematic text of European Romanticism has long been Wordsworth's _The Prelude_. It is precisely this emblematic status of the poem that gives contestation over its appropriate reading such significance. The poem is an account of the poet's formation as a poet, from his childhood experiences of nature to his mature vision of the sublime. Abrams reads Wordsworth's poem as part of his
program for the secularization of inherited theological ideas, for a “natural supernaturalism.” The “high argument” of The Prelude is that the heights and depths of the mind of man are to replace heaven and hell, and restore the lost paradise; we need only to unite our minds to nature in a holy marriage, and paradise is ours (Abrams 1971: 17–140). Hartman gives central place to the cultivation of the imagination in Wordsworth’s poem, attending particularly to the role that “spots of time” – places in nature and time, and in creative time – play in this cultivation. The spirit that lurks in spots of time renews the poet vis-à-vis nature; as the genius loci or the indwelling spirit of a place, it also acts as spirit inspiring the genial powers of the poet. But for Hartman, the spots of time bring the poet closer to his imagination, not to nature, and the transference of significant experiences to nature acts solely to allow such events, such moments, to reach through time. The Prelude is an exercise in soul making, the development of the imagination and the formation of a poet, in which nature takes a secondary role (Hartman 1964: 208–9). McGann, in contrast, sets out to expose the ideology within Wordsworth’s poetry, and within such readings of his poetry. McGann is critical of Wordsworth for finding consolation in nature when he should be worrying about the economic realities of the rural life he idealizes. He reads Romantic poetry as an escape from or even suppression of socio-political conditions (McGann 1983: 81–92). These readings of Wordsworth have been highly influential.

Recent critics, however, have found in The Prelude both a Romantic ecology and an important religiosity. Bate, for example, argues that Wordsworth’s pastoral poetry, highlighting the life and beauty in nature, and finding poetry not only in language but also in nature, has a permanent, enduring power – it is a language that is “evergreen.” By fostering an emotional communication between human beings and nature, a love of nature leading to a love of humankind, Bate contends that Wordsworth’s poetry offers a political model for modern environmentalism, an “ideology” based on a harmonious relationship with nature that goes beyond, and in many ways deeper, than the neo-Marxist political model to which McGann appeals (Bate 1991: 12–35). Prickett, on the other hand, challenges Abrams’ reading, arguing that The Prelude, given its historical context, displays not so much the language of secularization as religious revival. Pointing to the relative absence of God from neoclassical literature and critique, and more generally from public life at the end of the eighteenth century, Prickett finds Wordsworth’s poem striking for its overtly religious language. Abrams represents Romantic poets as rhetorically adorning the robes of prophets who through the illumination of the mind of man and its communion with nature could restore paradise on Earth. Thus Wordsworth represented himself as the chosen son for his time, the poet now replacing the priest. But Prickett contends that this claim is not simply the poet’s retention of the rhetoric of the religious tradition he sought to displace. He argues that we need to take seriously Wordsworth’s claims for the religious calling of the poet, and reads The Prelude as a pious account of divine election modeled on St. Augustine’s Confessions (Prickett 1986: 95–104).

The Prelude closes with an image of the poet’s ultimate confrontation with nature, the divine and himself; climbing Mount Snowdon, he emerges from a fog to confront a terrifying alpine vista – brooding masses of hills and the dark sea receding into infinity, a chasm of raging waters. The experience of the sublime is the response of the viewer to such a vision that transcends the powers of understanding and imagination, with fear giving way to pleasure as the mind is expanded to encompass what previously seemed beyond comprehension. For Wordsworth, the imagination matured through “spots of time” has the power and autonomy to grasp the whole and dwell in the infinite. An alternative image of such a scene of a wanderer arrested by an infinite alpine landscape is offered by Friedrich’s famous 1818 painting “Wanderer above the Sea of Fog.” In this image the view remains veiled in part by the fog, which, in addition to heightening the role of the imagination, fragments the visible, eradicates the connecting ground and renders the scene insubstantial. The unusual, distorted perspective only finds its connection in the central figure of the wanderer, which orders and mediates our view of the landscape. This large, central figure with his back to us, viewing the scene, reminds us that the sublime lies not in the object viewed but in the subjective effect on the viewer; it is the experience of nature that is depicted in the painting, how we as viewers participate in what we see. The Rückenfigur thus leads us to reflect on our own views of nature. Friedrich’s landscapes are natural scenes infused with the divine, yet not explicitly; the divine is both present and absent. His landscapes also represent the alterity of nature, a nature the human subject is not able to appropriate. Indeed, a chasm stands between the wanderer and the landscape before him, a disjunction in the planes of the painting. Whereas in Wordsworth’s poem the divine power of the imagination enables the poet to feel at home in the infinite, in Friedrich’s image the play between proximity and distance, familiarity and estrangement, revelation and concealment, serves to depict the longing for unity with the infinite rather than its realization.

These images of the experience of the sublime depict on a grandiose and abstract scale what was a concrete and common experience of Romantic figures – a sense of alienation from oneself, from society, from the divine, and from nature. Reflection on this sense of alienation was also a critical consciousness of the limits of all knowledge and experience. Romanticism has often been depicted as a form of idealism in which all is resolved into the human
subject. Certainly Romantic thinkers were acutely aware of the role of the mind in knowledge of the world. Yet they were also aware of the impossibility of a full representation of the material world or the divine, of their irreducible otherness. Reflection on the alterity of nature was an acknowledgement of its potent presence, that the material world cannot be wholly abstracted into conceptual knowledge, that nature is at once impenetrable and the ground of all being. Poetic renderings of nature articulated the ultimate indecipherability of nature’s script, and hence the need for a continual creative reading and writing, rereading and rewriting, as an unending exploration of its elusive meaning.

Historically, these reflections were not so much a reaction to Enlightenment thought as a development of it. Romanticism has significant continuities with the critical philosophies of the Enlightenment and their radical questioning of social, political and religious institutions, and of traditional systems of thought. Its expression of the impossibility of complete systems of thought or perfect works of art, of the fragmentary nature of all human production, is an extension of Enlightenment critical tendencies. The experience of the French Revolution, in particular, its promise and its failure, was pivotal to its preoccupation with the tensions between illimitable aspiration and actual limitation. The eighteenth century’s discrediting of traditional authorities and certainties, its faith in intellectual, moral and material progress, its faith in humanity and earthly happiness, generated an atmosphere of optimism about new freedoms and new possibilities for individuals and society as a whole that was formative for many early Romantics. The failure of this promise, and the violence unleashed by the Revolution and its aftermath both in France and elsewhere in Europe, led to a conception of modernity in which a sense of crisis, a sense of alienation from nature, the self and society, and a sense of the infinite gulf between the ideal and its realization was central. Many poets used the metaphor of the Fall for this crisis, but now figured as a secular history of the individual and humankind, with the current suffering alleviated by the hope of redemption through communion with nature or a strengthened imagination. The celebration of “country” so characteristic of Romanticism was also an eighteenth-century theme – the glorification of the countryside and local places in opposition to the metropolis, of indigenous experiences of nature and culture as opposed to universal truths, of the songs and lore of common folk as opposed to elites or aristocrats. But many Romantic exaltations of country life were written from the distant perspective of privilege rather than direct experience, or ignored the physical and social hardships endured by country folk. Moreover, in the aftermath of the revolutionary wars the love of country often turned into the love of nation and virulent forms of nationalism.

What is not contested is the privileged place of the artist in Romanticism. As the example of Wordsworth shows, Romanticism saw artists cease to be representatives of religious and political powers, and assume the authority in their own right to speak in the name of the concerns of humanity. Bénichou argues that in France the dethronement of former spiritual powers and the elevation of the self to the highest level of critique and edification begun in the eighteenth century led in the Romantic period to the investment of writers with high social function and spiritual power, what he terms the consecration of the writer. In Germany, Schiller gave aesthetics a political role, arguing that an aesthetic education alone is capable of exciting and refining feelings, of cultivating sensibility, so that citizens could take pleasure in the form of things and thus be ready to act according to rational principles rather than out of self-interest. It is through beauty that the human being achieves freedom. Friedrich Schlegel argued that by possessing an element of divinity in his soul, the poetizing philosopher or the philosophizing poet is the modern prophet. But for all the discussion of artists and their productions, few artists managed to live from their art alone and their aesthetic manifestos did not translate into real political power.

One area where artistic genius and the role of imagination did come to be especially valued was in the study of nature. Kant drew parallels between the judgment of art and the judgment of organic nature in his 1790 Critique of Judgment. Schelling developed Kant’s philosophy of nature, making a powerful argument for all of nature and each natural product to be conceived as organic, as a complex, dynamic organization of formal and material principles. Schelling held that what is essential to art as well as to the organism is the creative or productive activity of relating matter and form, the real and ideal. It is the daimon, the creative spirit or indwelling element of divinity that is part of the nature of all human beings that is alone able to comprehend the productive, synthetic forces of art and nature. But although the study of nature during the Romantic period emphasized the correspondences between the hidden forces of nature, the imaginative genius within human nature and divine creator, it would be oversimplifying their insights to label such philosophies of nature pantheism. Romantics were acutely aware of the gap between infinite aspiration and its actualization, and of the limits of articulation, and often resorted to metaphor when approaching what defined definition, whether it be the absolute or the fundamental forces of nature.

Indeed, the greatest danger in reading Romanticism is confusing the figural with the literal. Perhaps the continued contestation over Romanticism arises from its excessively figurative expressions, from its deceptive play with language, and from its unusually reflexive and ironic critical positioning. Confronting the boundaries of human comprehension and language, even as they had a vision of
what exceeded such boundaries, Romantic works are often difficult to engage and hence it is understandable that their significance has been variously construed. As Bate and Oerlemans convincingly demonstrate, however, critical engagement with Romantic works can be an important stimulus for reflection on nature and religion of particular relevance to the concerns of modern environmentalism.

Romanticism in European Literature

European Romanticism’s complex understanding of the word “nature” must be seen against the background of the eighteenth century and the growth of the industrial city, which gave rise to a new understanding of the beauties of nature as these ceased to be a mere backdrop to human activity and became the place where human beings could be closest to themselves and to God. Appreciation of the grander landscape beauties of nature and a fascination for the “sublime,” encouraged by the popularity of artists like Salvator Rosa (1615–73), resulted in a new “aesthetics of the infinite” that coincided with changing religious views of nature.

Behind the Latin tags *natura naturans* and *natura naturata* lie roots extending as far back as Classical times, but now revived in complex ways. The latter consists of the “forms of nature,” laid out to be investigated and observed. The former, literally “nature naturing,” is nature experienced as active, dynamic and constantly changing. It refers to that animating principle that gives life to the objects of nature, which may remain at the disposal of God, or else be regarded as a pantheistic “presence” or a “power of harmony” that in Wordsworth’s “Tintern Abbey” “rolls through all things” without God’s help. For the Anglican priest John Keble, however, the Book of Nature is precisely to be “read” as an indication of the workings of God. In Keble’s poems in The Christian Year (1827), nature is a book “which heavenly truth imparts” to the Christian “reader.” In a very different Romantic portrayment of Christianity, Chateaubriand’s Genie du Christianisme (1802), drew his experience of nature from his visit in 1791 to America, where the “cultivated fields” of Europe, which “everywhere meet with the habitations of men,” are replaced by virgin forests and the “abysses of cataracts” where alone the unknown “Supreme Being manifests himself to the human heart” and we can find ourselves solely with God. Nature is only truly appreciated where it has escaped the destroying hand of human cultivation.

In the Lyrical Ballads (1798), Wordsworth claimed to be writing in the “real language of men,” deliberately giving attention to rustic life lived “among the natural abodes of men, Fields with their rural works” (The Prelude XIII, 102–3). It was here that the poet sought to recover the roots and affections of human nature. For the young Wordsworth, at least, and certainly for Shelley and Rousseau, human nature is fundamentally good, and most truly discovers itself as it recovers an affinity with nature that the city-dweller has lost. Though their aspirations remained highly idealized, the Romantic poets at least abandoned the classical literary conventions of Theocritus or Virgil, so beloved of the eighteenth century, and donning their walking boots gave minute attention to “the mighty world / Of eye, and ear,” and “the beauteous forms / of nature” (“Tintern Abbey”). Yet, at the same time, they were not blind to the heartlessness of nature’s creatures, and Keats, even while he celebrates the “flowers gay / Of periwinkle and wild strawberry,” laments the “fierce destruction” wrought by the shark, the hawk or even the “gentle robin” as “ravening,” as it attacks the worm. For William Blake, this same worm is a canker which destroys the rose by its “dark secret love.” Nevertheless, though we live in a fallen world (an acknowledgment which awaited the advent of Darwinian theory later in the nineteenth century), still, for some Romantics the goodness of nature
is seen as a proof of the goodness of its creator, while for the pantheistic Wordsworth (Lucy, though her name is not mentioned in the brief lyric of 1799, “A slumber did my spirit seal”), death returns us to an absolute unity with the natural world of rocks, and stones, and trees. Blake, who can “see a World in a Grain of Sand” (a remarkable though probably unconscious echo of Julian of Norwich’s hazel nut that is the whole of creation), also sees heaven in a rage at a caged bird (“Auguries of Innocence”).

Even at his death, Werther remains one with nature and the Eternal One: “Through the storm clouds flying by, I can still see a few stars in the eternal sky. No, you will not fall. The Eternal One carry you in his heart as he carries me.”

For Goethe and Romanticism there is no final reconciliation between the spirit in nature, of which we are a part, and nature as spirit, often seen in terms of the ancient Mother-Goddess, and there is a complex, eclectic coming together of Christian theology and mythological references. Later in nineteenth-century literature, the Mother-Goddess may be personified in such figures as Mother Carey in Charles Kingsley’s The Water Babies (1863), a parable of the purity of nature set against the life-denying city as the chimney sweep Tom becomes conscious of his grimy body, falls into a river and is transformed into a water-baby.

But there is more to Goethe’s view of nature than Werther. He was also fascinated with scientific observation of plants, animals, rocks, light and color, holding an idea of evolution that, unlike Darwin’s later theory, is nonlinear. For Goethe, what evolves in nature is timeless, a spiral development of endless motion, at the heart of which is a central Romantic concept – polarity: the idea that natural processes live by the interaction between opposites. Without this, as Blake said, there can be no progression. The Romantic fascination with science and nature (which often fed a highly mythological viewpoint), finds a later devotee in John Ruskin (1819–1900), who approached art entirely through nature. In some ways a successor to Wordsworth, Ruskin took a far more intelligent interest in nature, and, with his strict religious upbringing, regarded nature, like Keble, as a holy book. He sometimes described himself as nature’s priest. As he looked at the minute particulars of nature, Ruskin was both a poet and a scientist, and, like Goethe and the artist Turner, he was fascinated by the quality of light and color. Ruskin regarded nature as a moral being, for both good and ill, objects in nature often “speaking” to us as moral tutors. In Modern Painters (vol. 5), the pine tree has “a tremendous unity [which] absorbs and moulds the life of a race. The pine shadows rest upon a nation.”

The complex Romantic view of nature has continued to influence our thinking. Aware, long before Darwin or Tennyson’s evolutionary version of “Nature red in tooth and claw,” of the cruelty in nature, Romanticism nevertheless regarded nature as a primary source of our education and was deeply aware of the dangers of our neglect or destruction of its delicate balance. In the symbiosis between nature and the human spirit, the destruction of the former, symbolized, for example, by the albatross in Coleridge’s “Rime of the Ancient Mariner,” was also, inevitably the demise of the latter.

Schelling, Friedrich Wilhelm. Ideas for a Philosophy of
American Romanticism is traditionally thought to have begun in the late 1820s and to have ended by the 1860s, the period of the Civil War (1861–1865). Several important historical events and trends were associated with these middle decades of the nineteenth century. Perhaps most importantly, the Romantic era saw a movement away from – and calls for a return to – the Jeffersonian values of agrarian republicanism that had dominated during the preceding Federalist period. Thomas Jefferson had argued that the moral, spiritual, and national integrity of American culture rested upon the citizenry’s relationship to the natural landscape and its gentle cultivation, and he had imagined a nation of small farmers. By the 1830s and 1840s, however, industrialization had begun to spread across the American landscape in the form of railroads, steamboats, and agricultural machinery. According to historian Leo Marx, this led to a consciousness of what has been called the “machine in the garden” – the recognition that the utopian and rural values of early American identity were being challenged by industrialism, expansion, and urbanization.

The middle of the nineteenth century also marked a change in American self-perceptions in two important ways. Perhaps most importantly, the question of slavery and abolition became increasingly urgent as the economic and social climates of the urban North and the agricultural South diverged radically and as the opening of the western frontier shifted the balance of political power. At the same time, the territorial expansion of the United States westward also changed the way Americans came to understand and to construct their identity. During this period, characterized by the philosophical imperatives of expansion known as “Manifest Destiny” and shaped by the war with Mexico from 1846–1848, the settlement of the American west was advancing rapidly, so that by 1893 Frederick Jackson Turner could claim that the frontier was closed and that it had irrevocably shaped what it meant to be an American. In the “Frontier thesis,” Turner had completed the idealization of the west that had begun during the presidency of Andrew Jackson (1828–1836), and the settlement of the west brought with it new mythologies, stereotypes, and images of progress. American Romanticism may be understood as an alternatively nostalgic and progressive response to these shifting values and as an effort to negotiate the tension between different models of the American relationship to the landscape.

These changing attitudes toward the American landscape and its relationship to national identity are reflected in the art of the Romantic period, particularly in the works of a group of painters known as the Hudson River School. Established during the 1820s and working until about the 1850s in the United States, these painters represented in their images the tensions surrounding American attitudes toward nature and the unsettled wilderness. While earlier paintings of the American landscape had emphasized the
aesthetic tradition known as the picturesque, in which the harmonious balance of natural and human elements was central, the Hudson River painters introduced the more complex dynamics associated with the sublime. The sublime had been a central theme of European Romanticism since the 1780s and was used to explore the mind’s encounter with objects that overwhelmed the understanding. According to its most important theorist, the English writer Edmund Burke (1729–1797), the sublime was an experience characterized by feelings of fear and anxiety in the face of something awesome – particularly wild and rugged landscapes such as the Swiss Alps, Niagara Falls, or, later, the American west.

While elements of the sublime are present in the work of many painters associated with the Hudson River School, including the works of Asher B. Durand (1796–1886), paintings such as Thomas Cole’s (1801–1848) *The Oxbow, the Connecticut River near Northampton* (1836) are considered representative examples of the movement. In this image, Cole captures the contrast between a calm and cultivated pastoral valley and the threat posed by the encroachment of the wilderness, and the painting has been read as symbolizing the Romantic tension between nature and human endeavor. “Luminists” such as John Kensett (1816–1872) continued this tradition of Romantic landscape painting from the 1840s–1880s, focusing on subjects associated with maritime scenery. Most importantly, as the nineteenth century progressed, painters began to create images of the American west that drew upon the visual language of the sublime. Artists such as Albert Bierstadt (1830–1902) and Thomas Moran (1837–1926) helped to mythologize and, therefore, ultimately to preserve areas of the Rockies and the west by helping to create support for the conservationist movement (1850–1920) and for emergence of the National Parks in the 1870s; yet, by representing western America as “virgin” territories, they also reflected the very conditions of “Manifest Destiny” that placed these landscapes in jeopardy of development.

This tension between civilization and wilderness can be seen in the literature of American Romanticism as well, but in these works the dynamic is often internalized. In other words, the contrasting aspects of the landscape often come to symbolize a conflict within the national psyche, which imagined American identity as simultaneously a product of the frontier and of emerging industrial capitalism. Romanticism emphasized the individual encounter with the natural, moral, and spiritual world, and one of its central concerns was the process of self-knowledge. Writers often described this encounter with the self in very different ways, however. Some Romantic writers, such as Edgar Allan Poe (1809–1849), Nathaniel Hawthorne (1804–1864), or Herman Melville (1819–1891), focused on the wild or “savage” drives to power, domination, and cruelty within human nature, and their works often engaged themes of supernaturalism, psychological disturbance, or the Gothic. The classic example of American Romanticism in this vein is Melville’s novel *Moby Dick* (1851), which focuses on Ahab’s encounter with a natural world that takes on the characteristics of his own mind and its pathologies.

While authors such as Melville emphasized the sublime or Gothic mode of Romanticism, other authors represented the American psyche and the progress toward cultivation of the landscape more positively. Writers such as James Fennimore Cooper (1789–1851), Henry Wadsworth Longfellow (1807–1882), and David “Davy” Crockett (1786–1836) offered images of Anglo settlers and frontiersmen transforming and taming the American wilderness, and these works connected American national identity with the characteristics of the “noble savage.” The term “noble savage” was first popularized in the eighteenth century by European philosophers such as Jean-Jacques Rousseau (1712–1788), and it was used as part of the language of colonial encounter to describe indigenous peoples such as the American Indians in ways that idealized them as simple, uncivilized, and close to nature and to natural religion. During the nineteenth century, Anglo writers hoping to create a new literary tradition and to define their own national voice came to assimilate these same “savage” values into an image of American political identity as grounded in a reverence for and personal connection to the landscape, even as individuals participated in its conquest and appropriation. Davy Crockett’s *Autobiography* (1834) and the mythology that surrounds him, for example, reveal the powerful legacy of Romanticism on American culture during this formative century.

Finally, the American Romantic period was also associated with a group of writers and philosophers known as the Transcendentalists. This group included writers such as Ralph Waldo Emerson (1803–1882) and Henry David Thoreau (1817–1862), and the movement later influenced or involved important nineteenth-century nature writers such as Margaret Fuller (1810–1850), Oliver Wendell Holmes (1809–1894), or George Perkins Marsh (1801–1882), founder of the conservationist movement. A central theme of Transcendentalism was the idea that complete human experience could only be achieved through harmony with nature and through participation in the universal consciousness ascribed to the living universe. In formulating its ideas, the Transcendentalist movement drew upon several theological and philosophical traditions, including pantheism, Unitarianism, Platonism, and the increasingly available translations of Eastern religious traditions. The literary texts most closely associated with Transcendentalism include Emerson’s *Nature* (1836) and Thoreau’s *Walden* (1854).

American Romanticism, then, describes a formative period in American cultural history, during which the landscape and its wilderness again came to represent a particular source of spiritual, moral, and national vitality. If
the previous and first generations of Americans had viewed the wilderness as an obstacle to be overcome in the cultivation of democracy and as a space to be conquered and tamed as one of the conditions of stable nationhood and national identity, the Romantics came to see the matter differently. For the American Romantics, the wilderness came to symbolize an empty space, the very vacancy of which allowed for the projection onto it of an idealized and powerful vision of national identity. Preserving the wild and the mythologies that characterized the wilderness as “empty” allowed the American landscape to become the scene in which the moral, spiritual, and political conflicts of Romanticism were forged and resolved.

Romanticism – Western toward Asian Religions

Although some of the pioneers of the environmental movement, notably Henry David Thoreau, were interested in and sympathetic to Asian religious ideas, it was not until the 1960s that the idea that South and East Asian religions are more likely to promote beneficent behavior toward nature became widespread amongst scholars, adherents of those religions, and the public. The idea became popular at a time when environmentalists began to argue that the severity of the environmental crisis demanded a deep and radical change in attitudes rather than scientific or technological fixes.

The perception that scientific and technological intervention in natural processes was a part of the problem, rather than a solution to environmental degradation, was reinforced by the publication of Rachel Carson’s Silent Spring in 1962. Carson’s belief that “whenever we substitute something man-made and artificial for a natural feature of the earth, we have retarded some part of man’s spiritual growth” (Carson 1998: 160) found ready acceptance in the counterculture of the period. In 1967, Lynn White argued in an influential article that the roots of the ecological crisis were to be found in Judeo-Christian conceptions of divinely legitimated human mastery of nature. Moreover, White argued that “Marxism, like Islam, is a Judeo-Christian heresy” (White 1996: 189) and that therefore, both shared Christian axioms. Alternative values or an alternative spirituality that could promote a less damaging relationship with the environment had therefore to be sought outside the Western religious tradition in, amongst others, the religions of South and East Asia.

Although each of the major South and East Asian religions has found advocates for the environmentally positive values of the tradition, by far the most significant have been the claims made for Buddhism. White already identified Buddhism as offering the best chance to rethink humanity’s relationship to nature, although he remained doubtful of its viability in the West. As Buddhism has attracted more Western converts, the claims made for its environmental credentials have grown. Martine Bachelor and Kerry Brown write, “at its very essence, Buddhism can be described as an ecological religion or a religious ecology” (Bachelor and Brown 1992: viii) and Alan Sponberg makes the claim that “Buddhism is an environmental ethic” (Sponberg 1997). Other prominent Buddhist environmental thinkers and activists, such as Gary Snyder and Joanna Macy, have made comparable claims. Rather more sober estimates have been offered by Ian Harris and Lambert Schmithausen. It is, however, the strength of some of the claims made for Buddhism’s environmental credentials, and their similarity to some other Western claims about Buddhism (for example, Rita Gross’s claim that “Buddhism is feminism” [Gross 1993: 130], that may indicate that they owe more to Western interests than to anything that is the case about Buddhism. To demonstrate this, it is worth conceptualizing these claims within the longer history of Western perceptions of Asian religions, and of Buddhism in particular.

Although as early as 1710 the Jesuit writer J.F. Pons had connected the Chinese who revered the Buddha, the monks of Japan and the Lamas of Tibet with the Buddhists reviled as atheists in India, it was not until the 1840s that speculations about the possible African or central Asian origins of Buddhism were finally replaced by a consensus among European scholars that India was the birthplace of Buddhism. Once the question of the relative priority of Buddhism and Brahmanism had been settled in favor
of the latter (by about 1850) the idea that Buddhism was to Hinduism as Protestantism was to Roman Catholicism (or, more rarely, as Christianity was to Judaism) became irresistible to northern European authors. The late-nineteenth-century vogue for Buddhism, especially in England, owed much to contemporary revulsion for Hinduism and to anti-Catholic polemic. Philip Almond quotes the Unitarian James Freeman Clarke, who insisted that despite the apparent external resemblance of Buddhist and Catholic ritual, “deeper and more essential relations connect Brahmanism with the Romish Church, and the Buddhist system with Protestantism... Buddhism in Asia, like Protestantism in Europe, is a revolt of nature against spirit, of humanity against caste, of individual freedom against the despotism of an order, of salvation by faith against salvation by sacraments” (Almond 1988: 74).

Just as the Buddha was represented as the ideal Protestant for a certain northern European, anti-Catholic audience, so he was represented as an agnostic among those doubting Victorians for whom the term was coined in 1869. The idea that the Buddha was an agnostic may be found among both scholars sympathetic to Buddhism, such as T.W. Rhys Davids, and those who were more hostile. That this was another projection arising from intra-European debate may be demonstrated by considering David Snellgrove’s comments on the absurdity of applying the term “agnostic” to the Buddha, who is consistently presented in Buddhist sources from the earliest period as omniscient.

The best-known attempt to say something of a general kind about Western perceptions of Asia remains Edward Said’s Orientalism. For Said, Orientalism is characterized by the conviction that the Orient is above all different, that which the West is not. This gives rise to a series of oppositions that configure Orientalist perceptions of both self and other. Where the West is rational, active, disciplined, masculine and free, the Orient is irrational, passive, degenerate or lascivious, feminine and subjugated – all ideas that can be abundantly documented in relation to early European perceptions of Asia and its religions. Said’s work has been subject to extensive correctives – there were always exceptions to the perception of the Orient as entirely “other.” For the British, India’s “martial races” were masculine, and Buddhism has been seen as a rational, even a scientific, faith. Nevertheless, the best evidence for thinking that ecological concern in the West has simply extended this binary logic by adding another series of oppositions to it (where the West is environmentally destructive and polluting, the Orient – and its religions – are environmentally affirming and beneficent) is the uniformity and vehemence of the claims made on behalf of Asian religions. Indeed, these claims have been made on behalf of all the major South and East Asian traditions and arise not from the overwhelming weight of evidence of practical or doctrinal environmental concern among Asian religions but rather in spite of the (at best) inconclusive nature of such evidence. This strongly suggests that the key reason for the emergence of such claims has been the Orientalist perception of such religions as fundamentally “other.” As the West came to perceive itself as environmentally destructive and, following White, to attribute that to its religious formation, this Orientalist logic dictated that Asia – and its religions – being “other,” had to be seen as environmentally beneficent. Moreover, as was the case with other Orientalist perceptions, the idea that Asian religions are environmentally beneficent has been readily adopted by adherents of those religions, the more enthusiastically because this perception lacks the derogatory associations of some earlier perceptions of Asian religions despite depending on the same logic of difference.

Rousseau, Jean-Jacques (1712–1778)

Jean-Jacques Rousseau, a leading Enlightenment thinker, was perhaps most famous for his appeal to the “state of nature” as an ideal in which the general distortions of modern society could be measured and remedies proposed. Rousseau was a passionate critic of what he perceived to be the artifice, false consciousness, and inequality of modern society, and he advocated strongly the need to recover natural feeling, virtue, natural compassion, freedom, and equality. He placed such trust in “nature” because he trusted nature’s God.

Born a Calvinist, Rousseau converted to Catholicism as a young man, and later adopted deist views rejecting revealed religion in favor of “natural religion” based on the evidence of God’s existence that reason discerns in the wondrous order and harmony of the system of nature. He elaborated in detail an educational agenda aimed at protecting the natural feelings and growing virtue of young people by having them first engage the challenges and constraints posed by the natural environment, rather than the alienation, prejudice, and competitiveness thrust at them by society. During his last years of life, he turned for comfort to the study of botany and to walking in the countryside. His last book, Reveries of a Solitary Walker (1782) described ecstatic periods of direct contemplation of the “great pageant” of creation. This work was widely read and gave impetus to the Romantic Movement’s general reverence of the nature and celebration of natural feeling. Rousseau was a watershed figure of the eighteenth century whose writings did much to popularize a growing sense of reverence for nature.

Rousseau followed the lead of classic Christian theologians and deist thinkers in seeing proof of God’s existence in the harmony, order and motion of the system of nature. Rousseau drew on Christian and deist views regarding God’s providential dominion over the world and on humanity’s “fall,” combining these into a powerful narrative of original goodness, societal corruption, and proposed paths of recovery and renewal. He broke with the Christian notion of original sin and located the Fall not in human nature, but in human history. Armed with these themes of creation and Fall, Rousseau could launch a harsh indictment against societal alienation and injustice and still affirm hope in humanity’s fundamental goodness and potential.

Born and raised in Geneva, Rousseau received no formal education, but his father gave him a love of nature and of books. He was apprenticed to an engraver, but he soon left, and was taken into the home of a Swiss baronetess, Madame de Warens, who became his patron and lover. Under her guidance Rousseau converted to Catholicism, enjoyed years of undisturbed study of philosophy and literature, and grew in his appreciation for the beauties of nature. At the age of thirty he moved to Paris, developed a close friendship with Denis Diderot (1713–1784), the pantheistic French philosopher, and met many other philosophers. He achieved notoriety in 1750 with the publication of his essay, Discourse on the Arts and Sciences, which sparked controversy by arguing that progress in the arts and sciences distorted human life by pulling us away from the essential goodness, contentment, and virtues found in the “state of nature.” This argument clashed with a central assumption of the Enlightenment, namely, that progress in reason and science directly promotes human well-being and moral virtue. After publishing a Discourse on Inequality (1755) that developed his account of societal evolution, Rousseau moved out of Paris to the country home of a benefactor. There in rapid succession he wrote his masterworks: Julie, or the New Heloise (1761); Emile, or On Education (1762), and The Social Contract (1762). The first, a novel about romance and love and their conflict with duty, became the most widely read work of fiction in France for a number of years. The second became a recognized classic of educational philosophy. The Social Contract became a landmark of political theory. Its stress on popular sovereignty and freedom gave voice to aspirations that anticipated the ideals of revolutionary France. Many critics, however, noted the irony that Rousseau, who could not tolerate the demands of family life and abandoned his five children to a public orphanage, could write so eloquently of love, personal duty, and the importance of children’s upbringing.

Rousseau’s fullest account of his views on religion is found in Emile, in a section titled the “Profession of Faith of the Savoyard Vicar.” In it the Vicar explains that when we ponder the marvelous order, harmony, and motion of the physical universe we can only conclude that there exists a rational and benevolent power who wills this universe into existence and sets things in motion. As he says: “I perceive God everywhere in His works. I sense Him in me; I see Him all around me” (Rousseau 1979a: 277). As God is good, so is all God’s creation, including humanity itself. Religious belief thus provides Rousseau with basic confidence for trusting nature’s goodness and purity. Rousseau thus affirms the essential goodness of humanity even while stressing the history of human corruption. As he put it in the opening of Emile: “Everything is good as it leaves the hands of the Author of things; everything degenerates in the hands of man” (Rousseau 1979a: 37). For Rousseau, the path out of societal “sin” lies not in some special divine grace, but rather in recovering our original goodness.
Both *Emile* and *The Social Contract* were condemned in Paris and Geneva by religious and political authorities who viewed the books as subversive. Rousseau fled France and lived for a number of years at the mercy of benefactors. Anxiety ridden and often paranoid, he worked on his *Confessions* and retreated into the solace of the botanical studies and countryside walks. His *Reveries*, published posthumously, describe him as feeling rejected by friends and society and yet experiencing a sense of “peace and contentment” arising from a sustained contact with nature and its simple plant life. Walks in which he observed the “great pageant of nature” gave him a sense of the “unity of all things.” Such encounters promote an “expansive soul.” “I feel transports of joy and inexpressible raptures in becoming fused as it were with the great system of beings and identifying myself with the whole of nature” (Rousseau 1979b: 108, 111, 112). Walks amidst nature gave him a pure “feeling of existence” (Rousseau 1979b: 89).

Many in Rousseau’s lifetime dismissed him as an apostle of “primitivism” and this caricature is alive and well even today. This view arises from readings of Rousseau’s *Discourses* where he fails to clarify exactly how we are to recover the “state of nature.” In places he does seem to call for a return to the practices of a primordial “golden age.” However in *Emile* Rousseau makes clear that such a return is neither possible nor desirable. He states directly that his aim in education is to protect young people’s natural feelings and virtues from premature bending under societal pressure so that when they reach adulthood they may join society with their emotional integrity and sense of moral responsibility healthy and uncorrupted. Emile, the boy, is to live in the countryside amidst nature, so he will grow “naturally” and be well prepared to enter marriage and society in adulthood. The “state of nature,” for Rousseau, functions less as a claim about historical origins than an assertion about fundamental human capacities to recover natural integrity, simplicity, and virtue.

Rousseau’s naturalism anticipates in important ways our ecological understanding of humanity as a part of the natural world. The anthropologist Claude Lévi-Strauss among others admired Rousseau’s insights in his attempt to understand humanity’s evolutionary history. Rousseau’s expansive sense of identification with the rest of creation anticipated a similar emphasis found in today’s deep ecology movement. Likewise, while Rousseau followed the general anthropocentrism of classic Western ethics in placing humanity as the crown of the natural world, he extended basic “natural rights” to animals and thus anticipated the core moral principle upheld by today’s animal welfare movement. Years before British utilitarian philosopher Jeremy Bentham famously made the same point, Rousseau held that natural compassion urges us both to refrain from harming not just other humans, but also “any other sentient being” except in cases of true necessity. Humans are bound by strict duties toward animals who enjoy “the right not to be needlessly mistreated” (Rousseau 1988: 7).

In addition Rousseau’s analysis offers insight into some of the contemporary societal dynamics that increase ecological degradation. For example, his understandings of inequality and how it shapes social structures and psychological dynamics shed light on forces that promote over-consumption and ecological degradation. Similarly, his critique of education anticipated the concerns of ecologically concerned people who fear that modern advertising promotes unsustainable lifestyles. Rousseau’s suspicion of socially inflated wants and his affirmation of the simple, virtuous life are as timely now as they were in his day. For all of his eccentricities and faults, Rousseau remains a seminal figure in eighteenth-century Western philosophy and letters challenging many aspects of modernity by an appeal to nature’s goodness as it comes from the hands of the divine.

**Rubber and Religion (Belgian Congo)**

The Belgian occupation and exploitation of the Congo (1885–1960) was one of the most brutal chapters in world history. At the infamous Berlin Conference of 1884–1885, European powers carved up the African continent into colonial possessions, and the King of the Belgians, Leopold II, was granted sole control of the vast Congo River Basin. A devout Catholic and self-promoting “philanthropist,” Leopold founded The Congo Free State (1885–1908) and...
vowed to bring civilization to its people, which for him meant bringing Christianity to save “pagan” souls. In reality, the Congo Free State was a colonial slave system designed to exploit two of Central Africa’s most precious natural resources: its people and its land, first for rubber and ivory and later for minerals. Catholic missions played an integral role in this system, providing moral sanction and local manpower for the plunder, making this form of religion a tremendously destructive influence on the region’s environmental and social history. On the other side of the struggle, however, Protestant missionaries brought the horrors of the Congo Free State to the world’s attention, while indigenous Congolese religious movements like the Kimbanguist Church rose in staunch resistance to white occupation. Thus religion was a central force in both the establishment of and resistance to Belgian rule in the Congo and its concomitant environmental and social destruction.

Roughly the size of the United States east of the Mississippi River, the Congo Basin is dominated by a network of rivers and tributaries that flow into the one of the world’s greatest rivers, the River Congo. This riverine system generously nourishes the immense Central African Rain Forest, which is bordered to the north and south by rolling savannah and to the east by the Ruwenzori Mountains and the great lakes of the Rift Valley, the birthplace of humanity. The original inhabitants of the region, often incorrectly referred to as “Pygmies,” count as descendants the baMbuti and the baTwi, who today still live in the Congo’s rainforest much like their ancestors did since at least 2000 B.C.E.: living in small kin-based clan units, hunting, gathering, and praising the forest for providing them with the gifts of life. Appreciation of these gifts in the form of dance, song, and prayer remain the ritual emphasis of their religion. One of the most painful ironies of Central African history is, therefore, that a foreign religion, Catholicism, would join forces with Leopold in the massive plunder of this forest and its indigenous peoples who so venerated it.

By around the year 1000, Bantu ethnic groups had migrated from north of the forest to the Congo Basin, eventually becoming the region’s dominant peoples, with large and complex centralized kingdoms forming as early as the fourth century. The Bantu brought with them monotheistic religions that were centrally concerned with the dead and local nature spirits, which, for instance, the baKongo call basimbi. Certain basimbi reside at local springs or other significant topographical features. A key difference between their worldview and that of the Congo Basin’s indigenous peoples was the Bantus’ deep-seated fear of sorcery. Bantu religion is in fact largely concerned with the negotiation of sorcery (i.e., with detecting it, combating it, and healing those who are afflicted by it).

Generously funded by Leopold from 1874 to 1877, the Englishman-turned-American Henry Morton Stanley explored the Congo Basin to locate both the source of the River Congo and the famous English Protestant missionary and explorer David Livingstone, from whom no one in Europe had heard in five years. Upon finding Livingstone, Stanley triumphantly returned to Europe, and Leopold promptly hired him to establish commercial relations with local Congolese chiefs and a series of trading stations along the River Congo. Leopold’s foray into “The Scramble for Africa” thus began to unfold as European powers looked to the African Continent to provide natural resources for the Industrial Revolution. Like Leopold, most Europeans involved in the Scramble liked to think of themselves as having higher moral purpose, hence the spread of civilization was linked to Christian missions and the abolition of the Afro-Arab slave trade in East Africa.

With the invention of the pneumatic tire, rubber immediately became a key natural resource for a rapidly industrializing Europe. Merely six years after Leopold founded the Congo Free State, his personal colony was producing one-tenth of the world’s rubber, upwards to 6000 tons a year. How this was accomplished is one of the most violent and tragic stories in African history. Local chiefs had signed away their lands in treaties that they could not read, while Leopold aggressively sent administrators and missionaries to oversee his plunder of the Congo, ordering them to “neglect no means of exploiting the produce of the forests.” To do so, the Belgians enslaved thousands of Congolese, razing their villages and forests to clear land and provide labor for rubber plantations. Symbolic of this great injustice, the chicotte, a whip made of strips of dried hippopotamus hide, was liberally used to beat Africans either to work or to death. Along with severed African hands, the chicotte would become the symbol of colonial oppression in the Congo.

Resistance to such oppressive and violent domination was of course to be expected. Hence Leopold arranged for the formation in the Congo of La Force Publique, a standing army of African mercenaries and forced conscripts under Belgian command. This notoriously brutal force of some 19,000 soldiers served to ensure that Leopold’s greed would be satisfied with abundant exports of rubber and ivory. In order to swell the Force’s ranks, the King of the Belgians had Catholic missions double as boot camps for thousands of child soldiers. Some were orphans; many others were quite simply slaves. In 1890 Leopold wrote,

I believe we must set up three children’s colonies. One in the Upper Congo near the equator, specifically military, with clergy for religious instruction and for vocational education. One at Leopoldville under clergy with a soldier for military training. One at Boma like that at Leo . . . The aim of these colonies is above all to furnish us with soldiers (Hochschild 1999: 133–4).
In time, many other “children’s colonies” were founded by Catholic missionaries, whom Leopold heavily subsidized. Thousands of Congolese became orphans as a result of La Force Publique’s brutality. These children were sometimes forced to march hundreds of miles to Catholic missions for military inscription. One priest described the fusion of military and religious symbolism reflective of this horrific arrangement: “the children marched in front, the soldiers following . . . During Mass . . . at the moment of the elevation of the host, ‘present arms!’ was sounded by bugles” (Hochschild 1999: 134). Discipline and order were of course maintained by liberal use of the chicotte, exacerbating the already inhumane conditions for African children on the Congo Free State’s Catholic missions. Between malnutrition, disease, beatings, and long marches, over half of the colonies’ children perished. Yet even this was lent a glaze of ecclesial sanction, as seen in the commentary of one mother superior:

Several of the little girls were so sickly on their arrival that . . . our good sisters couldn’t save them, but all had the happiness of receiving Holy Baptism; they are now little angels in Heaven who are praying for our great king (Hochschild 1999: 135).

These “little angels” were among some 10 million Congolese who perished in Leopold’s Congo Free State, more than half the region’s entire population. The Congolese interpreted such oppression in other religious terms, looking to nature to render divine justice, as expressed in their singing:

O Mother, how unfortunate we are! . . .
But the sun will kill the white man,
But the moon will kill the white man,
But the sorcerer will kill the white man,
But the tiger will kill the white man,
But the crocodile will kill the white man,
But the elephant will kill the white man,
But the river will kill the white man
(Hochschild 1999: 139).

Some whites also cried out against the rampant human-rights abuse in the Congo Free State. E.D. Morel was a high-ranking Belgian administrator during the early phase of Leopold’s plunder of the Congo. Outraged by the brutality of the occupation, Morel quit the regime and sought to alert the world to the grave injustice of the Congo Free State. His cry was echoed by numerous Protestant missionaries in the Congo Basin, who, unlike Catholic missionaries, were independent of Leopold’s regal authoritarianism. In 1904, Morel founded with British Protestant missionaries John and Alice Harris the West African Mail, a newsletter that publicized the horrors of Leopold’s Congo. Among their more influential readers, Bertrand Russell wrote,

The only men in the Congo who could not be silenced were Protestant missionaries . . . To take one instance out of many, Joseph Clark, of the American Baptist Missionary Union wrote: on March 26, 1896: “This rubber traffic is steeped in blood . . . The lake is reserved for the king – no traders allowed – and to collect rubber for him hundreds of men, women, and children have been shot” (Russell 1934: 454).

The world took note, and in 1908 the Congo Free State was annexed from Leopold by the Belgian government and renamed “The Belgian Congo” (1908–1960). Central African prophets (Kikongo: bangunza) had by then reinterpreted Christianity to denounce white rule, recasting indigenous notions of sorcery into modes of understanding and denouncing colonialism. The most important of these was Ngunza Simon Kimbangu, whose rapidly blossoming movement was so threatening to the Belgians that he was imprisoned in 1921 and given 120 lashes. Many of his followers were exiled to other parts of the Congo Basin, which only served to spread the movement into an international multi-ethnic religion that today counts some 5 million adherents. After Kimbangu’s death in prison in 1950, his son Joseph Diangiende was declared the leader of the Church of Jesus Christ on Earth through the Prophet Simon Kimbangu (l’Eglise de Jesus Christ sur la Terre par le Prophete Simon Kimbangu: EJCSK). EJCSK holds that Kimbangu was God’s apocalyptic messenger who prophesied the end of white rule, the establishment of the kingdom of God, and the second coming of Christ. The Church was formally recognized by Belgian authorities in 1959, one year before Congolese independence. Since 1970 EJCSK has been a member of the World Council of Churches.

Rubber Tappers

In the year 1839 Charles Goodyear perfected the vulcanization process for rubber, thus creating an immediate worldwide demand for rubber. The Brazilian Amazon, and in particular, the upper Amazon region and the state of Acre, holds the world’s largest natural rubber tree stands. In the late 1870s, immigrants from the northeast of Brazil, driven by droughts in the northeast region and drawn by the promise of riches from collecting rubber, provided the labor for extracting, or “tapping” latex. They became known as seringueiros, or rubber tappers. The rubber “boom” ended with the domestication of rubber trees in Southeast Asia in the early 1900s. However, another wave of northeastern migrants, known as soldados do borracha, or rubber soldiers, came to the region during World War II as the axis powers cut off access to rubber plantation production in Southeast Asia and the upper Amazon once again became the world’s source of rubber. This second “boom” ended at war’s end, but rubber tappers remained and still ply their trade.

Northeastern migrants brought to the Amazon a strong Catholic faith without indigenous religious influence. The names given to seringais, or rubber forest areas, such as São Pedro, São Vicente and São Francisco do Iraçema, themselves demonstrate the strength of the Catholic tradition brought by the rubber tappers. However, upon their arrival, the rubber tappers did not wholly impose their religious traditions on the local population, but rather their religious traditions were modified by the new sociocultural and environmental conditions of life in the Amazon. Many of the beliefs of rubber tappers today are of mixed influence, with Catholic traditions influenced by the Amazon folk beliefs held by caboclos, or mixed-race river-dwelling populations, and indigenous populations that inhabited the region. Some of these folk beliefs have European origin and were brought by Portuguese settlers in the early seventeenth century. Santo Daimé, a religion founded by a rubber tapper in the 1920s which involves the drinking of ayahuasca as its sacrament, also reflects this mixing of Christian and indigenous beliefs, as well as African influence. Thus, like the religious beliefs of other Amazon populations, the formation of rubber tapper religious beliefs should be looked upon as a “continuous process” (Galvão 1952: 169), one that retraces their cultural background and adaptation to the Amazon environment for over a century.

The most widespread folk beliefs adapted by many rubber tappers are: mãe seringueira, the mother of the rubber tree; panema, a hex that prevents rubber tappers from killing game; and cabloquinho, father of the forest. Smith (1996) provides an excellent description of mãe seringueira, a short, long-haired woman with bleeding arms and legs, that appear to have been cut by a tapper’s knife. Mãe seringueira appears to those who overexploit her rubber trees. Although regular, measured cuts can be made during the tapping season, “mae de seringa becomes upset when people abuse her children,” namely, cut her trees excessively or too deeply, causing the trees to die (Smith 1996: 132). Smith recounts the story of a rubber tapper, in debt to his patron and needing greater rubber production to pay it down. Mãe seringueira appeared to him as he was angrily overtapping the trees. Explaining his situation, mãe seringueira agreed to provide him the latex he needed if he “would leave her daughters alone” (Smith 1996: 132). He was also told to tell no one about the agreement. However, the following year, unable to keep silent about their accord, the rubber tapper died of a poisonous snakebite, attributed to his broken promise.

Panema is another common belief among Amazon folk peoples. A rubber tapper’s “repeated failure” in hunting “that cannot be explained by natural causes” is attributed to panema, a hex that contaminates both the individual and their weapon (Galvão 1952: 108). Although panema is sometimes referred to as “bad luck,” “... it is not merely an occasional failure of fortune, but an incapacity,” sustained over time (Galvão 1952: 108). Galvão noted that this can occur for various reasons. For example, the consumption of game by a pregnant woman is one common source of panema. “Ill feelings or jealousy among friends over food” may cause that friend to experience panema (Galvão 1952: 108). A rubber tapper in Acre, Brazil stated that one can get panema if one shoots an animal and then cannot find it, thus it dies un consumed by the hunter (Weigand 1997). A tapper may be stricken with panema if his wife sleeps while he is hunting, or if “he hunts with dogs on Thursdays, the day belonging to Caipora,” the father of the game (Almeida 2002: 123 [our translation]).

Methods to cure panema may involve the use of plants collected in the forest or grown in home gardens in “smoke” and water baths. Cabloquinho is described by a rubber tapper in Acre as a “magical boy-like creature, one meter tall and owner of all wild game” (Weigand 1997: 55). Cabloquinho punishes hunters who exploit wild game for pleasure or commercial gain. If a rubber tapper hunts every day, beyond consumption needs, cabloquinho may become angry and beat the hunter. Rubber tappers in Acre noted that he may inflict physical pain on both the hunter and their hunting dogs to the point of unconsciousness. One rubber tapper stated that his brother was hunting a peccary when a small boy appeared and touched him on the head before he was able to shoot. The man passed out and when he woke up his ammunition was gone and he felt poorly. The rubber tapper’s belief in cabloquinho is similar to the more generalized Amazonian belief in the curupira legend. Thus, mãe seringueira, panema and cabloquinho illustrate tapper conservation behavior and rationale in using forest resources.

The Santo Daimé religion, founded in the 1920s by
Raimundo Irineu Serra, a rubber tapper living in the Southwest Brazilian Amazon state of Acre reflects the melding of Christian, indigenous, and African beliefs. The Santo Daime ritual is centered on the consumption of ayahuasca, a drink made from the psychotropic vine plant *Banisteriopsis caapi*. While drinking ayahuasca, Serra experienced a series of visions during which he encountered the “Queen of the Forest . . . a woman whom he identified with the Virgin Mary” (Mizrach 2003: no page number). It is through these visions that the tenets of Santo Daime, “reincarnation, salvation and protection of the rainforest” were developed (Mizrach 2003: no page number). Hymns and rituals that accompanied the consumption of ayahuasca focused on “enlightenment and healing” (Mizrach 2003: no page number). Today Santo Daime ritual still centers on the drinking of ayahuasca with the chanting of hymns and rhythmic dancing. Although still practiced in small forest communities of southwest Amazonia, it is primarily urban-based, with a growing network of followers in major urban centers in southern Brazil as well as in Europe and the United States.

In addition to its spiritual role, the Catholic Church has also played a critical role in the rubber tapper’s struggle for social justice, most notably in the state of Acre. In the 1970s, as the rubber tappers came under increasing pressure from ranchers to abandon their landholdings, the Catholic Church, through the establishment of Comunidades Eclesiais de Base and the teaching of liberation theology, became an organizing force for poor landholders in their confrontations with ranchers. The Church supported union organization and educated rubber tappers of their land rights. During empates, nonviolent confrontations with workers hired by ranchers to deforest areas where rubber tappers lived, rubber tappers recited prayers, such as Pai Nosso do Seringueiro and Ave Maria do Seringueiro, to ask God for liberty and justice.

Today, the Catholic Church continues to play an important role in rubber tapper community development in the forest, serving as a base for community organization and social action. In addition, annual festival days celebrating Patron Saints, such as San Sebastian, the Patron Saint of the cities of Rio Branco and Xapuri in Acre, remain important religious holidays to the rubber tapper population. Throughout the 1990s, evangelical churches have also established a growing presence in many forest communities. Future research should examine how different religious beliefs among forest families may be creating new community customs and shaping natural resource use.

In the state of Acre, the state “Forest Government,” elected in 1998, is incorporating rubber tapper traditions and beliefs in innovative policies for forest management. These policies are part of a broader state development vision referred to as “neoextractivism,” which emphasizes the role of traditional peoples in conserving tropical forests while improving their economic well-being.

Ruether, Rosemary Radford (1936–)

Rosemary Radford Ruether is a leading ecofeminist voice. She seamlessly connects feminism, liberationist thought, and concern for the Earth.

Ruether’s ecofeminist approach has been a longstanding and vital part of her constructive theological work. Her ecofeminist commitment emerged organically out of her recognition of the connections between human domination of the Earth and human interspecies domination: men over women, “First World” over “Third World” peoples, whites over people of color, rich over poor, Christian over non-Christian, and other forms of oppression. Her influential book *New Woman/New Earth* (1975) made her the first Christian liberation theologian to articulate those relationships explicitly.

Ruether’s theology demonstrates thorough historical knowledge. She explores the historical traditions of Jewish and Christian scriptures, Greek philosophy, Ancient Near Eastern worldviews, mainstream as well as marginalized Christian theologies, and more contemporary philosophies of romanticism, liberalism, and Marxism. Her nuanced approach balances incisive critique of elements in these sources that contribute to sexism, racism, and environmental degradation with the reclaiming of liberating aspects of the same sources. *Gaia and God* (1992) expands
the sources of her constructive thought to include the new, scientific "creation story."

Ruether’s work illuminates the systemic nature of patriarchal, hierarchical, and environmentally destructive attitudes and behaviors. Equality of women with men is not enough if both continue to dominate nature. Bridging the gap between rich and poor countries cannot be accomplished by raising the worldwide consumption rate to the unsustainable levels of northern rich nations. She calls for transformation of religious symbols and cultural values, and also for a radical restructuring of power relationships within societies and globally. To accomplish this restructuring, Ruether builds alliances with others who are struggling for eco-justice and justice in human relationships. The book Women Healing Earth, which she edited, includes essays from Third World women about the impact of globally destructive environmental practices and political policies on their lives, their communities, and the natural world around them.

Her far-ranging critique of patriarchal values in Christian thought and in Western social/ecological practice is made more valuable by her concrete pictures of a different way to live. Her books include imaginative portrayals of how life might be different if men and women lived in mutual harmony with each other, in sustainable communities that did not oppress the Earth or privilege one culture over another. In these communities she calls for shared childcare and use of renewable resources, for egalitarian relationships and widely available mass transit. She enticingly describes life in such a place, where people “watch sunsets . . . plant seeds in soil . . . The sun rises every day. Con Ed sends no bill for sunshine” (1983: 266).

Rosemary Radford Ruether's ground-breaking connections between the human domination of nature and the subjugation of some human groups by other human groups have been a key influence on liberation theology, the feminist movement, and the ecological movement. She untiringly speaks out for the continued struggle for liberation for the Earth and for women and men of all classes and races, cultures and religions.

Rumi, Jalaluddin (1207–1273)

Rumi, the greatest Sufi poet of Islam, was born in 1207 in Balkh, Afghanistan. The Muslim world honors him with the title of Maulana (Our Master). His uniqueness lies in that he based his anthropocosmic worldview on the principle of love. It is this aspect of his deep vision of the universe, and the place of humanity in it, which attracts environmentalists and provides them with a new perspective to see the deeper dimension of reality.

When Rumi was twelve years old, his family left Balkh to escape the Mongol invasion. For four years, the young Rumi traveled extensively in Muslim lands, encountering majestic mountains and beautiful plains, visiting major cities, and meeting well-known Sufis and scholars of the time. His family performed pilgrimage to Mecca and finally settled in Konya, Anatolia, then part of Seljuk Empire.

Rumi’s first teacher was his father, who was an authority in Islamic theology. However, Rumi found theology and classical learning unsatisfyingly occupied with formalism. At this juncture, he had a life-changing meeting with Shams-i Tabrizi, who would become his spiritual mentor. Through his friendship with Shams, Rumi discovered love as the dynamic force of universe. When Rumi died on 17 December 1273, Jews, Christians, and Muslims alike attended his funeral.

God and Creation
For Rumi, God the Cosmic Ego created the material world ex nihilo – out of nothing – and never ceases to create new things. Everything has been created with a specific order, duty, purpose, and meaning. There is no lifeless matter in this system; all matter is alive, albeit at various gradations of being. According to Rumi, “earth, and water, fire and air are alive in the view of God, though they appear to be dead to us” (Sharif 1995: 827). He cautions: “never think the earth void or dead; it is aware, it is awake and it is quivering” (Harvey 1994: 56).

Theocentricism is the key concept to understanding Rumi’s anthropocosmic worldview. God is the goal of Rumi’s thought. For Rumi, God wants to be known, so he manifests himself out of his eternal qualities. Two of God’s attributes are especially relevant in this regard: God is the Nourisher of all realms and beings, and as such, he creates and sustains out of love. Furthermore, God is not a static Absolute, but a perpetually gushing fountain of eternal life, manifesting his Majesty, Wisdom, and Knowledge through the universe. Consequently, in the cosmic system as Rumi sees it, everything happens according to a great plan formulated by Divine Will and Wisdom. Even bees build their houses by inspiration from God. So, a colorful and living world reveals itself in his poetry. While everything is related and connected to each other, everything also has a special space, meaning, duty, and importance.
The cosmos, thus, becomes a meaningful book and precious piece of art which manifests “the attributes and qualities” of its owner. Furthermore, the whole world – fish and moon, atom and sun alike – has been created to worship and love God, and to express its constant adoration in an intoxicated dance. Therefore, Rumi, “teaches his readers to contemplate this aspect of the ever-active God, who shapes the world according to a plan that He alone knows” (Schimmel 1992: 82).

For Rumi, human beings are not outsiders and strangers in a hostile and brutal natural environment. Rather, the whole world is a majestic garden, in which every flower has its function and represents various states and aspects of human life; every leaf on a tree and every bird in a bush offers praise and thanksgiving for God’s greatness and sustenance. Every leaf and tree is a messenger from nonexistence, proclaiming the creative power of God, talking with long hands and green, fresh tongues. Not only does Rumi listen to the constant praise uttered by the flowers and all other creatures, but he also visualizes them in the various positions of prayer. A plane-tree, for example, is opening its hand in prayer just like as a believer would do. The clouds, on the other hand, are pregnant from the ocean of love. The morning breeze is a fitting symbol for the life-giving breath of the Beloved that causes twigs and branches to become intoxicated and dance.

Animal symbolism is also prominent in Rumi’s poetry. Says Rumi, animals are not at all “machines or automata,” as Cartesian philosophy would have us believe. Even the wolf, rooster, and lion know what love is. Therefore, Rumi was very sensitive and kind to animals, as many anecdotes attest. For example, when he was walking, he would not drive a sleeping dog from his path, but rather would wait until the poor creature got up. Moreover, Rumi did not restrict his compassion and love to large animals but embraced every created thing.

The whole of Rumi’s poetry can be regarded as admiration of eternal Beauty as reflected in the cosmos. Therefore, he often uses a mirror as a symbol for the created world, which reflects the eternal Beauty of God. Since the natural world is a mirror of divine beauty, God is closer to human beings than their jugular vein. Rumi sees his Loving God’s signs everywhere, and he never tires of repeating the marvels of God’s creation – the result of the unceasing Divine Will and Power.

Rumi is regarded as an outstanding evolutionary thinker, although not a mechanical or biological evolutionist like Darwin and Spencer. While Darwin presented a biological view of the creation of higher species by blind urges of struggle for existence and life’s adaptation with environment, Rumi comprehends the whole process of evolution in a grand system. Instead of explaining it by mechanical dynamics, he resorts to love as the fundamental urge that creates attraction and affinities: “All atoms in the cosmos are attracted to one another like lovers, everyone is drawn towards its mate by the magnetic pull of love” (Sharif 1995: 828–9). The heavenly movements are waves in an infinite ocean of love. If cosmic love were not there, all existence would freeze and shrink into nothingness. The organic would refuse to merge and emerge into vegetation, vegetation would not be lifted into animal life, nor would life ascend toward the mind and spirit. In short, without love, nothing would move. It is clear that Rumi developed a different understanding of evolution as assimilation rather than annihilation, one that is based on love and interdependence instead of conflict and survival of the fittest. His theory of evolution can be compared with Bergson, who also argues the creative and evolutionary dimension of life. But while Bergson views this creative evolutionary process as devoid of goal and meaning, Rumi, on the other hand, regards God as the ground and goal of all existence, thus of evolution (Sharif 1995: 829).

Love as a Dynamic Force

For Rumi, a force – a secret energy – lies beneath the spiritual and material world, informing the invisible, progressive change in the universe (humanity included). This force is love, and it originates in God and moves toward God. According to Rumi, love is the positive energy that is responsible for interaction between particles, thus connecting everything with everything else in the universe. So, everything in the universe is interdependent.

Furthermore, says Rumi, since the love arouses every sense, increases the power of intuition, and leads to insight, love is superior to intellect in human life. In daily social life, for example, love has an important practical function: it solves disputes, eliminates selfishness and egoism, and draws aside all veils from the mind. Thus, not only is love basic and necessary for a religious and ethical life, but also for the sustainability of the cosmic order. In a nutshell, Rumi presents a deep and comprehensive understanding of the interdependence and interrelatedness of humanity and the natural world. In so doing, he affirms the reality of the world and dignity of all life, particularly of human life, which has become self-conscious and conscious of its divine origin and goal.

Humanity

Humanity is the central figure in God’s creation and, therefore, is the vicegerent of God on Earth in the sense that it is up to human beings to take care of the whole system. The whole creation is a gift from God and a sign of his creative power. Since God creates and sustains all ecosystems, human beings must interact wisely with the natural world and use its natural resources with care, nurturing a relationship with it founded on love and compassion, which is the essence of all reality.

To conclude, spirituality, rationality, and universal
morality have found a healthy synthesis in Rumi’s thought. In his system, God, the universe, and humanity are embraced in a single all-encompassing vision, the vision of creative love. Although six centuries old, Rumi’s notions are relevant to present environmental concerns.

Russian Mystical Philosophy

Orthodox Christianity had held the official status of state church in pre-revolutionary Russia, but its rivals were numerous and included Christian sects of a Protestant derivation as well as mystical and occult systems of a syncretic religious orientation. Russian esotericism and occultism have given the world such famous names as Theosophy founder Helena Blavatsky (1831–1891), Georgy Gurdjieff (1870s–1949) and his student Pyotr Ouspensky (1878–1947), and Nikolai and Elena Rerikh, all of whom brought Eastern-derived spiritual systems to the West. The mystical element is abundant in the work of many prominent Russian philosophers, such as Vladimir Soloviev, Vassily Rozanov and Nikolai Berdyaev. Less well known in the West but extremely influential in Russia were such mystical and “cosmicist” thinkers and visionaries as Nikolai Fedorov, Dmitry Merezhkovsky, Pavel Florensky, Konstantin Tsiolkovsky, Aleksandr Chizhevsky, Velimir Khlebnikov, Daniil Andreev, and Georgy Gachev. In recent decades, Lev Gumilev, Alexander Dugin, and others have provided an intellectual foundation for the emergence of a variety of strains of Russian ethnonation- alism, radical traditionalism, Eurasianism, and right-wing spiritual ecology, most of which are based on ideas regarding the connections between nation or ethnicity, nature, and spiritual or cosmic destiny.

The tradition of Russian mystical philosophy has been characterized by several traits and themes. These include: 1) a propensity for mixing Christian and pre-Christian mythological motifs; 2) a strong social, and often messianic, orientation, evidenced in an intent to inspire the whole nation and to organize it into an ideal societal body; 3) a cosmic dimension, oriented both to a planetary and even extra-planetary future and to the exploration of invisible spiritual worlds; 4) the idea of a global destiny for Russian civilization, based on the premise that its location between Europe and Asia ideally situates it to become the keeper of a universal wisdom combining the best of East and West, and holding forth the promise of Russia becoming the first “post-historical” nation, fated to experience the suffering and illuminations imposed on the world by the struggle of Christ and anti-Christ; and 5) an interest in the notion of a feminine spiritual essence, variously conceived as the Divine Wholeness, Sophia, “the Eternal Feminine” (Vechniaia Zhenstvennost), or “The Soul of the World” (Dusha Mira).

Cosmism

One of the most popular terms in contemporary Russian philosophical discussions, cosmism has come to designate both a particular movement or trend and the principal quality and legacy of Russian philosophy on the whole. Cosmism literally refers to a “cosmic orientation” of thought. The cosmos, in this perspective, is seen as the object of thought, but thought is also considered as a part of the cosmos, both a cognitive reflection of cosmic reality and a constitutive force of cosmic evolution. This philosophy of active evolutionism presupposes the possibility and necessity for the human mind to regulate and transform the laws of nature. Cosmism explains historical, social and psychological processes by the influences of cosmic energies and asserts a reciprocal dependency of the fate of the universe on human consciousness. It is thus a holistic, anthropocentric, teleological and frequently utopian tradition of thought, which sees humanity as in the process of developing a “planetarian consciousness” which could guide the further evolution of the universe and lead to its ultimate perfection.

The roots of cosmism can arguably be found in Eastern Christianity. While Catholicism had a principally historicist and more activist orientation, Orthodoxy is generally considered to be more concerned with the cosmic or
vertical dimension of reality. Within the Orthodox tradition, the foremost aspiration of a Christian is seen to be the "deification of the creature," presupposing the transfiguration not of only human flesh but also of the entire substance of the universe and of all living entities. Russian Orthodoxy was built on the foundation of an agrarian economy, and inherited from its pre-Christian substrate both a dualistic worldview of light and darkness and an intense sense of participation in the cyclical processes of nature, contrasting with the linear, historical imagination of the more urbanized West.

Perhaps the first monument of Russian cosmism is the so-called Golubinaia Kniga, or the Book of Depth. This book presents popular Christian beliefs, as expressed in religious folk songs, as a huge matrix of cosmical elements. For example, it says that human meditations derive from heavenly clouds and draws numerous other parallels between human life and the workings of the universe, thus anticipating the basic presupposition of contemporary cosmism – that humanity and the cosmos are symbiotically joined. In a conventional sense, however, the founder of Russian cosmism is considered to be Nikolai Fedorov (Fyodorov, 1828–1903). The religious thrust of Fedorov’s project is the reversal of all natural laws, death being one of them, in order that humanity may manifest God’s omniscience and omnipotence. Christianity, for Fedorov, is primarily the religion of resurrection, and the moral task of humanity is not to wait for the Last Judgment, but to follow the example set by Christ and endeavor to make bodily resurrection possible on the Earth, to transform the entirety of human existence into a humanmade and continuous Easter, using whatever technological resources we can muster.

Following in Fedorov’s path, Konstantin Tsiolkovsky (1857–1935), commonly honored as the “father” of the Soviet space programs, developed a philosophy according to which all physical matter is animate and sentient, and every atom a living and conscious entity. Two basic ideas of cosmism, the recognition of the universe as a living organism and the active regulation of natural forces through means such as genetics, owe their prominence to Tsiolkovsky. If Fedorov were primarily a religious thinker and Tsiolkovsky a hybrid scientist-visionary, Vladimir Vernadsky (1863–1945) represents the strictly scientific end of the cosmicist spectrum. He originated several new disciplines in the natural sciences – among them biochemistry, geochemistry, and integrative geoscience – and was the first scientist to theorize the geologic role of living matter, and the increasing influence of plant, animal and human life on the evolution of planetary structures. Together with French thinkers Eduard Le Roy and Pierre Teilhard De Chardin, Vernadsky developed the concept of the “noosphere,” the collective body of human thought incorporated into the biosphere as an active factor in its transformation. In his view, the geosphere organically overlaps with the biosphere, which in turn grows into the noosphere. Thought is a form of energy and an active factor of geological evolution that allows humanity to cooperate with nature as a complementary part of a living and thinking organism.

Though cosmism, like all other non-Marxist and “idealist” teachings during the Soviet period, was rejected by official ideology, it nevertheless enjoyed a privileged status. Fedorov’s project for the resurrection of the dead was implicitly incorporated into some undercurrents of Soviet ideology, as manifested most strikingly in the construction of Lenin’s mausoleum, which was designed to preserve his body until technology could resurrect him. In spite of the atheism of Marxism–Leninism and the religiosity of Fedorov, the two systems are compatible inasmuch as both attempt to give eminent realization to transcendent aspirations. The imperative of both ideologies is technological progress that will lead to the mastery by human-kind of the blind forces of nature. Both systems criticize capitalist civilization for its social inequality and materialistic obsessions, which appears in Marxism as the greediness of the bourgeois and in Fedorov as the dictatorship of fashion, which Fedorov considered to be corrupt and “feminine.” Both strive to overcome individualism and egoism, valuing labor instead as the highest moral duty, since the task of humanity is to subordinate nature to teleological and creative reason.

In recent years, Russian cosmism has been reinvigorated by an increased interest in environmental matters, giving rise, in the writings of Svetlana Semyonova (the most prominent follower of Fedorov), Nikita Moiseev, Fyodor Girenok, and others, to a scientific strand that could be considered the Russian equivalent of the environmental holism of James Lovelock, Gregory Bateson, and other “New Paradigm” scientists. Here, cosmism has been influenced by ideas of negentropy, the anthropic principle, and the Gaia hypothesis.

**Gumilev’s Biocosmic Theory of Ethnogenesis**

The son of poets Nikolai Gumilev and Anna Akhmatova, historian and ethnologist Lev Gumilev (Gumilyov, 1912–1990) has been one of the most influential voices in recent popular Russian ecological and cultural thought. Influenced most by the “Eurasianists” of the 1920s–1930s, for whom Russia was a distinct world civilization embodying the combined virtues of Asia and Europe, and by the Earth scientist Vernadsky, Gumilev developed a “theory of living matter,” according to which the organic substance of life determines the formation of both inorganic and superorganic (rational) layers of the global ecosystem, including the biosphere and noosphere. In his most important work, *Ethnogenesis and the Earth’s Biosphere* (Etnogenezi i biosfera zemli), Gumilev applies his theoretical model to the development of ethnic groups, or *ethnos*, proposing that each ethnos undergoes an organic evolution through
which it develops a sense of deep connection with its geographic environment. The key factor for development of an ethnos is “passionality,” or the “passionate drive.” Whereas most people, for Gumilev, are motivated by a desire for self-preservation, a select proportion are “passionaries” who devote their lives to particular goals and charge the larger society with the energy of action. In contrast to this life-affirming energy, necessary for any creative development and associated with the growth of an ethnic group living in harmony with its environment, Gumilev argues that ethnic mixing leads to a dangerous loss of that organic connection with the natural environment, a turn to abstract thinking, and ultimately an entropic degeneration into an inert or “vacuum” state.

Another danger, for Gumilev, is represented by the “parasitic ethnoses” or “chimera,” which develops outside of any environmentally symbiotic context and, when it becomes lodged within the territory of a “benign” ethnos, threatens it with destruction from within. (Gumilev stops short of blaming the Jewish diaspora for the misfortunes of Russian and other ethnic, but this allusion is implicit in his writings.) Needless to say, Gumilev’s assumption of ethnic essences goes against the grain of Western scholarly thinking on nationalism and ethnicity, and his thought bears an obvious resemblance to fascist notions opposing communities of organic solidarity against dangerously rootless “cosmopolitans.” Yet he remains an extremely popular cult figure, influential even on elite Russian conceptions of nature and society.

Other Developments
In the post-Soviet context, various streams of nationalist and anti-globalist thought have emerged at the forefront of Russian popular philosophical discourse. Paralleling Western civilizationalist thinkers such as Samuel Huntington, with his argument that global conflicts of the future will be based on the “clash of civilizations,” Russian neo-Eurasianists, radical traditionalists, and defenders of “Orthodox civilization” oppose the commercial empire of the “Atlanticist” West, claiming that a Russian–led Eurasia harbors a more proper balance between the spiritual and material worlds. Frequent reference is made to the rather loose notion of “ecology of culture,” which draws on Gumilev’s ideas about ethnos as a biological phenomenon, as well as the more conventional views of cultural and historical preservationists such as the cultural historian Dmitry Likhachev.

Beyond vague pronouncements about the necessity of environmental protection, however, nature remains muted in most current Russian philosophy, playing second fiddle either to the quest for a Russian national (or civilizational) identity or to a more speculative cosmovision. Beliefs in the sacred destiny of Russia and in the power of specific landscapes (such as the Ural mountains), however, have been spread through the work of artist and theosophist Nikolai Rerikh (1874–1947), his wife Elena (1879–1955), and followers of their synthetic spiritual philosophy alternately known as Agni Yoga and “Living Ethics” (Zhivaya Etika). A mixture of Theosophical occultism, millennial beliefs about Russia’s role in a coming world transformation, beliefs in “vital energy” and the power of art to channel this energy, and parareligious revisions of official Soviet ideology, these ideas now inform a broad network of centers and groups, found in every major Russian city today. The teachings of Ukrainian–born nature mystic and ascetic Porphyrii Ivanov (1898–1983) have also found a large audience of followers scattered across the former Soviet Union, and have even been incorporated into the official educational curriculum of Kazakhstan. Rejecting materialism, Ivanov advocated a “system” of living in close harmony with nature, including twice-daily cold bathing in natural waters, regular barefoot walking in the outdoors, weekly waterless fasting (from Friday evening to noon Sunday), abstinence from smoking and drinking, and an altruistic demeanor in all activities. With its focus on natural health and rejuvenation and its mixture of personal virtue ethics, rural communitarianism, millenarian optimism, and rejection of worldly power, Ivanov’s teaching represents the latest in a long tradition of Russian (and East Slavic) nature religion. Similar ideas and practices have mixed with cosmicist thinking, Asian spiritual trends, occultism, and strands of Orthodox belief, to produce much of the diversity of alternative religion in Russia today.

Rustlers Valley (South Africa)

Rustlers Valley was established as a community in 1991 under the guidance of Frik Grobbelaar in the eastern highlands of the Free State, South Africa. Rustlers community does not embrace any particular religion but rather draws from religious practices worldwide where they seem appropriate to our world vision. Our world vision is primarily shaped by a belief in the value of diversity and freedom of thought – no method, no guru. This approach derives from the recognition that all religions arose in isolation from one another due to the experience of religious feeling in the individual human breast. We therefore see all religions as garbled human attempts to cater to this feeling. We see this feeling as the only legitimate basis for religion. Living in one of the most beautiful valleys in the world we see the expression of divinity in nature all around us and attempt to enhance this with simple reverence in everyday cultural behavior. By reverence I mean living in the constant awareness of nature’s beauty and bounty. To this end we use sweatlodies, ayhuasca ceremonies, drumming circles, traditional healing methods and the upliftment of our surrounding community through the creation of a food-rich environment. We use a permacultural approach which includes organic farming methods but is more like an adaptation of nature by concentrating plants that are useful to the human community while maintaining nature’s patterns and strategies.

Rustlers believe society is undergoing a fundamental transformation. A new worldview is being born and whether this birth is to be an easy or difficult one will depend largely upon the individual. It is our aim to assist the individual to cope with and contribute to the birthing process. The goal is to embrace the hopes, transform the fears and discover the magical behind the mundane to encourage the individual to achieve his/her highest level of spiritual awareness.

Rustlers runs permaculture design workshops at the Lodge twice a year and has hosted annual music festivals for the last decade with a view to spreading this awareness. Neighboring Rustlers Valley is Mautse (the valley of the ancestors) which we believe is one of the oldest sacred places in the world, as our valley has had human occupation for a hundred thousand years and this sacred site was inherited by the current indigenous people from the Bushmen who were here before them. Mautse is currently occupied by traditional healers or “Sangomas” who are teaching us about the collection and use of medicinal plants.

Sustainability is our primary value as it applies to the species and to our community and to this end we are creating a model for sustainable African existence, promoting the conservation of all energy including human effort and the use of renewable natural resources. We have a living seed bank of the 280-odd vegetables that are still available on the planet and we use the production of our gardens in our restaurant.

Rustlers Valley works in conjunction with Food and Trees for Africa to promote permaculture in disadvantaged schools and communities throughout South Africa to supplement school feeding schemes and poverty alleviation projects.

Rustlers considers the recognition and integration of nature’s bounty to all the people of the planet as a great spiritual healing that will aid the birthing of a new worldview and therefore a new world. The various rituals that we use, such as the sweatlodge at full moon, are meant to assist in the shifting of paradigms through the experience of one’s own personal power and sense of well-being in the universal context of one’s connectedness to all else.

Saami Culture

In Sápmi, the traditional settlement area of the Saami (earlier: Lapps) in central and northern Norway and Sweden, northern Finland and northwestern Russia, nature is varied. There are steep coastal mountains and fiords, spruce forests, areas with tundra (a word that originated with the Saami), swampy grounds, the Scandinavian mountain chain, valleys with birchwoods, and many rivers intersect the area. In these different types of biotic communities, the Saami have developed various economies. Fishing in the sea, in lakes and in rivers, hunting for game and game birds, reindeer herding, stock raising and farming have all been traditional Saami means of subsistence.

The different Saami groups in this large area have until the last century lived rather isolated from one another and there are, therefore, great regional differences in culture. Depending on where in Sápmi they live, these differences have made Saamis relate themselves to nature in various ways, but, at the same time, some ideas are and seem also earlier to have been common all over Sápmi. With the help of sources from the western parts of Sápmi during the late seventeenth and early eighteenth centuries and oral traditions collected during the nineteenth and twentieth centuries, it is possible to outline some of the traditional ideas about nature, at least among the reindeer-herding groups that the majority of the sources describe.

Since the landscape is no neutral room, but loaded with meanings, parts of the landscape – mountains, brooks, stone boulders – can function as symbols. Every landscape can be said to consist of both the natural formations and the cultural constructions that add symbolic values to some of these formations. In traditional Saami thought, certain places were regarded as connecting links between our world and the otherworld. These were the lakes where the noaidi, the most important ritual specialist, was regarded as being able to travel to the world of the departed, mountains where different types of subterranean beings were regarded as living, burial places of humans and of bears, stones that men smeared with fish fat or the blood of sacrificed reindeer, and the fireplace in the tent or cot (goahti) around which women poured out milk or gravy. In all these places rituals were performed. For the nomadic, reindeer-herding groups, there was a concentration of places for rituals and especially sacrificial sites in the area around the tree limit (orda) where the reindeer stay during both the mating season in autumn and calving in spring.

The year was traditionally divided into two halves, the dark (when in some areas the sun never rises for two months) and the light (when in some areas the sun never sets for two and a half months). During the dark winter, the Saami navigated with the help of the stars and many had a good knowledge about constellations and movements of the celestial bodies. The importance of nature also permeates Saami language, which is well known for its rich terminology for different types of snow, reindeer, and so on. Attitudes to and interpretations of nature are also embedded in Saami place-names. They are very often descriptive and indicate the physical character of the place or the occurrence of animals there. Also, several of the names of the months convey similar messages: March is “the swan month,” April “the month with frozen crust on the snow,” and May “the reindeer calf month.”

During the era of the indigenous religion, there were ritual ceremonials when several reindeer or other animals were sacrificed, for example during the Great Autumn festival in late September, but those occasions were exceptions. The daily ritual activities and also the rites de passage took place in and near the tent, which as the center of the cosmos represented safety in contrast to the wilderness (meahcci) in the periphery, where all kinds of dangers – wolves, wolverines as well as evil spirits – threatened herds and humans. One important aspect of nomadic cultures such as the Saami herding groups is their dynamic adaptation to the landscape. Every time the tent was moved to a new site, the center of the cosmos moved as well as the center of ritual life. Therefore, the dynamics of traditional Saami conceptions of the landscape lay in the tension between the sacred places that were stationary in the landscape and the movable sacred places related to the tent.

Saami traditionally also reckoned with another landscape, located beneath and behind the one we can see when awake. It was important to be able to orient oneself also in this invisible landscape (visible only in dreams) where the departed ancestors and different types of spiritual beings were considered to be living. To take one example, the South Saami related, according to sources from the 1720s, that there was a category of beings called saajjh that could be inherited, sold, and bought. Status in South Saami society at that time depended on how many saajjh a person owned. Many could tell about visits to these beings in the mountains where they lived and about how the saajjh had helped them in difficult situations.

Even more important than the saajjh were the ances-
tors. They were socially alive, regarded as members of the family and lived in a world beneath the surface of our world. They could help in hunting, fishing and reindeer herding, they could guard the children and they often gave messages in dreams. For example, when a woman was pregnant, it was ancestors who suggested the name of the child.

For Saami hunters “a respectful attitude to the animal, and the proper treatment of its remains after it has been killed and eaten” was extremely important (Hultkrantz 1994: 357). This meant, for example, that the remains after the meals were placed in special bone deposits. Also, many of the divinities were related to nature. Sun (Beavri) and Moon (Aske or Mánna) received sacrifices as well as thunder (Hovrengaellies, Atjá, or Dierpmis) and the divinities for water, snow and ice, migratory birds, etc. A hunting god and a god for the reindeer were responsible for different sources of livelihood. In addition to the rituals directed toward these divinities, there were also rituals for many types of spirits in animal form. The ritual specialists had to relate themselves to spiritual birds, fishes, reindeer bulls, and in the south, every child (or, according to another interpretation, the boys in the families of the ritual specialists) received a special tutelary spirit called name-fish (nimmequelie) in connection with the naming rituals. This fish helped the person through life’s difficulties and prayers were directed to it. Another type of spiritual being was the rulers (hâlddit) who guarded plants and animals and ruled over areas in nature. The most important of the “rulers” was the bear, which was regarded both as an animal and as a spiritual being. It was the bear that was responsible for what we today would call the ecological balance in nature, and in order to safeguard that balance a bear festival was celebrated in springtime. Before, during and after the hunt there were strict rules and the whole hunt was ritualized. When the bear was taken to the settlement, there was a bear feast during which several chants were performed, the most important of which was the bear chant in honor of the animal. The meat was carved from the bones and boiled in a certain order. The men ate some parts of the bear in a tent that had been erected for the occasion, the women and children had other parts in the ordinary tent. During the feast it was important that no bone was broken, because all the bones were to be buried in an accurate order, whereas the skin was used in a game that decided when and by whom the next bear was going to be killed.

To sum up the indigenous religion’s relation to nature, one could with Hultkrantz say that even if there were differences between hunters, fishermen and pastoral nomads (and farmers – I would add), indigenous religion in all its forms has been “close to nature in its expression and well adapted to environmental demands” (1994: 367). This is clearly shown by the Saami chants, the yoiks, in which nature and animals are the two most common themes, apart from human individuals. In yoiks about landscape “the localities are always mentioned by name, and by means of their names have an individual quality and power of association; a complex of memories, legends and traditions is linked to each one of them” (Ruong 1969: 17).

After several hundred years of missionary work, animal sacrifices, rituals performed for the indigenous divinities, and many other aspects of the traditional religion were abandoned. In most regions this happened during the eighteenth century, in some areas a century later. However, knowledge about the traditions of the ancestors was transmitted to younger generations and many of the spiritual beings related to nature were more or less integrated into contextualized Saami forms of Christianity. Today, most of the Saami are as secularized as the majority populations in Norway, Sweden, Finland, and Russia, but many young Saamis show a keen interest in the indigenous religion and attend courses to learn more about this important part of their cultural heritage. Some individuals and groups, inspired in some cases by Native American friends, or in others by the neo-shamanism of Michael Harner, have also tried to revitalize parts of the indigenous religion. At the same time, the condemning attitude of the church has changed, opening space for rekindling interest in their indigenous religious traditions. The yoik and the traditional drums, for example, which were heavily condemned by clergymen during the seventeenth and eighteenth centuries, have been used in religious rituals again. This time they are used in Christian contexts and symbolize respect for Saami cultural values. There have also been services of reconciliation where bishops have asked forgiveness from the Saami for how the Church acted during the time of religious confrontation. When it comes to Saami rights to self-determination and as this regards land and water in Sápmi, however, the national churches have not, as of the early twenty-first century, taken clear sides with the Saami.

To use Rochon’s words, many Saamis still have “a deep sense of dependency and reliance upon the natural environment,” but their concept of nature, based as it is on ecological principles, “has been so drastically manipulated that in many instances this concept is difficult to practice” (1993: 54). The damming of rivers, devastation of forest land, mining, tourism, the use of pasture-lands and hunting-grounds for the European space program or as artillery ranges, and the Chernobyl catastrophe, have all created many problems for the traditional Saami economies and especially for the reindeer breeding which needs large pasture areas for the herds.

The Saami have not been passive onlookers to this process; quite the opposite. The fight against a hydro-electric project in the early 1980s, for example, was decisive for Saami political mobilization. In that case, environmentalist groups and Saami organizations were on the same side of the conflict. In other cases, they have taken opposite
stands. This is especially the case in what is usually – because of lack of knowledge about the long Saami cultural history in the area – called “Europe’s last wilderness.” This “wilderness” is however a cultural landscape, because the Saami have, as Beach put it, “been instrumental in creating their environment which some conservationists wish to label as purely natural” (1994: 183).

Disagreements between the Saami and environmentalists have also occurred over nuisance predators. Environmentalists from the urban regions in the south of Scandinavia and other parts of Europe have in general little understanding for Saami claims for a reduction of the number of predatory animals in the areas used for reindeer herding, even though wolves and wolverines harm the herding economy. The Saami, who base their lives on traditional economies have, through their chosen parliaments, begun to tackle the many environmental issues they face. But since these parliaments have still not been given any authority over land and water in Sápmi, it is difficult for them to get their proposals approved at the level of the nation-states they inhabit.

**Sabbath-Jubilee Cycle**

Consistent with Ancient Near Eastern practices of debt cancellation and economic renewal during the two millennia prior to the Common Era, the Hebrew Bible records a set of interlocking practices of social and economic redemption. Built into the liturgical calendar of an agricultural society, this Hebraic Sabbath-Jubilee cycle proposed the periodic economic justification of relations among humans and, secondarily, with regard to the land’s productivity. Three distinct movements – the Sabbath day of the week, the Sabbatical every seventh year, and the Jubilee every fiftieth year – were built into the cycle. The attempt to proclaim a Jubilee year was revisited by the authors of the Christian gospels as that which occasioned the ministry of Jesus; in these texts, the Sabbath-Jubilee tradition associated the liberty promised by God with redemption from economic injustice and with unburdening the land from Roman and Herodian temple-state constructions. The vision encompassed in the Sabbath-Jubilee cycle was most summarily articulated in the refrain of Isaiah 61:1–2 as good news for the politically and economically oppressed, liberty for enslaved persons, and release for debt prisoners. Poetic elaborations of the same practice envision it as an occasion of “new creation,” of a “new earth” (Rev. 21:1).

**Historical Context and Hebrew Biblical Background**

The Hebraic Sabbath-Jubilee cycle was prefigured in Babylonian and Assyrian “clean slate” legislation. Indeed, edicts announcing the forgiveness of debts extend back to third millennium B.C.E. Sumer. Palaces and temples, often having traders in their employ, were the first major creditors of the ancient world, engaging in forms of corporate enterprise. Agrarian debts – an economic structure secondary to these trade enterprises – accrued most typically when crop failures prevented farmers from delivering the royal and/or temple tithes. Because agrarian debt alienated farmers from the land via land forfeitures, depopulated the countryside, catalyzed wage labor and debt bondage, and therefore occasioned a disruptive economic polarization in a population, rulers periodically restored a basic population distribution pattern of widespread self-support on the land. The Hebrew Bible echoes such a concern in the prophetic complaint of Isaiah against wealthy individuals “adding house to house” and so irresponsibly depopulating the land (Isa. 5:8). Broad-scale debt forgiveness or “clean slate” legislation was probably declared when economic conditions warranted or on such civic occasions as the inauguration of a new ruler or the building of a new temple.

Given “the land” as the primary unit of life in Hebrew thought (“the land” being a collective term inclusive of humans, plants, animals and the terrain), the Sabbath-Jubilee system named for the Israelites a way of living its equitable distribution and its stewardship. Having an allotment of land, the broad space in which bodies take place and the generations of life unfold, grounded the notion of freedom for these people who traced their lineage to former slaves. Once divided according to clan, tribal and household size and need, the family apportionment was made inalienable. Such ties to place theoretically promised human self-sufficiency and sustainable soil
management. Further, these laws guaranteeing the distribution of land suggested how God was to be honored as Lord and Liberator. To the extent that human welfare was secured through a subsistence allotment of the land, claiming Yahweh as Sovereign had distributive justice as its socio-ethical consequence.

Hebrew biblical documents suggest some innovation in the ancient pattern of “clean slate” legislation. Removing the control from the king, it placed the practice of “proclaiming liberty . . . the year of the Lord’s favor” (Isa. 61:1–2) within the terms of a cyclical liturgical calendar. According to the calendar, the Sabbath or Sabbatical year (Ex. 23:10–11; Lev. 25:1–7, 18–22; Deut. 15:1–18), which was to be celebrated every seventh year, rested the land by allowing Earth to remain fallow, trees and vines unpruned. Humans were to feed upon the harvest of the sixth year, while allowing the poor and animals to forage volunteer grains and fruits. The removal of the agricultural demarcation between wild and domesticated animal as also between weed and cultivated crop allowed for the freedom of animal and plant, while revitalizing seed stock. Deuteronomy 15 also names this “the year of remission,” and Ezekiel “the Year of Liberty” (Ezek. 46:17; see also Ex. 21:2–6). During this year of amnesty, debt and human servitude among the Hebrews themselves would be canceled or redeemed by other family members. Nehemiah 10:31 hints at the continuing practice of this Sabbatical year phenomenon during the fifth century B.C.E.

As a year of liberty throughout all the land, the Jubilee or fiftieth year in the cycle was to be a once in a lifetime liberative transformation of all relations (Lev. 25:8–17, 23–55 and Num. 36:4). After every seven sabbatical year cycles, all land reverted to its original pattern of tribal, clan and household distribution. Forgiveness of debt and return to the ancestral land prevented the development of a landed aristocracy, since the sale of land amounted to a lease which could not exceed the life of a generation. The Jubilee also spelled a second year of freedom for the nonhuman constituents of the land community – hence, no cultivating of the soil was to be undertaken, no sowing of seeds was to practiced, neither any pruning nor harvesting. Textual citations averring to the practice of Jubilee range from that of the prophet Jeremiah (34:8–15) in the late seventh century B.C.E. through the work of the prophet Isaiah (61:1–11) to the time of the Maccabees (1 Macc. 10:43, 15:8) in the late second temple period of the first century B.C.E. While these texts do not record direct ecological ramifications from the practice of Jubilee, Ezekiel 47–48 gives poetic and visionary elaboration to such – as does Revelation 21 in the Christian testament.

Historically speaking, the notion of keeping every seventh day as a Sabbath day (Lev. 16:31; 23:3; Ex. 23:12; 35:2–3) may have been the last aspect of the cycle to develop and probably should be read in tandem with the Sabbath year insomuch as it reiterates sabbatical concerns on a more regular, if less extensive scale. Two interrelated traditional memories have been melded into the practice of the Sabbath day – the liberation from slavery via the Exodus from Egypt (Deut. 5:12–15) and the sense of restful, creative fulfillment associated with the seventh day in the priestly creation account (Gen. 1). By suggesting that God’s rest was built into the rhythm of the Earth as a law of natural time, this commandment deactivated the obsessive aspects of labor, which as psychic compulsion or economic condition can otherwise become as obsessive as enforced slavery within urban or marginal agricultural situations. Insomuch as rest breaks the instrumental use or objectification of any and all members of the land community (people, animals, slaves, and Earth), keeping the Sabbath day anticipates the Sabbatical and Jubilee years.

Christian Biblical & Theological Considerations

That Rome was the first empire in at least two millennia to refuse debt cancellation may be most significant for understanding the demands for a Jubilee situated at the beginning of the Christian testament. At the time of Mary and Jesus, Jews in Galilee were living at the intersection of several colonizing political institutions – the Pax Romana, the Hasmoneans, and the temple-state of Herod Antipas; how Jews, especially peasants, experienced this Roman-introduced “state of peace” was quite distinct from how Romans themselves thought of their policy. Indeed, Jews of Galilee apparently experienced the Herodian construction of Tiberias along with the Roman architecture of basilicas and aqueducts as, among other things, interfering with the flow or “liberty” of their naturalized sacred cosmology. Consequently what happens to Jesus could be read as the reaction of political, economic, and religious powers to the reintroduction of a demand for a baseline of just relations within the land.

While the celebration of the Sabbath-Jubilee cycle may not have always followed the precise pattern as codified by Israel’s priests, the expectations of Jubilee seem close to the surface when reading the Christian gospels. Isaiah (61:1–2) called the Jubilee the “year of the Lord’s favor,” and this hope for an alternative to the socio-political and economic pattern of empire and temple was taken up by Luke as the framework for Jesus’ ministry (4:18–19, but also 1:46–55). While Luke’s evocations of Jubilee appear most textually prominent, Matthew as well as Luke transmits this demand in petitionary form in the Lord’s Prayer (i.e., “forgive us our debts” [Matt. 6:12]), and in the telling of the parable of the unforgiving servant (Matt. 18:21–35; Lk. 7:40–43). The Hebraic tradition of debt redemption, within which the gospel writers set Jesus’ ministry, recognized that “forgive us our debts as we forgive our debtors” had to do with the transaction of properties, with the restitution of peoples to place so as to assure self-sufficiency.
Sacramental moments are experiences of the loving and creative presence of the Spirit. Creation flows from divine vision and is the locus of the human experience of divine presence. People perceive signs of the Spirit in creation, signs that might or might not be acknowledged but which nonetheless link innermost human being with divine Being. People have moments of engagement with the Spirit when they are open to the loving and creative presence of the Spirit in evolutionary creation.

In Christian churches, sacraments traditionally have been religious rituals, mediated by a member of the clergy in a dedicated, human-constructed sacred space, which are visible signs or symbols of an invisible experience of God’s “grace” – divine presence expressed in relational love – in significant life moments. Recently, pristine places also have come to be viewed as sacramental because they reveal the Spirit’s loving creativity in their biodiversity, textured topography, and provision of food, water and shelter for the community of life.

The term “sacrament” in the Catholic Church usually is applied to seven church rituals, presided over by a priest in a church building. These rituals, derived from teachings and actions of Jesus, were formalized by the Council of Trent (1547–1563). There have been exceptions to this reserved use of the term. For example, the Vatican II document Lumen Gentium called the Church a “sacrament”; and Pope Paul VI stated that “the poor are a sacrament of Christ,” a theological expression of the teaching of Jesus in the Last Judgment story in Matthew’s Gospel (Matt. 25:31–46).

In 1991 the U.S. bishops, in their national pastoral letter Renewing the Earth, said that creation as a whole is sacramental. They declared that “The Christian vision of a sacramental universe – a world that discloses the Creator’s presence by visible and tangible signs – can contribute to making the Earth a home for the human family once more sustainable practices. If the Lord’s Prayer carries such a prophetic memory as the Sabbath-Jubilee practice, the ancient baptismal claim from the Pauline tradition (i.e., “In Christ, there is neither [slave, Jew, male] nor [free, Gentile, female]” [Gal. 3:28]), may also recollect the resuming of structural demarcations in the year of Spirit’s amnesty.

In summary, Sabbath-Jubilee suggested an economic practice of the redemption of human livelihood. This restoration of a person to his/her allotment of subsistence sustenance served as a baseline of what was construed as justice. The redemptive cycle periodically interrupted distinctions (e.g., free/slave, rich/poor) which might otherwise be leveraged into enduring systemic oppressions. Unlike later strains of Christianity which articulated the hopes for a “new earth” via apocalyptic cataclysm and the consequent amelioration of all that represented “fallen nature” (e.g., death, transience, temporality, finitude), these cyclical practices recognize that human social and environmental relations do tend to drift towards inequality, but can also be rectified through a change of human social behavior. Suggesting that the Sabbath names what was seen as the equilibrium of shalom or well-being with the Earth, this liturgical cycle oriented one to the nature of work, the goal of human life, the way of living with Earth and other Earth creatures. It suggested a practiced harmony that denied neither the flux nor disequilibrium of systems, but nevertheless took seriously the charge to secure the welfare of the poor. Today we recognize that such a redemption from indebtedness among the poor of the world would also entail ecological redemption of the devastated lands to which the poor have been marginalized. To cite but one example of how economic indebtedness can be related to ecological devastation: the 33 African countries classified as heavily indebted suffered 50 percent more forest loss than non-indebted African countries (Friends of the Earth). Reconsideration of these ancient practices has recently inspired several environmental programs – namely, the UN Environmental Sabbath, Jubilee 2000, and the reclamation of weekly Sabbath as a practice of Earth healing.

The bishops of Alberta, Canada, in their 1998 pastoral letter *Celebrate Life: Care for Creation*, taught that Catholics see creation in a sacramental way. The abundance and beauty of God’s creation reveals to us something of the generosity of the Creator. God is present and speaks in the dynamic life forces of our universe and planet as well as in our own lives. Respect for life needs to include all creation.

These church teachings state that the whole of creation can be sacramental for the person of faith, revealing God’s grace – offering presence and life – conferring productivity. The sacramental universe teaching has scriptural bases in passages such as Wisdom 13:5: “from the greatness and beauty of created things their original author, by analogy, is seen”; and Acts 17:28: “in God we live and move and have our being.”

A sacramental place is naturally a commons: a home shared by all the members of the community of life. In it, their food and habitat needs are integrated, their competitive needs are balanced, their relationships are inter-dependent, and their associations are consciously or unconsciously collaborative. The commons is the locus of engagement of the biotic and abiotic communities, internally in their respective modes of being and engagement and externally in their interaction with each other. The commons is the place in which dynamic natural history evolves, diversifies and complexifies, and the base from which cultural history develops in all its intricacy.

In the Bible, human property in land and goods is part of a human commons (Acts 2:44 describes how the early Christian community “had all things in common”), which is to provide for human needs. In a complementary way, the Earth is a commons: shared space and the source of life-providing goods for all creatures. The Earth commons, then, is not intended solely for humans’ use and enjoyment, although as part of the biotic community they share in its benefits; it is being created to provide for all creatures as they live related to and dependent on each other in complex ecosystems.

The sacramental commons is creation seen as the locus of the interactive presence and caring compassion of the Spirit. It implies that people are called to integrate the spiritual meaning of “sacramental” and the social meaning of “commons” and engage in concrete efforts to restore and conserve ecosystems: to care about and care for creation as a whole, and to care about and for the members of the biotic community.

The “sacramental universe” becomes localized in the “sacramental commons” when Creator Spirit and created spirits consciously engage each other in sacred space, which is every place in creation. People in their spiritual center experience sacramental moments in sacramental places of a sacramental commons in the sacramental universe. As “sacrament,” a place at special moments is revelatory of God-immanent; as “commons,” a place at all moments is a sign of the creativity of God-transcendent, while simultaneously providing the natural goods necessary for the well-being of the community of all life. In acknowledging a “sacramental commons,” people express an appreciation of the sacredness, integrity, and life-sustaining qualities of creation.

Ethical conduct and ecological consequences flow from sacramental understandings of cosmos and commons. Christians who acknowledge the creative, communicating and community-creating immanence of the Spirit in creation, recognizing thereby the revelatory power of creation as a whole and of the biotic community within it, treat Earth and Earth’s inhabitants with reverence and respect. In understanding that the Spirit intends that Earth’s goods meet the needs of all Earth’s creatures, they avoid consumerism and exploitation. In viewing creation holistically, they act responsibly toward those who are strangers in space, time and species, not solely the human “neighbors” who have the most noticeable claim on their concern, but also otherkind and pristine nature that comprise the variant forms of the community of creation ever emerging from the creative power and loving presence of the Spirit. Within this consciousness, generational and intergenerational responsibility are fostered, the limits on Earth’s liveable space, productive places, and available goods are respected, and space, places and goods are shared equitably.

*John Hart*

An increasing concern of mine is the use and misuse of the idea of the sacred in the modern world. During the great disaster of the twin towers and Pentagon we constantly heard from the media of many things we “hold sacred,” among them our respective freedoms, but other more mundane things. While we certainly needed reassurance that we were the good guys, even when we learned that we had trained most of the terrorists to kill Russians and that we had been a major supporter of the Taliban, the idea of holding things sacred has such a typical American individualist ring that the words now mean very little. We use the phrase to cover all our activities and seem to believe that our attachment to things gives them a sacred validity they would not otherwise have. Contrast this attitude with those of the people of the Middle East, many of whom have no hesitation in sacrificing themselves for beliefs they hold sacred. We can hardly be accused of understanding what the word means in its larger context.

I had previously encountered this flippant American attitude when discussing the sacred nature of the Devils Tower or Bears Lodge to an audience of environmentally conscious people. I explained that several Indian tribes had discovered a feeling of the sacred there and had learned to do ceremonies that enhanced the lives of the people and animals that recognized its power. During the question-and-answer session following my presentation I was, as one might expect, confronted by a husky young man who argued that people should be able to climb the mountain any time they wanted because they held mountain climbing sacred and it was one of the greatest challenges they could face.

In America, religion is easy. We approach it like people at a swap meet, changing and exchanging beliefs to fit our current mood or understanding, seeking a bargain or hoping to find instant reality so that we can confirm the validity of our way of life. It never occurs to us that the way we use religious terminology says much of the depth of our understanding. We act as if we were primarily responsible for the creation and manifestation of the sacred. In other words, in holding things sacred we endow those things with our personal energies, and we believe that we have experienced the same kind of feelings that our ancestors had when they used the same words. Using this logic it is safe to say that we do not believe the sacred exists except for when we call it into being.

I tried, rather unsuccessfully I might add, to distinguish for the young mountaineer the difference between intuiting the sacred in nature and proclaiming a site to be sacred to an individual. Quite obviously if we are able to bestow sacredness then religion in America is a matter of individual choice and not a case of apprehending the mysterious power that seems to be the ground of everything. The Sioux, Cheyenne, and other tribes who perform ceremonies at Bears Lodge do so because they have had experiences so extraordinary that they understand it as a place of reverence.

Many years ago I encountered a book that has been seminal in all my thinking: Rudolf Otto’s *The Idea of the Holy.* In it Otto analyzes the constituent elements of the experience of the Holy: *mysterium tremendum fascinans.* The great mystics of all world traditions and the shamans and medicine men of hundreds of smaller groups have testified to the feeling of finitude and helplessness followed by recognitions of compatibility and peacefulness and the absolute emotional certainty created in their beings by this experience. It is mysterious, upsets our intellectual beliefs with a devastating display of energy, and remains with the individual as a fascinating, attractive presence and reminder that there are dimensions to life we cannot possibly imagine.

We need only call to mind Samuel in the Temple hearing a voice, Isaiah confronted with the majesty of a divine throne room, or Black Elk riding with the thunder beings or entering the tipi where the Six Grandfathers gathered to begin to understand that the sacred is a powerful presence when it descends on a human being. The majority of people experiencing this *mysterium tremendum fascinans* report not simply a feeling of insignificance, but their great hesitancy in placing themselves in a situation where they might encounter the sacred. Most people have several preliminary encounters with voices or omens and they pray that they will not be chosen and set aside from their communities to become a holy person. It is unquestionably a burden and it may be an overwhelming burden.

Our popular conception of the sacred can hardly compare with the body of data we have describing the experience of the sacred. In previous decades we used to require of people becoming priests and ministers to have a “call” from God before they enter into the religious life. Anyone describing a call from God in picturesque terms today would certainly be rejected for ordination or employment in our religious institutions since such an experience would be so far outside the mainstream of rational religion as to be threatening to established doctrines and dogmas. We fail to notice that once ordained, whether by an institution or via personal conversion, people representing religion today have no hesitancy in announcing that they have personally talked with God, even as they are measured for the best clothing and ordering an expensive car.

A religious vocation used to imply another realm standing in judgment of our familiar natural world. It had a purpose and direction that guided us in spite of our errors and shortcomings. Those people who received a vocation were destined to become the fulcrum points in a larger historical scenario that was moving toward a celestial conclusion. We were, in a sense, co-creators of the future along with the mysterious presence that provided us with clues and insights into the nature of religion and reassured
us that we would ultimately be justified. Revelation was the continuous presence of the sacred to which we were obedient.

Basic religious experiences can be almost anything from the rapid hypnotic heartbeat of fundamentalist hymns to the contemplative moments spent staring onto the Grand Canyon, from ecstasy to a near-comatose state of reflection. Unfortunately we are not inclined in this society to probe any deeper and while we may be properly called aesthetes, I doubt if we have any profound sense of religion in the old classical sense since we stand in awe of nothing and know not of how to contact the truly sacred. A new factor has recently emerged that may invoke substantial changes in the way we view the sacred. For several decades, we have seen the rise of “Near Death Experiences” (NDE) that seem to speak of the continuity of life with data we have not before considered.

In the typical NDE, people facing a severe health crisis, or experiencing a traumatic event such as an automobile accident, find themselves floating above their bodies as the scene unfolds below them. Patients report having unusual powers in this state of being which include being able to walk or fly through physical things, objects, and full command of their thought processes, often wondering what had happened to them. A significant number of people report a tunnel-like landscape in front of them at the end of which is a strong white light, brighter than they have ever seen, and feel an intense desire to move toward it. Often a relative or friend who has passed on earlier greets them.

Most of the literature, and there is an impressive number of books by competent doctors now, concentrates on proving that we have an immortal soul or that there is no judgment placed on our lives, although some people say they were asked to review their lives to that point. Depending on the doctor’s range of patients reporting this phenomenon, Jesus greets some people; others see no identifiable religious personality at all. Scientists rejecting NDE experiences have claimed that they can reproduce all the significant elements of these events by probing certain parts of the brain with electrical impulses. No one, however, has been able to reproduce the sequence of the phenomena of NDE. Whether such experiences prove the existence of the soul is irrelevant to me. More important is the fact that people are told they must return to their physical lives because they have not yet accomplished their mission in life.

In religion we often talk about the religious “mission” of the founder and his disciples as if it were something preordained, and NDE seems to validate that concept. Tribal societies were based on a similar idea – that each individual had a specific path to walk – and vision quests were a regular part of seeking this path. One might not be given powers to use in one’s daily life, but certainly from all reports no one who made a sincere effort to establish a relationship with the higher powers went unacknowledged. In the NDE case, it seems certain that a pre-determined life is the standard for everyone, not just outstanding religious personalities, and the mission may simply be one of caring for family and friends, exercising a certain trade or profession, or acting as a friend to assist others in accomplishing their life’s mission.

In Sidney Kirkpatrick’s new biography of Edgar Cayce, he reports a dream Cayce had in 1941 while giving a reading. In Kirkpatrick’s words, Cayce was permitted to visit a great hall of records, which housed bound volumes of recorded events both past and future. The records not only told of what was, but what might have been. According to this dream, had he not married Gertrude Evans, she would have died of tuberculosis in 1906. And Edgar himself would have died, in 1914, from a debilitating stomach condition (Kirkpatrick 2000: 81).

In Plenty Coups, the life story of a Crow Indian, Plenty Coups had a vision in which he found himself staring at an old man who was bent, gray and very debilitated, and as the picture became clear in his mind, he realized that this pitiful old man was himself in the far-distant future. Cayce had alternate life scenarios; Plenty Coups saw the result of his life’s journey.

We have sometimes involved ourselves in discussions of the omnipotence of God and asked how, if he is all-knowing, we can have free will to choose. Cayce’s dream of the bound books suggests that the decisions we make do have profound consequences and that we may be co-creators of the world as it moves into the future. Apparently we can create the future course of events since every decision has some definite alternatives that are realized by our choice. Life, then, has meaning every step of the way.

Everyone with a scientifically bent mind will certainly object to including this kind of data as religious because it cannot be duplicated in a scientific experiment. It is good to get the narrow scientific minds safely on the sidelines when we examine this data because they reject everything that does not fit the materialistic paradigm. There are many things in life that cannot be repeated because they are unique to ourselves or part of a process of growth that cannot be duplicated. There is an old Victor Herbert song “Toyland” that insightfully states that once we pass Toyland’s border we cannot return again. Thus our first adolescent crush, our first effort to swim, the time we recited a poem in kindergarten, when we had our first child, when a parent died, almost the whole spectrum of things we experience have a quality all their own and cannot be duplicated by a white-frocked scientist.

How then, do we recapture the sense of the sacred in our lives? If choices are important and, once made, they project particular paths of activities, we can maximize the
choices available to us by recognizing that we are helping to create the coming historical scenarios. It seems to me likely that Near Death Experience may be the manner in which the sacred mystery of the universe is reaching out to us. Certainly in a highly urbanized society we cannot be expected to find a place of isolation and open ourselves to this mystery. The sacred may be offering us a new chance to understand the meaning of life. Patients reporting on NDE say their lives and their view of how they were living were permanently changed by the experience.

Today in the study and practice of religion we have abandoned traditional concepts and treat religion like a strange form of sociology. We have very little empirical data to examine so we simply increase our efforts to study obscure points in various traditions. What insights we could gain if we took the phenomena rejected by science and institutional theologians and asked deep and probing questions of it. We would soon learn considerably more about our world.

Sacred Geography in Native North America

“Portals to the sacred” is an expression I use to convey belief common among Native Americans that there are specific places that possess great sacredness, and this concept illuminates the ritual functions of sacred sites in Native North America. Such “portals” should not be viewed as limited in size or scale. Some may be large in their geographical extent while others are limited in size. Likewise, use of the portals concept must include the understanding that they are not only positioned in geography but also positioned in time, such that they become sacred “time/spaces.” Although the concept of the “sacred” is employed widely in recent discussions of sacred geography, no satisfactory definition of this fundamental idea has been offered.

Basic ethnographic research concerning American Indian concepts of sacred geography is sparse. The recent collection of papers edited by Christopher Vecsey (1991), the Handbook of American Indian Religious Freedom, stemmed from this absence of research but must be regarded as only a beginning. Research on this topic is abundant for many cultures of Asia, Europe, the Middle East, and Mesoamerica (e.g., Townsend [1982] and Vogt [1965, 1969]), but with few exceptions (e.g., Harrington’s 1908 “The Ethnogeography of the Tewa Indians”) is a subject largely undeveloped for most regions in North America and northern Mexico. Based on what published sources are available, the following trends seem most common.

In addition to being vital to ritual practice, sacred geography in Native North America is a source of religious meaning in group identity and group cohesion. Sacred sites in Native North America are invested through ritual with complex layers of religious meaning. Tribal religions in Native America differ from most other world religions in their conceptions of the sacred and in their conceptions of sacred geography.

Definitions of the Sacred
In his Elementary Forms of the Religious Life, Durkheim defines the sacred as follows:

A religion is a unified system of beliefs and practices relative to sacred things, that is to say, things set apart and forbidden beliefs and practices which
unite into one single moral community called a Church, all those who adhere to them (Durkheim 1947: 47).

Fundamental to this definition is the distinction Durkheim draws between the sacred and the profane:

The opposition of [the sacred and the profane] manifests itself outwardly with a visible sign by which we can easily recognize this very special classification, wherever it exists. Since the idea of the sacred is always and everywhere separated from the idea of the profane in the thought of men, and since we picture a sort of logical chasm between the two, the mind irresistibly refuses to allow the two corresponding things to be confounded, or even to be merely put in contact with each other . . . The sacred thing is par excellence that which the profane should not touch, and cannot touch with impunity. To be sure, this interdiction cannot go so far as to make all communication between the two worlds impossible; for if the profane could in no way enter into relations with the sacred, this latter could be good for nothing . . . The two classes cannot even approach each other and keep their own nature at the same time (Durkheim 1947: 40).

This classic distinction does not fit American Indian conceptions of the sacred in Native North America, because the sacred is not viewed as a domain set aside, distinct, and forbidden as Durkheim suggests. Instead, the sacred is an embedded, intrinsic attribute lying behind the external, empirical aspect of all things, but not a domain set aside or forbidden. The situation is both more complex and more subtle. For example, among the Lakota this embedded, intrinsic attribute is wakan; among the Algonkians it is manitou; among Ute-Aztecans it is pu'ha; among the Sahaptians it is weyekin; and among the Salishans su’shesh. In this large region, accessing the sacred is a primary goal of ritual and entails actually entering into sacredness rather than merely propitiating it. Whereas certain cultures tend to create their own sacred space and sacred time somewhat arbitrarily by special rituals of sacralization, American Indians of North America more often attempt through ritual, visions, and dreams to discover embedded sacredness in nature and to locate geographical points that permit direct access to it in order to experience it on a personal level. Unlike Durkheim, Eliade’s view of hierophanies is somewhat more compatible with American Indian views of sacred geography. Citing Eliade, Carrasco says,

In Eliade’s view, all religions are based on hierophanies or dramatic encounters which human beings have with what they consider to be supernatural forces manifesting themselves in natural objects. These manifestations transform those objects into power spots, power objects, wonderful trees, terrifying bends in the river, sacred animals. The stones, trees, animals, or humans through which a hierophany takes place are considered valuable, full of mana, things to be respected and revered. Human beings who feel these transformations in their landscape believe that a power from another plane of reality has interrupted their lives. Usually, they respond with a combination of great attraction and great fear. Their lives are deeply changed as a result of this encounter with numinous places (Carrasco 1979: 203).

Sacred Geography in Native North America: General Features

It is the rule rather than the exception that American Indian ritual life is inextricably linked with access to and ritual use of sacred geography. Traditional American Indian spiritual leaders generally assert that the geographical locations of rituals are vital to their efficacy; unless rituals are performed in their proper times at their proper geographical locations they will have little or no effect. Although there are significant differences among American Indian religions, they generally share the following characteristics central to understanding American Indian sacred geography:

1) A body of mythic accounts explaining cultural origins and cultural history, which depend upon the geographical area. These describe a prehuman or precultural time dominated by heroes, tricksters, other mythical figures, and animals indigenous to the area.

2) A special sense of the sacred that is centered in natural time and natural geography.

3) A set of critical and calendrical rituals that give social form and expression to religious belief and permit the groups and their members to experience the events of their mythology in various actual geographical ritual settings.

4) A group of individuals normally described as shamans or priests who teach and lead the group in the conduct of their ritual life.

5) A set of ethical guidelines establishing appropriate behavior associated with ritual and extensions of ritual into ordinary life.

6) Reliance on dreams and visions as the primary means of communicating directly with spirits and the sacred. These and oral tradition are the primary sources of sacred knowledge.

7) For individuals, the major goal of ritual is gaining the spiritual power and understanding necessary for a successful life by engaging the sacred at certain special times and in certain special places.
8) For groups, a belief that harmony must be maintained with the sacred through satisfactory performance of rituals and adherence to sacred prescriptions and proscriptions.

9) A belief that while all aspects of nature and culture are potentially sacred, there are specific places that possess great sacredness, which I term “portals to the sacred.”

10) In their religious life, American Indian groups of Native North America are rarely hierarchically organized; nor do they favor the tightly constructed hierarchical mythologies or philosophies developed by priestly elites of either the Old or New World agricultural societies; calendrical reckoning of ritual life is somewhat less important among hunting groups of Native North America.

11) The sacred sites of Native North America are more numerous, more diverse, and less geometrically patterned than is seen among religions of Mesoamerica and the Old World. This reflects the diversity of cultural groups in Native North America who are not often unified into only a few major religious systems of the types found in the Old World and Mesoamerica.

12) Mountains and other points of geographical sacredness are not so often at the center of religious life in Native North America as in the Old World or in Mesoamerica. Nor are mountains identified as frequently with the state, with society, or with the group as in Mesoamerica and the Old World. This probably again reflects the diversity of cultural groups in most of Native North America as well as the general absence of large-scale political and religious systems.

13) Generally, hunting groups in Native North America seek the intrinsic or embedded sacredness of nature and do not often force their notions of sacredness onto the land in the manner of the pyramid builders and Earth sculptors we see in both the Old World and Mesoamerica.

14) Ritualists in Native North America are generally shamanic unlike the priestly figures encountered in the more complex religious systems of Mesoamerica and the Old World. Priests are more often identified with large-scale political and religious systems that encompass various cultural groups.

15) Sacred sites are numerous and include the following types (see Walker 1991):

   a) Shrines, vision-quest sites, altars, and sweat-bath sites that serve as ritual settings.

   b) Monumental geographical features that have mythic significance in a group’s origins or history. Included are mountains, waterfalls, and unusual geographical formations such as Pilot Knob, Kootenai Falls, Celilo Falls, and Mount Adams.

   c) Rock-art sites such as pictograph and petroglyph panels.

   d) Burial sites and cemeteries.

   e) Areas where plants, stones, Earth, animals, and other sacred objects are gathered for ritual purposes or where sacred vegetation such as medicine trees serve as objects or centers of ritual.

   f) Sites of major historical events such as battlefields where group members died. Sites where groups are thought to have originated, emerged, or been created. Pilgrimage or mythic pathways where groups or individuals retrace the journeys and reenact events described in myths and in the lives of mythic and other figures. Lakes, rivers, springs, and water associated with life and the vital forces that sustain it.

   j) Areas or sites associated with prophets and teachers such as Smohalla, Handsome Lake, Sweet Medicine, and others.

Ethnographic investigation of several hundred sacred sites suggests strongly that they are an essential feature of American Indian ritual practice. Without access to them, practice would be infringed or prevented altogether in certain cases. Likewise, all known groups possess a body of beliefs concerning appropriate times and rituals that must be performed at such sites. The more important a sacred site is in the ritual life of a group, the more numerous symbolic representations it will have in art, music, and myth. It has also become clear in this review that sacred sites also have very diverse functions in that they serve to objectify key cultural symbols, illustrate dominant religious metaphors, and sustain patterns of social, economic, and political organization. Sacred sites can also serve as indicators of cultural unity as seen among the various medicine wheels described by the Arapaho and their neighbors of the Northern and Central High Plains. In general, sacred sites lend concreteness to the less visible systems of linkages within and among different cultural groups. Sacred symbol systems, when superimposed on geography, give to geography a significance and intelligibility similar to relatives such as father, mother, or simply kinsmen. Through ritual, sacred sites function to create a conceptual and emotional parallelism between the objective order of the universe, the realm of the spirits, and the intellectual constructs of American Indian cultures. They are portals between the world of humans and the world of spirits through which sacred power can be attained and spirits contacted. Such sites give order to both geographic and social space, and by thus ordering natural space and time they give order to all that exists.

Sacred sites involving a conjunction of geographical, social, seasonal, and other transitions enhance opportunities to access the sacred. In observing these conjunctions of multiple transitions, I have been struck by the parallel-
ism of these ideas with those of Arnold Van Gennep concerning rites of passage (1960) and others who have demonstrated that the rites of passage in the human life cycle are ritually celebrated as times of great sacredness in the life of the individual. From this perspective, the sacred may be more easily experienced as individuals go through life-cycle transitions, especially when such transitions are conjoined with other transitions such as “first game” or “first fruits” rituals that may coincide with additional transitions such as equinoxes and solstices. Similar transitions in the lunar cycle in which the first quarter, second quarter, third quarter, and full moon are seen as paralleling the human life cycle in birth, adolescence, marriage, and death are further transitions in nature that may coincide with transitions in the lives of individuals and communities. In Native North America the conjunction of multiple transitions provides heightened opportunities for accessing the sacred, especially at points of geographical and environmental transition such as mountaintops, waterfalls, cliffs, and other breaks in the landscape.

Conclusion
From this view, therefore, sacred sites and sacred geography among cultures of Native North America function as fundamental ingredients of ritual. Points of geographical transition are joined with multiple transitions in the seasons, the sun, the moon, the life cycle of the individual, and the rhythm of community life to form conjunctions of multiple transitions that become especially powerful access points to the sacred or hierophanies. This view of sacredness and sacred geography stresses the embeddedness of the sacred in all phenomena, distinguishes between the general sacredness of all things and the specific sacredness of access points or portals to the sacred. It also notes the importance of conjunctions of multiple transitions in the individual life cycle, in nature, in community, and in tribal life, and how such multiple transitions help establish the times of greatest sacredness and ritual efficacy of sacred sites. It rejects the Durkheimian view that the sacred is a domain set aside or forbidden, and agrees more with the view of Eliade (1964, 1969, 1972) that the sacred can be accessed and experienced directly through ritual practice at appropriate times and in geographical locations.

Sacred Groves of Africa
Sacred groves, which may be forest patches, clusters of trees and even individual trees, are recognized by many African ethnic groups; this recognition often implies that “the community has established a covenant with deities or other sacred entities to refrain from certain uses of the environment” (Lebbie and Freudenberger 1996: 203). Any attempt to do more than list well-known examples of sacred groves, for example, by providing a classification of these sites according to various criteria, runs into many problems. By their very nature, sacred groves are objects of fear and respect, about which people are reluctant to share information with outsiders. In the early years of colonial rule knowledgeable local community members hid much arcane information from colonial officers and missionaries; more recently, many elements of traditional
beliefs systems have been lost, so published sources, of whatever date, are likely to have incomplete information. Even in the post-colonial era, traditional custodians of the groves may deny outsiders the right to enter, as two Nigerian scholars, Okafor and Ladipo, discovered in 1992 when they carried out a study of fetish groves in southern Nigeria. Attempts to analyze unwritten and evolving belief systems also have to cope with the perception that the sacred essence of the groves may be based on several properties, and that some of the groves have multiple functions.

Lebbie and Frederenberger (1996), Michaloud and Dury (1998) and Laird (1999) provide useful short overviews on the significance and function of sacred groves, and readers interested in sacred groves in Africa would also do well to pay attention to some of the extensive literature on Asia. Unlike in Asia, sacred groves in Africa are not typically the site of an actual temple structure; an exception is the sacred grove at Oshogbo (Nigeria), which has over recent decades been the site of considerable architectural and sculptural development, much of it inspired by Suzanne Wenger, a Yoruba priestess of Austrian origin. In Africa, sacred groves may be revered as the residence of a deity, as is the grove of the goddess Numafooa in the Nanhini area of southern Ghana. Another grove particular to a deity is the Pinkwae grove in central Ghana, home of the Afiye god whose powers enabled the Katamanso people to defeat the Ashantis in battle. In Anloga, southern Ghana, the Nyiko grove held the shrine to Nyigbla, the Anlo’s war god.

Groves may also be revered as the home of ancestors or other benevolent or malevolent spirits. Rituals in the kaya forests of coastal Kenya begin with the erection of small grass houses for the spirits, known as vitisimbakazi in the local Mijikenda languages. The Kikuyu believed that trees possessed spirits capable of interfering in human affairs, and when clearing land, people had to leave a large and conspicuous tree at intervals to absorb the spirits from the trees that had been cut down. This tree was not supposed to be cut or allowed to fall without a ceremony transferring the spirits to another tree.

Some groves are burial sites of certain ancestors or revered elders; Kaya Kinondo in Kwale District contains the grave of Nkomboboza, a distinguished female rainmaker and clan ancestress. In North Pare, Tanzania, many clans keep their ancestors’ skulls in sacred forests, which are also believed to cause rain. In Benin there are graveyard forests where people who have died from accidents or infectious diseases are buried, while in Moyamba District of Sierra Leone there are forests where fetuses removed from the bodies of women who died while pregnant are buried. These forests are controlled by women and their flora and fauna are considered abominable, never to be harvested, particularly by men.

Sacred groves may be located at particular sites, such as mountaintops or ridges (for example among the Kikuyu of central Kenya, as described by Castro and other authors) or along and around bodies of water which themselves may also be sacred. To the west of Anloga in southern Ghana lies the Blolui pond, the home of a powerful goddess, which was formerly surrounded by a thick, dark grove. In such cases the presence of a sacred grove affords protection to the natural vegetation in environmentally sensitive areas such as steep slopes and river banks, contributing to soil and water conservation and reducing the risk of environmental degradation.

While some sacred groves are set apart from human settlements, they can also be located within or close to villages. Trowell and Wachsmann describe Karamoja and Teso villages in northern and eastern Uganda as having an “Abila, or central tree, round which are little shrines and stones for sacrificing to the gods and where the hunter places his spears in preparation for the hunt” (1953: 78). In the Oromo region of Ethiopia trees such as Euphorbia canadabrum are planted around churches and on graves because “it is believed that trees on a grave look like the flesh of the dead person and serve as statues” (Kelbessa 2001: 44). Every living Oromo has their own dallik tree, which is a symbol of peace and stability, the abode of spirits, and a link between waaqa (God) and the individual. In some areas, fences are built around these trees, which may be of a variety of species.

Historic or prehistoric events may explain the sacred nature of certain groves, for example, stories of community origin. The Mijikenda believe that their ancestors originated from a northern homeland and migrated southwards several centuries ago to the areas they presently occupy. Threatened by aggressive enemies, they made their first homes in heavily fortified villages, surrounded by thick forest. Their security was further ensured by the presence of fingo, sacred objects essential to community well-being that were buried in the forest. The Mijikenda moved out from these villages as their population increased and security improved, and today the former settlement sites have been reclaimed by forest, but the respect for the groves as the historical homes of each of the nine Mijikenda communities remains. The Asantemanso sacred grove in central Ghana is believed to contain the cave from which the seven clans of the Ashanti tribe originated. Mbewe ya Mitengo in the Lower Shire Valley of southern Malawi is a sacred grove that is said to have been the capital of the Lundu state in the early seventeenth century, and is still used for sacrifices today. Most of the sacred forests in Mpigi (central Uganda) are historical sites, such as the former site of the home of an important leader, the burial site of an important clan member, or the site where an ancient leader had planted a tree. Sacred groves may be former battlegrounds, such as the Pinkwae grove in central Ghana, the site of a battle between the people of Katamanso and the Ashantis in 1826; the spirits
of those who died in the battle are believed to dwell there, as well as the Afye god.

In many pre-colonial African societies, sacred groves had political and economic importance. Among the Kikuyu, the ituika ceremonies that marked the handing over of ritual power from one generation to the next were held in the sacred groves. Sacred groves may serve as monuments to the legitimate land tenure of the communities that surround them. Communities make both socio-cultural and material use of sacred groves. Some ethnic groups hold initiation rites for young men and/or women in the groves, which are convenient sites for the periods of seclusion that many such rites involve. The groves may be the meeting places for secret or semi-secret societies, which are responsible for controlling access to the grove and use of its natural resources. The Mende people of Moyamba District, Sierra Leone, have separate groves for the men’s (pora) and women’s (sande) secret societies. In some places regular community rituals and celebrations are held in the groves, while elsewhere rituals are only held when particular needs arise, for example, when there is a risk of drought, disease or war. The Mijikenda believe that if appropriate rituals are held in the kaya forests, involving sacrifices, eating of ceremonial food, drumming, dancing and prayers by the kaya elders, rain is sure to follow within a few hours. Rituals may be open to all community members, or restricted by age, gender, ethnicity, menstrual status or other criteria. However, not all members of a kin, ethnic or community-based social group may recognize the sacredness of a particular grove, and certainly neighboring groups may not recognize them as such.

People may visit sacred groves on their own or to consult with healers or spiritual leaders when faced with individual or family problems. In central Kenya women might rub the sap of sacred fig trees on themselves, to increase their chances of having children. At the sacred grove of Edinkra, the goddess of Nkoranza in Ghana, offerings are made to the grove and use of its natural resources may be restricted to the local chiefs responsible for the rambotemwa (“refuse to cut”) sacred woodlands of the Karanga people of southern and central Zimbabwe made sure that the trees were not cut, but women were allowed to collect deadwood and some hunting was allowed. In coastal Kenya traditional healers, including women, collect medicinal herbs from the kaya forests, though there are particularly sacred areas within these forests, which even they would not normally approach. Some Mijikenda also claim that in the past women were allowed to collect dead wood from the kaya forests for domestic use. As with participation in rituals, entry to the grove to extract resources may be restricted to certain groups, or limited according to a daily, weekly, monthly or seasonal schedule. At Nkodurom nobody is allowed to enter on a Thursday, which is believed to be the day of rest of the original fetish priest of the grove. Visits to Kaya Kinondo are not permitted by the elders during two days at the new moon, on the fourth day (“chipalata”) of the Mijikenda four-day week, or early in the morning and after 5 p.m., when the gods and spirits are resting.

Certain plant species may have sacred status, whether or not they are growing in a sacred grove. Falconer names two trees Okoubaka aubrevillei, Chlorophora (Milicia) excelsa and a liana (Spiropetalum heterophyllum) as sacred to many communities in her study area in southern Ghana. In Buganda, central Uganda, individual trees are said to have the ability to prophesy, including one called Kaindu, and a forest called Nakalanga. Among the Ban-yoro, also of central Uganda, a sacred tree called kirikiti is used to make drums played at the royal court. Among the Kikuyu of central Kenya, the mugumo tree (Ficus natalensis) is the most significant sacred tree, though other species of Ficus may also be sacred. According to Castro “A single tree within a groove often formed the focal point of ceremonies” (1990: 279), but he goes on to say “not every fig tree was sacred, nor were figs always found in the groves.” The Shona of Zimbabwe recognize several species of sacred trees; individual ancestral spirits are believed to dwell in large specimens of Parinari curatellifolia, which is also used for rainmaking festivals. Another example from Zimbabwe is Gardenia spatulifolia, which protects against witchcraft and lightning, and a tree called muminu whose removal from a field is said to precipitate fighting between spouses or during a beer and work party. In parts of South Africa, the marula (Sclerocarya birrea) has sacred status, but also material value, in that its fruits may be stored or made into beer. The Oromo recognize bokkuu or scepter trees, under which officials of the traditional courts sit. No branches may be cut from them, and it is not even permitted to collect dry animal dung from around these trees.

No plant material can be collected from the Nkodurom sacred grove in central Ghana, nor can people hunt in the grove. In other cases there is a partial ban, which allows sustainable use of timber, non-timber forest products, wildlife and water resources. Mukamuri describes how the local chiefs responsible for the rambotemwa (“refuse to cut”) sacred woodlands of the Karanga people of southern and central Zimbabwe made sure that the trees were not cut, but women were allowed to collect deadwood and some hunting was allowed. In coastal Kenya traditional healers, including women, collect medicinal herbs from the kaya forests, though there are particularly sacred areas within these forests, which even they would not normally approach. Some Mijikenda also claim that in the past women were allowed to collect dead wood from the kaya forests for domestic use. As with participation in rituals, entry to the grove to extract resources may be restricted to certain groups, or limited according to a daily, weekly, monthly or seasonal schedule. At Nkodurom nobody is allowed to enter on a Thursday, which is believed to be the day of rest of the original fetish priest of the grove. Visits to Kaya Kinondo are not permitted by the elders during two days at the new moon, on the fourth day (“chipalata”) of the Mijikenda four-day week, or early in the morning and after 5 p.m., when the gods and spirits are resting.
However wood can be cut from these trees for roasting meat during certain rituals.

Sanctions on those who break the regulations on entry or use of the grove’s resources range from social (often involving payment of a fine to the elders responsible for the grove) to supernatural. Since some groves are seen as repositories of community fertility and power, transgression can lead to disaster for a whole community as well as for individuals. Mijikenda men and women interviewed around Kaya Chonyi, Kilifi District in January 2002 warned that destruction of the kaya would lead to crop failure, disease and poverty. Among the Oromo, it is believed that people who cut the bokkuu trees illegally will die soon. Around the sacred groves in northern Ghana, “It is believed that food cooked with firewood from a sacred grove could result in the death of those who eat the food” (Telly 1998: 2). People who enter prohibited forested areas of Mount Mulanje in Malawi are believed to disappear completely, or return after a month or two dead and dumb. The Karanga of Zambia believe that lion spirits chase people who flout the taboos of the rambotemwa sacred woodlands. In Kirinyaga a person who encroaches on a sacred grove has to pay a goat to the elders. People who intrude into the Nkodurom sacred grove are arrested by the traditional guards and sent to the local chief for the imposition of a fine that will pacify the gods and spirits; this may include a cash fine, several bottles of alcohol, and a sheep to be sacrificed. Offending individuals or families may also be subject to social sanctions such as isolation from community members or, as a last resort, curses imposed by particular elders.

The current status of sacred groves varies widely across Africa and even within one country or ethnic group. Groves were powerful metaphors of social, moral and ecological order, and their rituals affirmed orderly meanings of social and ecological interaction. The impact of new belief systems, in particular Islam and Christianity, has been instrumental in weakening the indigenous belief systems that protected sacred groves, and contributing to the chaos of rapid social, political and ecological change in colonial and post-colonial Africa. Greene quotes the German missionary Carl Spiess as rejoicing over school children’s apparent loss of respect for a fallen sacred tree, the “Tree of God” in the Anlo region of southern Ghana, in 1927. A comparable event occurred in northern Kenya in January 2002, when a minister of the Assemblies of God church in Laikipia District led his followers in cutting down and burning a sacred fig tree. The tree, locally called oroteti, had been the site of offerings and prayers by local elders during recent severe drought years. When the minister refused to make the required payment of a goat and local beer for the elders to cleanse him, they cursed him through traditional chants and threatened to kill him.

In the town of Anloga, the original site of the Nyiko grove is now a police station, erected by the colonial government; the shrine was moved to the outskirts of the town but the trees at the new location were cut down in the early 1960s in order to build a secondary school. Kaya Fungo, the sacred grove of the Giriama sub-group of the Mijikenda of Kenya, was destroyed by British colonial forces on 4 August 1914 in response to Giriama resistance to colonial policies such as taxation and labor recruitment. As vividly described by Brantley,

The elders watched silently as the main trees and gates were blown up, all the dwelings and trees inside the kaya burned, and the entrance dynamated and barricaded. Next day, it was reported, they went away quietly to their homes. British officials thought the matter was closed . . . But despite the outward calm, anger was simmering (1981: 111).

Hostilities escalated, culminating in a one-month military campaign during which the British forces burned at least 5000 houses and killed over 150 Giriama. Kaya Fungo was reopened in 1918 and regained some, although not all, of its traditional power. In recent decades destruction of the kaya forests has been harder to resist, occurring incrementally as the result of pressure for land for settlement and farming and the increasing demand for timber and firewood (Nyamweru 1996). Younger people have moved away from the indigenous belief systems and, driven by joblessness and poverty, are less likely to resist such destruction and may even participate actively in it. However, there have been numerous occasions, quite well documented in the Kenyan press, where elders have, sometimes successfully, resisted attempts to take over the groves and convert them to private property for commercial development. Newspaper stories headed “Elders protest destruction of shrines” (Daily Nation, 9 July 1992), “Elders threaten to curse government” (Daily Nation, 14 April 1994), “Elders urge Govt to preserve sacred land” (Daily Nation, 1 August 1997), and “A sacrifice to thank the gods” (Daily Nation, 4 July 2001), testify to the continued activity of some elders’ groups and the position of these sacred groves as highly contested resources, as well as to the interest of the Kenyan media in this issue.

Other groves are still largely intact, where pressures are less intense and the traditional belief systems continue to discourage people from entering the groves for destructive purposes. Even though population pressure and competition for land has caused the destruction or drastic reduction of many sacred groves in Kirinyaga, “respect for tradition has caused many landowners, including devout Christians, to preserve some groves” (Castro 1990: 286), and many of the groves referred to in earlier paragraphs are still in existence. In some areas where they survive, sacred groves and the belief systems that sustain them have become the focus of attention, and sometimes material support, from national and international
conservation organizations such as the Environmental Protection Agency of Ghana, the National Museums of Kenya, the World Wide Fund for Nature (WWF) and UNESCO. The continued survival of the groves demonstrates the contribution of local management and indigenous knowledge systems to environmental conservation. Examples of successful collaboration between local communities and international agencies include CIPSEG (Co-operative Integrated Project on Savannah Ecosystems in Ghana) which ran from 1992 to 1996, focusing on three sacred groves in Northern Ghana (Schaff 1998: 146), and CFCU (Coastal Forest Conservation Unit), which began in 1992, located in coastal Kenya and working to conserve the kaya forests (Nyamweru 1996: 20). Optimal strategies for collaborating with local communities to ensure the survival of these culturally and environmentally important sites are still being worked out, though differences of interests between various groups of local, national, and international stake-holders makes this a complex and challenging project. Volumes such as those edited by Ramakrishnan et al. (1998) and Posey (1999) provide an excellent introduction to this dynamic field of debate.

Sacred Mountains

As the highest and most impressive features of the landscape, mountains have an extraordinary power to evoke a sense of the sacred. Their imposing peaks, the clouds that gather about their summits, the dramatic play of light on their slopes, the waters that issue from hidden springs, these and other characteristics combine to imbue them with an aura of mystery and sanctity. In that mystery and sanctity, people of diverse backgrounds, both traditional and modern, experience a sense of a deeper reality that gives meaning and vitality to their lives.

As sacred expressions of a deeper reality – however that may be construed – mountains have become associated with the deepest and most central values and beliefs of cultures and traditions throughout the world. Mount Sinai occupies a special place in the Bible as the imposing site where Moses received the Torah and the Ten Commandments, the basis of law and ethics for much of Western civilization. The remote Himalayan peak of Mount Kailas, rising aloft above the Tibetan Plateau, directs the minds of millions of Hindus and Buddhists toward the utmost attainments of their spiritual traditions. The Hopi of the American Southwest revere the San Francisco Peaks of Arizona as the abode of the katsinas, ancestral rain deities on whom they depend for their very existence.

The sacredness of mountains manifests itself in three general ways. First, certain peaks are singled out by particular cultures and traditions as places of special sanctity directly linked to their deepest values and aspirations. These mountains – the ones traditionally known as “sacred mountains” – have well-established networks of myths, beliefs, and religious practices such as pilgrimage, meditation, and sacrifice. Primary examples would be Mount Kailas in Tibet and the San Francisco Peaks in Arizona.

Second, mountains that may or may not be revered in themselves are frequently associated with sacred persons or contain sacred sites and objects such as temples, monasteries, hermitages, stones, springs, and groves. Great numbers of people, for example, visit pilgrimage shrines located in mountainous regions, such as the Hindu shrine of Badrinath in the Indian Himalaya or the mountain monastery of Montserrat in Spain. Singling out this role of mountains, a passage in the Mahabharata, the religious epic of ancient India, describes a Himalayan peak as a “refuge of hermits, treasury of sacred places” (Mahabharata 3.43.21–25).

Third, mountains in general commonly awaken in individuals a sense of wonder and awe that sets them apart as places imbued with evocative beauty and meaning, frequently spiritual in nature. Many tourists, hikers, and climbers today go to the Alps in Europe or the Sierra Nevada in California for aesthetic and spiritual inspiration and renewal, often regarding them as expressions of important cultural values enshrined in works of literature and art. Such peaks function for them as personal sacred mountains.

People of different cultures generally experience the sacredness of mountains through the particular views they have of them, such as the mountain as center of the
universe or source of life. These views or themes differentiate the experience of the sacred and provide a framework for exploring the many different ways in which mountains function as sacred places in diverse cultures and traditions around the world. We will examine here ten of the most important and widespread of these themes.

Heaven

Many people revere mountains as high places. As the highest mountain on Earth, Mount Everest has assumed the status of a sacred mountain in the modern world. Its summit symbolizes for many the highest goal one can strive to attain, whether one’s pursuit be material or spiritual. Because of its importance in the West as the ultimate high place, the Tibetan name of Mount Everest, Jomolangma, is almost always mistranslated in Western literature as “Goddess Mother of the World.” Foreigners assume that for the Tibetans and Sherpas the highest mountain must be the home of a supremely important deity. In fact, Jomolangma is short for Jomomiyolang-sangma, the name of the Tibetan goddess of Mount Everest, one of the Five Sisters of Long Life and a relatively minor deity, invoked for worldly benefits, such as longevity, food, and wealth.

Center

An extremely important and widespread theme is that of the mountain as center – of the cosmos, the world, or a local region. A number of Asian mountains, such as Mount Kailas in Tibet and Gunung Agung in Bali, are patterned on the mythical Mount Meru or Sumeru, which stands as a cosmic axis around which the universe is organized in Hindu and Buddhist cosmology. Meru itself is said to rise from the depths of hell to the heights of heaven.

Many mountains in East Asia, Japan in particular, are viewed as centers of *mandalas* – circular spaces and arrangements of deities used in Buddhist meditation. Some, such as Mounts Koya and Omine, are treated as *mandalas* themselves, their peaks, trees, and other natural features regarded as parts of a sacred circle representing the divine space of a visualized deity with whom a meditator identifies himself or herself.

In North America the highest peak of the Black Hills, known to the Lakota as Paha Sapa, appears as the center of the world in vision quests by religious leaders such as Black Elk. Delphi on the slopes of Mount Parnassus played a central role as the site of the Omphalos or navel of the ancient Greek world.

Power

Many sacred mountains, including those viewed as centers, are places of awe-inspiring, often dangerous, power. The way to the awesome summit of Mount Olympus was blocked by doors of clouds and darkness controlled by the Horae, goddesses of time entrusted with protecting the sacred mountain. Maori warriors crossing the plateau beneath Mount Tongariro in New Zealand used to avert their eyes from its summit for fear of provoking a blinding snowstorm.

The power of mountains can assume various forms. The five principal sacred mountains of China enshrined the political authority of the emperor to rule over the four quarters of his empire, supported by the mandate of Heaven. The earliest annals of Chinese history say that the legendary first emperors of China performed sacrifices on a mountain in each quarter of the empire in order to establish their sovereignty over the princes of the real. Frequent storms made the jagged peaks of Olympus a dramatic setting for vividly displaying the power of Zeus, king of the gods and deity of thunder and lightning. The molten lava of Kilauea in Hawai’i embodies for many Hawaiians today the fiery energy, both destructive and creative, of the volcano goddess Pele.

Deity or Abode of Deity

In many traditions the power of mountains derives from the presence of deities. A poem from the earliest collection of Japanese poetry refers to Mount Fuji as “a god mysterious.” In other traditions, a mountain may be regarded as the seat of a divine power. Traditional Kikuyu of Kenya reverence Mount Kenya or Kere-Nyaga as the resting place in this world of Ngai or God. Dry paintings used by Navajo singers in healing rituals will sometimes depict the four sacred mountains of the Navajo in the form of hogans, traditional homes of the Navajo people. As deities or abodes of deities, mountains frequently play important roles as divine guardians or protectors. People invoke their power to protect livestock, crops, religion, the local community or even the state. Like the gods of many other peaks in Tibet and Himalayan border areas, the “country” god of Mount Khumbhila is revered as a warrior deity who watches over the Sherpa region of Khumbu, warding off the forces of evil. Herds of yaks, goats, and sheep fall under his protection. In the Andes, mountain gods are considered protectors of llamas and alpacas as well as wild vicuñas.

Temple or Place of Worship

Deities are frequently associated with the widespread view of the mountain as a temple or place of worship. Members of many traditional societies revere sacred peaks as temples in which their deities reside. Tibetan Buddhists, for example, view Mount Kailas as the pagoda palace of Demchog, the One of Supreme Bliss, a tantric deity embodying the ultimate Buddhist goal of enlightenment. Many temples in India are modeled on the idealized form of the sacred peak and bear the name of Kailasanatha, Lord of Kailas – a reference to Shiva, the Hindu form of the supreme deity who dwells on the mountain.
Mountains may also take the form of places of worship, viewed or imagined as altars, shrines, churches, and cathedrals. Here a deity does not necessarily reside in or on the peak, but rather the mountain provides a special setting for making contact with a divine presence through prayer, ritual, or contemplation. Just as Christians revere churches as sacred places of worship but do not regard them as objects of worship in themselves, so the same applies to mountains for many followers of monotheistic religions.

The view of mountains as places of worship plays an important role even in modern secular societies and is reflected in the names of numerous groves, valleys and peaks. John Muir, the founder of the Sierra Club and a key figure in the genesis of the modern-day environmental movement, wrote of Cathedral Peak in the Sierra Nevada of California that he would climb it “to say my prayers and hear the stone sermons.”

Paradise or Garden

Modern societies also share with traditional cultures the view of mountains as gardens and paradises. The Muslim Kirghiz of western China, for example, believe that the snows on the summit of Muztagh Ata, one of the highest peaks in the Pamir, conceal an earthly paradise that goes back to the time of the Garden of Eden. The Buddhist Dai people of southwestern China regard the flora of their Holy Hills as the gardens of the gods. Mount Athos, a mountainous peninsula in northern Greece that serves as the monastic center of Orthodox Christianity, is known as the “Garden of the Mother of God” – a reference to the role of the Virgin Mary as the patron saint of the holy mountain.

Many in the modern world view the untrammeled environment of mountains as a pristine paradise that preserves the purity of creation. Mountain meadows and wildflowers tend to evoke such views: one of the most popular destinations for visitors in Mount Rainier National Park in the United States, for example, is Paradise, a flowering meadow close to the glaciers.

Ancestors and the Dead

A major theme frequently linked to conceptions of paradise as the otherworld is the view of mountains as divine ancestors and places of the dead, often involved in origin myths. Traditional Chinese beliefs hold that the spirits of the dead go to the foot of Tai Shan. Mount Koya, the center of Shingon Buddhism, has one of the most impressive graveyards in Japan. East Africans traditionally bury their dead facing sacred peaks like Kilimanjaro and Mount Kenya.

Many peaks in New Zealand, including Aoraki, or Mount Cook, are revered as the frozen ancestors of the Maori who came to the islands in legendary canoes. According to the origin myth of the Korean people, they are descended from the union of a sky god and a bear woman on the sacred mountain of Paekdu. The natural features of Uluru, or Ayers Rock, in Australia record the formative activities of the Dreamtime Ancestors of the Pitjantjara and Yankunijatjara tribes.

Identity

As divine ancestors and places of origin, mountains provide many societies with their sense of communal identity and cohesiveness. In the Bolivian Andes, the metaphor of Mount Kaata as a human body unites the various communities who live on its slopes into an organic unit that has been able to resist all efforts to break it apart into smaller administrative subdivisions.

At intra-tribal gatherings, Maori ritually identify themselves by first stating their tribal mountain, followed by their river, or lake, and then their chief. One clan of the Yakutat Tlingit has Mount St. Elias, or Washetaca, the second highest peak in Alaska, as its crest or totem. The Armenian people regard Mount Ararat, a volcano in eastern Turkey believed to be the site of Noah’s ark in the Bible, as the symbol of their national and cultural identity.

Source

People throughout the world look up to mountains as sources of blessings – most notably, water, life, fertility, healing, and general well-being. Mountains such as Ausangate in Peru, Tlaloc in Mexico, the Himalayan Range, and the San Francisco Peaks in Arizona are revered as abodes of weather deities, places of springs, and sacred sources of rivers and rain-clouds on which societies depend for their very existence.

Sacred mountains also provide the blessings of fertility and healing. Today, great numbers of elderly women climb Tai Shan to make offerings to have grandchildren if their daughters or daughters-in-law have been infertile. Female shamans in Japan and Korea routinely climb sacred mountains to charge themselves with healing powers and conduct rituals for their patients. Traditional singers or medicine men go to the four sacred mountains of the Navajo in the southwestern United States to collect medicinal herbs and pebbles; they also invoke these mountains in rituals and sand paintings intended to restore a sick person to health and harmony. In Europe and North America, there is a tradition of putting sanatoriums, particularly for tuberculosis, on mountains, based on the idea that the mountain air and environment have special curative properties.

Much of the modern appreciation of mountains derives from the perception of them as sources of spiritual and physical well-being. Jean-Jacques Rousseau, the French philosopher who played a major role in transforming European attitudes toward the Alps in the eighteenth century, wrote:

In effect, it is a general impression experienced by...
all men, even though they do not all observe it, that on high mountains, where the air is pure and subtle, one feels greater ease in breathing, more lightness in the body, greater serenity in the spirit (Rousseau 1976: 45).

A century later John Muir exhorted Americans to:

Climb the mountains and get their good tidings. Nature’s peace will flow into you as sunshine flows into trees. The winds will blow their own freshness into you, and the storms their energy, while cares will drop off like autumn leaves (Muir 1901: 56).

Revelation, Transformation, Inspiration, and Renewal

The final theme to consider is that of the mountain as place of revelation, transformation, inspiration, and renewal. Mount Sinai plays a prominent role in the Old Testament as the imposing site where God reveals the Torah and the Ten Commandments to Moses. In the New Testament, Jesus is transfigured on a mountain and revealed there as the Son of God. Muhammad received his first revelation of the Qur’an in a cave on Mount Hira.

In China and Japan mountains are regarded as such ideal places for meditation and spiritual transformation that the Chinese expression for embarking on the practice of religion means literally “to enter the mountains.” Hua Shan, the most spectacular of the five principal sacred peaks of China, was a favorite haunt of Daoist hermits intent on transforming themselves into immortals. North American Plains Indians, such as the Lakota and the Crow, seek out high places for vision quests that give them spiritual power and determine the course of their lives.

The mountain monasteries and hermitages of Mount Athos in Greece have the primary function of providing an environment conducive to pursuing the Orthodox path of spiritual purification and illumination. The monk or hermit who follows this path to its goal is transformed, in the words of Saint Symeon, the New Theologian, into: “...one who is pure and free of the world / and converses continually with God alone; / He sees Him and is seen, loves Him and is loved, / and becomes light, brilliant beyond words” (Symeon in Bernbaum 1998: 114).

Many people, both traditional and modern, seek out mountains as places of artistic inspiration and spiritual renewal. Kuo Hsi (Guo Xi in Pinyin), one of China’s greatest landscape painters, wrote of the reason for painting landscapes: “The din of the dusty world and the confines of human habitations are what human nature habitually abhors; while, on the contrary, haze, mist, and the haunting spirits of the mountains are what human nature seeks (His 1935: 30–1).

Interest in the Alps for scientific, artistic, and mountaineering reasons developed when philosophers and poets such as Rousseau, Goethe, and Shelley began to extol their spiritually uplifting qualities. Inspired by the ideas and sentiments of such writers and their successors, many Europeans today flock to mountains like the Alps and the Pyrenees, seeking spiritual nourishment and inspiration from views imbued with transcendent power and mystery lacking in their everyday lives. In the United States, John Muir, a major figure in the genesis of the modern-day environmental movement, founded the Sierra Club primarily to preserve the natural environment of mountains such as the Sierra Nevada as places where people could go for spiritual and physical renewal.

Each of these themes or views brings together different ideas, images, and associations to evoke the experience of a deeper reality. Tibetan pilgrims, for example, view the peak of Mount Kailas as the pagoda palace of Demchog. The two images fuse in their minds so that the mountain becomes the palace. This fusion of images awakens the experience of something that imbibes Mount Kailas with an aura of sanctity. The pilgrim becomes aware of a divine presence emanating from the mountain.

The process works a little like the fusion of two slightly different photographs of a scene in a stereoscopic viewer to trigger a vivid perception of the third dimension inherent in each two-dimensional picture. The scene that looked flat suddenly seems to pop open with depth – in the case of a mountain like Kailas, a luminous depth full of meaning and significance for the pilgrim who reveres it as sacred.

The juxtaposition of images and associations also acts like the resonance of notes in a chord of music. Hearing the different tones resonate together creates a harmony, a sound with a quality that no note can produce by itself. In a similar way, a sense of the sacred issues from the resonance of images and associations in a view of a mountain, not from any single one of them. For followers of religious traditions, however, the fusion or resonance of cultural and spiritual associations in a view of a sacred mountain does not just create an effect: rather, it reveals an underlying reality present but hidden from usual awareness.

For the sake of simplicity, we have examined each theme or view by itself. But in actual practice, they do not appear in isolation. They come in clusters linked to each other in complex ways. The power of a sacred mountain, for example, may come from a deity whose abode lies on a high place at the center of the universe from which life-giving waters flow. The more themes that gather like clouds around a peak, the more associations they bring to bear on it, making the mountain resonate with deeper meaning and significance.

Edwin Bernbaum

Sacred Sites in England

The issue of “sacred sites” links Pagans, Druids and other practitioners of “alternative” religions with heritage management and policy-makers. The issue is of site-preservation versus site-use, and the lines are not clearly drawn. The best-known British prehistoric sites are Avebury and Stonehenge, but sites number in the thousands, and Pagan interests in “using” stones circles, prehistoric barrows or standing stones as sites of worship are increasingly becoming evident not only in traces of “use” expressed through offerings, but in the pressure put on local government and heritage management to recognize the value of even remote sites as contributors to a spiritual as well as an archeological heritage.

In 1998, 16 percent of people visiting Avebury expressed “spiritual motivation” as their reason with a further 11 percent giving “personal meditation” as the purpose of their visit. At the summer solstice in 2002, English Heritage facilitated “managed open access” allowing an estimated 23,500 people into the Stonehenge environs, the third consecutive year such an event has occurred. Such events in Britain and elsewhere display so-called “sacred sites” are a focus of increasing attention and tension, suggesting that such interest warrants serious academic scrutiny.

There are theoretical and pragmatic on-site issues of how British archeological sites (primarily those of prehistoric origin) have been renamed “sacred sites” by contemporary Pagans who engage with them “spiritually” and by heritage management itself, which has had to negotiate these issues. David Miles (Chief Archaeologist, English Heritage) has said that he accepted “Seahenge” was a “sacred site.” And Clews Everard, site manager until 2003 at Stonehenge, has referred to the stones as a “sacred site,” suggesting this term might be used to develop dialogue between the interest groups involved in summer solstice access negotiations. These issues are of timely concern to the archeologists who excavate and interpret sacred sites, the heritage managers who curate them, anthropologists interested in constructions of identity in contemporary Britain, local communities, the hospitality industry and, of course, Pagans themselves.

To “outsiders,” Pagans’ interests in the past may initially appear laughable, trivial, inauthentic and romantic: on the latter point at least, some Pagans may indeed romanticize the past in order to “reenchant” their lives in an increasingly secular society. On closer inspection, it is clear that Paganism is far more complex than the tabloid stereotypes imposed on it: Pagans are deeply committed to their religion and take their engagements with “ancestors” very seriously. We consider Pagans’ interests in the past must at least be taken seriously and engaged with by those whose professional interests lie with the past and its representation.

Not all Pagans engage with sacred sites, not all sites are perceived to be “sacred,” and it is not only Pagans who are interested in them. But for those Pagans who do engage with sites (most famously Druids), they treat such sites as places where the presence of ancestors, gods, goddesses, wights and other nature/spirit beings is felt most strongly, and where communication with these “other than human persons” is particularly effective. Rituals and ceremonies are often conducted at these sites during auspicious times of the year, including at the eight festivals comprising the “wheel of the year,” at various phases of the moon, and for Pagans local to sites, on a day-to-day basis. Such rites happen at hundreds of sites across the country, and while some may leave no trace of their occurrence, others may have a significant impact on sites. At an extreme, instances of graffiti and fire damage have been linked by some to Pagans, and a group named “Friends of the Stone”...
ignited an ersatz napalm-like substance at Men-an-Tol in Penwith, Cornwall. Such incidents are atypical of Pagans generally who tend to have reverence for sacred sites and tend also to respect the “preservation ethic” of heritage discourse. To show their respect for the other-than-human-persons at sites, some Pagans leave votive offerings, increasingly in some places, from flowers and mead to more enduring “ritual litter” such as candles, incense and crystals. Such material remains of Pagan rituals are common in West Kennet long barrow near Avebury, and at a wide variety of other “sacred sites,” especially stone circles. In the end, someone has to clear up these remains: until recently, this job fell to National Trust and English Heritage site curators, but whether locally or through such groups as SOSS (Save Our Sacred Sites) and ASLaN (Ancient Sacred Landscape Network), Pagans are now active in site litter-clearance and the promotion of suitable site etiquette – the maxim encouraging others to “leave only footprints” being borrowed from the U.S. wilderness movement.

Pagan engagements with the past extend beyond the day-to-day use of sites for ceremonies with potentially greater implications for what archaeologists do and how sites are curated. Pagans tend to approach sacred sites as part of a wider sacred landscape, and often this sacredness is seen as inherent in the place itself – the genius loci, power spot or wight is not deemed a construction of human imagination, but as extant a priori in the landscape. This worldview is in part inspired by indigenous conceptions of landscapes and has implications for archeological theorizing, which tends to take the opposite view, that landscapes are a tabula rasa that becomes encultured by humans. There are clear differences of opinion over how sacredness is constituted. The “sacred sites” constitute through a Pagan discourse of a “living landscape” that may be very different for the concept of “sacred site” constructed in the discourse of a heritage manager. At the very least, this indicates it is imperative that a singular meaning of “sacred site” is not set in stone but that sacredness continues to be problematized and theorized. In a further instance of how Pagan and heritage views conflict, Pagans may argue the sacred site itself has a view on how it should be managed. Such a point of view grates with rationalist and heritage management, which may write off the idea completely. Yet to do so is short-sighted; the attitudes of Pagans cannot be ignored, as the example of a British reburial issue demonstrates.

The politics of the reburial of prehistoric human remains and associated artifacts is well known as a “hot topic” in, for example, the U.S. and Australia, but, currently, it is also having ramifications in Britain, with the return of not only remains but also artifacts (e.g., a Ghost Dance shirt brought to the U.K. by Buffalo Bill returned to the Lakota by Glasgow’s Kelvingrove Museum). British Pagans, drawing on such indigenous claims, have been calling for the reburial of Britain’s own “indigenous” prehistoric remains. Many Pagans identify themselves as spiritually allied with the prehistoric peoples who built “sacred sites.” Rites at megalithic tombs in particular, involving perceived direct communication with prehistoric “ancestors,” prompt these Pagans to feel a responsibility to ancient peoples once interred there, and to the sites themselves. So, not only are contemporary Pagans collaborating with site managers in site welfare (litter collection or removing chalk graffiti) but they have also, more contentiously, begun to address issues of “ancestor welfare”; concerns over the archeological excavation and storage of human remains and artifacts.

British Druid Order member Davies expresses this concern:

Every day in Britain, sacred Druid sites are surveyed and excavated, with associated finds being catalogued and stored for the archaeological record. Many of these sites include the sacred burials of our ancestors. Their places of rest are opened during the excavation; their bones removed and placed in museums for the voyeur to gaze upon, or stored in cardboard boxes in archaeological archives . . . I believe we, as Druids, should be saying Stop this now. These actions are disrespectful to our ancestors. When archaeologists desecrate a site through excavation and steal our ancestors and their guardians . . . It is a theft . . . We should assert our authority as the physical guardians of esoteric lore. We should reclaim our past (Davies 1997: 12–13).

This view clearly has an indigenous-inspired tone to it. Many Pagans, neo-shamans in particular, draw inspiration from indigenous peoples around the world, and in Britain some refer themselves as “new-tribes.” More theoretically, we are discussing Pagans as the “new indigenes.” Davies outlines how Pagans can get directly involved in this issue:

I speak for the ancestors and guardians of the land, those spirits not currently represented in the archaeological record . . . The Druid or Pagan shaman can use their gifts as harmonic bridges to communicate between the realities of archaeology, land developers and Pagan Druids . . . Druids should join together and encourage debate between archaeologists and museums in the reburial issue (Davies 1998: 10–12).

At first glance, individual Pagans and Pagan groups do not agree upon core beliefs or practices, let alone centralized spiritual beliefs concerning disposal of the dead. Nonetheless, in “the time of tribes,” the reburial issue is gathering momentum and coherency. Stonehenge, within
the context of its Management Plan and proposals of a tunnel to replace part of the nearby A303, is currently a focus for Pagan concerns over the excavation of human remains. Druid Philip “Greywolf” Shallcrass, asked a focus for Pagan concerns over the excavation of human remains after a suitable period of study (author interview).

More recently, negotiations have moved forwards. After meetings with the liaison group established to discuss the future of Stonehenge, Greywolf had this to say:

I’ve come to focus on respect and reburial as my primary reasons for being involved in the talks . . . I have been, and will continue asking for any remains that are found to be treated with respect and then returned to the Earth as near as possible to their original burial sites, preferably with any accompanying grave goods and with suitable ritual (author interview).

While indigenous communities elsewhere can demonstrate genetic or cultural links to satisfy the law, focusing on the extent to which Pagans can claim British prehistoric remains as “theirs” is to miss the point, for two reasons. First, the issue here is one of respect and reburial rather than repatriation: most Pagans do not claim to be exclusively related to the ancestors. And second, the issue here is not one solely of academic discourse versus public understanding, of authenticity versus inauthenticity, or validity/invalidity. Rather, it is of multivocality and forms of knowledge and power within a diverse postmodern or late-modern society. More conservative archeologists may assume they have the power to charge Pagans with inauthenticity because scientific archeological claims are perceived to be more objectively substantive. But positivist dichotomies (authenticity/authenticity, validity/invalidity, etc.) and staunchly empiricist approaches are incompatible with contemporary reflexive archeologies and with current social research methods generally. While it is not required of us that we agree with Pagan claims to the past, in the current post-processual climate of archeology at least, there is need for archeologists, heritage managers and others to be reflexive and transparent, and for them to open up their research/data to external scrutiny. So the issue is really whether archeologists are prepared to address such pluralities and engage with them dialogically, rather than dismiss them as fringe and eccentric.

Sacred Space/Place

Landscape, space, and place are three concepts that merge together to create the human experience of the environment. Space is the most basic concept of geography; it is the three-dimensional extent in which objects and events occur. Landscapes and places are both contained within space. Landscape provided the taken-for-granted backdrop for human activity and behavior. It is the most visible but least consciously felt aspect of regional character; it is an assemblage of sensory information, which generates a seen and felt experience of the world. Not only are there practical economic bonds between peoples and landscapes, there are also powerful religious, social, and psychological bonds. It is through these bonds that people develop affinities with particular locales and develop a sense of place.
Part of the human quest for meaning involves the ordering of landscape into places, and all cultures have separate, dedicated, hallowed spaces. Places are discrete units of meaningful space, and are fundamental expressions of human involvement with the world. They are distinguished from landscapes not in their scale, but in their qualitative experiential dimension. Whereas landscape is part of any immediate encounter with the world, place is further distinguished through symbols and affections. Places focus landscapes around human intentions and are sources of inspiration and insight; they are centers of cultural and personal meaning.

A “sense of place” begins with interactions between people and the world and develops out of a symbolic constitution of the environment within which we exist. It involves a blending of intellect, intuition, and imagination. On one hand people feel what it is like to be at a place, and on the other hand people intellectually grasp the meaning of a place. A sense of place unfolds, then, through the application of religious, moral, and aesthetic discernment of specific locations. Place is a universal marker of identity in relation to the landscape, although expressions of this association vary culturally.

Geographical places become sacred or symbolic when they conjoin human social facts with those of nature. A sacred place, then, is a charged meeting ground between person and the other. People in diverse parts of the world have long utilized natural places in their quest to connect with the numinous. Through mythological interpretation of landscape and place, geography is transformed into cosmology. People experience discrete places of power, and these culturally defined sacred places offer a nexus between humans, the physical environment, and deities. Sacred places are symbolic, transcending their immediate physical forms; they are unique parcels of the Earth, which aid in the transformation of self.

Sagan, Carl (1934–1996)

Astronomer, author, educator, and television personality, Sagan was one of the few scientists of the late twentieth century to achieve celebrity status. Through various media, notably his best-selling books and the enormously successful Public Broadcasting Service series Cosmos (first aired in 1980), he achieved worldwide fame for his lucid and often entertaining explanations of advanced scientific concepts. A self-proclaimed religious skeptic dedicated to the scientific method and the empirical verification of all truth-claims, Sagan was firmly in the tradition of Western scientism. Nevertheless, he often used religious language to frame his discussions of the aims, methods, and content of modern science. Among other things, Sagan affirmed the role of the imagination in the shaping of scientific inquiry, most conspicuously in his career-long quest to find extraterrestrial life forms. He also eloquently celebrated the sense of awe and wonder evoked by modern views of nature.

Background and Career
Sagan was born in New York City in 1934 to Jewish parents. Although exposed to Judaism as a boy, after his bar mitzvah he largely abandoned normative Jewish thought and practice, including the belief in a personal God, in favor of a career in science. An excellent student, he was voted “Class Brain” in his high school and went on to earn advanced degrees in physics and astronomy at the University of Chicago. As a working scientist, Sagan’s projects included studies of the atmospheres of other planets, theoretical works on the possibility of extraterrestrial life, and advisory roles for various NASA missions. From 1968 until his death he was a professor at Cornell University where he served as David Duncan Professor of Astronomy and Space Sciences and director of the Laboratory for Planetary Studies. Politically, Sagan was an unabashed liberal who regularly supported feminist, environmentalist, and arms control causes. No stranger to controversy, he figured prominently in public debates over nuclear weapons policy and missile defense during the Reagan era.

Unlike most of his peers, Sagan had a flair for publicity. His ideas on space science and the origins of life began appearing in newspapers and national magazines when he was still a graduate student. Later, his accessible writing style and media-friendly demeanor helped make him a household name. His first nominal success was a book co-authored with Soviet scientist, I.S. Shklovskii, Intelligent Life in the Universe (1966). His real breakthrough, however, came in 1973, when he published The Cosmic Connection to wide acclaim, and made the first of 26 guest appearances on The Tonight Show with Johnny Carson. Further recognition came in 1977 when his best-seller on the evolution of human intelligence, Dragons of Eden, won the Pulitzer Prize for non-fiction. Subsequent books on
hominid evolution, space exploration, pseudo-science, and religion also met with critical and popular success. *Cosmos* was the apogee of Sagan’s public career and established him as a cultural icon. Estimates suggest that half a billion viewers watched the series during the 1980s, and the book version became the top-selling scientific book of all time. His novel *Contact* (1985), a fictional account of a scientist who successfully communicates with aliens, was made into a movie starring Jodie Foster (released in 1997).

Sagan’s rangey interests and high public profile got mixed reviews in the scientific community. He was denied tenure at Harvard in 1967. In 1992, after a rancorous debate, the prestigious National Academy of Science voted against his nomination for membership – in part, because some members felt his scientific work had not been substantive enough to warrant inclusion. Two years later, however, the same body awarded him its Public Welfare Medal for his popular writings.

**Scientism and Religion**

Sagan was perhaps the leading advocate of scientism of his generation and consistently argued for both the superiority of science to other forms of knowledge and the necessity of greater public understanding of its “delights” and “social consequences” (Sagan 1993: 14). Much influenced by philosopher Karl Popper, he regarded true science as that which could be formulated into testable hypotheses and thus potentially proven wrong, or “falsified.” Much of his criticism of traditional religions (as well as pseudo-science and metaphysics) was that they resisted challenge, testing, and revision and thus were not as fully self-corrective as science. Sagan believed that the ethical values that sustained science included “a delicate mix of openness and skepticism,” democracy, education, “decency, humility, and community spirit” (Sagan 1996: 431, 434). Because so many religions were “steeped in an absolutist frame of mind,” he hailed the strict separation of Church and state as one of the great achievements of the American Constitution and a crucial step in the emergence of free inquiry (Sagan 1996: 432).

Paradoxically, Sagan often enlisted the aesthetic and emotive language associated with religion to make his case for the authority and sufficiency of science. For example, he peppered his popular works with quotations from religious texts ranging from the Bible to the Mayan *Popol Vuh*. In *The Demon-Haunted World: Science as a Candle in the Dark*, he asserted that the very “act of understanding is a celebration of joining [and] merging . . . with the magnificence of the Cosmos.” Through science individuals grasped the “intricacy, beauty, and subtlety of life,” and the contemplation of scientific ideas produced a “soaring feeling” that combined “elation and humility.” Cumulatively, science assumed transcendent qualities, becoming the “transnational, transgenerational meta-mind” of the modern world. Furthermore, if one defined “spirit” so as not to imply anything immaterial, science was “not only compatible with spirituality,” it was “a profound source of spirituality” (this paragraph’s quotes from Sagan 1996: 29).

In ethics also, Sagan mingled scientific ideas and traditional religious language. In *The Cosmic Connection*, he argued, given our common evolutionary heritage, that “spiders, salamanders, salmon, and sunflowers are equally our brothers and sisters,” and that “the time has come for a respect, a reverence, not just for all human beings, but for all life forms” (Sagan 1973: viii). Conceptually, ethical progress followed the “identification horizon” – the process of extending the Golden Rule to more and more categories of beings. In turn, this ethos supported environmental activism and conservation efforts.

**Critique**

Perhaps the most common criticism of Sagan was that his optimistic scientism was naive – particularly in light of the persistent social and political strife of the twentieth century. The devastation wrought by modern warfare, genocides, purges, and nuclear proliferation suggested to many that faith in the good will and rationality in human nature, even when scientifically informed, was misplaced, even dangerous. One detractor noted that Sagan’s dedication to the “spirit of geometry” led him to exclude “non-scientific modes of thought – the very tools needed to understand history and apply its lessons to the present” (Royal 1986: 29). For others, the beneficial effects of scientific knowledge seemed unlikely to mollify what ailed the restless modern spirit. After seeing *Cosmos*, novelist Walker Percy, a Roman Catholic, wrote a wry rejoinder, *Lost in the Cosmos: The Last Self-Help Book*. In it, he jibed, “once everything in the Cosmos . . . is reduced to the sphere of immensity, matter in interaction, there is no one left to talk to except other transcending intelligences from other worlds” (Percy 1983: 173).

As biographer Keay Davidson has noted, Sagan was a man “troubled by grand dichotomies” – a “prophet” who was simultaneously a “hard-boiled skeptic”; a “boyish fantasist” who insisted on “ultrarigorous” analysis; a visionary and cerebral “merchant of awe” whose life was one of hectic schedules and driving ambition (Davidson 1999: 1, 333). His polished persona as a public intellectual belied a complicated personal life, which included two messy divorces, marijuana use, and accusations of arrogance and egotism. With religion too, Sagan was a man of considerable paradoxes. Perhaps the most widely read doubter of received traditions in recent American history, he nonetheless could impress even his critics with encyclopedic knowledge of scriptural traditions, and could forge alliances with religious groups (including the Vatican) who held similar views on environmental issues and arms control.

Overall, Sagan was more than just a genial critic of
supernatural beliefs, he also imagined a world liberated, expanded, inspired and ethically invigorated by scientific knowledge and inquiry. In the words of his wife and collaborator, Ann Druyan, he envisioned humanity “conscious, wise, compassionate, energetically curious, eternally skeptical; and] immune to the manipulations and intimidations of the powerful.” By embracing its “utterly decentralized place in the fabric of nature, space, and time,” human culture would be “secure enough at last to embrace the wonder inherent in this reality, [and] awakened to our responsibilities as a link in the generations past and future.” In doing so, Sagan advanced nothing less than “a new sense of the sacred” by giving sustained public voice to the “spiritual high that is science’s overarching revelation – our oneness with the cosmos” (this paragraph’s quotes, Druyan 2000: 25–7).

Saharan Pastoralists

The territories of Central Saharan pastoral nomads are not bounded spaces, but are a mosaic of water-points, grazing areas, places for social and ritual events, each having symbolic value and chosen to fulfill religious and economic needs within the cultural landscape. The nomadic pastoralists of the Central Sahara today: Tuareg (Kel Tamacheq) and Touareg (Teda, Daza, Zagawa) are Muslims. Islam, however, is a veneer that overlies an earlier animist belief in spirits, and these pre-Islamic survivals are merged with Islamic rituals. Spirits inhabit pools, trees, mountains and other natural features of the landscape. While the pastoralists move across their exploitation territories, these spirits need to be placated. This can be done by sacrifice, adding a stone to a cairn at the top of a col (a saddle at the head of a valley), refraining from killing the crocodiles (water spirits) that live in the pools (Toubou), or marking the tree, Maerua crassifolia, where spirits live (Tuareg). Alternatively, with the latter, stones can be thrown at the tree to scare off the spirits.

A particularly strong belief, which seems pervasive, is in the fire spirits, which are believed to be controlled by endogamous castes of blacksmiths. These smiths practice curing possession rituals among the Tuareg, where the smith becomes the embodiment of the fire spirit. Such rituals may have considerable time depth. In the Tassili n’Ajjer of southeastern Algeria, rock art that is possibly 4000 years old shows a scene with ritual specialists working with fire, observed by “wavy-line” cattle. These “wavy-line” cattle are found in other scenes that appear to be of a narrative nature, depicting pastoral activities.

Rock-art studies elsewhere in the world (e.g., Australia, South Africa, the Americas) indicate that the art is a reflection of deep meaning (i.e., religious beliefs) and has usually been drawn by ritual specialists as part of ceremonial or transcendental experience (shamanism). The art may depict specific events, but is rarely purely narrative in intent. Thus the “wavy-line” cattle may well have been symbols of a more basic religious nature. Cattle are wealth to pastoralists, but they play a much greater role in society than purely economic. Among African pastoralists, cattle are often seen as living representatives of the ancestors, and human/cattle lineages parallel each other in marriage exchanges, with the genealogy of both being well known to all the herdsmen.

Markings on cattle in both paintings and engravings on rock walls are a common theme from the Central Sahara all the way to the Red Sea. Concentrations of these paintings in the main mountain masses of the Sahara (Tassili n’Ajjer, Hoggar, Air, Tibesti, Ennedi) may well have been identity points in the landscape, as would have been (and are) cemeteries where holy men were buried. The tracks connecting rock-art sites, cemeteries and places where
souls lived, along with the water and pasture basic to any herding strategy, would constitute a landscape of belief repeated in stories and myth passed down from generation to generation.

Intentional burial of cattle as part of ritual is first documented in the Western Desert of Egypt at Na’ba Playa, dated to between 6500–5500 years ago. This predates the Badarian civilization of the Nile Valley and may well have been a precursor of the later cattle goddess cult of pre-Dynastic Egypt. Such cattle burials are also found in Saharan sites of Niger.

Cultural contact over large distances among pastoralists is well attested today (viz. Fulani and Tuareg distributions across the Sahara and Sahel). Archaeological data suggests that similar connections go back to Neolithic times, more than 7000 years ago. It is across this belt of the Sahara that the pre-Islamic survivals exist. If the rock art and cattle burials are any indication, then these Saharan belief systems predate their appearance in North Africa or the Nile Valley. Rather than seeing the Sahara as a cultural backwater absorbing attributes of more “advanced” people, we might suggest that this was an area of innovation.

Salvadoran Reflection on Religion, Rights, and Nature

A few decades ago when I was in primary and high school, the Jesuits taught us the importance of becoming God’s messengers by defending religion, particularly because of the threat imposed by communism. I remember we were taught about how the devil inspired Martin Luther to attempt to destroy the Church, the saint inquisition and the infallibility of the pope. Of course some stories like Galileo’s left some of us confused.

In those days the teachings seemed to be oriented to defend religious rituals – that was the divine duty – and the key idea was that the next life was more important than this one. Genesis stated that all things are here for man’s use and man has domination over all things. I remember we, the students, felt the divine obligation to bring flowers to the Virgin Mary in May and take communion every day, and also the need to become crusaders.

A few years after finishing high school, the same Jesuits that warned us about communism were being accused of being communists themselves by the powerful Salvadoran oligarchy. This happened because in their religious teachings these Jesuits were including as a central religious duty the defense of the human being and his or her dignity. New questions were asked such as: Why are people poor? Is it not a social sin when few people in our society have so much and most people have so little, sometimes not even enough to live as a human being? What should a Christian do when we are faced with these circumstances? If all of us were made in the image of God, is it not God who is suffering in the flesh of the poor? Are we not obliged by divine duty to try to change all this?

These human-centered religious teachings, often labeled as theology of liberation, encountered fierce opposition by the ruling economic class, the government, and even by some priests. At this same time the archbishop who had been sympathetic to these new teachings was replaced because of old age, and a new archbishop was appointed in 1977. This new archbishop was “Monseñor” Oscar Romero. Romero was favored by the government and the ruling oligarchy as a religious intellectual. They thought he would get the Jesuits back into teaching the importance of bringing flowers to our Holy Mother, keeping chastity until marriage, and accepting reality as the will of God.

A few weeks after “Monseñor” Romero was appointed, a friend of mine, the Jesuit Rutilio Grande was killed. This was when Monseñor showed who he really was.

I remembered attending Rutilio’s funeral and Monseñor Romero’s questions were: How can anybody kill a priest? How can anybody kill a person that is helping poor people? How can anybody kill a messenger of God?

Monseñor Romero must have forgotten for a moment that 2000 years ago the same evil forces had killed the Son
of God, and what was happening here only showed that not much had changed.

The three following years until Romero’s assassination were something unique and exciting in El Salvador. To be at the Sunday masses with Monseñor Romero gave many of us the impression it was Jesus Christ preaching. If for some reason I could not go to a Sunday mass I always had a radio to listen to it.

I remember the day before he was murdered, I attended the Sunday Mass, crowded as usual, and Monseñor Romero was as inspired by the Holy Ghost as ever. I remember I saw the U.S. Ambassador Robert White, attending the Mass also, surrounded by his bodyguards and his car running at one of the church entrances, waiting for him just in case. That day I was scared because the previous Sunday Mass somebody left an attaché case at the church with 72 dynamite candles, which fortunately did not explode. After the Mass, there was the usual press conference given by Monseñor Romero. I then had the chance to talk to him briefly. He asked me for my reaction to what he said during the Mass and also told me that in the middle of his homily the national communications office had blocked the telephone lines so that his homily could not be transmitted outside of the country. The next day Archbishop Romero was killed.

Most of us felt what Ignacio Ellacuria, the president of a Jesuit-run university, said once: the Saint Spirit passed through El Salvador in the figure of Monseñor Romero. A few years later Ellacuria and other Jesuits, my high school teachers, were also killed.

What this experience has taught us is that religion does not need to be the opium of the people, as some religious people have made it seem in the past. I remember during the war in El Salvador, some priests were blessing the army weapons and of course it was very hard to tell poor peasants that the weapons killing them were sacred. What Monseñor Romero taught us is that religion, when rightly interpreted, is a force of liberation. God does not want people to suffer, God wants people to have life and have plenty of it. As Romero said, “There is much of God in the earth and it cries out when some people hoard it unjustly. I raise up my voice to say: do not worship your wealth.”

While I am writing this, 23 years after Romero’s death, the social conditions, in most places, have not improved. Poverty and violence keep increasing, now aggravated by something else: the destruction of nature.

It is common knowledge that there are environmental problems. Universities and institutes are talking about it and the general public perceives it as the price we have to pay for the good of our civilization. But the problem is that such a price is not paid equitably everywhere and for some people in some regions of the world, it might be unfair and too high a price.

If we compare a southern Country like El Salvador with the northern countries of Europe, USA or Japan, we see that, in the northern countries, the environmental problems are incorrectly perceived by politicians, the general population and sometimes even the scientific establishment. Their discussion of environmental problems remains mostly in the ecological or biological domains, or at the scientific or resource policy levels, since they are not seen as having a considerable impact on the performance of the society. Scientists talk of the disappearance of animal species or the destruction of the ozone layer, activities the impact of which, though affecting the health and well-being of people, is not felt in a direct way and may therefore go unnoticed.

In a country like El Salvador, the situation is rather different. The environmental problems are at the same time social problems in the sense that the average citizen feels them in a direct way. They are becoming political problems because of the violence they generate. When we talk about ecological problems, we are talking about a lack of water to drink. Water with unacceptable levels of pollution leads to the most common causes of childhood death in the country. When we talk about climate change, we are talking about the “El Niño” phenomenon that upsets crop cultivation because of too much or too little water, leading to famine in the country, or we might be talking about Hurricane Mitch that left 12,000 people dead in Central America.

In many countries or regions in the south, the environmental destruction has reached such levels that what were once considered gifts from God, like air, water or food, are now the main sources of death. In El Salvador for example, the leading causes of death are infectious respiratory diseases, coming from air pollution, followed by gastrointestinal diseases coming from water and food pollution. In other words, the most dangerous things that a human being can do in El Salvador is to breathe air, drink water, or eat food.

So the structural violence that Archbishop Romero focused on is not just generated by the social sin of unjust distribution of wealth but also by the mismanagement or lack of natural resources, and their wastes. Water is becoming a source of violence. Sometimes communities fight among themselves over access to a given water spring. Other times the battle is between the local population and the government, when some government agency attempts to take the water away from a rural place to satisfy industry or city demands. This lack of water is even becoming a source of conflict not only in El Salvador but also between many neighboring countries, for example Israel and Jordan.

Environmental destruction in the southern countries is of no surprise, when we realize that the management of natural resources follows the logic of profit and not the logic of the societal well-being or the logic of nature (ecological). Resources are exploited in order to obtain the
largest possible profit, irrespective of how much the environment is deteriorated or society is affected.

This state of affairs is something that will be made worse by the current corporate-led globalization. The whole idea behind corporate-led globalization is to remove all possible obstacles or barriers to the “free” flow of capital and goods, so that the corporations can keep up the exploitation of resources. Corporations are interested in profits, and governments, most of the time, follow these corporation guidelines or in the best-case scenario simply do not oppose them.

To facilitate this globalization, the governments of the world, motivated by international capital, have established the World Trade Organization (“WTO”) with the objective of facilitating international trade, above any other concerns. There are environmental and social regulations regarding trade that corporations pay lip service to, but according to WTO rules and practices, even if the liberalization of trade brings the displacement of jobs or the pollution of a river, the WTO will favor trade. There is an example in Mexico where a municipality that rejected wastes from a transnational corporation was fined several million dollars by the WTO. The reality is that we live in a social system where the short-term profit of transnational corporations is more important than the medium and long-term benefit of society and nature.

We thus live in a world economic system that intrinsically violates human rights. For example, our system promotes the consumption of goods. Anybody has the legal right to consume as much as he or she wants, limited only by the wealth that he or she possesses. This consumption of goods means, among other things, consumption of resources like oil. Much energy is required for the production of goods and their transportation from the production site to the consumption place. It is scientifically established that the exhaust emissions coming from oil consumption generate carbon dioxide that contributes to climate change, which in turn takes people’s lives in other parts of the globe. This means that our present economic system promotes the unlimited consumption of goods by some people, which at the same time damages other people, therefore violating their rights.

The problem is not consumption per se, because nature has the capacity to process wastes and transform them into useful products. The problem is overconsumption where wastes, such as gas emissions, exceed the capacity of nature to process them, thus generating problems. In this mode of thinking coming from current societal values, it would be inconceivable to limit the consumption of goods to any sectors of the population, even though such consumption generates suffering to other population sectors.

Some of the most important “rights” in our society are the right to private property, and accumulation of wealth, whether or not that “right” negates other people’s most fundamental human rights, like the right to live healthily and in a decent way. The following is article 17 from the Universal Declaration of Human Rights: “(1) Everyone has the right to own property alone as well as in association with others . . . (2) No one shall be arbitrarily deprived of his property.”

When anybody starts a production unit for example, the law allows the privatization of profits coming from that enterprise, but at the same time the law allows the enterprises to pass some of the costs of production, like the impact generated by garbage or gas emissions, to society, such that many costs are socialized. Why are oil companies allowed to privatize the revenues coming from oil exploitation and consumption and at the same time not required to assume the costs coming from those activities, like pollution of water bodies, destruction of forests or climate change? In the way our society functions, corporations are reaping the benefits of the generation of this socio-ecological debt. Therefore corporations are mostly responsible for the existence of that debt.

The violation of human rights takes many other forms. For example, consider oil again. Every time a new oil well is opened in Colombia, to meet industrial energy demand, there are always people killed, sacred places and forests destroyed and local indigenous populations displaced. A similar situation is developing in the Ogoni land in Nigeria. Thousands of Ogoni people have been killed, many others displaced and tens of thousands live in a pollution nightmare, just to keep the oil running from their wells, motivated by the profit mentality of the transnational oil corporations. The same happens to millions of people displaced by the construction of hydro-electric dams to generate electricity to produce goods, sometimes consumed by people living on the other side of the planet.

Looking at this rationale of our economic system of “privatization of profits and socialization of costs,” which has prevailed for centuries and remains to this date, we can deduce that an ecological and social debt has been generated. The people who consume more resources owe this socio-ecological debt to the people who consume fewer resources. In political terms this means a socio-ecological debt owed by people from the overconsumptive North to people from the South. North does not only mean people from the northern countries but also includes upper and middle economic classes from the southern countries that also overconsume. Likewise the South also includes lower economic classes living in the northern countries.

People from urban areas also owe this socio-ecological debt to people from rural areas, because the urban way of life, cities and industries, have always been developed and kept functioning at the expense of rural places. Taking a look at history, starting with the periods of colonization and continuing with interactions between races and sometimes between countries, it can be seen that this socio-ecological debt is also owed by white people to indigenous
and colored people all over the planet. Considering our basic gender division and the relationship of exploitation and inequity that has always existed, it must also be realized that men owe this socio-ecological debt to women.

The way our generation and previous ones have misused the resources of the planet means that our generation owes a socio-ecological debt to future generations. Finally, we are just one of the many species that exists and shares the space of the planet. One of the most important differences between human beings and all other living creatures, which amount to between 5 and 30 million species, is that all species take from nature only what they need to survive, except human beings. Humans have developed a social system with a set of values that promotes an ever-increasing consumption of resources and by doing so generates violence to other species that are also part of the creation. Therefore, Homo sapiens have a socio-ecological debt to the rest of the creation.

Looking at this social behavior from a religious perspective, there is a basic question that comes to mind. How can human beings claim respect for a Creator and supposedly follow divine laws, when this same human being respects neither the creation nor the creatures that are part of it?

It is unfortunate to realize that there has been little effort by the major religions to consider environmental aspects and the defense of creation with her corresponding creatures as central to religious duty. It is time that a second chapter be written in liberation theology, to include the defense of nature. On one hand, creation is the will of the Creator, and that by itself generates a religious duty, but on the other hand, the destruction of creation also means the destruction of human beings. Polluted water kills people, so does climate change. As the commandments state: Thou shall not kill. It is everyone’s responsibility to take that seriously. This thinking about the consequences of overconsumption, where products come from, and what that means to the people who provide those products. Be a conscious consumer.

Samia Culture (Western Kenya)

For Samia people of western Kenya, like most African peoples, nature is filled with religious significance. The invisible world of god and spirits is symbolized or manifested by natural phenomena, and people see “that invisible universe when they look at, hear or feel the visible and tangible world” (Mhiti 1969: 56–7). Nature, the bountiful source of life, is also unpredictable, dangerous and powerful. It is “wild.” For humans to live in their social world, they must – through work and rituals – have appropriate relationships with the natural world and the spirits that inhabit it. Hard work turns wild bush into farmland, producer of food and sustainer of life. Rituals and other religious practices make wild nature more beneficent and orderly.

Samia live around the northeastern shores of Lake Victoria, in a land of steep hills, undulating valleys, and open plains – all lushly green in rainy seasons, rusty brown in dry seasons and droughts. The hills are dotted with trees, roadsides are lined with invasive non-native perennials such as lantana and tithonia, and everywhere there are people, houses and cultivated fields. The Samia in their home area numbered about 75,000 in the 1999 census, though many Samia, especially men, are away as migrant laborers. The Samia are a sub-group of Kenya’s second or third largest ethnic community, Abaluyia.

In the late nineteenth century, before colonial rule was imposed, only a small proportion of the land was cultivated. There were few people and many animals such as elephants, crocodiles, hippos, hyenas and leopards. People farmed and herded cattle, fished and hunted. A century later, in post-colonial Kenya, to see elephants and other such animals is rare, hunting is illegal, and with a greatly increased population (more than doubled from 1969 to 1999), the balance between cultivated land and bush has shifted heavily toward cultivation. Today many people do not have enough land to practice the traditional shifting cultivation with bush fallow, a system that renewed soil fertility. Marginal lands are cultivated, deforestation and erosion are growing problems, and, increasingly, farms are too small to be economically viable. Bush that harbors monkeys is cleared because monkeys, great destroyers of crops, may no longer be legally hunted. Fuelwood and thatching grass are scarce. The pre-colonial sustainable subsistence economy and the integrated socio-political-religious-moral system in which it was embedded have been fragmented and, often, replaced by imported ideas and behaviors.

Like their nineteenth-century forebears, contemporary Samia are farmers and cattle herders; unlike their ancestors, they are implicated in the global political economy. But they still wrestle daily with the land and keep an eye on the weather. Because of the tropical climate, many activities take place outdoors all year round. Like Gikuyu in central Kenya, Samia “are daily and hourly in the most intimate contact with Nature” (Kenyatta 1953: 241). The natural world is all around, and the contemporary Samia social and symbolic world is a fabric woven from both human and natural environments, indigenous and Christian cosmologies.
Samia cosmology has a high god, Were, creator of the world and everything in it. Were resides in the sky, invisible and all-powerful, the ultimate giver of life and all prosperity. He manifests himself in natural phenomena: sun and moon, rain, rainbows, thunder and lightning. Earthquakes are Were’s sign that general bad behavior needs to be corrected. Ancestral spirits (emisambuva) are active in their descendants’ lives; they are intermediaries between living people and Were. Homesteads had an ancestral shrine of small stones and little mud-houses placed before the senior wife’s house. Here people sacrificed meat and beer to their ancestors and prayed for blessings or for help in a crisis. Sometimes the sacrifices were to placate an angry, hence dangerous spirit. Just before sunrise each day, the oldest male in a homestead went outside and, standing by the shrine, spat to the east and asked Were for blessings for the day; at sunset, he spat to the west and asked Were for blessings for the night. Diviners and spirit mediums interpreted events and recommended ritual or practical redress. Rainmakers ritually directed nature’s powers to produce rains, destructive or beneficial, and even drought. Sacred trees were meeting places for ancestral spirits; the trees were given names and were not to be cut down; the ground around them was swept clean. Today some huge, old sacred trees are cut down for fuelwood or to make charcoal, and anyone who has an ancestral shrine probably hides it in their house, as most Samia are at least nominal Christians, and some – the born-again “saved” people (in a crossdenominational movement of religious revival) – are adamant that these shrines, rain-making paraphernalia and other such things are Satan’s and must be destroyed.

Christian ideology has centered on matters of faith, on sin and salvation. Christian churches in Samia have concentrated on educational and health programs, not environmental issues. A rare exception was the work of Sr. Marianna Hulshof, a Medical Mission Sister who, for nearly thirty years, showed people in Samia how to farm in ecologically more sensitive ways. She did this by practical demonstrations, not by religious rhetoric. Samia have not embraced a “protect the environment” ethos; rather, they deal with their environmental problems individually and pragmatically, sometimes with help from government agriculture and forestry extension agents or in response to directives delivered by government administrators.

Few people follow the old religion in its entirety, yet many aspects persist. Diviners, spirit mediums and herbalists are still consulted – along with priests, doctors and government officials. Ancestral spirits remain active in family life, visiting their kin in dreams or making themselves known through illness. Everyone, saved or not, insists that the dead must be placed in the Earth of their own homes, making generational continuity visible, placating angry spirits and opening oneself to blessings from the spirits. Every Samia person’s connections to kin and claims to identity and land are mediated by ancestors’ graves, the land itself and the spirits inhabiting it.

Wildness continues to figure in Samia life through everyday experiences, as people move between homestead, farm and bush, and the categorical and symbolic distinctions Samia make between wild and human. The homestead, a physical expression of social life, is a clearly defined moral space, marked by houses, graves, and formerly, ancestral shrines but now by Bibles, crosses and pictures of Jesus. Hedges surround many homesteads, marking off the homestead as “inside” and the land, cultivated and bush, as “outside.” Inside is the world of humans, who behave properly, work hard, and are responsible and orderly.

Yet there are interpenetrations, fluid boundaries, ambiguities. Ancestral spirits are betwixt and between, no longer human, yet not wild – except for the bad spirits known as esikhieno. Humans go into the bush to make use of its resources such as thatching grass, poles and stones; wild animals such as monkeys, mongooses and snakes come into the homestead. Cattle, sheep and goats who spend the day on grazing lands return to the homestead for night-time security, yet they – like all animals – are wild, even though they are closely implicated in human social life through their ritual roles and use as food, gifts and bridewealth. Thieves, who are humans turned wild, enter homesteads secretly to steal, and the power of witchcraft or an evil ancestral spirit may cross the boundary. Anyone who goes out of the homestead at night runs the risk of meeting a hyena or leopard, or omulosi, a person who travels with an animal familiar and creates minor disturbances in homes. Storytellers still tell of the mysterious wild beasts who enter homesteads in human form and then eat the inhabitants. Thus, though the bush and its animal population have been greatly diminished, wild things still enter the homestead, humans go into the wild, and the notion of wildness continues to resonate in Samia thought and ritual action.

San (Bushmen) Apocalyptic Rock Art

Southern African San or “Bushman” rock art is currently most adequately understood as an outward shamanistic expression of relationships that the San had with each other, with non-San, with an ordinary outer world, and with an extra-ordinary spirit world. For approximately 30,000 years, San rock-engravings and rock-paintings helped connect these co-dependent, parallel, and immanent worlds. San rock-art sites were thus points of breakthrough, and what we call “images” were for the San actual spirit world beings emerging from their home behind the rock. Unlike representational or even symbolic art forms, San rock art represents a radical departure from image making where representation and reality fuse seamlessly.

Similarly, what we call “nature” was for the San a deeply cultural entity that contained the entirety of human experience and that required constant custodianship. Over the last two thousand years, the character of San rock art changed to accommodate immigrant black farmers and KhoeKhoen herders. No longer was the landscape cus-todial – it became for these immigrants a commodity whose prime function was to provide an economic base for their existence. For a time the landscape’s bounty and the San’s revered spiritual status allowed the San custodial ethic to cautiously coexist with the imperialistic ethics of KhoeKhoen herders and black farmers. But this uneasy “truce” could not last, and in the last 600 years, images of weapons and scenes of conflict between different groups of people became alarmingly frequent. The arrival of White colonists in the mid-seventeenth century violently increased the hunger for a suddenly finite landscape. When the San realized that “their” land was being taken for granted and that they were being pushed off, it appears that they used rock art as a visible statement of their armed and political resistance by indelibly marking their homes in bright and local pigments. This war lasted 300 years but eventually the superior weaponry and rapacious body politic of the colonists took their toll. In 1875, Diakwain, a man who barely survived this war, told the story of The Broken String in an attempt verbally to articu-late his disbelief at how his unbreakable connection with inner and outer landscapes had, in fact, been broken: “People were those who broke for me the string. Therefore the place does not feel to me as the place used to feel to me. The place does not feel pleasant to me” (Bleek and Lloyd 1911: 236–7). From physical resistance the San turned, one last time, to a similarly ailing spirit world for deliverance. They tried to coax potent but dangerous spirit world beings into the outer World by painting their grotesque and bizarre likenesses on rock walls. Never-before-imagined frightening phantoms appear in an ephemeral and ghostly white paint, often with enigmatic lines emanating from their misshapen heads. Many marauding dogs representing the powerful trickster god’s/Kaggen’s “dogs of war” endlessly pursue deformed human figures that represent the Qobé or non-San. These distorted paintings appear to reflect a dislocated self-image and a sense of worldly alienation.

Determined by pigment analyses and study of 645 San rock-painting sites, these paintings date between 1750–1850. In the hotly contested southeastern southern African landscape, this eschatonic or apocalyptic art appears to be an attempt by the San to reclaim their worlds by banishing, by supernatural means, those who did not share their custodial ethos. But the boundaries between inner and outer worlds seem to have become rigid and distant and it appears that not even the most powerful shamans could now bridge this divide. Nor does it seem as if spirit world beings were able to break through the rock and deliver the San from their suffering. Fortunately, the San did survive this Apocalypse. Today about 140,000 San live in Angola, Botswana, Namibia and South Africa. They have remained connected to their spirit world and are helping non-San discover this ancient yet ever-relevant spirituality.

San (Bushmen) Religion

The domain of nature looms large in the lives of the Bushmen (or San). Their natural environment is today primarily the Kalahari of southern Africa, a semi-desert plain with summer rains and winter droughts, and, as recent as a century-and-a-half ago, also included the mountainous grasslands of the northwestern Cape, as well as other regions of southern Africa. As hunters and gatherers, San men and women are intimately involved with their natural environment, its animals, plants, seasons, climatic cycles, wind, weather, and sky. These impact closely on how, when, and where the people forage; they dictate the seasonal cycle of population dispersal and aggregation. Their loose kinship, marriage and leadership institutions, their egalitarian social and gender relations, exchange patterns, notions of territoriality and values of sharing and reciprocity are all affected to varying extent by the people’s adaptive lifeways. Religion, too, is intimately linked to nature, so much so that some researchers see in it an “ideology of foraging,” that is, a mindset that is congruent with the production mode and social patterns of a foraging people.

Before turning to the nature component of Bushman religion (the main theme of this brief account), it should be noted that San religion addresses itself also to the social domain, in the ways all religions do. Like myths everywhere, Bushman myths, too, explain and validate the social order, while ritual enacts, reinforces or defuses basic social processes, values and conflicts. The Bushman healing dance is a case in point: as the people’s central ritual, the trance dance plays out such things as intra- and inter-group sharing, social and gender equality, exchange and kin networking, “ludic” conflict resolution, leveling and cooperation, all of them key structural and ideational elements of Bushman band society. Moreover, the dance becomes an arena for the moral, emotional and creative interplay between the individual and the community, enacting thereby one of the basic structural characteristics of this fluid and loosely organized society – the juxtaposition of the individual to the group and the balance between individualism and communalism.

The element of nature most prominent within Bushman religion is animals. Plants receive far less symbolic elaboration in Bushman myth and ritual, while stellar and meteorological phenomena may be salient features of the myth and lore of some groups (especially the /Xam). An example for the second is the !Kung mystical concept of now, the mystical and magical connection of some persons to the wind and rain at their birth, which is dramatically evident also at the person’s death, through the unleashing of a mighty wind or rainstorm.

As a hunting people the Bushmen are intellectually and emotionally attuned to animals, especially the game species and the animals that prey on them, the carnivores, in whom the Bushmen see resourceful fellow hunters, one of whom, the lion, they hold in special esteem (so much so that one group, the !Kung, have established a pact of mutual respect and avoidance between themselves and the lions). A sympathetic bond links a hunter to his quarry, which may be palpable, expressing itself through bodily sensations, which the /Xam called “tappings” and experienced in those parts of their body that correspond to the distinctive markings of the prey animal (for instance, on their head, face or eyes, corresponding to the hunted springbok’s horns, black facial stripes and back hair). When tracking a wounded animal, the hunter had to refrain from certain actions – such as uttering the animal’s name (using its secret name instead), or from drinking and sleeping, lest he invigorate the pursued animal.

San (Bushmen) Rainmaking

One of the central characteristics of San religion is its fluidity and adaptability. Although all Khoisan people broadly share a similar religious outlook the specifics vary from group to group, and within a group may change according to particular socio-economic circumstances. This is clearly illustrated with reference to the diverse rainmaking practices of the San, which is clearly an expression of their religious outlook. All San ascribed to the Supreme Being, or to a lesser and sometimes malevolent deity, the power to create or withhold rain. Among the northern San this deity is frequently prayed to or simply addressed in times of drought. Some healers had the power to know where the rain would fall but the northern San as a rule did not have rainmaker specialists like the southern San. The lower deity among the southern San is, like other forces of nature, zoomorphized and frequently manifests as the rain-animal – a mythological and often dangerous creature with the ability to change its shape.

Southern San healers or shamans have the ability to capture this rain-animal and to create rain where its blood falls on the ground. It is also believed that the spirits of the dead, especially those of previously powerful rain shamans, may cause the rain to fall by riding on the back of the rain-animal. These are often prayed to in times of drought. Whereas many rainmaking rites refer to shamanistic visions and trances, there is substantial evidence that rainmaking became more ritualized where San groups assimilated into the societies of Bantu-speaking farmers. These spirits are often prayed to in times of drought. In addition there is a special relationship between a San girl experiencing her first menses and the rain and it is said that an angry rain may ensue when this girl does not honor the correct customary procedures.

Frans Prins
Another powerful expression of human-animal identification was the vigorous mimetic "eland dance" a number of Bushman groups performed at the occasion of a girl's first menstruation. It was performed outside the girl's hut, by old men and women, and its steps and choreographed routine were the courtship behavior of the eland, the Bushmen's premier antelope and game animal, because of its bulk, fat and tractability, as well as its mystical association with rain, fertility and health. Inside her menstrual hut, the girl herself, among the /Xam, became a metaphorical eland, drawing the animal toward her, allowing it to be shot by hunters. At male initiation, on the occasion of the young man's "First Buck" ceremony, the eland was once again a portentous presence. Through a variety of acts of contagious magic, a palpable bond was established between the /Xam young hunter and the eland, such as being covered with eland fat and having "eland medicine" – the animal equivalent of n/om – rubbed into medicinal cuts.

An especially dramatic and profound expression of animal-human identity is transformation, of a human, metaphorically, spiritually and experientially, into an animal. This happens most elaborately during the trance dance, the universal and principal ritual of the Bushmen. To the women's chanting and rhythmic clapping, one or several healers will dance themselves into a trance state, around a large fire, that is kept lit throughout this night-long curing ritual. In trance a dancer activates the healing potency (which the !Kung call n/om) that resides in his stomach and with it he heals the sick person or persons at the dance (as well as administering, in the spirit of sharing, general palliative treatment to all of the spectators). When he finally collapses, his spirit leaves the dancer's inert body, to fly away, in search of supernatural assistance from the spirits, in his curing task. At one point in their trance experience, some dancers may undergo animal transformation, either into antelopes – ideally elands, that may sprout wings flying heavenward – or into lions. Such "lion experiences" are capable of absorbing a dancer so forcefully that he might feel his "lion-teeth forming and his lion-hair growing."

Therianthropic, man-animal beings also figure prominently in the myths and tales of the Bushmen (while animals are prominent also in Bushman rock art, some of which presents splendid, polychrome depictions of game antelopes, especially elands). The "Early Race" that inhabited the mythic age were, for the most part, such beings – animals who had certain of the anatomical and behavioral patterns peculiar to the species – such as the antbear eating ants and burrowing, or the wasp having a slender waist. Yet, they were also persons; so much so, in fact, that a storyteller will point out that if you came across such beings today, you would not think that they were anything other than people. Yet they could also be a zebra, a lion, a gemsbok, elephant or ostrich; you only need to look more closely and you will see that they are animals. Animals to the Bushmen are evidently more than just bearers of certain anatomical traits – stripes, mane, horns, trunk or long neck. They can be identified by means of non-physical, subcutaneous attributes, drawn from the animal's inner being rather than its exterior form.

There were also humans in the mythic age, as well as animal or human trickster beings, well suited, because of their quixotic and ambiguous nature, to the inchoate conditions of that first order of existence. Other types of being were sun, moon and some stars, who were persons in the mythic past – some of them living on the Earth – before being cast in the sky. The early humans were flawed; they had, so the Nharo storytellers remark, "no customs." Their lives were marred with social and moral transgressions. One common transgression, in /Xam mythology, was the breaking of menarcheal taboos by a girl in seclusion, who was punished by the mysterious rain-divinity /Khwa, usually by being transformed, along with all of her hapless band members, into frogs. Their material belongings reverted to their natural state (from digging sticks to shrubs, leather cloaks or jackal tail swats to antelopes or jackal). Thus, the boundary between human and animal and culture and nature was porous in the mythic age and the distinction between ontological realms precarious.

Another problem of the "Early Race" of people (as well as of the animal-people), which is the subject of tales found in all Bushman and Khoe Khoe groups, is in-law tension. One of its manifestations was the murder of the wife of one of the band's men and the eating of her flesh, the perpetrators all the while convincing themselves – and the reluctant husband – that what they were eating was in fact meat, not a person, and that their band member had "married meat." This symbolic equation of women with meat (or game), meat (and fat) with sex, and hunting with sex and marriage, is a pan-Khoisan notion. Beyond its expression of in-law tension, it stands as another forceful expression of human-animal identity.

Through an act of creation, by either a wise animal-person (such as the Anteater-Woman or the Kori Bustard, among the /Xam and !Kung, respectively), or god or the trickster, the early order became transformed. The human component of the therianthropic beings shrank and they became fully animal (although retaining, in some cases, vestigial humanness within them, to this day). In some cases, the reverse happened, so that the early man-animal, in shedding its animal component, became and remained a person. This, among the /Xam, is what happened to the springboks of the "Early Race."

Through ideas of this kind – humans and animals of today being the animals and humans of the mythic past, women as meat, the ontological fluidity of humans and animals and culture and nature – Bushman mythology provides the symbolic and cosmological basis for an ideology which links humankind closely to nature. That
ideology is underscored further by mystical notions and ritual practices of sympathy, between hunter and quarry, a person and the weather, and the transformation of an initiate or shaman into an animal. Bushman religion, being thus informed with the beings and forces of nature, provides the ideological underpinnings for a way of life that is closely attuned to the natural environment.

Sanders, Scott Russell (1945–)

Scott Russell Sanders’ religious vision is grounded in Quaker traditions he first encountered as a graduate student in England. “Quakers are mystics,” he says in *The Force of Spirit*, “but homely and practical ones, less concerned with escaping to heaven than with living responsibly on Earth” (2000: 155). Sanders’ essays and fiction seek ways of living responsibly on an Earth torn by violence, greed, and environmental degradation. In *The Force of Spirit* Sanders says too:

All the names we use for the fire at the heart of matter are risky – God, Yahweh, Creator, Allah, Manitou, among countless others – for each comes freighted with a long, compromising history. From all the possible names I favor spirit because the word seems to catch the lightness, radiance, and windlike subtlety of the power that I seek (2000: 3).

As an essayist and writer of fiction, Sanders explores his relationship with spirit, especially the flashes of illumination it provides him in moments of silence on the mysterious border between nature and civilization.

One can glimpse Sanders’ growing preoccupation with matters of the spirit in the titles of his essay collections: *Stone Country* (1985), *The Paradise of Bombs* (1987), *Secrets of the Universe* (1991), *Staying Put: Making a Home in a Restless World* (1993), *Writing from the Center* (1995), *Hunting for Hope: A Father’s Journeys* (1998), and *The Force of Spirit* (2000). There is great violence at work in the world Sanders describes. His essay “At Play in the Paradise of Bombs” in the 1987 volume, for example, describes life on a military reservation in northeast Ohio, where he spent some of his formative years. This Ravenna Arsenal becomes a metaphor for our modern predicament. We all live, says Sanders, in a “fenced wilderness devoted to the building and harboring of instruments of death” (1987: 4). His essays, novels, stories, even his children’s books, can be read as attempts to understand how we came to inhabit such a grim place and how we might transform it by attending to spirit.

With the exception of a few short stories set in the twentieth century, most of Sanders’ fiction takes place before or after our own time. One might expect a writer who almost became a physicist to try science fiction, and Sanders has published three sci-fi novels: *Terrarium* (1985), *The Engineer of Beasts* (1988), and *The Invisible Company* (1989). In *Terrarium* people have moved into fabricated enclosures on the ocean because civilization’s toxic by-products were about to destroy wild nature. Like the rebels in Ernest Callenbach’s *Ecotopia* novels, the protagonists in *Terrarium* seek to create an alternative to the technocratic, totalitarian society they inhabit. Instead of threatening nuclear blackmail, as Callenbach’s characters do, the rebels in *Terrarium* rely on memory of place, sexual love, and ceremonies similar to Quaker worship.

Sanders’ historical fiction includes *Wilderness Plots* (1984), *Wonders Hidden: Audubon’s Early Years* (1984), and *Bad Man Ballad* (1986). Humanity’s troubled relationship with nature is at the heart of all three books. *Wilderness Plots*, for example, is a collection of very brief tales, based on fact, about the people who settled the Ohio Valley. With the stark, unembellished quality of folktales, these brief narratives offer a view of nature that is anything but sentimental. “Embryo Town” tells of a failed attempt to impose civility on a frontier that fosters greed and violence. “Profit and Loss” recounts the story of Daniel Cross, who doubles his wealth in a day by selling a wagonload of oats and then is eaten by wolves.

Sanders’ writing is a search for the disciplines at the core of culture and the sacred power at the heart of creation that might allow us to find our way beyond the violence, greed, and destruction that mar our history.

William Nichols
Santa Fe, New Mexico

Founded in 1610 by the Spanish, the area surrounding the city of Santa Fe, New Mexico was for centuries the home of the Pueblo Indian tribes of the Rio Grande valley. The city itself was developed on the site of a Pueblo Indian ruin known as Kaupoge, or “place of shell beads near the water.” The five elements of mystical religions are amply in evidence in the landscape surrounding the city: volcanic, mountainous country forged by fire; vast stretches of earth, so rich in iron ore that it appears painted; water, from the nearby river the Rio Grande; the cielo grande, or vast open sky and clear air; and space, represented by the canyons and ancient standing-stone ruins of the Pueblos that line the Rio Grande to the west of the city. The location of Santa Fe along ancient migration lines from Central America to the north and more modern transportation lines from the eastern United States, situate it as a symbolic crossroads.

The modern era and its union of cultures can be traced to the settlement of the Native American lands by Spanish soldiers, political officials, and Franciscan missionaries. Translated from the Spanish, Santa Fe means “City of the Holy Faith.” Like the Mexican ancestors who settled in the area following the Spanish conquest, the contemporary Holy Faith. "Like the Mexican ancestors who settled in the area following the Spanish conquest, the contemporary Hispanic Catholic population reveres the Lady of Guadalupe, a manifestation of the Virgin who appeared to the Indian Juan Diego in 1531 at Tepeyac, near Mexico City, and spoke to him in his native language, Nahuatl. The Chapel of Our Lady of Guadalupe in Santa Fe was built in 1795 and her feast day is celebrated annually on December 12.

Another religion to appear in New Mexico was the Brotherhood of Penitents, Los Hermanos Penitentes. Primarily composed of men, the Penitentes practice regular flagellation with whips made of local weed and carry heavy wooden crosses to emulate the Passion of Jesus Christ. The religious practices of the Penitentes derive from the landscape, where harsh desert conditions and absence of rain symbolically underscore the ways that human existence can mirror the suffering and privation of Christ. The Brotherhood of Penitents appeared in New Mexico in the early nineteenth century, but in the twentieth century, due to public scrutiny of the rather brutal practices of the group, the society began to hold secret meetings. The group is still active in the region.

Native and Christian beliefs coexist in Santa Fe, making the city and its environs a haven for anthropologists who seek to examine the relationships between native religious practices and Christianity. In the early decades of the twentieth century, the city became a destination for tourists interested in discovering “authentic” and “primitive” cultures in the American West. In the 1920s and 1930s, the Fred Harvey Company drew affluent easterners to New Mexico by combining train travel with motor car excursions through Native American villages. Travelers were escorted by female guides who had been trained in anthropology and literature at Eastern American universities. Tourists were able to learn about the culture and history of the southwest, but were also entertained by native dancers and artisans. The development of US Route 66 in the 1930s meant that more visitors could easily reach the high desert country of northern New Mexico, and the city quickly grew from a religious and trade outpost along the Camino Real and the Santa Fe Trail to the modern capital it is today.

Santa Fe is currently home to many modern nature-based philosophies, metaphysical religions, and spiritual practices. Religious groups holding meetings in Santa Fe today represent Eastern and Western spiritual traditions, and alternative religious groups that emphasize the relationships between mind and body. Vision quests and stone circle meditation retreats are common among women’s spiritual groups, some of which are connected to Wicca and some to Eastern religions such as Buddhism. The popularity of the site may be linked to theories of sacred space. As Paul Devereux writes, “We need to go to the moors, deserts, forests and mountains, the remaining wild places of our world [to find] the caves, springs and mountain peaks recognized and selected as natural places of power by traditional peoples” (1992: 15). Places like Santa Fe and its surrounding wild spaces “embody perennial knowledge” (Devereux 1992: 15).

This religious history and the ensuing twentieth-century reputation for the city as a place of social tolerance and human rights activism have resulted in the city becoming a spiritual center. The location of Santa Fe in the foothills of the Sangre de Cristo (Blood of Christ)
The Santal region (India)

India is home to a large number of indigenous tribes known as adivasi (early inhabitants), vanavasi (inhabitants of the forest), vanajati (castes of forest) and paharia (hill-dwellers). Among these various tribal groups, the Santals constitute “the largest homogenous scheduled tribe in the country” (Troiš 1978: 24). According to the 1991 census of India, the Santals numbered approximately 4.2 million, largely concentrated in the three Indian states of Bihar, West Bengal, and Orissa. A sizeable number are also found in Assam, Tripura, Meghalaya, Bangladesh, and Nepal. Santal folklore describes the tribe as a wandering race. Although there is no consensus among either scholars or the Santals themselves about their original habitat, by the mid-eighteenth century large numbers of Santals were found in the Chotanagpur tribal belt in central India, who eventually migrated to the Rajmahal hills in the state of Bihar. Reportedly, the British government officials engineered this migration in order to clear the virgin forests and create human habitations as the Santals were renowned for their jungle-clearing skills. Since then the tracts of the Rajmahal hills have been considered the heartland of Santal life.

The Santal religious consciousness and its more concrete expressions (such as myths, rituals, and sacrifices) revolve around a large number of both benevolent and malevolent supernatural beings and spirits called bongas, who are believed to conduct the course of nature, human events, and ultimately human destiny itself, and with whom the Santals seek to live in close fellowship. In addition to these spirits, they believe in a number of impersonal powers residing in or connected with natural objects which are not worshipped but controlled through exorcism or magic exercised by the ritual specialist. The ojha (diviner) is the minister of white magic since his administrations are beneficial to society, whereas dan (witch or sorcerer) is the minister of black magic. The ojha is believed to have the power to deal with the spirits, superior knowledge of common substances and objects, and the ability to diagnose the causes of misfortunes and/or sudden illnesses and prescribe appropriate ritual remedies through magical spells (mantar), incantations, and oil divination (sunum bonga). In contrast, the dan is capable of influencing the evil bongas and causing societal misfortune. The office of the ojha is reserved for men and a woman claiming to be an ojah is suspected to be a witch. Unlike other Indian tribes, the Santals believe that only women practice witchcraft.

The Santal Sacred Grove

The sacred grove and the tree-cult associated with it are widespread among Indian tribal groups. The Santals are no exception. Typically, the Santal sacred grove, known as jaherthan, is a cluster of five trees – four sal trees locally known as sarjom (shorea robusta) and one mahua (bassia latifolia) tree – believed to be relics of the primeval forest. Each tree in the grove represents one of the five principal spirits of the tribe: Maran Buru (great mountain), Jaher Era (The Lady of the Sacred Grove), Moreko-Turuiko (five-six), Gosai Era (a female spirit), and Purgana Bonga (boundary spirit). Usually located at the end of the village, the exact location of the jaherthan is determined by the first settlers of a Santal village after careful divination in which the principal spirits of the tribe themselves are said to demarcate the site through a human medium.

As the abode of the national spirits and as the locus of community worship, the jaherthan is the most auspicious sacred space for various ritual, cultural, and social celebrations. Religiously, it is the preeminent site of interaction between the Santals and the supernatural world. Socially and culturally, the grove also serves as the locus where an individual Santal’s identity is constructed, celebrated, and reinforced insofar as major life-cycle ceremonies involve some form of ritual performance at the sacred grove. According to Santal belief, failure to “remember” the

spirits (bongas) at such occasions would bring disastrous consequences such as epidemics and death.

A number of taboos – gender-specific as well as generic taboos – govern Santals’ attitude to the sacred grove. The most important gender-specific taboo concerns women’s participation in the ritual activities at the sacred grove. As a rule, women are not permitted to be present when sacrifices are offered nor can they eat the flesh of animals offered to the grove spirits. While women are specifically excluded from ritual activities at the sacred grove, all Santals are forbidden to “cut any of the sacred trees in the jaherthan or collect fallen branches” (Troisi 1978: 227). The sacred character attached to the grove and the accompanying taboos instil in the Santals a sense of reverential fear for the spirits and a concomitant respect for the natural environment.

Santal Religious Culture: Seasonal Festivals and Rites
The Santal fellowship with the spirits (bongas) is most prominent in their seasonal festivals and calendrical rites that are intimately tied to the agricultural cycle. The Santals observe seven annual community festivals that involve ritual offerings, libations, and blood sacrifices – typically fowls – dedicated to the sacred grove spirits. The sohrae (harvest) festival, celebrated in December–January after the harvest is gathered, and the baha (flower) festival, held in February–March when the matkom trees begin to blossom, are the two most important festivals. The seasonal festivals help to ensure the protection of the benevolent spirits as well as to ward off malevolent spirits. Prior to these festivals, the village priest (naeke) is subject to a series of ceremonial taboos and interdictions that typically include purificatory baths, fasts, penance, and abstinence from sexual intercourse intended to ensure the efficacy of the rites and the proper propitiation of the spirits of the sacred grove. Large-scale drinking, singing, drumming, and dancing are characteristic of these seasonal festivals. The seasonal festivals offer important clues to Santal religious culture and its core values. First, they reveal the Santal recognition of the presence of the spirits in the natural order. Second, they demonstrate the Santal dependence on the spirits for societal stability and well-being. Third, they afford an opportunity for the Santals to celebrate the lordship of the spirits over their life, habitat, and fields. This is most evident in the baha festival and the offering of the first-fruits of matkom flowers to the spirits. Until the spirits are properly propitiated, the flowers can neither be harvested nor eaten. Finally, they reveal the community’s desire to live in harmony with nature.

Santal Material Culture
The Santal religious worldview and culture translates into a material culture that values close kinship with nature. As an agricultural community, most Santal villagers grow the rice and vegetables necessary for domestic consumption, procuring other necessary items at the weekly market in the neighboring town several miles away from their homes. Walking is the most conventional way of getting to and from the marketplace (hatia), although occasionally bicycles may also be used. In addition to providing a social outlet for intra-village and inter-family fellowship, the custom of walking to the marketplace minimizes Santal dependence on motorized vehicles. Even after walking several miles to the market, Santals are wont to purchase only what is urgently needed. This is due, in part, to their cultural attitude and in part to a lack of storage and refrigeration facilities.

Related to their frugal lifestyle is the Santal tendency to conserve and recycle. Since there are limited industrial resources in the region, the Santals make maximum use of the products they design from raw materials collected from their physical and natural geography. For example, almost every Santal village in West Bengal has bamboo groves from which baskets and other household items are made. Their domestic utensils are generally made of copper, brass, or clay. Furthermore, Santal women tend to reuse old saris and dhotis to tailor children’s clothes. Often an entire village shares a single well or pond. Given the limited supply of water, Santals make diligent use of available water. All in all, the Santals demonstrate an ethic of conservation and a certain respect for the land in which they live since their personal and social identity is intimately connected to their physical space.

The third feature of Santal material culture is its reliance on tribal herbal medicinal system. While the Santals view most diseases as unnatural, ascribing them to the agency of certain evil spirits which they believe can be counteracted through religious medicine, they also acknowledge the natural causes of ordinary illnesses. The Santal curative system utilizes medicines made from a large number of plants, herbs, and natural objects. Bodding records a list of 305 Santal prescriptions for various human diseases and 15 veterinary medicines. Whereas the village medicine man (raranic) is believed to have good knowledge of roots and herbs and their medicinal power, most adult Santals also have a basic knowledge of this “root medicine” (rehet ran). Since they regard nature and vegetation as a valuable resource for cure, Santals are careful not to destroy the vegetation, partly out of self-interest and partly out of reverential fear for the spirits permeating the universe.

Santeria

The mystical worldview of Santeria, like that of its cultural ancestor, the religion of the Yoruba-speaking people of Southwestern Nigeria, is characterized by a highly personalized view of nature. The Yoruba-speaking people, called in Cuba lucumis, were brought to that island beginning with the sixteenth century. However, at the end of the eighteenth and throughout the first three-quarters of the nineteenth centuries, due to the expansion of the sugar and coffee plantation enterprise in Cuba, the number of imported slaves grew dramatically. Among them, the Yoruba-speaking were over-represented because it was a time when civil wars were ravaging their homeland, thus turning its inhabitants into easy prey for the slave traders.

In Cuba, Yoruba slaves and their descendants were able to preserve their religion, language, mythology, dances, legends, and music. This factor was important in also preserving and transmitting the important relationship between Santeria’s beliefs and nature.

In the merging of cultural traditions that took place in the cultural history of Cuba, borrowing and reinterpretation were common in the process that resulted in a new Cuban product. As such, the Yoruba religion in Cuba was placed in contact with other religious beliefs and practices. In the merging process that ensued, the transplanted Yoruba religion borrowed from the Mediterranean Catholic and the European, Kardecian, and Spiritualist beliefs and practices that were prevalent on the island. It also borrowed from beliefs and practices from other African ethnic groups. The Afro-Cuban religion that emerged as a result of these merging processes is commonly called Santeria, or Regla Lucumi or Regla de Ocha.

Central to the religion of the Yoruba people and of Santeria believers is the belief in supernatural power and energy called ashe, and its sources and manifestations. Ashe is primarily manifested in important orishas, or gods, who are the personification of the generic forces of nature (thunder, lightning, volcanoes, the sea); other orishas are patrons of important human activities such as hunting, farming, and smithing. Moreover, ashe is manifested in the lesser orishas who dwell in rocks, stones, streams, shells and other natural phenomena; it is also manifested in revered ancestors, and in consecrated stones, images, necklaces and all sorts of amulets.

Ashe is power that can be manipulated and controlled by magical means to be used to do good as well as harm. Worship is geared to secure the ashe necessary to deal with daily problems, to survive and propagate. Magical and spiritual means are directed to engage the goodwill of gods, who are the sources and manifestation of ashe, but who also require human assistance, and so they are constantly demanding to be fed and taken care of. This worldview is in consonance with a value orientation based on an intuitive-sympathy-with-nature stance, rather than the control of nature by scientific and pragmatic means, the value orientation prevalent in Western culture.

Whereas ashe is manifested in all natural phenomena, it is especially present in those related to the Earth. According to McKenzie, “Yoruba religion in the nineteenth century would seem to be a religion of the Earth rather than of the sky” (1997: 38). This statement is validated by Lydia Cabrera’s Afro-Cuban informant, “Los Santos estan mas en el Monte que en el cielo” (“The saints, or personalized supernatural beings, are in the wilderness rather than in the sky”) (in Cabrera, El Monte, Havana: Editions Chichirekú, 1954, author’s translation). El Monte, the wilderness, is the equivalent of planet Earth, which is inhabited by all kinds of supernatural beings: gods and spirits who constantly intervene in human affairs, thereby causing illness, misfortune, death or conversely good health and fortune.

This Earth-centric stance is reflected in the perception that gods and spirits, the sources or receptacles of magical power or ashe, animate most earthly inorganic natural phenomena such as the mountains, volcanoes, rocks, stones, the water in streams, rivers, the sea, and the oceans. Organic natural phenomena are viewed in a similar way. Animals, particularly snakes, snails, lizards, and birds, especially vultures, as well as trees, especially when growing in groves, plants, and herbs are also perceived as receptacles or manifestations of supernatural beings, the orishas and spirits, imbued with ashe.

On the other hand, atmospheric phenomena, such as lightning, thunder, rain, tornadoes, the wind, which so greatly impact the lives of earthly dwellers, are also perceived as animated by anthropomorphic supernatural spirits, who are also considered important sources of ashe. Rainbows are especially admired and revered, though not as much as the more dynamic and destructive atmospheric phenomena. Meanwhile, celestial bodies such as the Sun, the Moon and the Stars, although seen as magnificent manifestations of the greatness of the creation of the Supreme Being, Oludumare, are not objects of religious interest. Finally, ashe is also manifested in humanmade symbolic and consecrated objects, such as amulets, which are perceived as receptacles of this power.
Among Afro-Cubans this mystical worldview persists when confronting untamed nature, wild animals, and/or plant life. In Cuba, *la ceiba*, siguaraya, and the royal palm tree are perceived as particularly potent receptacles of the sacred. This belief is evident in the words of Lydia Cabrera’s informants and documented in her monumental work *El Monte*. It is in this wilderness where trees, plants, and herbs subjectively interact with humans.

Plants and animals have a distinctive personality and display the whole gamut of human emotions and nature, as demonstrated in the testimony of Florencio Baró. A child of slaves, Baró was born and raised in Carlos Rojas, a town well known in Cuba as one of the cradles of Santeria. He described the magical ambiance of his native town where wild vines and weeds grew, filling the empty lots with mystery and silence. In his own words: “Anything can be *brujo*” (can have supernatural power, can have a spirit) (interview with the author, 1991).

One of the most important functions of Yoruba religion and its cultural descendant, Santeria, is to serve as a health system, providing practitioners the means of diagnosis and treatment for all kinds of ailments. As in traditional Yoruba religion, in Santeria herbalism assures survival and adjustment, which was especially true during the nineteenth century when access to medical care in Cuba was very limited. However, during the last century the role of santeros as pharmacists was deemphasized. Santeros placed greater reliance in medical prescriptions and treatment rather than in their own medicine derived from their knowledge of the healing power of herbs. Consequently, the wilderness in Santeria started to lose importance as a receptacle and source of supernatural power.

In current times there has been a trend for Santeria to flourish in large metropolitan areas where the wilderness is absent and natural phenomena is less threatening than in rural villages and towns. Thus, even though *ashe* remains integral to Santeria’s beliefs and practices, the awesome and mystical view of nature in the ambiance of Santeria is being lost.

**Saro-Wiwa, Kenule Beeson (1941–1995) and the Ogoni of Ogoni**

Born in the southern village of Bori, Ken Saro-Wiwa was one of Nigeria’s most recognized and accomplished citizens. An Ogoni leader from Ogoni, he was tried and hanged for challenging what he considered to be genocide perpetrated against the indigenous minorities of the Niger River Delta by the petroleum industry and their political allies.

Saro-Wiwa’s life was punctuated by careers as a teacher, civil servant, publisher, television producer and dramatist. He is the author of over forty major works, including novels, volumes of poetry, essays, plays, journalism, short stories and children’s books. From 1985 to 1990, Saro-Wiwa created, wrote, produced, financed and marketed Nigeria’s most popular situation comedy, *Basi & Co.*, watched weekly by 30 million Nigerians. Winner of the Goldman Environmental Prize and the Right Livelihood Award in 1995, he was nominated for the Nobel Peace Prize prior to his execution.

Always environmentally conscious, Saro-Wiwa adopted the plank of environmentalism as a strategic tool to promote the Ogoni cause. “The visit to the United States (1993) sharpened my awareness of the need to organize the Ogoni people to struggle for their environment,” Saro-Wiwa wrote. “A bit of research and thinking of my childhood days showed me how conscious of their environment the Ogoni have always been and how far they went in an effort to protect it. I had shown this consciousness all along” (1995: 79).

Jailed under the *Treason and Treasonable Offenses Decree* promulgated in 1993 by President Gen. Ibrahim Babangida, Saro-Wiwa wrote (from prison) poetry that widely echoed the sentiments of the minority delta peoples:

> Ogoni is the land  
> The people, Ogoni  
> The agony of trees dying  
> In ancestral farmlands  
> Streams polluted weeping  
> Filth into murky rivers  
> It is the poisoned air  
> Coursing the luckless lungs  
> Of dying children  
> Ogoni is the dream  
> Breaking the looping chain  
> Around the drooping neck  
> of a shell-shocked land  

(widely circulated prison poem).

“The land and the people are one and are expressed as such in our local languages,” according to Dr. Owens Wiwa, Ken Saro-Wiwa’s brother.
The Ogoni have always respected nature, and this informed the struggle for the environment. There are lots of names for the spiritual trees, sacred rivers and lakes, and the traditions are very important. When people are ill, they revert back to indigenous beliefs and folklore (personal communication, Dr. Owens Wiwa, 2003).

The Ogoni number some 500,000 people today, a minority among a 300 minority and three majority (Yoruba, Igbo/Ibo and Hausa-Fulani) ethnic and religious groups in Nigeria. They live on the coastal plain of the vast mangrove estuary of the Niger River. The floodplain is home to some seven million people, grouped by nation, ethnicity and clan, including: the Ijo, Urhobo, Itsekiri, Isoko, Efik, Efie, Ibibio, Andoni, Ikwerre, Ogoni, Isoko, Edo, and Kwale-Igbo. These tribes’ relationships to religion and nature are complex and difficult for outsiders to understand.

Like other affiliated linguistic groups in the delta, the Ogoni connection to the environment is defined in spiritual and ritualistic terms, where Earth, soil, water, trees, plants and animals are sacred. (Despite the catastrophic spiritual, ecological and cultural devastation in the delta, this section is written in the present tense to reflect the prevailing attitudes, practices and beliefs.) Certain sacred groves and forests are revered: burial grounds for good and evil people; sacred boundaries between neighboring communities; family heritage forests. Ancient and enormous African oak, Iroko and cotton trees, animals and plants are worshipped. Customary laws have existed; formal legislation to protect nature proliferated after 1850, and historical accounts of willful or accidental injury to wildlife document punishment by death. Sacrifice and ritual cleansing are daily events used to placate and honor nature spirits and deities. Priests and priestesses hold sway over the delineations and durations of sacred spaces.

Rights of habitation and ownership of communal spaces are intermittently transferred to animals: where the sacred Odumu (royal python) finds a home, it is the legal owner and community law recognizes its rights (until it vacates).

The concept of animal libertarianism has been practiced among the communities of the Niger Delta since antiquity . . . The people do not hunt animals for sport; rather, they are categorized in accordance with value – religious, ecological, social and economic . . . Infraction could result in fines, expensive ablation and atonement rites, and ostracism from the age group or the community as a whole . . . Shell’s right to explore and produce hydrocarbon (a right now seriously challenged by all communities of the Niger River Delta) does not preclude the rights recognized to be enjoyed by persons, animals, and other living and nonliving things (Okonto and Douglas 2001: 215–25).

During his final activist years (1989–1995), Ken Saro-Wiwa championed the cause of the Ogoni people in international arenas; toward the end he expressed his indigenous consciousness by addressing Ogoni audiences only in his native Gokana language. In 1991, Saro-Wiwa organized the Movement for the Survival of Ogoni People (MOSOP), and was elected President in abstentia in 1993; MOSOP sought to reclaim economic rights and protect the environment against the petroleum ecocide that had already claimed the Ogoni mainstays of fishing, farming, hunting and gathering. In 1992, Saro-Wiwa delivered the Ogoni Bill of Rights in person, with his book, Genocide in Nigeria: The Ogoni Tragedy (1993) during a speech to the UN Unrepresented Nation’s and People’s Organization (UNPO) in Geneva, Switzerland. Saro-Wiwa called for an end to the petroleum corporation’s occupation of Ogoni, for political autonomy and international attention to the devastation of the delta’s ecology.

“The extermination of the Ogoni appears to be policy,” Saro-Wiwa stated.

National ideas of national independence, the fact of Africans ruling Africans in nations conceived by and for European economic interests have intensified, not destroyed, the propensity of man to subject weak peoples by force, violence and legal quibbling to slavery and extinction (1995: 98).

After 1992, Saro-Wiwa was relentlessly harassed and prevented from speaking abroad. On 4 January 1993, the first annual Ogoni Day, Saro-Wiwa organized some 300,000 Ogoni in a nonviolent celebration, with music, dance and a rally at each of the seven Ogoni kingdoms. Elaborate masks worn by revelers attested to the indigenous cosmology: “people are supposed to believe what the masks represent” (personal communication, Dr. Owens Wiwa, June 2003). Masks (masquerade) are used as expressions of mysticism and power, and to validate the people’s beliefs. “To Shell and the Nigerian government, my brother was a dangerous and irresponsible terrorist” (personal communication, Dr. Owens Wiwa, June 2003).

protesting the expropriation of delta life by multinational petroleum corporations. The result at every stage, Ogoni supporters claim, was corruption, deceit, propaganda and violence, against the backdrop of the theft of natural resources (Okonto and Douglas 2001).

Competition between Islam (north) and Christianity (south) fueled by the military government has led to widespread pogroms and communal violence in Nigeria. The persecution of Christians and their churches in the delta provoked an international Christian solidarity movement (1990s). An equally frequent phenomenon is the dogmatic use of religion (Christianity and Islam) to justify punitive and repressive military operations. This phenomenon has been prevalent amongst delta oil communities.

As an example: “Grace be unto you and peace from God our Father and from the Lord Jesus Christ,” begins a memo (21 December 1995) from the commander of the Rivers State Internal Security Task Force, charged with "wasting operations" in Ogoni (read: raping, torturing, killing), to Ogoni clergy. “Let us pray for Ogoniland and the Ogonis, even with the following passages in our mind: Luke 18:1; 1 John 5:14, 15; 1 John 8:21, 22.”

Raised a protestant, Saro-Wiwa attended church infrequently; but he read the Bible constantly while imprisoned (personal communication, Dr. Owens Wiwa, June 2003). His writings are infused with the symbolism of Islam and Christianity, though he admonished or lampooned these major faiths (and the blind or confused faith of followers) as often as he praised them for attributes in them that he admired. Biblical references were also common, often in the context of biting satire. His writings were equally contradictory about traditional village life, tribal beliefs, indigenous cosmology and paganism; in contradistinction were his confusions about modernity and the “comforts” and “benefits” of Western civilization.

He wrote: “The Christian church, as I have said, has a powerful hold in Ogoni, and the arrival of the Pentecostal churches at a time of serious economic difficulties had led to even more people seeking solace in religion … it was making the people not seek answers to their problems … [t]he Pentecostal churches tend to be one-man outfits out to exploit the people. They lack the strength of the organized Churches, which I definitely admire (1995: 152).

On 22 May 1994, Saro-Wiwa was arrested and imprisoned on charges of murder stemming from what was widely regarded as a military frame-up. In an irregular trial convened by a special military tribunal, Royal/Dutch Shell bribed two prosecution witnesses, Ogonis who recanted in exile. Lawyers for Royal Dutch/Shell attended and presented briefs at the hearing. Saro-Wiwa’s defense team of high-profile lawyers resigned in refusal to add legitimacy to the proceedings. A posthumous United Nations fact-finding mission documented the extensive irregularities. Amnesty International and Human Rights Watch condemned the trial.

By the time of his death, Saro-Wiwa was a living manifestation of the Gandhian philosophy of Satyagraha. Given the opportunity to escape Nigeria, even by the jailers of the cell that held him, Saro-Wiwa refused to abandon his people. “I have devoted my intellectual and material resources, my very life, to a cause in which I have total belief, and from which I cannot be blackmailed or intimidated,” he read, from his final defense statement. His last words to the tribunal cited the Quran (Sura 42, verse 41): “All those that fight when oppressed incur no guilt, but Allah shall punish the oppressor.” On 10 November 1995, Ken Saro-Wiwa and eight Ogoni men were hanged in a shallow pit at Port Harcourt, Nigeria. His last words were “Lord, take my soul, but the struggle continues.”

Protests and repression continued into the twenty-first century, often taking unique spiritual forms. The Ijo Youth Council (1999) initiated “Operation Climate Change” as a vehicle to raise environmental awareness through non-violent protest.

Tapping the veins of Ijo culture, it sought to bring the pains and travails of the people to national attention through the “Ogele,” a traditional Ijo dance where stories, song and mime are deployed to chastise the erring, heal the wounds of the injured, and invoke the spirit of the ancestors to cleanse the land in a festive atmosphere of drink and merriment (Okonto and Douglas 2001: 146).

Sarvodaya Shramadana Movement

The Sarvodaya Shramadana Movement began in 1958 as a series of youth work camps held to assist depressed villages in Sri Lanka. The work camps, which came to be called Shramadanas or “donations of labor,” were organized by Dr. A.T. Ariyaratne. Ariyaratne eventually led the volunteers who participated in these Shramadanas to form a new society dedicated to Sarvodaya, or “the awakening of all.”

Aiming in the context of the post-colonial Buddhist renaissance in Sri Lanka, Sarvodaya articulated a vision of a new social order based on Gandhian and Buddhist ideals. From the Gandhian heritage, Sarvodaya adopted the ideal of selfless service and nonviolence as guiding principles of a socio-economic order. Sarvodaya interpreted these Gandhian influences through its Buddhist heritage in Sri Lanka and became one of the first examples of what later came to be called “socially engaged Buddhism.” From Buddhism it drew upon the ideal of “awakening” or “liberation,” construing this ideal as a process of dual liberation: the liberation of the individual through the liberation of society. Sarvodaya’s interpretation of this process of liberation critiqued the image of Buddhism popularized by Weber and other Westerners that regarded it as a world-denying religion. Sarvodaya’s description of how liberation takes place through the process of working in society to assist others is expressed through its saying, “We build the road and the road builds us.”

Sarvodaya spells out the interdependent nature of awakening and development by specifying six levels of human awakening: personality awakening, family awakening, village or community awakening, urban awakening, national awakening and global awakening. Sarvodaya’s view of the awakening of society on these levels constitutes a sweeping reinterpretation of the nature and process of social and economic development. Sarvodaya’s model of development is “people-centered” and has as its primary aim “human fulfillment” rather than the creation of material wealth. The economic ideal of the social order Sarvodaya seeks is described as one of “no poverty and no affluence.” For Sarvodaya, development is an integrated process involving six elements that reinforce each other to bring about the best society. In this process the reform of the social, economic and political elements of a society should take place in conjunction with the reassertion of its spiritual, moral, and cultural factors. Sarvodaya pursues this program of integrated development and social reform by emphasizing Buddhist spiritual values such as loving kindness (mettā), compassion (karuṇā), sympathetic joy (muditā), and equanimity (upekkhā).

Employing this ideal of an integrated development founded on spiritual values, Sarvodaya has established a program of village development that has sought to provide alternatives to the kind of capitalistic, materialistic development promoted by the government and multinational agencies. In Sri Lanka, Sarvodaya works through a network of district centers and local Sarvodaya societies in over 11,000 villages. Through these groups it seeks to construct from the grassroots up what may be called a form of dharmic civil society that is not driven by the desires of the market but guided by the spiritual values of the Buddhist dharma. As one of the largest non-governmental organizations in Asia, Sarvodaya facilitates a variety of services to empower the people at the village level including programs of village pre-schools, relief and rehabilitation, village banking and micro credit, appropriate technology and sustainable development.

Sarvodaya’s integrated approach to development weaves together themes such as economics, spirituality and ecology. Explaining that according to Buddhist teachings all things and all beings are interconnected, Ariyaratne has placed great emphasis on the preservation of nature and the environment. Sarvodaya has sought to promote methods of sustainable agriculture and has established the Sarvodaya Institute for Biodiversity Conservation. Sarvodaya has also opposed government and multinational development plans that endanger the environment. For example, Sarvodaya organized a large demonstration to oppose the government’s scheme to build a tourist hotel in an area that was both a semi-wilderness...
area and a Buddhist sacred area. Sarvodaya argued that such a large hotel would adversely affect the cultural and moral environment of the community, disrupt the ecological balance of the semi-wilderness area where one of the last wild herds of elephants in the country lived, pollute the water supply and infringe on the sanctity of an ancient, sacred Buddhist shrine.

The Sarvodaya Shramadana Movement has also been one of the major voices for peace during the long-running conflict in Sri Lanka. Sarvodaya has organized peace marches and peace meditations since the conflict erupted in 1983. In that year, Sarvodaya organized a massive, Gandhian-style peace march from the southern tip of Sri Lanka to the north. Although that first march was eventually stopped short by the government, Sarvodaya went on to organize further peace marches and peace meditations. In March, 2002, Sarvodaya held a peace meditation attended by 500,000 people at the ancient Buddhist sacred city of Anuradhapura. Through the peace meditations and marches Sarvodaya has sought to create a critical mass of spiritual consciousness for peace and social transformation.

Satanism

With the foundation of the Church of Satan in 1966, Anton LaVey gave a rational, coherent voice to what had previously existed mainly as a fiction. In prior centuries, the myth of Satanism was used by Christian authorities to control those who might stray from church doctrine. It led to some disgruntled individuals adopting this fictitious adversarial religion in an attempt to resist the hegemony of the self-anointed servitors of Jehovah. These rebels used the tales of the clerics as a template for their practices; hence historians note the emergence of actual Black Masses, as well as the structured debaucheries of the Hellfire clubs. The renegades worshipped God’s opponent in an attempt to gain from him what they thought Yahweh had denied them in the here and now. Still, they remained within the Christian paradigm that saw life as transitory, a preparation for either reward or punishment in an afterlife outside of nature.

With the publication of The Satanic Bible in 1969, Anton LaVey defined Satanism from the perspective of a practicing Satanist. For the first time, Satanism was presented as a structured philosophy in an above-ground manner via a mass-marketed text. This new religion, rooted in Epicureanism and Nietzschean iconoclasm, rejected Christian definitions, and discarded the dualism that had been a part of Western belief systems since the advent of Zoroastrianism. This Satanism was not “Devil worship.” Instead, it embraced the Prince of Darkness, not as God’s equal-but-opposite adversary, but as the central archetype of a philosophy promoting personal freedom. Satan, the symbol of the liberated self, is externalized in ritual – a natural behavior of our species – and seen as an extension of the Satanist’s psyche or volitional essence. LaVey determined what he called the “unvarnished truth” about the nature of the human animal, and deemed it to be the foundation for this religion that sees nothing sinful in the beast called Man. He understood that beauty and monstrosity are part of the range of our species, and thought that only by accepting these extremes could a final philosophical synthesis be made that is consistent with the normal, healthy state of the human animal. His Satanism attempts to preserve and celebrate, rather than alter or suppress, humankind’s natural state of being.

Most significant to this new doctrine is its axiom that man is solely a “carnal” being. To the Satanist, flesh is reality and spirit is fantasy. Satanism thus eschews all spirituality as fiction – rejecting anything posited to be outside of nature as illusion or delusion. There are no gods or devils, angels or demons. Most Satanists thus deny the possibility of any afterlife.

Nature, to the Satanist, is all that exists – the totality of the objective universe. It includes all things organic and inorganic and the processes that govern their existence. Nature exists in and of itself, is inherently self-coherent, and does not require an exterior author. It cycles eternally, from “Big Bang” to “Big Crunch.” This recurrent expansion and contraction, emergence and extinction, is accepted by the Satanist, with no need to posit a supernatural “escape clause.” Satanists understand that nature is neither benevolent, nor malevolent – it is indifferent. They pragmatically live in harmony with its mechanisms, collectively called “The Law of the Jungle,” without trying to impose contrary human idealism over them. To Satanists, these laws must be understood and obeyed if the intent is to move elements of existence in the direction of their will.

Satanists see themselves as their own gods, but they have not deluded themselves that they are or will become actual deity figures. Each individual Satanist is simply the center of his own subjective universe. The Satanist bears the responsibility for creating his own hierarchy of values.
that determines what he considers to be pleasure and pain. The goal of a Satanist is to enjoy his life to the fullest.

It follows that Satanism offers to each individual his own birthday as his highest holiday. Beyond that, since understanding and embracing the flow of nature is of paramount importance, the days upon which the seasons change – the equinoxes and solstices – as well as the midpoints between these days that are defined as climactic points for the seasons, are celebrated as holidays.

While LaVey’s philosophy is man-centered, it does not elevate the human species above the other organisms with whom it shares the globe. Man is just another animal, one small part of the fullness of nature. Satanists appreciate the natural order of the Earth’s ecosystem and oppose human activities disruptive to this harmonious structure. Most Satanists strongly empathize with nonhuman animals and thus many choose to support organizations that work toward the preservation of species threatened by humankind. Such pernicious behavior, far worse than any found in those animals who follow their instincts, arises in man because his own instincts have often been warped through the acceptance of unnatural spiritual doctrines.

Satanists condemn such doctrines for inhibiting the instincts of the human animal, perverting these naturally existing mechanisms. Satanists think they are born to their philosophy because they are animals whose instincts remain intact. Individuals with damaged or repressed instincts are seen as being likely to embrace supernatural religions, as they do not feel a part of nature. They are “spiritual,” not “carnal,” and thus not born Satanists. The conversion of one type to the other is not deemed possible.

In the early 1970s, a small group of members of the Church of Satan began to adopt the idea that a supernatural entity existed, whom they called Set. In 1975, led by Michael Aquino, they left the Church of Satan to found the Temple of Set. Today this remains the only significant offshoot of the Church of Satan, and even though their membership is generally numbered in the hundreds, this organization has developed a consistent philosophy and a body of literature. While these Setians initially saw themselves as “evolved Satanists,” their direction from the start was in contradistinction to the philosophy of the Church of Satan. To the Setian, Set exists as a supernatural entity, one with whom members of their Priesthood claim they can “commune.” The essence of Setian doctrine states that Set caused the intelligence of the human species to manifest itself, and that this conscious act is counter to the inertia of nature. Set is thus the God of the “non-natural,” one who promotes individual consciousness in opposition to the collective blending that is thought to be the mechanism of nature. The followers of Set are named his “elect” and are considered to be special among the human species. Through the process of “Xeper” (pronounced “kheffer” – an Egyptian word meaning “to become”) Setian initiates attempt to willfully evolve into a god-like state. Such is not expected to occur in a single lifetime, and so the isolated consciousness of the individual Setian attempts to “Remanifest,” essentially to reincarnate, to continue the process of evolution toward a Set-like final state.

Clearly, this is not congruent with the philosophy of the Church of Satan. Setians have recently dropped their claim to being Satanists, and are generally viewed by those who examine fringe religions as being a Thelemic religious organization, derived from the concepts advanced by Aleister Crowley. The Temple of Set considers itself to be part of the Left Hand Path – which Setians define as those religions that seek to isolate individual consciousness from nature, as opposed to the Right Hand Path, which they see as those religions whose adherents seek unity with their deities.

Most recently, the internet has proved to be an avenue for the spread of contemporary Satanism. The Church of Satan itself maintains a presence, as does the Temple of Set. However, primarily because of the use of Satanic imagery by popular musicians, Satanism has recently attracted a diverse group, including many young people who are generally drawn by its imagery, rather than the philosophy itself. This interest is both fueled by and manifested on the internet.

The ease of making a website has led the many fascinated by Satanism to create sites that are an amalgam of materials, including literature from the Church of Satan, the Temple of Set, and numerous other traditions from Eastern and Western occultism that have no relationship with the ideas espoused by these two organizations. Because the authors of these sites are not scholars, and often their research is limited to what they have encountered by chance, these web-based collections of concepts are not necessarily internally consistent. The possibility exists that another philosophy could emerge online, also calling itself “Satanism,” which might develop a body of literature and an internally coherent philosophical position.

The philosophy of Satanism as defined by Anton LaVey continues to be embraced by those individuals who agree that man is just another animal, that he is a part of nature, and that being alive, it is his own prerogative to determine his values. To these Satanists, the individual plays the natural role of furthering his species in the niche it has evolved to fill. He decides that he will maximize his pleasures, both intellectual and physical, during that treasured span of his one and only life. In the process, he appreciates his kin, the other living beings with whom he shares the Earth, who are viewed as colleagues in the struggle for exuberant life.

Sauna

Sauna, a Finnish and Sami word for a building in which to bathe for cleansing body and mind, has become somewhat varied, even with commercial meanings in communities without a history of sauna culture. As an inseparable part of Finnish identity, sauna has been part of the Finnish life cycle for thousands of years – and continues to be so, both in Finland with 2.2 million saunas for 5.2 million people – and among expatriate and emigrant Finns.

Sauna as a log building comes from Finnish-related and Slavic peoples living in Northern Eurasian forest territories. Throughout its traditional area it still is a place for ablutions conducive to hygiene and health, but also a part of their ethnic religion and cultural habits. Although the sauna as a building and as a heated construction has undergone various changes, it has been adapted into new milieus. Also, in urban environments, many sauna habits and rituals have shown remarkable strength not only to survive but even to be revived as a part of socially shared group behavior among youth, adults, and environmentalist societies.

There are bathing habits reminiscent of Finnish sauna behavior on other continents (e.g., Roman, Turkish, or Celtic bath; Japanese *furo*; and the Native American sweat-lodge, such as the Lakota *inipi*). What is spiritually common to them is the feeling that bathing in the steam of *löyly* is not only a cleansing experience, but also one touching the very soul. The spirit of *löyly*, greeted in charms, is the main element in the folk belief related to Finnish sauna with birch switches and its healing effects. *Löyly* is a more ancient word than sauna, being a Finno-Ugric word referring not only to the steam issuing forth from the stones, but also to a human soul. The word goes back some 6000 years to the shared ancient vocabulary of the Finno-Ugric peoples.

What the baths of these three continents have had in common with the passing of time has been their connection to human life and their rites. On the other hand, they have also played a part in solving various crises. In *inipi*, *furo* and sauna, the spirit and the body are purified – recreated, as it were, to enable the person to face the challenges life presents. There are religious epics on the sauna in the oral traditions (e.g., in Japanese Buddhist texts, Native American Indian initiation songs, and in the *Kalevala*, the Finnish national epic).

The core of sauna is *kiuas* (i.e., stones in a hot heap), around which, the sauna in a depression in the Earth, and subsequently, the smoke sauna were created. There were numerous stages through which the development passed from mere heaps of stones covered by skin or cloths to the present electrically powered sauna stove in private home apartments or hotels. The public sauna was a part of Finnish city culture before its almost complete disappearance from the Helsinki street scene after World War II. In Tokyo the *furo* is faring better; public facilities for this amount to well over a thousand.

The Finns assumed the task of propagating sauna at an early stage. Around the year 1638, the Delaware New Sweden Colony was established on the eastern seaboard of America, with several hundred Forest Finns among the inhabitants. What was typical of the pioneering tradition of the first habitation was that the settlers built a smoke cabin. The so-called pioneer house on the west coast was no more than a smoke sauna, a log house that served frequently as a model for other inhabitants of the area. The propagation of sauna has continued to this day, with the construction of saunas at their postings being among the first tasks of Finnish UN peacekeeping forces.

Sauna is the Finns’ national symbol, just as the *furo* symbolizes the modern Japanese way of life, and the *inipi* the new consciousness of Native American identity. Symbols are important, even more so for the small nations compelled to exist under pressure to change from the major cultures. Sauna is one of the Finnish words recently to be borrowed by other languages. Along with the Finnish, sauna has made its way all around the world, even if not in complete agreement with the rest of the world in the matter of sauna manners.

The sauna has been a sacred place for Finns. According to the weekly routine, there usually was only one visit to sauna, on Saturday evening. Moreover, to heat a smoke sauna for several sessions was a whole day’s operation, an operation demanding its own expertise in the selection of kindling, the laying of the kindling, the adding of firewood, and above all an unhurried approach; whoever heated the sauna and bound the birch switches had to have time. The taking of sauna itself entailed a certain ritual which was observed with religious zeal. A proverb has it that one should conduct oneself in sauna as in church – reverently. Going to sauna and partaking of it were social behaviors governed by many rules of conduct: not to be rowdy, curse, gossip, speak evil, break wind or make a noise in sauna.

It is a Finnish custom to greet the *löyly* spirit before entering or mounting the benches. The recipient of this prayer-like salutation was not primarily the sauna
building, but rather the spirit of the sauna or the *löyly* itself. Adults and older children were expected to bless themselves as they entered. It was prepared for the sacred space and the delicate nature of the situations; people were naked, the pores of the human body were open and exuding sweat, defenseless against the evil eye and envy. When a sauna was inaugurated, reference was made to the power of Väinämöinen the wise man who is the central figure in the *Kalevala*; the *löyly* itself was said to be “Väinämöinen’s sweat.”

*Löyly*, the vapor rising from the water splashed over the stones of the sauna stove, establishes a connection between the sauna or sweat shed and the Hereafter. The steam arising from the stove, like the smoke issuing from the open fire, the door of the smoke sauna, the flue or chimney, established a symbolic connection between the sacred space of the sauna and its people (microcosmos) and the sphere of the Hereafter and its inhabitants (macrocosmos). An individual healing event occurring within the sauna and concerning the health of an individual is linked to the entire universe. It is easier for an individual to recover when he knows that his ailment is part of that universe. Myths are based on a connection to the gods, the departed and to spirits, which are recounted and incanted in the *löyly* of the sauna, or by the campfires. As mentioned above, the word *löyly* is of Finno-Ugric origin. It does not only refer to the steam rising from the sauna stove as it does in Finnish or Estonian (*leil*), but one of a person’s souls, linked as it is throughout life to breathing. The Hungarian *lélek* is such a soul. The word encompasses the span of a human life, which in old beliefs was held to last from the first breath to the last. Thus “departure of *henki* ‘breath’ ” (which in Finnish is synonymous with the word for spirit) was thus the end of physical life, the perceptible sign of death.

However, *löyly* is only one of the appellations among the Finno-Ugric languages for “soul.” Another is *itse* “self,” in Hungarian *iz*, which circumscribes social rather than physical life and death. The “self” of a person has a different lifespan from *löyly*. A person acquires this at a later stage than *löyly*, and it lasts longer. A child acquires the status of “having a self” when s/he acquires a name. He is deemed to have a social existence, his name endows him with a right to inherit, and, among the Saami, with his own reindeer mark of identification. The “self” does not expire when the spirit departs, but only two to three years later. Then the person is dead as an individual. Finnish *henki*, (Estonian *heing*), refers to the third soul, which, according to superstition, is immortal. In the world of shamanhood, the spirit refers to the soul of the shaman traveling outside the human body in various forms, generally as an animal, a fish, a snake, a bear, a reindeer, or a bird to the realm of death.

The sauna was generally the first building a Finnish settler built, thereby also designating the limits of his for- est, hunting, fishing and slash-and-burn farming. Building a sauna involves knowledge of timberwork construction, the right type of wood and choice of felling time. As in all buildings with a fireplace of some sort, according to folk belief, there was a spirit watching to see that customs were observed and infringements punished. Thus, the first person to light a fire had to be chosen with care, as it was he who would, according to the superstition, assume the position of *saunatonttu* or spirit of the sauna.

Peaceful heating of the sauna and the correct way of making birch switches was taught by one generation to the next. Expertise in the effects of taking sauna is a special doctrine of traditional Finnish-Karelian folk medicine, of those versed in cupping, bleeding, and healing joints. When a healer was called to sauna or when an injury was being healed in the home circle, very special attention had to be paid to the heating of sauna and to other operations. Alder should be used for the logs. This would ensure greater efficacy of the cures effected in sauna. The familiar proverb encapsulates the effect of sauna: “What tar, alcohol or sauna cannot help is fatal indeed.”

Long ago there was a custom in central Finland to lay a table for the spirits of the farmhouse kitchen. While the people of the house bathed, the spirits took to the table. There are many ways in which sauna has been connected to the progress of the agricultural year. Many of the main occupational tasks were performed in it: the softening of flax, the smoking of meat, the brewing of beer and the like in the malt sauna. The annual procedures, lasting for days, were connected to the younger and older family members spending time together with folk poems and songs: erotic songs might be sung in time to the job at hand, yarns were spun, tales told, riddles solved, and the message might well be an erotic one.

For the Finns sauna has been a sacred place to which they go for purification at all crucial points in their existence from birth to laying out of the dead. The rituals at such times are exclusively the women’s province. Only in such cases in which the current transition from one state to another is considered by the community to be infelici- tous for one reason or another – for example if the child or patient is very sick – would the intercession of a male witch, sage, or folk healer be called for. This is then a crisis situation requiring the most potent religious leader of the locality or family, a woman or man to restore order through remedial procedures.

Until the 1930s, Finnish women mostly gave birth in sauna. The midwife was referred to as the “sauna wife” and the mother-to-be as the “sauna woman.” “Sauna time” among the womenfolk might last as much as a week before the child was triumphantly carried into the farmhouse. This marginal situation was associated with precautionary measures against diseases and the evil eye, as a child who was “without self,” having no name, and a woman before the churching, six weeks after the birth,
Sauna as a Finnish National Institution.

Savages

Structurally speaking, savages – whether noble or ignoble – are category violators. Ideologically speaking, savagism – again, whether of the noble or ignoble variety – is a discursive device in the service of cultural criticism. In the
case of “savages,” taxonomic violations – especially imagined cannibalism and incest – are emphasized as a way to mark the differences between “civilization” (proper society: + God and + institutional constraints on human appetites) and “natural man” (– God and – institutions, a veritable Hobbesian war of all against all) and to justify whatever means necessary to redeem the latter category to (the interests of) the former, whether as ends – converted human beings – or as a means to an end (i.e., converted into labor). In the case of the noble savage, cultural criticism is internally leveraged. Here ideological struggles are against “society” itself, with noble savages – à la Montaigne and Rousseau, for example – serving as the counterpart to and antidote for the corruptions of “civilization.” While thumbnail, this schema of savage/noble savage holds in some permutation or another from Herodotus to the American novelist Fenimore Cooper. What remains to be specified is how savagism reverberates to the present and with what ramifications for how we understand the intersection between religion and nature.

Here I will limit my comments to the North American context, where savagism persists to the present, particularly in some government policies (continued paternalistic treatment), social practices (Indians facing explicit racism), and media images (one acute example is the character Zach Provo, played by James Coburn in The Last Hard Men, who is a particularly smart but depraved “half-breed”). However, in all of these realms the noble savage has gained ground on the ignoble savage, as reflected in increasingly proactive legislation, softened public sentiment, and romantic Hollywood films, for adults and children alike. The primary characterization of Indians in this mode is as stewards and priests of nature: Indians have become eco-shamans of the contemporary world. This phenomenon has two basic sources: non-Indian and Indian authors.

Historically, non-Indian authors of noble savagism emphasized aspects of native cultures that could be construed as rejoinders to European social constraints, whether at the level of the body, community, property, or the land. Thus, drawing upon native traditions, authors of noble savagism celebrated Indians’ putative naturalness, especially as reflected in dress, demeanor and sexuality, “original” democracy, communal property, and connection to the land. In this way, historical noble savagism operated by means of selective interpretation and strategic distortion of existing Indian traditions. Modern noble savagism, by comparison, is less concerned to construct itself in relation to “tradition,” and looks instead to already circulating images of “the Indian” that might be refashioned to fit the times. This is particularly true in the representation of Indians as environmentalists. Non-Indian authors of this persona have not, on the whole, worked from the ample resources of Indian traditions concerning care for the Earth. Whether images are cast by way of crying Indians, fictive chiefs’ speeches, or new age books, the icon of the noble environmentalist is a product of modernity, even while being a critique of it.

Complicating this picture is that native people are co-participants in modernity. Not only do they inhabit the present, they shape it. Most significantly, Indians have exerted their voice in the symbolic economy. In particular, Native Americans have gained unprecedented agency in the control of images of themselves. Whether by way of tribal museums, congressional hearings, or mass media, in the last several decades Indians have responded to centuries of savagism (of both varieties) by insisting upon their representational autonomy. One aspect of this has been by way of tremendous cultural revitalization, as tribes and nations have expressed their identities and aspirations in the idiom of local traditions. Here, to be sure, land and nature are emphasized. Land is simultaneously the source of creation (both in the sense of autochthony and as ongoing creation), loss (by way of removal or desecration), and hope (the source and site of future generations). That is, land is frequently spoken of as timeless, in the sense of a geographical synchrony wherein past, present, and future coalesce in and as nature. Maintaining tradition – that which links the generations – is predicated upon maintaining proper relations with the land. It must be said here that such figurations of the land, while building upon ancient religious traditions, constitute an oppositional discourse leveled against the forces and threats of anti-native interests. Unlike non-native noble environmentalism, however, here agitation is not a response to abstracted disaffection with the modern condition, but is a response to proximate and concrete impediments to daily life.

Another aspect of Native Americans taking control of self-representations raises new sets of issues. If tradition-centered concern for the land is inwardly focused, we need to describe outwardly focused claims by Indians about the land and nature meant for non-native audiences. This distinction is not in the service of distinguishing between sincere and insincere or authentic and inauthentic claims. Rather, my analysis of inwardly focused and outwardly focused speech is in recognition of the multiple audiences of “tradition.” All speakers will modify their speech according to audience in order to achieve desired rhetorical effects. Neither “tradition” nor Indians stand outside of this dynamic; to imagine that they do is to participate in another form of savagism cum essentialism.

When addressing non-native audiences, contemporary Indian orators frequently assume the posture of the noble environmentalist familiar to consumers of the non-native incarnation of the image. In order to reach audiences, Indian speakers often adopt stereotypical images of themselves. This is a lesson native peoples have learned from years of interacting with the dominant society. In the contemporary context this means appearing according to
script as eco-shamans. If our analysis ended here, however, we would have failed to see this as a form of resistance to dominant culture, not a capitulation to it (recognizing, however, that “sell-outs” exist). Resistance is waged insofar as adoption of dominant images entails adaptations of them. Specifically, the noble environmentalist takes on a militant edge, appearing as an eco-warrior. This enables native speakers to confront members of the dominant society in forceful and blunt moral terms.

Speaking outwardly as moral warriors, native orators often invoke nature in a schematic way. To paraphrase:

We are born of nature, our mother. From time immemorial we have had a sacred pact to care for nature. While society has grown away from nature, we have maintained our relationship to her, preserving vital knowledge in the process. Doing so, we have sacrificed self-interest and economic gain. Now we are in crisis because the dominant society has taken advantage of us. Tradition, religion, and language are in decay, and we face cultural extinction as a result. At the same time the world itself is in crisis. The Western ethos has run its course, exhausting nature in the process. The only remedy is for native people to use our knowledge and ritual practices to restore the Earth for the good of all humanity. This situation had been prophesied repeatedly. We are here today to show you that we can heal nature from the damage you have caused her, but only if you first begin to heal the damage you have caused us.

This discourse does a variety of things. Primarily, it signals a desire on the part of Indians to have their moral and political voices registered and seeks to extend the moral authority of the native speaker over the non-native audience. This discourse implicitly – and sometimes explicitly – relies upon feelings of guilt and spiritual inadequacy on the part non-natives, using vulnerable emotional states of the audience as a platform upon which to construct and advance moral claims in a religious idiom. Specifically, moral claims are framed in reciprocal terms: we care for you at the spiritual and cosmic level (by maintaining the Earth); in turn, you must care for us by making sure our political and economic grievances are addressed.

Whether spoken by Hopi representatives to the United Nations, a Ute leader to journalists, a Crow religious leader to museum officials, or by a Lakota political activist to college students, to give some examples, this discourse operates as a kind of strategic essentialism. Insofar as speakers traffic in the dominant culture’s stereotypical images, and to the degree that this discourse functions as a modality of cultural criticism, outwardly focused Indian self-representations participate in the rhetorical economy of noble savagism. Recognizing this, we nonetheless want to point out some important respects in which native-produced noble savagism differs from the non-native variety. First, and most importantly, this discourse – however much it is stereotypical and therefore redolent of non-native discourse – is spoken by native people about themselves. Moreover, this version of the noble environmentalist is a form of cultural criticism engaged in by people who are and are not members of the society in question: issues of citizenship and sovereignty pervade this discourse. Finally, even when spoken in the most general and stereotypical terms, this discourse is defined by its concrete sources and sub-texts. One needs to cultivate an ear for how local concerns are made audible to general audiences through this language. For example, in a recent presentation a self-proclaimed “Indian elder” spoke to college students generally about the “desecration of the Earth” and, simultaneously, he gave voice as a Dineh rancher to specific frustrations: his reservation faces regular environmental degradation and so few people seem to care.

Schelling, Friedrich Wilhelm Joseph (1775–1854)

The work of Friedrich Wilhelm Joseph Schelling is one of the most comprehensive and elaborated philosophies of nature to date. Its influence was enormous, not only on the
romantic philosophy of nature, but also on today's nature discourse. Schelling, the colleague of Fichte and Hegel, strove from the beginning to overcome what has been described as the difference between the idea of ontological substance and Transcendental philosophy. Transcendental philosophy asks for the conditions of cognition of nature and, consequently, considers the perceiving subject, the active consciousness, as the uniting factor (this was elaborated by Immanuel Kant). In contrast, Schelling defines Naturphilosophie (philosophy of nature) as a discipline that asks ontologically for the uniting factor within active nature itself, thus considering nature to be the productive power of its evolution. Nature as an active category can only be recognized by transcending its single products – the material world – and looking behind the process of its evolution. To illuminate this, Schelling uses the famous distinction between nature as a mere product and object of empiricism (natura naturata) on the one hand and nature as productivity and subject (natura naturans) on the other hand. For Schelling, philosophy of nature deals only with the latter. It tries to find out how nature brings forth its materially given products. The term natura naturans designates the aspect of a “living becoming.” It contrasts with the study of dead being. The generated, material objects are of importance only insofar as they allow conclusions about the principles of “becoming” that lie beneath them. Hence, Schelling argues against a mechanistic concept of nature that is limited to empiricism, and for an organismic model that has become prominent again in the twentieth century. In this perspective nature is not characterized by stability but by a continuous destruction and reproduction of its products, thus bringing the blind and chaotic productivity into evolutionary form.

With this concept Schelling argues against both Kant and Fichte. In contrast to Kant's contention that the only authority for judging nature lies in the observing subject, Schelling conceptualizes nature as an independent and self-organized entity that can be known by humans through empathy and open-mindedness. This is crucial, because Schelling here overcomes the Cartesian dichotomy of res extensa (the extended, material realm) and res cogita (the realm of thinking). And in contrast to Johann Gottlieb Fichte, who saw nature as a dead object, Schelling holds the position that the dichotomy between humans and nature has to come to an end. He complains that in his time nature had been (theoretically) reduced to a mere mechanism and (practically) had been forced under human interests, a species that does not shrink from destroying nature. Schelling asserted that this mechanism and exploitation would lead not only to nature's but also to humankind's death.

Against those tendencies, Schelling’s philosophy advocates principles of empathy and connectedness, and after 1804 these ideas grew stronger in his work. Schelling argues that the only way truly to recognize nature is to acknowledge nature's familiarity and correspondence with a person’s own mind and to approach it with a trait of inner love. To be sure, this aspect of his philosophy mostly influenced Romanticism and Transcendentalism, but it is important to note that Schelling's philosophy did not confine itself to philosophy of nature. Instead, it is integrated in a whole framework of an “absolute system of philosophy,” which comprises philosophy of mind (Geist) and history, on the one hand, and philosophy of art and religion, on the other. This kind of “meta-philosophy” was the joint project of Schelling and Hegel after 1801. Despite their different approaches and results, both shared an interest in establishing a consistent idea of nature and its formulation in a logical concept.

School of Living

Ralph Borsodi, a vigorous critic of industrial civilization, began to advocate a back-to-the-land ethic when he and his wife left Manhattan for a rural acreage in 1920, and his 1933 book Flight from the City was a widely read manifesto of decentralist agrarianism. His first large-scale attempt to work out a cluster of small self-sufficient acreages was undertaken at Dayton, Ohio, under government auspices in the 1930s, but he clashed with federal authorities and soon began a similar private project, called Bayard Lane, near Suffern, New York. Borsodi’s vision entailed simply-built homes on lots of perhaps two acres (leased, not purchased, to deter speculation) on which residents would engage in subsistence farming and gardening as well as various creative and artistic endeavors. Borsodi called it a School of Living because residents would learn great lessons in life through their mundane activities.

Borsodi’s work was outwardly secular in nature, although undergirding it was a quest for individual spiritual fulfillment, moral values, and creativity. His work was part of the larger decentralist movement, a loose grouping of rural idealists who, particularly in response to the economic travails of the depression, sought a return to simple living. Some parts of the decentralist movement, such as the Catholic Rural Life movement, were explicitly
religiously oriented, and spiritual seekers of various stripes were represented in many decentralist programs, including Borsodi’s.

In the late 1940s, Borsodi’s work was revitalized by his disciple Mildred Loomis, who founded a new School of Living in Ohio and then at Heathcote Center in Maryland. Like Borsodi’s, Loomis’ work was largely secular, but her American Indian-inspired sense of the interrelatedness of all beings provided a spiritual underpinning to it. Several other projects based on Borsodi’s thinking emerged as well, and his ideas influenced government depression-era resettlement projects in which clusters of small-acreage tracts were provided for impoverished farmers. Among those influenced by Borsodi’s teachings of self-sufficiency and organic gardening were J.I. and Robert Rodale, who visited Bayard Lane and whose magazines, Prevention and Organic Gardening, spread Borsodi’s message much further than he ever had managed to do alone.

Schumacher, Ernest Friedrich (1911–1977)

E.F. Schumacher was a prophet of reverential ecology. His attitude to nature differed from those of utilitarian environmentalists who value the natural world because of its usefulness to humankind: they say, “we need to protect the forests, conserve biodiversity, keep the rivers clean and farm the land organically because these are the necessary ‘resources’ for the good health of human beings.” But such pragmatic proclamations are, according to Schumacher, “metaphysically blind.”

Much of the environmental degradation and depletion is caused by the arrogant conviction that human beings are in charge of the Earth, Schumacher argued. He rejected the anthropocentric view that animals, forests, rivers and all the other forms of life are there purely to serve human interest, as well as the belief that there are no constraints upon how far human beings should go to control nature and pursue human desires.

In the context of religious and spiritual understanding of the phenomenal world Schumacher realized that behind the myriad manifestations of life, the creation is a seamless whole. From bacteria and butterflies to mountains and cosmos, including humankind, all are part of an interconnected unity of life. This ever-unfolding, and ever-evolving process of the universe is embedded in the principles of reciprocity, participation and mutuality. Life nourishes life and in return life is nourished by life. There is an everlasting balance of belonging at work. There is a meaningful and intricate relatedness within existence, which maintains the cosmic connectivity and continuity.

There is an inbuilt natural justice and ecological ethics, which hold together this symbiotic, systemic, and self-organizing Earth community. Schumacher’s vision of wholeness in the cosmic order repudiated the notion of progress based on the human versus nature and spiritual versus material split.

E.F. Schumacher came to ecology from economics. When he was in Burma (now Myanmar), advising the government there on economic development, he came across the Buddhist view of wholeness and spirituality, which he came to believe underpinned the economy of that country. Inspired and enlightened by the Burmese experience he wrote his classic essay “Buddhist Economics” where he questioned the claim that “economic laws are free from metaphysics or values” (1999: 37). Schumacher realized that in Buddhist economics “the maximisation of human well being was dependant on the minimisation of material consumption” (1999: 41).

This encounter with the East was shattering as well as transforming. Schumacher changed from an agnostic intellectual to a spiritual seeker and saw the creation through the eye of the sacred. The Buddhist notion of nature spirituality made him realize that nature is not merely a mine to meet the material needs of human societies obsessed with economic growth. Rather, the natural world is a web of sacred relationships of which human communities are an integral part – endowed with a responsibility to act ethically, nonviolently and reverentially.

Schumacher came to believe that all creatures of the Earth have a right to be and live. He believed that in order to live in harmony with the natural process and to sustain a socially just and economically fair world our technologies must be appropriate, our organizations small scale, and lifestyles simple. “The essence of civilization,” said Schumacher “is not in the multiplication of wants but in the purification of human character” (1999: 39).

E.F. Schumacher was born in Bonn, Germany in 1911. He came to Great Britain in 1930 as a Rhodes Scholar to read economics at New College, Oxford. He went through a variety of careers including, teaching, business and journalism. Eventually he became the head of statistics in the National Coal Board of Britain.
Schumacher published his seminal and best-selling book \textit{Small is Beautiful: Economics as if People Mattered} in 1973. His second book, \textit{A Guide for the Perplexed}, which spelled out more clearly his coherent and spiritual worldview, was published in 1977. In both these books, Schumacher urged his readers to shift their attitudes toward nature from utilitarian and managerial to a reverential and participatory paradigm. Coming from a religious perspective, he saw the natural world not merely as a resource to be mined for human use and managed well for future generations; rather he took a Hindu and Daoist perspective in which humanity is an integral part of the phenomenal world and participates in it as a process of coevolution. This holistic context integrated nature, humanity and religion, and provided a cohesive understanding which underpinned Schumacher's philosophy.

Schumacher died in September 1977 in Switzerland. Immediately after his death the E.F. Schumacher Societies were established in Great Britain and the United States. These two organizations hold prestigious Schumacher Lectures every year.

The speakers and teachers giving Schumacher Lectures and teaching at Schumacher College have included Ivan Illich, Amory Lovins, Fritjof Capra, Hazel Henderson, Wendell Berry, Gary Snyder, Rupert Sheldrake, Vandana Shiva, Dr. A.T. Ariyaratne, Joanna Macy, Arne Naess, James Lovelock, Kathleen Raine, James Hillman, Thomas Berry, Alastair McIntosh, John Seed, Starhawk, and many others.

Topics and themes covered include deep ecology, eco-psychology, holistic science, care of the soul, politics of compassion, Buddhist economics, nature spirituality, Earth democracy, organic living, sustainable development, bio-diversity and indigenous cultures.

In 1991, Schumacher College was established at Dartington, Devon, UK, in order to carry forward and explore a way of life which is ecologically sustainable, socially just and spiritually fulfilling. \textit{Resurgence} magazine, to which he was a regular contributor, continues to develop and disseminate Schumachian philosophy around the world.

\textbf{Schweitzer, Albert (1875–1965)}

In terms of intellectual achievement and practical morality, Albert Schweitzer has been described as probably the noblest figure of the twentieth century. Born in 1875, he was brought up at Gunsbach in Alsace. His intellectual achievements span four major disciplines. Schweitzer learnt the organ under Charles-Marie Widor in Paris and published \textit{J.S. Bach, le musicien-poète} in 1905. He studied theology and philosophy in Strasbourg, Paris, and Berlin, and published major works of New Testament scholarship, most notably \textit{The Quest of the Historical Jesus} (1906; trans. 1910). In 1896 he made his famous decision to live for science and art until age 30 and then devote his life to serving humanity. Accordingly, despite his international reputation as a musician and theologian, Schweitzer turned to medicine and qualified as a physician. By 1913 he resigned his posts as principal of the theological college in Strasbourg and preacher at St. Nicholas and founded the hospital at Lambaréné, Gabon where he stayed until his death in 1965.

By 1952 Schweitzer had become a legend in his lifetime: his work in Lambaréné captured the public imagination, earning him the Nobel Prize for peace. But Schweitzer considered his most meaningful contribution, the one for which he wished to be remembered, to be his ethic of reverence for life (\textit{Ehrfurcht vor dem Leben}). Although the concept of reverence for life is known, it has been subject to a range of distortions and so it is important to confront these in order to understand what Schweitzer meant by these three words.

The first distorting lens is \textit{legalism}. Contrary to many commentators, Schweitzer does not propound reverence as a moral law, but rather as ethical mysticism. Ethical mysticism begins with a personal reflection on the self in the finite world that binds humans with nonhuman life and God (often referred to as the infinite Will-to-Live). For
Schweitzer, the most immediate and comprehensive fact of consciousness is that "I am life which wills to live, in the midst of life which wills to live." The direct, experiential identification of one's individual will-to-live (life) with other life, and through life with God, is foundational to his ethical mysticism. Though his mysticism starts from the individual subject ("I am life which wills-to-live"), it extends to a generalization on the world (in the midst of other wills-to-live). Crucially, Schweitzer returns to the finite manifestations of life and presents human moral action as the locus of mystical relation: in loving self-devotion to other life we realize our spiritual union with God.

The second distorting lens is inviolability. Many commentators have assumed that reverence for life upholds the moral inviolability of all life. It is true that Schweitzer sometimes writes in such a way as to invite this misunderstanding. The ethical person is one who:

...tears no leaf from a tree, plucks no flower, and takes care to crush no insect. If in the summer he is working by lamplight, he prefers to keep the window shut and breathe a stuffy atmosphere rather than see one insect after another fall with singed wings upon his table (1987: 310).

At first sight the sheer practical impossibility of these injunctions presents itself. But what Schweitzer offers here are not rules but rather examples of the type of action expected from one who upholds reverence for life. Indeed, the very word "reverence" (Ehrfurcht) indicates that he is not depicting obedience to moral law, it being concerned rather with a new temper of mind.

The third distorting lens is inconsistency. Since Schweitzer defines reverence as an absolute ethic which enjoins responsibility without limit toward all that lives, it is perhaps not surprising that reverence is judged to entail inconsistency in practice. Indeed, Schweitzer is not immune from such charges since, for example, he notoriously had fish caught to feed his sick pelicans. Such inconsistencies are made more glaring in the light of his rejection of any moral hierarchy: the ethics of reverence for life makes no distinction between higher and lower, more precious and less precious lives.

Schweitzer is often interpreted at this point as suggesting that no form of life should ever be destroyed and that all creatures, humans to microbes, should have the same moral worth. It is doubtful whether this was his intention. Rather what he is doing is rejecting here the long tradition of hierarchy that places humanity at the top of the pyramid of descending moral worth. Schweitzer readily and regrettaedly admitted that it is sometimes necessary to make choices between various forms of life. But what he wanted to emphasize was the essentially subjective (anthropocentric) nature of these declarations.

Having clarified aspects of Schweitzer's thought, it is now possible to indicate three of his contributions to religio-ethical thought.

The first contribution concerns service to life as practical mysticism. In contrast to most mystics, Schweitzer maintains that union with the divine is achieved not through contemplation, but primarily through service to other life: it is through the community of life, not community of thought, that I abide in harmony with the infinite Will. This is the mystical experience of ethics. In short, the phenomenon we call life is not something put here for our use or pleasure; we are part of life and our role is to enhance and serve each and every manifestation of it.

Schweitzer's second contribution concerns his protest against an anthropocentric view of creation. In a 1919 sermon he questioned whether humans should be considered the goal of creation: "The purpose of nature, with her thousands of appearances of life, is not understood as merely the presupposition of man's existence . . . and humanity may not conceive of itself as the purpose of the infinite world" (1988: 40).

Schweitzer's rejection of the elevation of humans in the universe suggests a transformation of our relationship to other life: we are to perceive each manifestation of life for itself, and no longer for ourselves.

Building on these insights, Schweitzer challenges the idea that humans' sole responsibility in the world is to take care of their own species. In his exegesis of the parable of the Good Samaritan, he seeks to expand our understanding of neighbor:

What is the sort of love toward God which compels us to be kind to others? What does love for our neighbour mean? . . . The presupposition of morality is to share everything that goes on around us, not only in human life but also in the life of all creatures (1988: 119).

Schweitzer's reading of the parable develops Jesus' refusal to limit the extent of neighbor love by extending the category of neighbor to include all life: reverence does not draw a circle of well-defined tasks around me, but charges each individual with responsibility for all life within his reach and forces him to devote himself to helping that life. Schweitzer reads the parable as a metaphor for moral inclusiveness that corresponds analogically to nonhuman species. Similar to Jesus' rejection of a racially restrictive criterion of neighborly discrimination, Schweitzer counters the limiting structures of communal proximity by highlighting humans' participation in the community of life.

The third contribution concerns non-injury to life as the central ethical imperative. A man is truly ethical, Schweitzer writes,
only when he obeys the compulsion to help all life which he is able to assist, and shrinks from injuring anything that lives. The time is coming when people will be astonished that humankind needed so long a time to learn to regard thoughtless injury to life as incompatible with ethics (1987: 310).

Schweitzer regarded traditional philosophy which restricted ethics to human-to-human relations as spiritually impoverished. He was deeply critical of animal experimentation, opposed sport hunting, and eventually embraced a vegetarian diet. His hospital at Lambaréné was a model of ecological responsibility: he went out of his way to preserve trees and flora, reused every piece of wood, string, and glass, and rejected modern technological developments which would have resulted in environmental degradation. As he saw it, his life was his argument.

To reverence life and to serve it: this is the heart of Schweitzer’s commitment. His personal and intellectual legacy continues to hold strong moral appeal and serve as an inspiration for a wider ethic of life. In the words of Rachel Carson: “If during the coming years we are to find our way through the problems that beset us, it will surely be in large part through the wider understanding and application of his principles” (1962: 2).

Science

Nature is both a scientific and a religious challenge. Nature must be evaluated within cultures, classically by their religions, currently also by the sciences so eminent in Western culture. Religious persons often find something “beyond,” discovering that neither nature nor culture are self-explanatory as phenomena; both point to deeper forces, such as divine presence, or Brahman or Emptiness (sunyata) or Tao underlying. Religions often detect supernature immanent in or transcendent to nature, perhaps even more so in human culture, though some religions prefer to think of a deeper account of nature, perhaps enchanted, perhaps sacred.

1. The Physical World: Matter and Energy
Science over the last four hundred years has opened up a vast extent of physical nature in space and time, unavailable to humans when the classical religions were formed. Once only speculative, cosmology has become science – and with mixed religious results, both from the vastness of the universe and from the naturalism, or secularizing, characteristic of science. Earth is lost out there in the stars; humans are dwarfed and shown to be trivial on the cosmic scale, as well as on the microscopic scale, (nothing but) the motion of atoms, molecules, biochemistries. Science seemed progressively to rob both our planet and the humans on it of any special place. But then the physical sciences took an unexpected turn.

Astrophysics and nuclear physics, combining quantum mechanics and relativity theory, have more recently been describing a universe “fine-tuned” for life. Physics has made dramatic discoveries at astronomical and submicroscopic ranges, remote from ordinary, native-range experience. The universe (this universe at least) originated fifteen billion years ago in a “big bang” and has since been expanding. From the primal burst of energy, elementary particles formed, and afterward hydrogen, the simplest element, which serves as fuel for the stars. In the stellar furnaces all the heavier atoms were forged. Some stars subsequently exploded (supernovae). The heavier elements were collected to form, in our case, the solar system and planet Earth.

In the last half-century, physics discovered that startling interrelationships are required for these creative processes to work. Theory interrelates the two levels; astronomical phenomena such as the formation of galaxies, stars, and planets depend critically on the microphysical phenomena. In turn, the mid-range scales, where the known complexity mostly lies (in ecosystems and human brains), depend on the interacting microscopic and astronomical ranges. If the scale of the universe were much reduced, there would not have been enough time for elements to form. If the expansion rate of the universe had been a little faster or slower, then the universe would already
have recollapsed or the galaxies and stars would not have formed.

Change slightly the strengths of any of the four forces that hold the world together (the strong nuclear force, the weak nuclear force, electromagnetism, gravitation), change critical particle masses and charges, and the stars would burn too quickly or too slowly, or atoms and molecules, including water, carbon, and oxygen, or amino acids (building blocks of life) would not form or remain stable.

These results have been summarized as the "anthropic principle" (an unfortunately anthropocentric term), which argues that the universe has been programmed from the start and in its fundamental dimensions for the subsequent construction of stars, planets, life, and mind. There are non-theological, naturalistic ways of interpreting these discoveries, but a plausible interpretation is divine design.

Whatever one makes of these anthropic claims, the most complex events known are found on Earth in biological systems, and the most complex of all is the human mind, pursuing its science or its religion. In a handful of humus, which may have in it ten billion organisms encoding a billion years of evolutionary history, there is more coded information (trillions of "bits") than in all of the stars. In the trillion neurons of the three-pound human brain, each capable of hundreds or thousands of connections with the others, there is more operational organization than in the Andromeda galaxy (so far as we know). The number of possible circuits in the brain exceeds the number of atoms in the universe. So we must turn to origins on that Earth, resulting in such a mind.

2. The Biological World: Life

Biology also has developed at two scales, the range of the very small and that of big-scale history. Molecular biology, discovering DNA, has decoded the "secret of life" (once ascribed to the Spirit of God). Evolutionary history has located the secret of life in natural selection operating over incremental variations across enormous timespans, with the fittest selected to survive. At native ranges, life takes place in ecosystem communities, where the competition remains, but also with many interdependencies, and also mixtures of order and disorder.

Over evolutionary time, speciation began with the simple and resulted in the complex, from microbes to persons. As with physics, the two levels have been theoretically interrelated. The genetic level supplies variations, does the coding of life in DNA, and constructs molecular proteins. Organisms cope at their native-range levels, inhabiting ecosystems, and across evolutionary time, species are selected and generated as they track changing environments.

In ecosystems, organisms are both challenged and supported. Every organism is what it is where it is; the "skin-out" environment as vital as "skin-in" metabolisms. Early ecologists favored ideas such as homeostasis and equilibrium. Contemporary ecologists emphasize more of a role for contingency or even chaos. Others incline to emphasize self-organizing systems (autopoiesis), also an ancient idea: "The Earth produces of itself (Greek: automatically)" (Luke 4:28). Some find that natural selection operating on the edge of chaos offers the greatest possibility for self-organization and self-transformation.

The process is prolific, but no longer fine-tuned. To the contrary, evolutionary history can seem tinkering and makeshift at the same time that, within structural constraints and mutations available, it optimizes adapted fit. In contrast to the astrophysics and microphysics, in the middle-range earthbound natural history, there is much openness, emergence, surprise, struggle, loss, gain, or wandering. Natural selection is thought to be blind, initially in the genetic variations bubbling up without regard to the needs of the organism, some few of which by chance are beneficial, and also in the evolutionary selective forces, which select for survival, without regard to advance. Many evolutionary theorists insist that nothing in natural selection theory guarantees progress; most doubt that the theory predicts, or even makes probable, the long-term historical innovations that have occurred. Others think that the creative results are inherent in the system.

Though dominant throughout biology, evolutionary theory has proved quite problematic itself (independently of any religious agenda). There are disagreements involving the relative degrees of order and contingency, repeatability, predictability, the role of sexuality, competition and symbiosis, the extent of social construction in evolutionary theory, the evolutionary origins of mind, especially the human mind, differences between nature and culture. The theory is, in many respects, incomplete.

Fundamentalist theology denies (much or any) evolution and sometimes seeks to prevent its teaching in public schools. Others construct an evolutionary theism, emphasizing the continuing vital creative processes over time, the ascent of life from the simple to the complex, the increase of information, the effective and efficient results of genetic creativity and natural selection, producing a quasi-design, the production of more out of less over the millennia. Increasing knowledge of the sophistication of molecular structures has led some to look for intelligent design there. Evolutionary speciation generates and tests novel kinds, a cybernetic process employing open innovation and selection, with analogues in rational thought, including the logic of science, where novel theories are generated and tested.

Asian religious traditions interpret natural history as appearance (maya, illusion) spun over Brahman, or as a spinning world (samsara) spun over Emptiness, sunyata. As with the monotheists troubled by the character of the evolutionary process, Asian traditions too may have
difficulties knowing how much of the phenomenal world to embrace, and how much to see through or transcend.

By Buddhist accounts life is suffering, dukkha, driven by thirst, tanha, which seems biologically compatible; although what becomes of nature in nirvana, with desires extinguished (extinction), remains problematic. Taoism is the most naturalistic of the classical faiths, though critics find the ever-oscillating, complementary yang/yin inadequate to explain the historically developing natural history. Native faiths find an enspirited world; they may loosely embrace evolutionary history. They struggle to make their animistic or personalist accounts of animals and plants compatible with those of zoology and botany.

Struggle and suffering, and life renewed in the midst of its death and perishing are central themes in Christianity. In the Psalmist’s metaphors, life is lived in green pastures and in the valley of the shadow of death, nourished by eating at a table prepared in the midst of enemies. In the letters of Paul, the creation is groaning in travail, with the labor of giving birth (the original meaning of “nature”). Jesus suffers and dies redemptively. Although non-moral, natural history is “cruciform” even before humans arrive; and in all creating of life there seems to be struggling through to something higher.

Though biologists are typically uncertain whether life has arrived on Earth by divine intention, they are almost unanimous in their respect for life and seek biological conservation on an endangered planet. Earth’s impressive and unique biodiversity warrants wonder and care. Anciently, the Hebrews marveled over the “swarms” of creatures Earth brings forth in Genesis 1.

Nature has generated only one species capable of cumulative transmissible cultures. Nature and culture are classical opposites, or complements (as are nature and supernature). By nature humans are “born that way”; by nurture humans learn to become civilized. Humans have a dual inheritance system. In one meaning (recalling Latin etymology, natura), “nature” refers to everything generated or produced. For metaphysical naturalists, perhaps for methodological scientists, nature is all that there is, without contrast class. Humans evolved within nature and break no natural laws.

Still, culture differs from nature. Humans are nurtured into an inherited linguistic and symbolic system, a worldview, by which humans communicate, perpetuate, and develop their knowledge. This cultural genius makes possible the deliberate and cumulative, and therefore the extensive, rebuilding of nature. Humans reshape their environments, rather than being themselves morphologically and genetically reshaped to fit their changing environments. Humans come into the world by nature unfinished and become what they become by nurture. Religious persons find their traditions vital in such nurture, and absent from nature.

Critics may object to distinguishing so sharply nature from culture (too “dualist”) on grounds that culture is already present in animals, and also that nature remains a strong determinate in human affairs. If by culture is meant transfer of acquired (and non-genetic) information from one generation to the next, culture is present in various social animals: chimpanzees (who imitate tool using), even in warblers (who imprint songs or migration routes). In classical anthropological meaning, however, culture requires intentional teaching of language, beliefs, skills, morals, laws, customs, arts, worldviews, religions – all historically transmitted over generations.

In that classical sense, culture remains distinctive to humans and is the dominant determinant in their affairs. Information in nature travels intergenerationally on genes; information in culture travels neurally as persons are educated into transmissible cultures. The determinants of animal and plant behavior are never anthropological, political, economic, technological, scientific, philosophical, ethical, or religious. Animal imprinting and limited transmitting of acquired information notwithstanding, humans gain a deliberate modification of nature that separates humans in their cultures from wild nature, increasingly so in high-technology cultures. Recently decoding our own genome, humans stand at the threshold of rebuilding even their own genetic nature.

Animals are not in this sense nurtured. Without some concept of teaching, of ideas moving from mind to mind, from parent to child, from teacher to pupil, a cumulative transmissible culture is impossible. Though language “comes naturally” to humans, what is learned has been culturally transmitted, using a specific language. The content learned during childhood education is that of an acquired, non-genetic culture. These cultural traditions are the locus of the generation and transmission of religious faith. In that sense religion is a phenomenon of culture, not nature.

4. Worldviews: Causes, Meanings, Values

Humans are only part of the world in biological, evolutionary, and ecological senses, their nature; but Homo sapiens is the only part of the world free to orient itself with a view of the whole, to seek wisdom about who we are, where we are, where we are going, what we ought to do. Religious persons claim that, with due admiration for the successes of science discovering causes in nature and culture, science leaves the ultimate value questions still unresolved, those assigning meaning and value. One needs a scientifically informed worldview, but the ultimate value questions remain as acute and painful as ever. There is no scientific guidance of life.

Nor can humans simply follow nature. Nature does not teach us how we ought to behave toward each other. Com-
passion and charity, justice and honesty, are not virtues found in wild nature. There is no way to derive any of the familiar moral maxims from nature: “One ought to keep promises.” “Do to others as you would have them do to you.” “Do not cause needless suffering.” No natural deca-logue endorses the Ten Commandments.

Although nature is not our moral tutor, there may be goods (values) in nature that humans ought to respect and conserve. Animals, plants, and species, integrated into ecosystems, may embody values that, though non-moral, count morally when moral agents encounter these. And, even if one is in doubt about divine creation, or sacred nature, or intrinsic values in nature, there is little doubt that humans and their planet have entwined destinies. Sustainable development has been a recent focus, pleasing economists, developers, and humanists, who find that ecologists and conservation biologists continually caution that what most fundamentally must be sustained is the biosphere.

Humans, if uniquely the wise species, are also uniquely the species that needs redemption. Religions may celebrate creation, or struggle with what to make of evolutionary history. But the real business of religion is salvation, mending the perennial brokenness in human nature. Ultimately such salvation is beyond the natural, perhaps supernatural, by the grace of the monotheist God, perhaps in some realization of depths underlying the natural, such as Brahman or sunyata. Meanwhile, whatever the noumenal ultimate, humans reside in a phenomenal world, which they must evaluate, and in which they must live, hopefully redeemed or enlightened by their faiths.

Humans sin, unlike the fauna and flora. Religion is for people, and not for nature, nor does salvation come natu-really; even the earthly good life is elusive. Christian and other ethicists can with considerable plausibility make the claim that neither conservation, nor a sustainable biosphere, nor sustainable development, nor any other harmony between humans and nature can be gained until persons learn to use the Earth both justly and charitably. Those twin concepts are not found either in wild nature or in any science that studies nature. They must be grounded in some ethical authority, and this has classically been religious. The Hebrews, for instance, were convinced that they were given a blessing with a mandate. The land flows with milk and honey (assuming good land husbandry) if and only if there is obedience to Torah.

Scientists turning to environmental policy often appeal to ecosystem management. Such management connects with the idea of nature as “natural resources” at the same time that it has a “respect nature” dimension. Christian ethicists note that the secular word “manage” is a stand-in for the earlier theological word “steward.” Ethicists have frequently thought of ethics as a social contract; environmentalists add that ethics needs also to be a natural con-tract, human responsibility for this marvelous planet on which we reside. Humans need a land ethic. Anciently Palestine was a promised land. Today and for the century hence, the call is to see Earth as a planet with promise.

Science Fiction

Science fiction is a very diverse category of culture that has explored myriad ways in which religion can relate to nature. Strictly defined, science fiction is the traditional literature that arose around a cluster of magazines, beginning with Amazing Stories in 1927 and Science Wonder Stories in 1929. More broadly defined, it also includes speculative fiction from any time period or publication source that concerns the human implications of science and technology. Science-fiction movies and television programs are often distinguished by the term “sci-fi,” but in an increasingly multimedia culture they also must be considered.

Alien Environments
The Mars novels by Edgar Rice Burroughs and the Dune novels by Frank Herbert both concern desert planets with hostile environments. For Burroughs, religion is a parasite, while for Herbert it thrives symbiotically with nature. A Princess of Mars and The Gods of Mars by Burroughs depict Barsoom, an arid world a million years after the fall of a great civilization, in which life is barely sustained by ancient canals and atmosphere factories that may be
disrupted at any time by warfare between feudal states. The priesthood of the Holy Therns exploits the superstitious Martians, and it does nothing to solve the chronic problems of social and environmental decay. In The Master Mind of Mars, an amoral scientist provides immortality to the wicked priestess of an anti-scientific religion, by transplanting her brain into the stolen body of a young woman, in order to get money to carry on his research. Far from promoting harmony with nature, these religions exploit the gullibility of desperate people struggling to survive in a hostile environment.

Frank Herbert’s Dune novels about the desert planet Arakis also concern religious scheming in a feudal society, but the result is quite different. Centuries ago, a jihad cleansed the galactic empire of computers and artificial biotechnology, so the spirit that would have gone into technological innovation has been diverted into symbiotic experiments with nature. The Bene Gesserit, a women’s cult, has been carefully controlling bloodlines for generations to breed a messiah. Human computers, called mentats, accelerate their minds with the spice melange, and space navigators employ this psychedelic to guide spacecrafts between the stars. The spice also prolongs life, so it is the most valuable substance in the universe, and it can be found only on Arakis where it is produced by titanic sand worms. A woman’s love for a man causes the Bene Gesserit to lose control of their breeding program, their son launches a fresh jihad, and his son becomes an immortal “god” emperor who is gradually metamorphizing into a mutant worm.

On Barsoom, the people living closest to nature are the Green Martians, exemplified by the character Tar Tarkas, who is too courageous to rely upon religion to assuage fear concerning his own death. But he mourns the death of the woman he loves, so he undertakes a long pilgrimage to the area that the common religion of his planet claims is the land of the dead. There he discovers not his beloved but the unnatural Therns and the monsters they employ to kill deluded pilgrims who enter their realm.

On Arakis, the people living closest to nature are the Fremen, apparently descended from Arabs, who have a demanding faith that helps them survive in the hostile environment. When the perfidious Harkonnens overthrow the Atreides aristocrats who rule the urban areas of Arakis, young Paul Atreides flees into the desert. Bene Gesserit breeding, the psychic effects of the spice, and a series of ordeals transform him into Muad’dib, the messiah prophesied by Fremen religion. The manipulative religions of Dune are amoral rather than evil, and they possess real supernatural powers derived from their symbiosis with nature.

Alien Messiahs
Extraterrestrials with apparently magical powers abound in science fiction, and some of them are greeted as messiahs when they come to Earth. They seem like gods, in part, because foolish Earthlings cannot rule themselves wisely, and because what is natural on an alien world seems supernatural here.

The Alien, by Raymond F. Jones, imagines a future age in which human society is disintegrating and individuals have lost all hope. A wave of hysteria called the Howling Craze sweeps through the cities, as people mass in the streets and vent their despair by weeping and emitting animal cries of pain. Government leaders last only a few months in office, either quickly impeached or committing suicide, and the populace longs for a superhuman messiah. In the Asteroid Belt between the orbits of Mars and Jupiter, scientists discover a time capsule that has preserved the body of Demarzule, leader of an alien civilization, with instructions on how to restore him to life. A religious movement believing Demarzule to be the divine savior seizes control. When Demarzule awakens, a few scientists realize he is the Hitler rather than the Jesus of his species. They flee across the universe in search of an antidote to this evil faith. On a distant world, a friendly alien must sacrifice his life so a gland that confers supernatural ability can be transplanted into a scientist and he can destroy Demarzule.

Stranger in a Strange Land by Robert A. Heinlein concerns Valentine Michael Smith, a human being who was raised by Martians. First glimpsed in Heinlein’s earlier novel, Red Planet, the Martians are an ancient and wise race who keep themselves aloof from the first human voyagers to their planet. Therefore, humans do not know that Martians have mental powers that allow them to dis incorpore any matter, and thus have the power to kill. Valentine Michael Smith is sent to Earth as a spy, unaware of his mission to help the Martians decide whether to destroy humanity. His Martian psychology naturally gives him remarkable powers to gratify people’s desires, and a communal religious cult quickly assemblies around him. Ultimately he must decide whether to defend himself against fanatics, or become a martyr.

Allegories and Prophecies
Science fiction is a suitable vehicle for religious allegories, of both conventional and radical kinds. For example, A Canticle for Leibowitz by Walter M. Miller and Out of the Silent Planet by C.S. Lewis are both Christian allegories of humankind’s exile from the Garden of Eden. Miller’s novel follows a religious order in the centuries after a nuclear holocaust, exploring the difficult question of whether humanity can long survive if it tries to conquer nature by means of atheistic science. Lewis imagines that a Christ rules the planet Mars, where three intelligent species live amicably in an Eden, and Earth is the only planet on which humans have become estranged from God and thus from nature.

The Star Wars series created by George Lucas, and the
Babylon 5 series by J. Michael Straczynski depict fictional cults that have interesting relations with nature, and might in future become real. The Jedi Knights of Star Wars are noble warriors with psychic abilities, rather like Knights Templar who have been trained in Zen Buddhism. Their power comes from The Force, which is based in microorganisms found in varying quantities within each living cell, and that spiritually binds the universe together.

Babylon 5 depicts a bewildering variety of cults, some belonging to alien planets and others newly arisen on Earth, but all are primitive reflections of the fundamental reality of nature. God is not a supernatural entity apart from nature. Rather, intelligence evolves from nature as the way in which the universe becomes conscious, and the most advanced intelligent species are in the process of evolving into gods. Billions of years ago, the First Ones evolved in the universe. Most of them departed to seek spiritual destinies on higher planes of existence, leaving the galaxy under the control of two highly advanced but imperfect races, the Vorlons and the Shadows. These two battle over the lesser races for two diametrically opposite principles: order and chaos. Ultimately, humanity must defeat both of these semi-divine influences and proclaim our species no longer needs gods to rule it.

As allegories, science-fiction stories may shape the reader’s subconscious orientation toward both religion and nature. However, it is also possible that the fiction may occasionally become fact. The small Church of All Worlds is partly based on Heinlein’s Stranger in a Strange Land, and the influential Church of Scientology was founded by a science-fiction author. Many stories, including the Dune series and the Star Wars series, describe religious orders that employ mental training regimes to achieve enlightenment and spiritual power. Science fiction is increasingly shaping popular culture, so real religions patterned on fictional ones may increasingly appear over the coming decades, and science fiction will become a self-fulfilling prophecy. Thus, fiction becomes a realistic venue for exploring the complex relationship between religion and the natural environment.

In 1950, author and explorer L. Ron Hubbard announced the discovery of Dianetics, which he said was a new science of mental health, and four years later he established Scientology, a new religion dedicated to human spiritual advancement. Although Scientology builds upon some of the same spiritual principles common to traditional religions, it was developed during the scientific era and thus takes advantage of extensive research and technological development.

A clear distinction must be drawn between Hubbard’s fiction and his Scientology writings, because his stories are free imaginative explorations rather than religious scriptures. However, two themes connect his science fiction to his work in Scientology: a conception of the Earth as one planet among many in a vast universe of nature, and the conviction that ordinary people can accomplish great things if they seek to gain knowledge and serve humanity. Occasionally the fiction touches upon important environmental issues, such as natural resource depletion in the novel Battlefield Earth.

The Church of Scientology considers humans to be spiritual beings, not merely animals, systems of chemical compounds, or stimulus–response mechanisms. Nonetheless, the condition of a person’s body is an important factor in that individual’s awareness and ability. A body polluted by toxic chemicals, radiation, or other harmful factors can prevent the individual from achieving spiritual betterment. Therefore, an important part of Hubbard’s religious research was the discovery of methods for purifying the body.

Scientologists believe that radiation and chemical toxins become lodged in a person’s body, chiefly in fatty tissue, and can affect the person adversely even years after the original exposure. The purification program has three chief elements: exercise to stimulate the circulation, sauna to sweat out the accumulated toxins, and a nutritional regimen including specific vitamins, minerals and oils.

The nutritional regimen does not radically alter the individual’s usual diet, but supplements it with vegetables and sufficient liquids to offset the loss through exercise and the sauna. Over the course of the program, a precise mixture of vitamins is gradually increased, with close monitoring especially of the niacin ingested. In addition to other minerals, a calcium-magnesium drink called “Cal-Mag” is an important part of the program. The intake of oils is required to replace some of the toxin-ridden fat that the program aims to clear out of the body.

In the view of Scientologists, the use of non-medicinal drugs is unnatural and harmful, and drug addiction is a highly destructive force in contemporary culture. A rehabilitation program called Narconon has been based on Hubbard’s purification and communication technology.
designed to handle problems of withdrawal and assist people in overcoming the effects of addiction.

Scientologists believe that spirit is potentially superior to material things and can accomplish miraculous changes in the physical universe if freed from the continuing effect of past traumas, transgressions and aberrations. Drugs, radiation, and toxic chemicals not only leave physical traces in the body, in their view, but also affect the individual’s mind through powerful memories called mental image pictures that can cause harm when restimulated by later experiences. Thus, the body-oriented purification program is a preparation for a comprehensive series of Scientology processes intended to deal with problems of the mind in order to liberate the spirit.

In its regimen designed to achieve total spiritual freedom, Scientology employs a form of counseling called auditing to move the individual up a gradient toward advanced states of clear and Operating Thetan (OT). A Clear is a person who no longer suffers the ill effects of a reactive mind, that portion of the mind which works on a purely stimulus–response basis. In OT, a Clear becomes refamiliarized with the abilities that belong to his or her fundamental nature. Scientologists consider psychiatric practices to be unnatural and harmful, especially psychosurgery, electro-shock, and drug treatment. Thus, the Church of Scientology has been active in efforts to reform the mental health professions and to make people aware that human beings are not mere biological mechanisms but are by nature spiritual.

Over the half-century of its existence, the Church of Scientology has grown into a worldwide movement, communicating its religious beliefs in more than fifty languages and active in over a hundred countries.

If one believes comments by Scientology’s founder, L. Ron Hubbard (1911–1986), the creation of Scientology’s forerunner, Dianetics, related directly to his efforts to improve the success of people who explored nature. The “original goal” of Dianetics, he stated in The Explorers Journal, “was to provide expedition commanders and doctors with a therapy tool which would increase the efficiency of personnel and reduce incidence of personnel failure” (Hubbard 1950: 52). Hubbard himself had undertaken several questionable marine explorations, but by 1950 he was claiming that the realm of the human mind was the last great frontier “capable of producing some adventures scarcely rivaled by [African explorer David] Livingston[e]” (Hubbard 1950: 1).

The mind, it seems, replaced nature as an exciting realm for Hubbard’s exploration. Nevertheless, in Dianetics and Scientology, Hubbard did develop a set of concepts (called “dynamics”) that supposedly identified urges or drives of life. In Dianetics, Hubbard identified the fifth of seven dynamics as being concerned with an individual’s affinity for life. By 1956 he refined the dynamics to include eight dimensions, with the fifth one involving “the urge toward existence of the animal kingdom,” which includes all flora and fauna (Hubbard 1979: 37). The sixth dynamic involved “the urge toward existence of the physical universe,” what Hubbard called “matter, energy, space, and time” (Hubbard 1979: 38). Consequently, in the context of these two dynamics, Scientologists are able to place themselves within an environmental framework.

Throughout his corpus, Hubbard frequently discussed what he called the “environment,” but he used the term in the broadest possible sense to refer to “all conditions surrounding the organism from the first moment of present-life existence to death, including physical, emotional, spiritual, social, educational, [and] nutritional” (Hubbard 1951: II, 293). Hubbard rarely discussed the natural world in his major ideological works, unless one includes his lectures and writings about possible radiation poisoning from the environment caused by nuclear bombs. This material reflected widespread fear during the 1950s of nuclear war and contamination, and Hubbard claimed that he had developed a program that would reduce the effects of radiation on the body.

In 1959 and 1960, Hubbard carried out a series of “experiments” (although they were never scientifically published), which “proved” that plants felt pain and feared death. He also experimented with the effects of heated soil on plant growth. For years afterward, media accounts about Scientology carried a picture of a pensive Hubbard looking intently at a vine-ripening tomato that he had hooked up with clamps and wires to the galvonometer (called an E-meter) reputedly used by his organization to identify negative incidents in members’ current or past lives. These experiments, however, did not become part of Hubbard’s lasting contributions to Scientology.
One of the few lasting images of the natural world in his ideology involved volcanoes, which appeared in Hubbard’s 1967 cosmological statement about how soul-like entities (called thetans) forgot previous negative experiences from past lives as they were about to enter new ones. According to Hubbard, 76 million years ago an evil warlord named Xenu (or Xemu) rounded up people on the overpopulated planets that he controlled, sent them to a planet called Teegeeack (which was Earth), placed them in (or near) volcanoes, and exploded hydrogen bombs in craters. Their souls (thetans) survived, but out of fear these thetans grouped together as clusters and continue to attach themselves to bodies. Upper-level Scientology courses supposedly allow people to detach these “body clusters” and thetans from themselves, which is supposed to advance their own developmental progress.

As environmental awareness grew in society-at-large, Scientologists received media attention for their clean-up efforts on beaches, along road sides, and in urban centers—activities that the Church of Scientology international praises on its own website. In 1998, for example, one special Scientology project in Clearwater, Florida, involved relocating a 100-year-old oak tree. Moreover, in September 2001, the Church of Scientology was among approximately 65 “customers” named by the Los Angeles Department of Water and Power for having made “green power” purchases from renewable energy sources (Los Angeles Department of Water and Power 2001).

While acknowledging that Scientologists share concerns about nature and the natural environment with the wider society, it remains true that the organization attempts to use members’ environmental efforts to extend Scientology’s “technology” into society. For example, in a secular booklet of moral aphorisms that Hubbard wrote in an attempt to gain recognition of his name, Hubbard instructed his readers to “Safeguard and Improve Your Environment.” Yet the unsophisticated level of his thinking about the environment and the natural world resulted in simplistic advice: “There are many things people can do to help take care of the planet. They begin with the idea that one should. They progress by suggesting to others that they should” (Hubbard 1981: 38, 45). Nevertheless, Scientologists hope that non-Scientology organizations will reprint this booklet and distribute it widely, thereby attracting attention to its author (i.e., Hubbard) and stimulating interest in Scientology and his other works. Along these same lines, Scientologists and a Scientology organization had close connections with an environmental group named “Cry Out,” and the principal of a Los Angeles-area elementary school canceled the group’s planned activities for her students when she realized that its booklet was printed by Hubbard’s literary agency, Author Services, Inc., and contained a song that Hubbard wrote.

It seems unlikely that “nature” or “the natural environment” ever will be a significant aspect of Scientology’s ideology. A stated purpose of the organization ostensibly is to remove the impact of negative experiences (called engrams) from people, and in many instances their removal (so the group claims) has medical benefit. Concerns, therefore, about nature are secondary (at best), since they are far outweighed by counseling and health issues.

Scopes Trial

In 1925, Tennessee passed legislation against teaching in state-supported schools “any theory that denies the story of the Divine creation of man as taught in the Bible, and the teaching instead that man has descended from a lower order of animals.” The American Civil Liberties Union announced that it would defend any teacher prosecuted under it. George Rappleye saw this as an opportunity to both test the statute and bring national publicity to Dayton. He found support among local school officials and attorneys and science teacher John Scopes agreed to be prosecuted.

Efforts to ban teaching evolution began in the early 1920s. The rise of Christian fundamentalism in the early twentieth century was a reaction against religious modernism, including the “higher criticism” that asserted the Bible is the product of human experience and that God works through history rather than revelation. Some fundamentalists were appalled by modernist efforts to reinterpret the scriptures to conform with scientific
understanding. The rapid growth in public school attendance and the exposure of children to rationalism and science, especially Darwinism, seemed a threat to the religious influence of families.

Tennesseans were not uniformly opposed to teaching evolution; many found the statute an embarrassment. At its annual meeting held in Memphis shortly before the trial began, the Southern Baptist Convention voted down an anti-evolution proposal offered by its fundamentalist wing. Even the chief prosecutor questioned the wisdom of the law under which Scopes was charged.

The trial received a major public relations boost when William Jennings Bryan and Clarence Darrow volunteered their services. Bryan, a well-known populist and former U.S. Secretary of State, was a social progressive, religious conservative, and anti-evolution leader. However, he had not tried a case in decades and contributed relatively little to the prosecution’s legal work. Darrow was one of the most famous trial lawyers of his day and an outspoken agnostic. He and Bryan had cooperated in progressive social causes, but were bitter opponents on religious matters. Although he did not lead the defense, Darrow played a major role in the trial.

Scopes admitted that he broke the law, but argued that evolution did not conflict with the biblical account of creation. The presiding judge, however, would not allow the jury to hear expert testimony to this effect. The prosecution argued that the only relevant issue was that Scopes broke the law. There were, though, larger issues. Politically, the prosecution argued that majority views should determine what is taught in public schools. The defense supported academic freedom and the authority of science. On a religious level the case embodied the ongoing conflict between fundamentalism and religious modernism.

Each day’s session was opened with a prayer delivered by fundamentalist clergy. The judge overruled the defense’s objection to this practice and the defense presented a petition from modernist clergy requesting that some prayers be delivered by non-fundamentalists. The defense argued that “we have an opportunity to hear prayer by men who think that God has shown His divinity in the wonders of the world, in the book of nature, quite as well as in the book of the revealed word.” This eventually became the practice as fundamentalist and modernist clergy alternated in delivering the prayer.

Darrow called Bryan as an expert witness on the Bible. Eager to defend his faith before the staunch agnostic, Bryan endured a grilling on his belief in the unerring literalness of the Scripture. Darrow questioned him on such points as whether Jonah was actually swallowed by a fish, Joshua made the sun stand still, and the days of creation were 24 hours long. Bryan made a poor showing and eventually agreed that the days could have been periods of indeterminate length, thus opening the door to interpretation beyond biblical literalism.

The following day the judge struck Bryan’s testimony from the record. At this point, the defense recommended a verdict of guilty and Scopes was fined $100.00. On appeal, the Tennessee Supreme Court found the statute to be constitutional, but overturned the conviction on a technicality. The statute was not repealed until 1967.

The Scopes trial captured the nation’s attention and highlighted the issues, but it did not slow fundamentalist anti-evolution efforts. Other states passed similar legislation and fundamentalists later developed new strategies to introduce “creation-science” and intelligent design arguments into classrooms. Although these efforts have been rebuffed, the conflict continues.

Ernst Myer pointed out that the Darwinian Revolution actually involves a complex collection of social and intellectual changes. These include accepting the geological concept of time, that the Earth has undergone great change, and that evolution is not linear and progressive but adaptive to present circumstances. It took nearly 250 years for these views to be incorporated into biological theory and the process is still underway within the lay public. The Scopes trial was part of this ongoing process.

Many religious people, organizations and denominations have found ways to reconcile scripture and the book of nature. However, the anti-evolution fundamentalists’ efforts to reinterpret nature to conform it to their understanding of the Bible promotes a distorted understanding of nature, ecological processes and biological diversity. In addition to retarding environmental understanding, they also promote the unfortunate belief that there is an essential conflict between religion and the vision of nature provided by science. Those who believe that God speaks through nature, as well as scripture, find this notion short-sighted.

Scotland

As the glaciers of the last ice age finally left Scotland as a bare and empty landscape about 10,000 years ago, pioneer species such as hazel and birch started to recolonize the land, the now-extinct wolf, bear and lynx returned, and people resettled (Edwards and Ralston 2003). These people left their mark in megalithic structures typically erected some 5000 years ago, such as the lunar-aligned Calanais Standing Stones on the Isle of Lewis. Such monuments are often found in beautiful places. Some probably had astronomical and ritual functions. Little can be said about this with certainty, but one claim that can be made without question is that they represent art. As such, the ancient sites have been described as “the longest show running”; a doorway to the imaginal realm where nature and the imagination intersect. The standing stones accordingly testify to a tripartite link between community, spirit and place and, as such, in all probability, to the early presence of nature religion – namely, the understanding that the spiritual realm interpenetrates and animates the natural world.

Scotland’s original Pictish inhabitants may have had a matrilineal structure, but little is confidently known about them. The Romans were largely kept out of Scotland; they built two defensive walls to keep the Picts back. According to Tacitus’ Agricola (ca. 98), the Pictish chieftain Calgacus said of the Romans:

Harriers of the world . . . they make a desolation and they call it peace . . . We, the noblest souls in all Britain, the dwellers in its inner shrine, had never seen the shores of slavery and had preserved our very eyes from the desecration and the contamination of tyranny: here at the world’s end, on its last inch of liberty . . . Then let us fight as men untamed, men who have never fallen from freedom.

During the second half of the first millennium the Scots of Dalriada, originating from Ireland and speaking Gaelic, subsumed whatever had gone before with patriarchal chieftain structures based around the extended family or “clan.” Irish-Scots’ Celtic monasticism, resting on a Druidic “Celtic Old Testament” base, embodied a rich nature spirituality.

These Irish roots were later used to assert, before the Pope, Scotland’s claim of right to be a nation free of Anglo-Norman suzerainty. English invaders based their claim to control Scotland on Geoffrey of Monmouth’s “translation” of the Historia Regum Britanniae of 1135 – parts of which were probably Geoffrey’s own creation, as he later claimed to have lost the original manuscript. The Historia maintained that Britain was named after Brutus of Troy who had arrived in the twelfth century B.C.E. after pillaging France and Africa, inspired by an oracular man-

date to dominate “the round circle of the whole Earth.” Geoffrey claimed Brutus had cleared Scotland or “Albany” of Picts and giants, giving it to his youngest son, Albanactus.

During the Wars of Independence (1296–1424) with England, Edward I used this myth to legitimize his colonizing conquest of Scotland. As embellished in the Hollywood movie, Braveheart, William Wallace and King Robert the Bruce drove the English out. However, to consolidate Scotland’s free status they required papal recognition. This was achieved through the Declaration of Arbroath, 1320, a remarkable document that drew on Irish charter texts to trounce Geoffrey’s Brutus myth (Ferguson 1998).

The Declaration links Scottish origins to ancient Scythia by the Black Sea, as described, for example, in the Irish Book of Invasions (ca. 1168 in final form). This portrays the Scots coming from Scythia to assist Nimrod with building the Tower of Babel, their leader learning all 72 languages of the world after its fall, his being summoned as Pharaoh’s linguist while the Israelites were still in slavery, his marrying Pharaoh’s daughter (“Scota,” hence “Scotland,” implying that the Mother of the Nation was black), his reconstructing Gaelic from the 72 languages (hence Gaelic’s sometime designation, “the language of Eden”), his people providing the Israelites with bread and wine on the eve of their Red Sea departure, and then later, having received Moses’ blessing, completing a 440-year-long migration via Spain to Ireland, and from there, according to the Scotichronicon’s account (ca. 1449), on to Scotland, bringing as proof of their peregrinations the Stone of Destiny – Jacob’s pillow from the original Genesis 28 version of Stairway to Heaven. Scottish nationhood is thereby symbolized by a holy stone, returned in 1996 from Westminster Abbey to Edinburgh Castle. This axis mundi stone, we might note, originally symbolized the connection between heaven and the land that Jacob was given; and that in a context where God pronounced blessing on all the world’s peoples.

Revealingly, the Declaration of Arbroath locates sovereignty of the Scottish people not in the sovereign, but in the “Community of the Realm” which is “the community of Scotland.” As such, and consistent with the principle that only God can own the land (Leviticus 25), Scotland had a King or “Queen of Scots” as distinct from a “Queen of Scotland.” Resonant with the spirit of Calgacus, the Declaration asserts, “It is in truth not for glory, nor riches, nor honors that we are fighting, but for freedom – for that alone, which no honest man gives up but with life itself” (Scottish Records Office, 1320). And while Scotland might have had its “Auld Enemy” in the English, the importance of loving the enemy was constitutionally embedded in the Declaration’s modification of Galatians 3:28 (“There is neither Jew nor Greek, slave nor free, male nor female, for you are all one in Christ Jesus”), asserting that under “the
Church of God,” there is “neither weighting nor distinction of Jew and Greek, Scotsman or Englishman.” Thus Scottish identity is generally considered to be civic rather than ethnic: at its best, a person belongs inasmuch as they are willing to cherish, and be cherished, by a place and its peoples.

While the nobles of Scotland as the medieval signatories to the Declaration looked to Rome (and successfully so) for recognition of national sovereignty, the Scots Reformation parliament of 1560 repudiated Rome. Protestants saw late medieval Catholicism as having been lax to the point of almost being “pagan.” It is perhaps the imperative of asserting narrow puritanical rectitude in order to give boundary and faith-based justification to spiritual revolution that we can trace the origins of the neglect, and even fear, of both nature religion and mysticism that has characterized much mainstream Reformed Church religious discourse in Scotland through until the late twentieth century.

That said, John Calvin, the benchmark of Scots Presbyterian Protestantism, was not averse to the love of nature. His Institutes (III:XIV:20) speak of the Creation as that “beautiful theatre” in which we might do well “to take pious delight.” Similarly, the formative 1647 Westminster Shorter Catechism affirms that “God executeth His decrees in the works of Creation and Providence.”

However, the seventeenth century, under James VI, who became James I of a “United Kingdom” with England in 1603, saw organized religion applied as an instrument of inner (psychological) and internal (within the British Isles) colonization. As with James’ policy in Ulster, muscular Protestantism was indoctrinated through, for example, his 1609 Statutes of Iona and in the 1616 education act. These helped to propagate a Protestant ethic of transcendental deferred gratification such as Max Weber would have recognized as the hallmark of the early-modern mindset.

In Ulster, James’ policies wronged the indigenous Catholics and wrong-footed the poor Scots Protestants who he “planted” there. In Scotland, the underlying imperial and mercantile ethic of his polices attacked indigenous bardic politics and laid the ground for the 1707 Union of Parliaments, by which Great Britain emerged as the world’s foremost exemplar of neo-Roman presumptions of Empire. Following the Jacobite uprising of 1745, British forces in the Battle of Culloden near Inverness (1746) crushed clan power, and key markers of indigenous culture such as the wearing of the tartan kilt were proscribed. Robert Burns, the national bard, was to say of this era in his poem, Strathallan’s Lament written in 1787: “The wide world is all before us / but a world without a friend.”

With the indigenous leadership now either compulsorily Anglicised or crushed in the remote Highland centers of resistance, land became valued as a commodity rather than for the number of people it could support. Improved breeds of sheep, and demand for wool from the Napoleonic wars, triggered the “Highland Clearances” in which perhaps some half-a-million people were directly, or indirectly from economic pressure, forced off their native territories until the passing of the Crofters Act in 1886. Ironically, displaced indigenous Scots often colonized other native people’s territories, the oppressed in some cases becoming oppressor. Much of rural Scotland became, in effect, one of the world’s first casualties of what would now be called “globalization.”

As with the famine in Ireland, many ordinary pious peasants internalized their oppression as punishment from God. At Croick, a congregation huddled in the churchyard awaiting the arrival of their emigrant ship scratched on a windowpane, “The people of Glen Calvie, the sinful generation.” The 1712 Patronage Act had permitted landlords to appoint clergy within the established Church of Scotland. Some of these preached a gospel focused only on a transcendent pie-in-the-sky-when-you-die salvation. As if in antithesis to nature religion, the Earth was portrayed as a realm that had been corrupted with the sin of Adam. It was portrayed as fallen in its own right, rather than merely enduring the consequences of Adam’s Fall. The Earth as Christ’s “footstool” (Matthew 5:35), the very seat of the immanent presence of God, was overlooked. It was too often presumed that when Jesus condemned “the world” he included nature, rather than, merely, the corrupted human sociological order known as “worldliness.”

Accordingly, the oppressed were, to the landlord’s convenience, encouraged to write the world off rather than to discern and seek to redeem it. In any case, Calvin’s double-predestination suggested that, ultimately, destiny fell outside of human control. It was mainly to break with patronage under the influence of an emerging liberation theology that the Church of Scotland split in the 1843 “Disruption.” In an effort, not always successful, to embody spiritual freedom, the Free Church of Scotland emerged as a more truly Presbyterian or grassroots alternative that recognized the authority of “Christ as Lord” unmediated by any landlord. One of the Disruption’s practical consequences was to give spiritual legitimatization to the land reforms that took place at the cusp of the nineteenth–twentieth centuries, and which preserved agrarian “crofting” communities.

Amongst the peasantry a strong nature religion – expressed as awareness of the immanence of God and through supernatural belief and totemistic animism – is continuously evident. However, much of this has been caricatured as residually “Papist,” (as with most of Car-michael’s great nineteenth-century collection, the Carmina Gadelica), or of the faerie faith, and therefore merely superstitious (as with the Rev. Robert Kirk’s seventeenth-century Secret Commonwealth). Recent work, such as that of the American Gaelic scholar, Michael Newton, and the Scots historian, James Hunter, reflects a continuous close
engagement between people and nature expressed in the bardic tradition often outside of or on the margins of the mainstream church. As a generalization, this represents human society as resting on the bedrock of ecological community under the Providence of God. Nature transfigures humankind in a grounded transcendence, thus the motto of Stornoway in the Outer Hebrides is “God’s Providence is our inheritance,” and the great twentieth-century Gaelic poet, Sorley MacLean, writes in An Cuilithionn (The Cuillin): “Beyond the lochs of the blood of the children of men / beyond the frailty of plain and the labor of the mountain . . . / beyond guilt and defilement; watchful / heroic, the Cuillin is seen / rising on the other side of sorrow” (in Hunter 1995: 175).

In the late twentieth century, a few activists, including the present author, used the above analysis of history in an effort to reintegrate nature, spirituality and a bardic politics in the public life of a Scotland developing a “devolved” or semi-detached relationship with the rest of the “United Kingdom.” The Isle of Eigg Trust, established in 1991, successfully enabled the residents of a Hebridean island to revolt and rid itself of its landlord and establish a democratic community land trust. This in turn helped stimulate flagship land-reform legislation in the Scottish Parliament, which was reestablished in 1999.

Similarly, when the Isle of Harris was threatened by multinationals wanting to make it a center for European production of roadstone with perhaps two massive “superquarries,” theological testimony against violating the integrity of the creation was made by a panel that included Scotland’s leading Calvinist, the Rev. Professor Donald Macleod, and the then-warrior chief of the Mi’Kmaq First Nation in Nova Scotia, a Sacred Pipe Carrier.

Attention was drawn in the public inquiry through the Mi’Kmaq testimony to the need for “defense of Mother Earth.” Scripture passages such as Genesis 2:15, Proverbs 8, Job 38 and Romans 8 were invoked to argue that it is not creation that is fallen (and therefore treated as fit to have its national scenic areas ravished), but humankind. Professor Macleod noted that the function of the creation is to reflect the majesty of God and that “to spoil the creation is to disable it from performing this function [giving rise to] the consideration that rape of the environment is rape of the community itself” (Macleod in McIntosh 2001: 234). Accordingly, the present writer concluded, an appropriate relationship with nature is one of reverence. This is not pantheism – God as nature – but it should be understood as, panentheism – God being present in the creation as, for example, in Job or Hebrews 1:3.

The Scottish Government that, in the previous year, had abolished feudalism, rejected the superquarry in 2000. The “harriers of the world” may hover yet in the guise of globalization, but the spirit of Calgacus, increasingly expressed through nonviolent direct action, remains strong in fighting, as Tacitus described it, “desecration and the contamination of tyranny: here at the world’s end.”

Alastair McIntosh

Scouting

Founded during the Progressive Era, the early Scouting movement in the United States embraced the era’s widespread beliefs in Darwinism, in the restorative power of nature, and (for the boys) in the spiritual dimensions of physical activity (“muscular Christianity”). Lord Robert Baden-Powell founded the Boy Scouts in England in 1908, and in 1910 a group of men already active in youth work in the United States gathered in New York City to found the Boy Scouts of America (BSA). Juliette Gordon Low created the first troop of Girl Scouts in 1912, and by 1915 the Girl Scouts of America (GSA) was incorporated. Although technically not part of the “Scouting” movement, the Camp Fire Girls, founded by Luther and Charlotte Gulick in 1910 and incorporated in 1912, shared Scouting’s ideas and approaches to building nature-based recreational programs for children and adolescents.

Ernest Thompson Seton (1860–1946) played a central role in bringing into the BSA ideas about the relationship between nature and religion. Seton had been experiment-
ing since 1903 with his own youth program, “Woodcraft Indians,” based on American Indian lore, and he brought that experience to the BSA in 1910. Seton wrote a good many sections of the first *Handbook for Boys* (1911), including sections on "woodcraft," and he held the title "Chief Scout" until his falling out with the BSA in 1915.

By the turn of the century, Seton had already established strong credentials as both a naturalist and an artist. Although Seton wrote scientifically sound and well-respected books on North American wildlife, he was best known as the author of a number of books of animal stories, such as *Wild Animals I Have Known* (1888). In his stories, Seton gave his animal characters intelligence, emotions, and even a sense of ethics. Although he was sometimes criticized for these stories, Seton defended them as based on scientific observation of animal behavior in the wild. Seton was a committed Darwinist, but his Social Darwinism resembled Peter Kropotkin's view of cooperation and "mutual aid" in nature, rather than the Spencerian view that brutal competition was the natural state of things. Accordingly, Seton's stories are full of animal cooperation and altruism. Although Seton had been developing these ideas over decades, he finally summed up his case for the moral lessons of nature in his 1907 book, *The Ten Commandments in the Animal World*, where he argues (using numerous examples from his observations of animals) that the Ten Commandments are "fundamental laws of all highly developed animals" (Seton 1925: 4).

When Seton turned to creating programs for young people, he brought into this work these same Social Darwinist ideas also found in the Social Gospel movement. Seton and other Darwinist reformers believed that they could intervene in the process of evolution and steer society toward more just and more spiritual (as opposed to material) ways. He read and agreed with G. Stanley Hall's (1844–1924) Darwinist approach to the evolutionary psychology of the race and of the individual child and, like Hall, Seton believed that male early adolescence was a particularly magical period when the boy's natural instincts could be turned to spiritual matters and to selfless service to others.

Seton held up the American Indian as a model for American character, spirituality, and physical fitness. He built his original youth program around Indian lore, and when he resigned as Chief Scout in 1915 (in a dispute with the leadership) he reestablished the Woodcraft Indians as a co-educational group in competition with Scouting. Seton thought that American Indian religions were the perfect model for human spirituality and ethics. Seton had moved from the East to settle in Santa Fe, New Mexico, in the early 1930s to create *The College of Indian Wisdom*, a training institute for leaders in the Woodcraft Indians and other youth organizations. During these years Seton continued publishing the Woodcraft League's monthly *Totem Board*, where Seton tried out the ideas he finally con-
densed into one book – *The Gospel of the Redman* (1937) – where the Christ-like qualities of the great Shawnee Chief, Tecumseh, come to represent the merging of American Indian religions and those qualities Seton thought best in Christianity. Not surprisingly, the American Indian's religion in Seton's account relied heavily upon ideas about nature, so Seton was thoughtfully weaving together ideas about male adolescence, spirituality, American Indian religions, and the ethical lessons from the animal world.

Many of Seton's ideas about nature and spirituality survived in the BSA handbooks and programs after his departure, but some of the other founders also had their own ideas about the ways religion and nature came together in Scouting. Three of the founders – Edgar M. Robinson, John L. Alexander, and James E. West – had extensive experience in the Young Men's Christian Association (YMCA), and they brought from those experiences a firm faith in the power of "muscular Christianity." While that philosophy energized the late nineteenth-century commitment to athletics as a means to socialize young men in ethics and morality, Scouting went even further than the YMCA in viewing nature as the playground for the spiritual and ethical training of young men. The "Acadian myth" in the United States is the long-standing narrative that a "return to nature" will save Americans from the debilitating, polluting, and demoralizing effects of urbanization and (later) modernization, and we see in the handbooks and other literature of Scouting this enduring mythological idea of "going into the woods" for spiritual renewal (Schmitt 1990).

The founders and authors of the early BSA handbooks included religion as an important ingredient in the Scouting program. The Twelfth Point (and last) of the Scout Law is that "A Scout is Reverent," and in the 1950s the BSA created a special category of Religious Awards so that the boy could learn more about his own religion and provide service to the congregation as an extension of his service to the community through Scouting. All mention of religion in the BSA materials, however, addresses more traditional understandings of religion. The BSA never formulated explicit ideas of a "nature religion" in these materials; those ideas appear far more often in the BSA publications about nature and in oral comments by Scout leaders (e.g., Scoutmaster's "sermon" in Mechling 2001: 18).

Under the rubric "woodcraft," the study of nature has always been a part of the Scouting program. In the Boy Scouts, boys must learn about nature for a range of badges, beginning at the lowest ranks and extending to Eagle Scout, the highest rank. Boys earn merit badges on topics running from the most general, such as "Nature" and "Environmental Science," to specialized merit badges in such fields as bird study and reptile study. The pamphlets for these badges are usually written by experts in science, but even these publications convey the sense of awe.
humans have in the presence of nature. If the modern “ecological consciousness” has a religious or spiritual dimension to it, then we see evidence of this in the BSA publications.

The religious or spiritual dimensions of the study of nature in Scouting are subtle but unmistakable. The notion of “stewardship,” an idea borrowed from religion by conservationists in the Progressive Era, pervades Scouting’s ideas about nature. These are the “conservationist” ideas of people like Gifford Pinchot, Teddy Roosevelt’s Secretary of the Interior, rather than the “preservationist” ideas of John Muir in the same period. William Temple Hornaday (1854–1937), who directed the New York Zoological Park from 1896 to 1926 and who was in the circle of Seton’s friends, is remembered in the BSA with the William T. Hornaday badge and medals for boys who undertake projects representing “distinguished service in natural resource conservation,” evidence of responsible stewardship over nature.

Although the social and cultural impetus for Scouting came from the pervasive sense of a “crisis” in white masculinity in turn-of-the-century Great Britain and the United States, some reformers thought that the ideas of the movement, including ideas about nature and religion, were also applicable to girls. Like Seton, the Gulicks created the Camp Fire program around American Indian lore and took care in designing campfire rituals meant to impart to girls the spiritual and service aspects of their lives as young women. Crafts and camping were part of the Camp Fire program from the beginning, sharing in the “Acadian myth” of the beneficial effects of having girls experience nature. Juliette Gordon Low’s ideas for the Girl Scouts (1912) did not rely upon American Indian lore for their program, but Low and her colleagues were just as committed to the view that teaching girls self-reliance for the twentieth century should include woodcraft skills. Seton created still another opportunity for girls with his Woodcraft Girls, an organization paralleling his Woodcraft Boys, with its own handbook, The Woodcraft Manual for Girls (1916). All three of these organizations – the Camp Fire Girls, the Girl Scouts of America, and the Woodcraft Girls – were feminist organizations in their cultural context, as they aimed to take young women beyond the domestic sphere and give them knowledge and skills, including campcraft and woodcraft. In these movements’ requirements, rituals, and excursions into the wilderness we see the same wedding of nature and spirituality so prominent in the boys’ movements.

**Scything and Erotic Fulfillment**

Ivan Illich has drawn attention to the “vernacular” as those practices and values that, like our vernacular (or native) tongue, are learned in family and community by oft-unconscious processes of social osmosis rather than through formal schooling. It is striking that vernacular activity in the satisfaction of fundamental human needs is typically rich in synergistic layers of meaning. Indeed, as development practitioners and “modernizers” have discovered to their cost, it is often the case in vernacular communities that “implicit meanings of local practices” will outweigh the superficially presented reason for doing things in a particular way. For example, stories abound in Africa of newly installed water pumps being broken by young men. Only then was it realized that having the young women walk to the distant well was an implicit but unspoken opportunity for courtship.

One of the most striking characteristics of much vernacular work is its relationship to rhythm – both as an outcome (for example, in work song), and as an organizing principle aiding the process. This emerges, for example, in walking, rowing, riding, cycling, milking, weaving, spinning, pounding corn, hauling on anchor chains, ropes and fishing lines, casting with a fishing rod, making music, repartee in discourse, varying forms of intercourse, rocking the baby, and in reaping with sickle or scythe.

The ability to “enter into the swing of things” in work, as in sport, is commonly the touchstone of right technique. Chant, song or dance, often in unison with co-workers, may be concomitant to such an extent that some cultures have built up considerable bodies of work-related folk songs. These are songs not necessarily about work, but rather, embodying the rhythm of work. Thus, for example,
the American-born Scottish ethnomusicologist, Margaret Fay Shaw, says of the weaving of Harris Tweed fabric in the 1930s: “Those were the days when a wearer could regard his homespun from the Hebrides with the thought of the songs and gaiety that went into the making of it” (Shaw 1986: 7).

The wielding of a scythe – a sickle mounted on a frame to allow full-body engagement in harvesting grass and grain crops – is a paramount example of rhythmic vernacular work, and one that is currently generating fresh interest for its Zen-like meditative nature. In his seminal work, The Scythe Book, David Tresemer refers to the obviating effect of rhythm and resultant work song on the passing of time, maintaining that, “The main function of these chants and charms and songs was to coordinate the breath and scythe stroke and to ‘deceive the tedious time. And steal unfelt the sultry hours away’” (Tresemer 2002: 60).

He sees this phenomenon as being spiritually transcendent, thus concluding his treatise with the paragraph:

It is my desire on this land, in the context of this small farm, to know the best use of my body, and to move with the scythe as an extension of my body – in relationship with the grass, and in a team of mowers – in the process of developing my own communion with the divinity that creates the task and all its parts (Tresemer 2002: 103).

In The Scythe Must Dance, a technical addendum to the second edition of Tresemer’s work and widely cited on the internet, Peter Vido likens the correct swing of the scythe to “The practice of Tai-Chi Chuan, with its emphasis on the executing of smooth motions and while in a reflective state of mind, it is a beautiful – even if idealistic – model” (Tresemer 2002: 169). He too, in his closing paragraph, transcendentally elevates the art, quoting a school essay by eighteen-year-old Hannah Sawyer of Kingfield, Maine. She writes:

Scything is simple; it is relaxing too. It is no wonder the people of yesteryear had very little problem with stress. The quiet rhythm melts away tension; swish, cut, swish, cut, swish . . . If I close my eyes it is easy to imagine myself back in time – a bird singing to the sky, the wind whispering to the trees, the splash of a horse pawing the water, the lowing of a cow calling her calf. Would you like to time-travel? I’ll teach you how (Tresemer 2002: 181).

I myself grew up on the Isle of Lewis off Scotland, knowing how to hone and handle a scythe for the making of hay and silage to feed our cow. I observe that, today, it has become a near-extinct and hard-to-get tool, driven out by the hegemony of the “strimmer” – the name given in Britain to pernicious petroleum-powered pestilences with rotating nylon whiplashes that brush the grass. Walk a meadow or woodland path that has been strimmed, and you step among the scrappy carnage of flayed vegetation and scuffed ground. By contrast, tread a scythed path, and the vegetation is cleanly cut and laid to the side in pleasing swathes that avoid messing one’s footwear. Rarely is the turf damaged because, as the Thai Buddhist Monk Tich Nhat Hanh puts it in a quotation at the leading website dedicated to the art, “Whenever I see anyone cutting grass with a scythe, I know he is practicing awareness.” Indeed, it was a personal meditation on strimmed versus scythed meadow paths in Scotland that inspired me with “The Scyther’s Prayer”: May my death be the clean cut of an honest scythe, and never the thousand lashes of an accursed strimmer!

Time and death wield a scythe because harvesting is both the fulfillment, and the transcendence, of them both. As Sir James Frazer suggested in The Golden Bough (1994), the practice of reaping connects humankind with the Corn God or the King of the Woods, and with the Earth Goddess. It is back into her sacred body, the Earth, that the sky god or King seasonally meets his nemesis, as at Diana’s Grove of Nemi. To consciously reap the life-force (which can be symbolized by mistletoe or the “Golden Bough”) with a hand sickle or scythe is therefore to participate in the perpetual archetypal cycle of life, death and rebirth.

To Frazer, this insight connected the Christian story with a much wider body of world mythology. As he concludes his seminal if professionally controversial and much-disputed yet remarkable work:

Our long voyage of discovery is over [and] once more we take the road to Nemi. It is evening, and as we climb the long slope of the Appian Way up to the Alban Hills, we look back and see the sky aflame with sunset . . . over Rome and touching with a crest of fire the dome of St. Peter’s . . . The place has changed but little since Diana received the homage of her worshippers at the sacred grove. The temple of the sylvan goddess, indeed, has vanished and the King of the Wood no longer stands sentinel over the Golden Bough. But Nemi’s woods are still green, and as the sunset fades above them in the west, there comes to us, borne on the swell of the wind, the sound of the church bells of Aricia ringing the Angelus. Ave Maria! Sweet and solemn they chime out from the distant town and die lingeringly away across the wide Campagnan marshes. Le roi est mort, vive le roi! Ave Maria! (Frazer 1994: 714; translatable as, “The king is dead, long live the king! Praise be the Mother of God!”).

Frazer’s work may have fallen on stony ground when the relationship between Christianity and fertility became
a shunned field of study. Nonetheless, it cannot escape notice that in the Last Supper before his "Passion," Christ, the Mahavatan embodiment of God incarnate (and so carnal), offers bread – risen from reaped corn – in memory of eternal communion with his body. The spirituality implicit in the biblical Song of Solomon, Proverbs 8, Luke 7 and Matthew 11 thereby finds congregual fulfillment in this "feast of love," this “communion of the saints,” that realizes heaven as the fulfillment of the erotic.

Sea Goddesses and Female Water Spirits

Water is not just regarded as a resource to be managed or exploited or as the source of natural metaphors, but as having an identity on its own. Such an identity has been, in many cultures, personified in the figures of female water deities.

Images of transcendent women surface worldwide – in the lakes, seas, rivers and springs of every continent. Nearly always of great beauty and ambivalence, they are seen as both seductive and threatening; as bringers of salvation and – at the same time – damnation; and – just like their element, water – as life-giving and life-taking, too.

Deities of the water, water spirits and mermaids cannot be seen only as a projection of attitudes toward women or just as a metaphor for male desire for and fear of the female. The following suggest the multiplicity of meanings inherent in a wide range of conceptualizations of sea goddesses in specific local and historical contexts and in connection with particular social practices.

Examples drawn from Europe, Africa, Brazil and Indonesia will focus on rites that are performed at present and which seem to be of growing significance. This reveals local strategies for dealing with the extraordinary, unpredictable and challenging element, water.

Europe – Sirens, Sprites, Melusine and Undine

Each epoch in Europe constructed its own characteristic version of women in the waters. Aphrodite or Venus, the goddess of beauty, unbridled love and creative fecundity, can be linked to pre-patriarchal social structures. In contrast to her, sirens – half-bird, half-woman – seem like dark, strange and uncanny creatures who are full of sensual temptation for Odysseus, whom they try to deflect from his road home. In the post-Homeric era, the sirens lose their threatening characteristics, although in the Middle Ages they come to embody a direct threat to the male, Christian mode of being because they distract from the word of God and promise carnal desires and earthly pleasures. The sprite with her fish’s tail moves to the front of the stage. While she is also a seductive creature she is a split being; Her form is human above and animal below. She is wild, but unreachable because of her sexual inadequacy, however in the course of time she is depicted in an increasingly harmless fashion. In early modern times, mermaids with one or two tails – the latter classified as Melusines – frequently appear in churches as well as in book illustrations and decorative folk art. This leads to the gradual supplanting of the wild, sexualized and demonized Melusine by the diminished child-woman Undine. The Undine is never a mixed form, but rather a different one in the sense of embodying a living, immediate naturalism.

The Romantic period sees a multitude of gushing literary variations on this figure. The Undine shares the Melusine’s neediness. She needs a man, not only to make her human, but also, through marriage, to gain a Christian soul. After getting it, she is characterized by submission and humility and is similar to the figure of the little mermaid in Andersen’s fairytale. Desexualization, devotion and silent sacrifice are central to the tale’s bourgeois ideal of motherhood, because the little mermaid dies before she has a chance to seduce the prince.

The death of females by drowning, especially that of Ophelia, takes on a great fascination around the end of the nineteenth century. The lifeless, floating female body represents an increasing deindividualization, while, at the same time, the Undine becomes merely an “art nouveau” ornament. Today, we have Barbie dolls with fishtails and the Lorelei on T-shirts as examples of mass consumer products. Just as nature has been turned into a useful but lifeless object lacking the divine, so the mermaid has degenerated into a commercial sex object and a “harmless” piece of kitsch.

But, simultaneously, the sea even nowadays can provoke impressions of open space, power, eternity, movement, metamorphosis, change of shape and color, and orgasmic waves.
Africa: Mami Wata (Mammy Water)

In Africa water and floods are unpredictable forces, potentially benevolent, but also harmful. The widespread polymorphous figure of Mami Wata (Mammy Water, oscillating between spirit and goddess) is actively worshipped in many African countries between Senegal and Tanzania. In West African cosmology the Mami Wata spirits (there is also Mami Wishnu, Mami Lakshmi or Mami Gabriel) are among the most popular and they are said to possess great mystical powers and authority. They are also known to extend their wrath and anger in the form of torrential rain, floods or lightning. These powerful spirits are usually depicted as mermaids of exceptional beauty or as snakes. Their history seems to be closely connected with colonialism. As there is a definite influx of prints from Europe and India, in the 1980s and early 1990s foreign influences in the iconography of Mammy Water were seen as central in the scientific interpretations of this figure. Mami Wata has many traits of a white woman or fashionable lady of Western style and, as offerings for her mainly consist of things associated with foreigners (a means of symbolic appropriation of their world), her followers appear to be selecting fragments from experiences of foreign cultures and investing them with new meanings. Today Mami Wata religious practice is interpreted as concerned predominantly with the articulation and expression of African social realities and in particular with social change. Other authors observe hybridity in the mixtures of African, European, Hindu and occult elements. Thus, Mami Wata is connected with colonialism, migration, globalization, with literacy, education and increasingly with new media (cf. the Mami Wata websites in the internet). Strangely enough, there are no interpretations of Mami Wata as an icon for environmental protection or as a guard for aquatic ecosystems.

In any case, the idea of an underwater world with splendid palaces and immense riches is a counterimage to the real world. Mami Wata includes aspects of ancient water – and snake spirits: In the Igbo context, in southeastern Nigeria, the royal python companion refers to the rainbow serpent that controls the waters of the sky and unites them with the waters on Earth. Hence Mami Wata and the rainbow serpent are an inseparable pair. In West and Central Africa the river deity Mami Wata is linked with notions of irresistible female sexuality and with modernity in urban life.

Women make up the majority of her adherents, both as priestesses and as adepts of the cults. Her worshippers attest to the goddess’ healing powers, benevolence, beauty, mystery and local origins. She can enter people through possession. Possession cults have often been modes of cultural resistance and means to domesticate male and alien powers. Therefore possession by water spirits can be interpreted as an embodied critique of colonial, national, global or religious hegemonies.

But the local meanings differ. For instance, in Igbo religion Mami Wata has a particular significance as a local strategy for dealing with the extraordinary, unpredictable, abnormal, nonconformist, challenging and/or innovative elements and events in nature. Another example is Zaire, where Mami Wata gradually lost her sacred aura and became a symbol for the prostitute. Association with her is seen as immoral because the wealth she provides is not shared. Thus, we can see her as a complex concept of multidimensional divinity and appropriation of nature.

Brazil: Iemanjá

In the Afro-Brazilian religion of Candomblé, the Sea Goddess Iemanjá (Yemanjá), brought by the slaves from West Africa to South America, is the revered mother of all the gods (Orixás, personifications of the forces of nature). According to the legends, Iemanjá (the waters) married Aganju (dry land). From this marriage Orungan (the air and the heights) was born, but, in the absence of his father, Orungan had sex with his mother, lemanjá. From this, lemanjá died and from her womb all the other Orixás were born. Therefore she is considered the mother of all of them.

During the era of slavery, lemanjá was a source of resistance and part of black cultural identity. Under the cloak of Catholicism, she was venerated as the Virgin Mary. But she also took on some aspects of the Indian Yara. As mother of the fishes, she guarantees fertility, and at the same time, there is a notion that she becomes the devouring mother and lover of fishermen killed at sea. Thus fishermen’s wives beg Iemanjá to look after their husbands, whereas their husbands are more likely to ask for a beautiful woman or a new boat. The place where petitions are made can be a temple, the beach or the sea. As gifts, Iemanjá, like Mami Wata in Africa, receives cosmetics, combs, clothing, embroidered cushions, rice powder, flowers, jewels, perfumes, honey – donations toward her beauty and erotic seductive power.

In Candomblé, more and more people of all colors and social classes come to the priestess for help and advice on general questions, relationships, family problems and health matters. People pay homage to Iemanjá in great public feasts, especially in the cities of Rio de Janeiro (8 December), Salvador de Bahia (2 February) and Porto Alegre. Celebrating the beginning of a new year the faithful take their offerings to the goddess, asking that their wishes be fulfilled.

Alaska: Sedna

According to the peoples of northern Canada and Greenland, known as Inuit, the Sea Spirit and mythical Goddess of the Sea, Sedna, on the bottom of the ocean, is the mother of all animals. According to one of the many versions of her legend, Sedna was a young girl who did not want to marry. Finally her father forced her to marry a dog, but afterwards he felt sorry for her and drowned the dog. After her husband died, Sedna was unable to support...
her children and herself. She had to send her children away and returned to live with her parents. One day, a bird, disguised as a man, sought Sedna in marriage. She accepted and went to live with him. But soon Sedna discovered that her new husband was not a man but only a fulmar. When Sedna’s father visited her, he convinced Sedna to leave with him in his boat. Unfortunately the fulmar caught them, and with his wings created an enormous storm, which threatened to overturn the boat. Terrified, Sedna’s father tried to throw the girl overboard to her husband, but she grasped the boat’s side. In fear, the father cut off Sedna’s fingers until she fell into the sea. It is said that Sedna resides at the bottom of the sea with the seals and other sea animals that were created from her fingers.

In contrast to the other sea goddesses, Sedna is not depicted as beautiful. Her hair and body gets dirty and ugly when humans break taboos or behave in bad ways. Then she holds the animals back and sends storms or diseases. Therefore a shaman will undertake an underwater journey to comb her hair and wash her after he has defeated her in a fight. This causes her to let the animals go. More recent research revealed that this shaman can also be a woman. In this case, the interpretation of symbolic sexual subjugation of women (by male shamans) (Zumwalt 1984) becomes obsolete, and the fertility as well as the moralistic aspect of Sedna comes more to the fore. In her image, the behavior of people and the cycles of nature, the weather and the fertility of the animals, are closely connected.

Indonesian: Ratu Kidul
Ratu Kidul is the Queen or Goddess of Java’s Southern Ocean. She is the ruler of all spirits, and she appears in the old texts and in the oral traditions of both the Javanese courts and ordinary people. In contrast to the above-mentioned figures, she is not first and foremost a mother goddess in connection with fertility but her central characteristic is the legitimization of political power. From the early seventeenth century onward, she has always been regarded as the consort of the Sultan (from the eighteenth century onward, of the Sultans of both Surakarta and Yogyakarta), supporting him and defending his realm. Implicitly the marriage meant that the ruler was approved and sanctioned by the primordial powers of the Sea. The significance of this relationship has been waning along with the declining positions of these courts in present-day Java. On the other hand, at present, ordinary people can and do ask her for help with all kinds of troubles. Spiritual and material goals become inseparable. Ratu Kidul is an ambiguous figure too: she can be the source of luck, welfare and healing as well as of illness, death and destruction. There are manifold adaptations to both modern life and Islam in imaginations of her, and the quality of her persona depends on the context in which it is presented.

Nevertheless Javanese popular belief in Ratu Kidul is still very vivid.

Seattle (Sealth), Chief (ca. 1790–1866)

Chief Sealth (or Seattle as he is commonly called today) was an influential chief of the Salish-speaking indigenous peoples whose lands included the Puget Sound region of what is now Washington State. Born sometime around 1790 from a Duwamish mother and a Suquamish father, and dying in 1866, this namesake of present-day Seattle was chief during the coming of the “Boston Men” (American-European settlers from the east coast of the United States), and maintained mostly cordial relations with them throughout his life. By nearly all early accounts, Sealth was an able chief and spokesman for the Salish, whose existence centered on the rich tidelands and estuaries that surrounded Puget Sound.

However, his fame today – especially in popular culture – is due mainly to the modern environmental movement, specifically to their appropriation and revision of a speech Sealth allegedly gave along the Seattle waterfront, probably in 1854. The earliest account of the speech, recorded by Henry Smith in the Seattle Sunday Star in 1887, comes from Smith’s recollections and diary fragments – the latter never found. In Smith’s account, Sealth contrasts the white culture with his own: the former apparently favored
by God, the latter rejected, with the white religion given by an "angry God" and hence incomprehensible to his and other tribes.

Most pointedly, the speech records Sealth as contrasting the Christianity of the whites (with its stark separation of Heaven from Earth) with his tradition's reverence for the land, hallowed by the very real presence of his people's ancestors. Regarding these sacred ties between the ancestors and the tribe's land, the chief warns: "the dead are not altogether powerless."

The modern legend of Chief Seattle and his "Speech," however, is not primarily due to Smith's account – with its authentic Salish ties between Earth and religion – but due to significant embellishments added by whites more than a century later, most notably from the pens of poets and screenwriters. In the past thirty years or so, in fact, many revisionist versions of Sealth's speech have appeared: quoted at Earth Day celebrations, highlighted at a World's Fair, used by political parties and "Green" political candidates, appearing in a Smithsonian exhibit, and penned even into children's books. Thanks to the massive information-exchange capabilities of the Internet, Sealth's speech – in seemingly infinite variations – is everywhere, from websites touting survivalist themes, to the home web pages of indigenous peoples.

In most of these accounts, Sealth is portrayed as fundamentally questioning not only an upcoming treaty with the U.S. government, but the very notion of private property itself: "How can we buy or sell the sky?" He also bemoans witnessing the "slaughter of the buffalo," despite the fact that bison are not indigenous to the Pacific Northwest, and the great slaughter of buffalo would not occur until a decade or more after Sealth's death. Thus, most scholars acknowledge that much of the text of "Chief Seattle's Speech" was in all probability not uttered by Sealth along the Puget Sound waterfront in 1854. Smith himself was known as something of a poet, and in the Victorian era it was common for writers to add rhetorical flourishes as they saw fit; but unless authentic documents are forthcoming, we are likely never to learn what exactly Chief Sealth uttered that so impressed Henry Smith.

Despite the difficulties in determining where Sealth's words stop and modern embellishments begin, Chief Sealth and his "speech" remain powerful and influential for two significant reasons. First, the authentic core of his speech points toward a land ethic and religious tradition which refuse to objectify nature, and which count ecological respect as a matter of course.

Second, the appropriation and adaptation of Sealth's powerful words, and the linkage of this text to the modern environmental movement, are reminders of the ever-present human impulse toward religious syncretism, the combination or synthesis of different elements from two or more seemingly disparate traditions. Many Native Americans are angry at how some groups of the majority culture have employed Sealth's speech, lifting it out of the specific Duwamish and Salish cultures from which it came. They view this appropriation as yet another example of theft. Others, however, look at the resultant text, not primarily in terms of historical accuracy, but of whether it expresses the truth of the results of persistent environmental degradation.

Sedona

One of the most celebrated of New Age "power spots," this small town in scenic north-central Arizona has been a hub of New Age and metaphysical activities since at least the late 1970s, when California-based psychic and self-help guru Dick Sutphen began touting it as a power center and psychic Page Bryant identified seven specific "energy vortices" in the area. Stories about extraordinary phenomena and about the area's healing energies circulated rapidly through the 1980s, and by the early 1990s the number of healing centers, New Age bookstores, crystal shops, and psychic channelers had multiplied far out of proportion to the town's population of ten thousand or so. Groups based in the area have included ECKankar, the Rainbow Ray Focus Group, the Aquarian Concepts Community, the Center for Advanced Energy Healing, and the Aquarian Educational Foundation.

Cradled in its other-worldly red rock surroundings, the town has become a spiritual melting pot of New Age millenarianism, neo-shamanic Earth spirituality, and post-traditional metaphysical and Theosophical occultism. Some of Sedona's channelers regularly contribute to the journal Sedona: Journal of Emergence, which has become the flagship of the American channeling community, with its millenarian beliefs in extraterrestrial contact, interdimensional portals, light-bodies and stargates. For some of Sedona's psychics and ecospiritualists, the colorful rock formations, steep-walled canyons, and piñon pine-juniper forests that surround the town are an energetically active and psychically catalytic wilderness rich with mysterious energy "portals" and spiritual presences. At the same time, the rate of real estate and tourist development has turned Sedona into one of the prime tourist sites of the U.S.
Southwest, attracting close to five million visitors annually, and into one of the most expensive places to live in the country, with several environmental conflicts resulting from pressures of development, sewage, land use, and related issues. Sedona’s New Age popularity may ultimately not save it from the “Aspenization” or “Californication” that has become the trap of many a picturesque town in the American “new west.”

Seed, John (1945–)

John Seed is an Australian environmental activist who, along with Joanna Macy, has done more than any other figure to spread globally deep ecology spirituality and ritual. Motivated in part by long-standing Buddhist practice, in his native Australia he founded the Rainforest Information Centre in 1979 (and by 1984 the World Rainforest Report). In subsequent years, while he has continued political work to protect forests and forest peoples, he has increasingly prioritized his spiritual work. He believes that the environmental crisis is so grave that only a miracle can save the Earth and that a prerequisite for this is the complete transformation of human consciousness along deep ecological lines. Given this conviction, he has put a high priority on creating and teaching ritual forms that evoke in participants a perception of the sacredness of the Earth and feelings of kinship and moral responsibility toward the entire community of life.

Born in 1945 in Budapest Hungary, Seed arrived in Australia at the age of five and recollects that the bushland and coastline around Sydney laid the foundations for his later love of nature. From 1973 to 1979 he steeped himself in Buddhist meditation and helped build a meditation center and community in the bush of northern New South Wales. After withdrawing to the forest, however, the deforestation sweeping the world found him, and he participated in direct-action campaigns in the Nightcap Range NSW (1979–1981), Franklin River Tasmania (1983–1984) and Cape Tribulation Queensland (1985–1986). Each of these campaigns led to the protection of rainforests and the creation of national parks that eventually received World Heritage listing.

In 1980 Seed met bioregionalist Gary Snyder who was reading poetry in Australia. Snyder mentioned to him the recently formed Earth First! movement in the United States, which was also involved in civil disobedience to save forests. Seed hooked up with these activists and during the summers of 1984 and 1985 started doing “road show” performances with Earth First! co-founders Dave Forman and Mike Roselle in the U.S. These performances used songs, slide shows, and lectures, to spread deep ecology spirituality and build direct-action ecological resistance in the U.S. (Seed is an accomplished song writer who has produced several albums of environmental and children’s songs.) Seed and Roselle would help Randy Hayes invent the Rainforest Action Network in 1984, which quickly established itself as one of the world’s most important environmental non-governmental organizations.

In 1987 Seed co-produced a television documentary for Australian national television about the struggle for the rainforests, which was subsequently shown in many countries around the world. Shortly thereafter he pioneered a number of important projects to protect rainforests in South America, Asia and the Pacific. One of the earliest and most innovative was in Papua New Guinea, providing portable “Wokabout sawmills” to indigenous peoples as a means to conduct sustainable tree harvesting. This was seen as a way to resist deforestation by showing forest peoples an alternative to industrial forestry, which destroys cultural and natural diversity. By the turn of the century he was investing a great deal of time in Ecuador, helping to establish and demarcate forest reserves there, both to protect their ecological integrity and the forest peoples who depend on them. Religious and spiritual organizations, including The Australian Council of Churches and the Foundation for Deep Ecology, have supported his work.

Seed is the source of an aphorism now commonly expressed in radical environmental circles, “I am the forest, recently emerged into consciousness, defending myself,” a perception that first came to him while engaged in direct-action resistance to logging, when he felt himself “no longer acting on behalf of myself or my human ideas, but on behalf of the Earth . . . I was literally part of the rainforest defending herself” (Seed, et al. 1998: 6). But Seed is probably best known for helping create and widely disseminating the Council of All Beings. He has also developed “Re-Earthing” and other workshops that can be considered Earth-revering rituals. The Re-earthing workshops draw on breathwork practices grounded in Yoga and other religious traditions originating in India. Other rituals, including some that are often used as preliminary exercises in the Council of All Beings, consecrate cosmological and evolutionary narratives; such ritualizing has affinities with the Epic of Evolution and draws on the work of Thomas Berry.

Seed has conducted such rituals and trained others to do so widely, not only in his native Australia and the U.S., but also throughout Western Europe, Poland, Russia,
Seeds in South Asia

In South Asia’s predominantly agricultural society, seeds as the source of food and life are generative not only of economic and nutritional value, but also of multiple poetic and religious meanings. Seed imagery is pervasive in Hinduism’s earliest sacred texts, and retains its importance into the current era. Actual seeds are present as auspicious offerings in numerous rituals of varied purpose; moreover, ritual actions surround farmers’ practices of saving and planting seeds. In the late twentieth and early twenty-first century, conflicts have swirled around the production and marketing of seeds. These include issues of biodiversity versus monoculture; of local control versus multinational corporate production; and most recently of the economic benefits and hazards of genetically engineered seeds. Seeds thus retain potent symbolic value in multiple and changing contexts through millennia of South Asian history.

The common word for seed in Hindi and Sanskrit is bij (or bija). From its earliest uses in ancient India this term encompassed a semantic domain similar to that of seed in English: its meanings range from the actual germ of plant life to human or animal semen, and expand to include any primary cause. Particular to Sanskrit usage, however, is the association of seed with the power of sound. Bij mantra denotes the mystical letter or syllable essential to an oral spell used to evoke a particular deity.

Hinduism’s oldest scriptures, the Vedas, pose homologies among seed, milk and other potent substances including butter, and the nectar of immortality – homologies that persevere throughout later Sanskrit literature as well as in vernacular sources. In popular devotional oral traditions, a seed planted and sprouting is a common metaphor for religious knowledge that may come from a guru or the lord, and take root in the human heart.

Because of its close association with semen, seed as male is sometimes identified as part of a cultural complex that disadvantages women. Women may be likened to fields – giving nourishment and growth to seed, but having no great part to play in the final product – whether determining its form or possessing its fruits. However, some South Asian esoteric traditions, such as those of the Bengali Bauls, describe women’s menstrual blood as “female seed” whose potency is equal to or greater than that of males. Both male and female seed may be ritually conserved to increase spiritual power and knowledge, or depleted through ordinary sexual intercourse to produce children.

A Sanskrit agricultural treatise called Krishi-Parashara prescribes a procedure for prayerfully sowing seeds in which, “The farmer with a pure and concentrated mind and after meditating upon Indra [the god of rain],” sows three handfuls of moist seeds on an auspicious day – thus ensuring prosperity in the future year (Bhattacharyya 1976: 293–4). Farmers throughout India have traditionally performed similar rituals to initiate the planting season, before it is time to sow actual crops. In the wake of technological change in recent decades, these practices have waned.

Besides rituals explicitly incorporated into the agricultural work cycle, many other Hindu rites involve seeds. For example, in Rajasthan, the worship of the goddess Sitala Mother (who presides not only over rash and fever disease but over fertility of humans and farms), precedes the monsoon planting season by at least two months. All the women who participate in Sitala’s worship on her festival day will go behind her shrine and plough miniature fields in the dirt with their fingers. In these fields they plant seeds for each of the coming season’s crops, seeds that have been offered to, and blessed by, the goddess.

Folktales also associate seeds with divine female beings. In Bengali folklore, Lakshmi, the goddess of prosperity, comes disguised as an old woman and gives rice seeds to a poor widow, thus blessing her household with

abundance. Throughout India, Lakshmi is associated with grain and grain seeds in iconography and folklore.

Vandan Shiva, one visible and vocal spokeswoman in India's environmentalist movement, explicitly compares the seed today to the spinning wheel during India's Independence movement, declaring that seeds today have become the "site and symbol of freedom." According to Shiva, seeds offer a unique conjunction for issues of cultural and biological diversity (Shiva 1999: 67). In 1999 the "seed satyagraha" movement (echoing Gandhi and nationalism) successfully opposed Monsanto's proposed introduction of seeds with genetically engineered sterility (known as "terminator" or "suicide") to the Indian market. Meera Dewan's Eternal Seed, a documentary film released in 1996, unites both ancient religious significance and modern activist politics to present the ongoing potency of seeds in South Asian rituals and lives.

Senoi (Malayan Peninsula)

Senoi refers to a cluster of Aboriginal or hill-tribe peoples of the Malayan Peninsula (including the Semai, Temiar and Jah Hut). They have long been classified as Negrito (being dark-skinned and with relatively crinkly hair) and they share a linguistic affinity within the Austro-Asiatic family of languages. They received worldwide attention in the 1950s when cross-cultural psychologist Kilton Stewart projected the Senoi (more particularly the Ple-Temiar people) as the most socially stable or "hygienic" society on earth, because their lives were governed by day-to-day attention to dreams. In the following decade anthropologist Robert Dentan reported on the Semai as a remarkable "Non-Violent People of Malaya." The question at issue here is whether the absence of violent crime in Senoi cultures, and the ideal of avoiding anger and hostile actions as the mark of group identity, translates into non-violent approaches to nature.

Stewart's point that the Senoi recognized threats in the external world both socially and environmentally. They formed semi-nomadic groups constantly struggling to establish garden land against the inroads of bamboo jungle, fearful fauna (such as tigers), and meteorological phenomena violating the normal order of things (such as thunder squalls). As for the socio-spiritual world, there was always the danger of quarrels, of causing offenses (by breaking taboos, for example), or disturbing what may be called "nature spirits." Outer events were coped with through victories achieved in the inner world of dreams: children were taught that humans reproduce the fears and tensions of "the socio-physical environment" inside themselves, and that settling problems in their dream states (conquering "fearful emotions," overcoming "hostile images") allows "powers of the other world" to be harnessed for achieving a cooperative and trouble-free life when awake.

Stewart's idealizations of the Senoi, however, proved premature, and some have even questioned her claims about regular dream "classes" in Senoi family life as a hoax. Whatever the extent of exaggeration, reassessments must be made. Although the Senoi were not in any technological position to harm their environment and never adopted any patterns of fixed routines of labor to modify its influence over them to any great extent, they were highly anxious within it about spirit-related diseases and death, and, despite assumptions about "familiar and regularly recurring phenomena" – even certain claims at rainmaking – they showed themselves more genuinely frightened about unpredictable weather changes than possessing confidence and organizing ability to handle nature's forces. One might concede that they were in a better position to cope through fostering dream-sharing sessions, but in no way more extraordinary than most other small-scale traditional cultures that invest in the instructive power of onecife. It has turned out that their dreaming has not made them less susceptible to the enticements of modern technology and consumer products in more recent years, and, during the communist insurgency of the 1950s, "the dream people" were not...
averse to taking up modern arms in their own defense against outsiders (or against each other, when the fighting generated intertribal hostilities).

Serpents and Dragons

From time immemorial humankind has been fascinated but also frightened by snakes. Their quick locomotion in spite of lack of legs, their poisonous bite, and their way of catching their prey by alleged hypnotization set them apart from men and animals. In all continents they are treated with fear and awe. In Western countries they are regarded as the enemies of humankind and, according to the order of the Lord (Gen. 3:15), man shall bruise the serpent’s head while serpents shall bruise man’s heel. In Genesis the snake is the tempter and representative of evil; in Matthew 10:16, however, it is an epitome of wisdom: “So be wise as serpents!” This ambivalence has governed the human relation to snakes: hatred and destruction on the one hand, admiration and deification on the other.

Qualities and habits of snakes probably gave rise to some of the snake beliefs and cults. The sloughing of skin by snakes was taken as an ability to rejuvenate and a sign of eternal life. The Gilgamesh epic in the Babylonian version of about 1200 B.C.E. explains the origin of this skill: the hero went to the underworld to obtain the plant of immortality. On the way back to Uruk the snake stole and ate it. Gilgamesh could not revive his friend, but the snake turned young again and again. In folk belief and folktales we meet snakes which possess medicines to restore life and health. First of all, they know the antidotes to snake bites. The Lord advised Moses to make a bronze serpent and set it on a pole, and whoever was bitten by a snake could look at it to be restored (Num. 21:9). Similar places of snake shrines were frequent in antiquity. In Greece they were devoted to Aesculapius, the god of medicine. He was portrayed as a bearded man with a staff; around which a snake coiled. This staff of Aesculapius has remained the emblem of the medical profession until today. In Southern Africa, the healer received his potencies of healing from a (mythical) snake during his initiation, and he led this to a patient to “lick” him. Until recently certain snakes were believed to have a stone in their forehead. This so-called snake-stone was regarded as a safe remedy against a snake bite. You only had to apply it to the puncture and the stone would draw out all the poison. As these cannot in fact be found in snake heads, clever businessmen have sold manmade imitations.

Another characteristic of snakes is their sudden disappearance into the ground. Therefore it is believed that they have connections to the underworld and the world of the dead from which they gain extraordinary knowledge. They were consulted as oracles. Delphi, the most important oracle of early Greece, was inhabited by the dragon Python. The priestess Pythia sat at a crevice from which rose an overpowering steam and told what she learned during a state of altered consciousness. In many countries, particularly among the Bantu-speaking peoples of Africa, a snake which comes to the house is a reincarnated ancestor who inspects his family. He may help or he may punish. Because of similar ideas, some people in Central and Northern Europe fed house snakes as protectors of the welfare of the family. The clash of these ancient concepts and modern ideas is illustrated by a widely known story. A little child used to share his food with a snake that crawled out of the basement of the house. When the parents happened to watch it they thought that the child would be bitten and killed the snake. Within a short period of time the child lost its strength and died.

In West and Central Africa kings lived in a mythical relationship to snakes, mainly pythons. At their residence they had temples in which pythons were kept. These serpents were served by a special priestess who was at the same time the serpents’ wife and the king’s wife. The peace in the region, the prosperity, the health of cattle, the regularity of seasons and the abundance of game in the country depended upon the pythons’ well-being. After the king’s death he was believed to turn into a python. The poisonous cobra at the crown of the kings of Lower Egypt was venerated in prehistoric times as the attribute of the goddess Uto in her temple in the Nile Delta. Later it became the Uraeus snake, a symbol of sovereignty, but originally it
was a guard of the king which defended him and destroyed his enemies merely with its poisonous breath. Similarly the Nāga snake king protected Buddha and spread his seven heads over him because in deep meditation he had not noticed the approaching thunderstorm. Generally it was believed that snakes guarded treasures, therefore their representations served to guard vessels and buildings. They possess gold. The snake of the folktales, particularly the snake king, has a golden crown. He may give it as a present to the kind maid, but whoever tries to steal it is vehemently persecuted. This tradition is blended with belief in the snake stone. Frequently the snake stone is thought to be a very precious stone, like a diamond. Typically, the thief is killed by the furious snake, but sometimes he succeeds in escaping; as with the Counts of Lynar in Northern Germany, who explain their heraldic animal by this event. A Nigerian story tells how the shining stone of the snake became the moon.

Snakes are closely related to water, for they can live in water as well as on the ground, and creeks and rivers resemble their shape. Snakes found in water are regarded as its personification, and even little ones are frequently not killed, in case the water should disappear. Water also should not be polluted or the snake will leave and the fountain dry up. In the urban cemented water basins in Nepal symbolical snakes of stone take their place. On the other hand, the snake of the river or pond might cause floods. People who drown are said to be pulled into the water by the snake. It either punishes their wrongdoings and breaking of taboos, or it catches them by trickery. First of all, women have to be careful when approaching water. The snake of the river is in close connection to rain and rain-clouds. It might go up to the sky or come down with heavy rains. In various parts of the world, especially Australia and Africa, the rainbow was regarded as its representation and thunder and storm were said to be caused by the snake. As the water supply depended on the goodwill of the serpent, drought-stricken countries made sacrifices; in extreme droughts they sacrificed young girls who were driven into the water until they either drowned or were killed by crocodiles. This was euphemistically called their “marriage” to the snake.

The memory of such sacrifices lived on in Southeast Africa until the twentieth century in reports of girls’ initiation ceremonies as well as in Mexican legends about the wells of Chichén Itza being hardened by the skeletons of youths found in the big cenote.

The legend of St. George is a Western example of the concept. St. George fought against a dragon and saved a princess who had been delivered to it so that the country might get water.

Snakes were representations of venom, treachery and evil, but also of eternity and rejuvenation, of healing and wisdom, of ancestors and the underworld, of riches and royalty, of protection and, according to their phallic shape and their connection to water, of fertility of individuals and of countries. In most cases they combined several aspects. Therefore it is difficult for present generations to comprehend the full meaning of ancient snake cults. In addition, we have to take into consideration a continuous development over the millennia.

Snake cults flourished among American Indians, Northern Africa and Southern Asia. They were connected with living snakes like those of the Hopi pueblos. Poisonous snakes are used in twentieth-century fundamentalist churches of the southern U.S. by “snake handlers” to prove their faith.

The female figures of ancient Crete who hold snakes in their hands (1500 B.C.E.) are generally regarded as snake priestesses or goddesses. In Burmese cults, girls danced with living cobras and “kissed” them at the climax of the rite. West African snake cults were exported to the Americas by slaves and kept on in Vodou traditions. In India, many snake cults are still alive, some turned into tourist attractions: the snake-charmer allegedly lets his snake dance to the tunes of his pipe, though the deaf snake only obeys his movements. Such snake-charmers were already known in biblical times. Psalm 58:4–5 warns that the wicked have venom “like the deaf adder that stops its ear, so that it does not hear the voice of charmers or of the cunning enchanter.” Snake-charmers in Europe who freed the country of snakes either turned into the sinister exorcists of legends similar to the Pied Piper of Hamlin or venerated saints of the Roman Catholic church (St. Dominicus at Cocullo, Italy; St. Aper at Krautersgersheim, France).

Next to natural snakes, and often blended in the traditions, are mythical snakes of gigantic size, such as the snake of the river (Loch Ness monster) and the rainbow snake. The most famous American example is the Mexican Quetzalcoatl, the Feathered Snake, which, besides many further aspects, is related to weather and storm. In cosmic imagery, a giant snake surrounds the Earth. According to the Eddic tradition of Iceland, Thor will battle this Midgard Serpent at the end of the world. The Indian God Vishnu rested on the Naga ananta snake and while dreaming created the world. Mythical serpents frequently have additional attributes: they may have seven heads or the head of another animal or of a human being. Such mixed beings probably were amalgamations of related concepts; for instance the giant snakes of the Namibian Brandberg paintings with the head of another local rain animal, the giraffe (2000–4000 years old). On the Celtic silver kettle found in Gundestrup, Denmark, the god Cernunnos is represented holding a big snake with a ram-head in his left hand. Closely related to the serpent is the dragon, an intensification of the gloomy aspects of snakes. It combines characteristics of crocodiles and further animals but first of all is imagined as a snake. St. Michael fought against “the great dragon, that ancient serpent” (Rev.
12:9). Viking ships had dragon heads at their bows to scare their enemies; the name of St. Olaf’s ship was, however, “urm Lange,” “long snake.” On the other hand, medieval depictions of the temptation of Eve might show the snake in the shape of a dragon, thereby stressing that it is not a natural snake that is purported but the symbolic associations, the imagery of Satan and evil.

From a contemporary point of view, man should not bruise the heads of all snakes. Some, like the python, are legally protected and the trade with their skin is prohibited.

**F Sexuality and Ecospirituality**

The Earth is not only a living world but a sexual one as well, making love to itself through its diverse constituent parts from the autoerotica of single-cell beings to libidinous bonobos to monogamous birds. There is an implied sexuality in the way mountain flowers attract the piercing beaks of hummingbirds, and the opening of hardened rock by probing river waters. It is perhaps this intertwining that weaves together so-called opposites into a single, contiguous whole: male and female, desert and rain. The cooing of mated rock doves and the cries of a mountain lion in heat, give voice to an imperative that is the very fuel of evolution.

The essential connection between humankind and nature was held to be self-evident, and holy, throughout most of our history and prehistory. It was a bond essential to our survival, and was therefore ritually celebrated, as evidenced from the carving of voluptuous “Venus” figurines by early *Homo sapiens* to the revels of Dionysus’ Greece and the phallic maypoles of ancient Britain. The eroticized Diana and Artemis find their counterpart in Pan, the lusting, hoofed god of nature and his American Southwest counterpart Kokopelli, the sexually non-ambiguous “hump-backed flute player” found carved in rocks at ceremonial sites.

As I write this I am part of a society that tends to glamorize and commercialize sex, while different elements simultaneously suppress and pervert it. Contemporary civilized populations, regardless of the country, seem to be increasingly divorced from both the intimacies of nature and their own natural sexuality. Contributing factors may include the ascension of religions unnaturally denouncing sexual desires during the Middle Ages, the demographic shift from agrarian and frontier communities to urban centers that continued accelerating throughout the nineteenth century, and now the trend toward virtual reality (erotic video, internet “fantasy” rooms, etc.).

Some contemporary Pagans, practitioners of Tantra and students of the Goddess movement, believe that sexual ecstasy (from the Greek ekstasis: to be taken beyond the narrowly defined self) can lead them beyond the fears and preconceptions of the rational mind, and open them to the experience of the sacred. They see sacred sexuality as a means for healing the rift between humans and nature, between the hungering body and the fearful mind. More obviously, they believe, sexual experiences have the ability to reset one back in present time, in the immediacy of life and the primacy of the sensual and emotional self. In this way, reclaiming a connection to one’s sexual being, and to this sexually enlivened Earth, may be seen as an element of both an environmental mission and spiritual assignment.

During the counterculture movement of the 1960s, sexuality was again celebrated, and at times, re-consecrated, even viewed as a sacrament. This was continued to a degree in the 1980s and 1990s by some adherents of deep ecology and ecospirituality. Like the global alternative movement the Rainbow Tribe, the radical environmental group Earth First! was known for its erotic exchanges, especially during the annual get-together known as the “Round River Rendezvous.” In this context sexual sensibility and activity aided the suspension of conventional psychological, moral, and societal restraint, and often served the participants’ personal rewilding and sensory immersion in the body-nature.

Reacting to what they see as alienation from the Earth, harmful serial monogamy, prudery and sexual dysfunction, some social and environmental activists are experimenting with new forms of relationship. These include “polyamory,” a term coined by Morning Glory Zell in 1992 to describe being consciously, carnally involved with more
than one other person at a time. “Polyfidelity” has since been used in print to refer to sexually exclusive groupings of three or more. In the literature on contemporary alternative sexuality, authors including Oberon RavenHeart regularly refer to recreating a more natural, nature-oriented sexual dynamic as part of the process of ecological and interpersonal healing.

A correlation has been repeatedly made between the rape of women or boys and that taking-by-force we call environmental destruction, in texts as diverse as Derrick Jensen’s *The Culture of Make Believe* and Susan Griffin’s *Woman and Nature*. On the other hand, ecosopher (in other words, ecological philosopher) David Abram has written that a new environmental ethic will result from “a rejuvenation of our carnal, sensorial empathy with the living land that sustains us,” and that it is only through “our direct, sensory interactions with the land around us that we can appropriately notice and respond to the immediate needs of the living world.” Author Terry Tempest Williams has called for an “erotics of place,” a purposeful interpenetration of the sensate landscape, as have I. In our own ways we have asserted that a deep sensual and spiritual intimacy with a specific area of land is the cure for both psychological estrangement and the desecration of the natural world.

### Sexuality and Green Consciousness

The confluence of religion, sexuality, and nature is virtually universal though diverse. Ecofeminist theory contends that the shape this confluence assumes under the dominant patriarchal and monotheistic mode is at the heart of the environmental crisis. Here I will explore this argument and outline an alternative “Green consciousness,” spirituality and cosmology – in the sense of the ‘green’ put forth by the twelfth-century revolutionary mystic Hildegard of Bingen – the elemental, implicitly sexual, and divine source energy of life, causing action, fructification, flowering, growth, creativity, healing, and moistness. Green consciousness resists the linked degradations of sex, women, racialized and/or sexualized others, animals, and elemental nature and puts forth an *earthly*, that is, an explicitly sexual, deliberately dirty and immodest spirituality.

Environmental perspectives have emerged from all major religions. Yet, arguably, their hegemonic beliefs support environmental abuse, beginning with the notion of the all-powerful, immutable, human-identified and celibate male god, “The Omnipotent” in Roman Catholic terminology. This notion not only legitimates the domination of those who claim to be his representatives, but fragments underlying unities. In the social version of this theology, an omnipotent “master” is placed on top, with degraded “others” defined by their supposedly negative qualities, forming a succession of oppositional and hierarchical dualisms including: male/female, culture/nature, light/dark, rationality/desire, civilization/savagery, high/low, spirituality/sexuality, thought/feelings, work/sensuality, immutability/change.

The “master” denies and represses the second part of the dualism, projecting these attributes onto “others” – the wild, animals, tribal peoples, women, lesbians and gays, a working class, a racialized people, and denies his dependency on those he strives to subordinate (e.g., wives, slaves, nature) (Plumwood 1993: 41–8). “He” (this is a masculine subjectivity but the role can be played by women) demonizes and even seeks to destroy those “others” who evoke in him simultaneous feelings of recognition and alienation, desire and fear, worship and hatred. This pattern underlies racial and sexual slaveries, heterosexual normativity, imperialism, and environmental devastation.

Fear – of “nature” and its inherent commonality, diversity, and flux, experienced externally but also internally in the body, particularly through experiences of sex and death – is one cause of this projection. A master consciousness only feels comfortable in monocultures (sexual, religious, ethnic, biological). The ideal human environment becomes a sterile one, dominated by plastic, concrete, steel. The ideal human becomes one made in the image of the artifact or machine.

Though Old Testament-based religions (Christianity, Judaism, and Islam) sometimes celebrate nature as reflecting the divinity of God, nature is not generally understood as itself divine, or even intelligent and active. In Genesis, humanity is granted dominion over nature, man is granted dominion over women and animals. God is transcendent over, not immanent in the world. As nature is degraded, reason must rule over desire, and those aspects of human beings that seem the most natural, our sexual organs, become a locus of shame, seen as “dirty” (like the Earth), hairy, smelly, instinctual (like animals) and wild, not susceptible to will and reason (something that particularly
hieros gamos between deities, an interchange with parallels in such "sacred sexual intercourse," refers to a ritual sexual union directing into sexual interaction. This intercourse is understood as in a spirit being (female or male) who seduces a human beauty and bestows upon him blessings and the right to invitation. As they copulate, she transforms into a fertile course from a group of brothers. Only one accepts her Ireland, an ugly hag guarding a well requests sexual inter-course: "A society based on body hate destroys itself and causes harm to all of Grandmother’s grandchildren" (1990: 53). Loathing of the body and attendant sex-negativity also cuts us off from knowledges and revelations otherwise inaccessible. Mircea Eliade understands that sexuality’s "primary and perhaps supreme valency is the cosmological function . . . Except in the modern world, sexuality has everywhere and always been a hier-oophany, and the sexual act an integral action (therefore also a means of knowledge)" (1969: 14). For example, in the Tantric tradition bodily desire, pleasure, and sexuality lead to enlightenment.

One of the knowledges that sexuality can bring is a loss of ego and a sense of communion. In many religious traditions, nature – the vast forces and beings not made by humans and outside of our control – is the divine transforming other with whom we connect, paradigmatically sexually. The hieros gamos, Greek for "sacred marriage" or "sacred sexual intercourse," refers to a ritual sexual union between deities, an interchange with parallels in such cosmic meetings as sky and Earth, north and south. The hieros gamos also can happen between a divinity and a human. In Sovereignty Goddess stories from pre-Christian Ireland, an ugly hag guarding a well requests sexual intercourse from a group of brothers. Only one accepts her invitation. As they copulate, she transforms into a fertile beauty and bestows upon him blessings and the right to rule. In the sacred stories of Southwestern American Indians, wilderness is associated with sexuality and embodied in a spirit being (female or male) who seduces a human into sexual interaction. This intercourse is understood as directing the awesome power and energy of our human sexuality – the preserve of wilderness in human beings – into socially useful channels. The coming together of person and spirit may lead to the birth of magical children, the discovery of rich sources of food or water, or the gift of a specific ceremony (Smith 1987: 178).

Such stories recall the Garden of Eden tale and suggest the need for a positive reevaluation of Eve’s interchange with the Old Serpent.

Contemporary feminist thinkers reclaim orgasm as a conduit to knowledge of the sacred. Mary Pellauer writes that orgasm allows her to melt into existence [as] it melts into me. I am most fully embodied in this explosion of nerves and also broken open into the cosmos. I am rent open; I am cleaved/joined not only to my partner, but to everything, everything—as-my-beloved (or vice versa), who has also become me (1994: 156).

Beverly Clack sensibly realizes that this account is of “particular importance to a world facing an ecological disaster which has arisen precisely through human unwillingness to be identified with the natural world” (2000: 129).

Mary Daly’s “elemental philosophy” is based in an identification with the natural world and elemental spirits. In her view, a continuing patriarchal warfare against elemental spirits takes modern forms in technological depredations (e.g., nuclear weapons threaten the final burning of the Earth anticipated in the gospel of Peter). Daly recognizes elementals as “spirits, angels, and demons . . . manifesting the essential unity and intelligence of spirit/matter” (1984: 11).

Pagans and tribal peoples generally respect non-human “persons” (including animals, plants, waters, the sun, moon and stars and even objects) as well as daemons (energies animating elemental phenomena). These beings – commonly known as gnomes, fairies, trolls, nymphs, and so on – are neither phantasmal nor “supernatural” but an intrinsic part of nature who interrelate with and influence human life (sometimes for good, sometimes for bad) and to whom humans have obligations. In patriarchal religious traditions, daemons are seen as invariably wicked. In 1967 Lynn White called attention to the ecological benefit of animist systems: “By destroying pagan animism, Christianity made it possible to exploit nature in a mood of indifference to the feelings of natural objects” (1996: 189). However apt the criticism, White misses the intersection of sexuality into this meeting of religion and nature, for nature daemons along with sex/fecundity goddesses were associated particularly with the sin of lust. Worship of “filthy” daemons and “immodest” goddesses was deplored (as in Augustine) and “the celebration of fertility as a dimension of the sacred was identified in the Christian mind with obscenity and evil” (Power 1996: 53). Islam similarly linked goddesses of desire, fecundity, generation, and sexual reproduction with wicked demons. When Mohammed received a revelation naming three local goddesses as intercessors for humans with Allah, he soon attributed this revelation to Satan.

The pagan nature god with his horns, green and sometimes even grassy flesh, protruding tongue (as if in the midst of orgasm), and serpentine and goaty nature is recast as Satan. Misogyny, sex-loathing, demonization
of the *daemons*, and nature-hating converged in the fifteenth-century religious/pornographic imagination of female witchcraft based in an insatiable “carnal lust” which led them to sexual trysts with Satan. Contemporary Wiccans affirm green values and celebrate sexuality as participation in the life-giving force of the goddess.

An early banner of the environmental movement is a photograph of the Earth as seen from space. “Love Your Mother” is the accompanying text. Historically, the image of the Earth as a nurturing mother has worked to forestall abuse of the Earth (Merchant 1980). The word “nature” is from the Latin word *nasci*, to be born. The soil of the Earth is understood as the goddess’s flesh; its depths or “bowels” her vulva/womb. Female deities represent the Earth and the teeming life of nature. Yoni symbols (shells, fruits, caves), the Milky Way, mountains, ocean, and fruit-bearing trees also are seen as re-presenting the body of goddess. This divinity is understood sometimes as a mother but more frequently as a lover.

Masculine sacrality is understood through symbols of a fertilizing sky god, through fire and digging sticks, and through natural symbols (*lingam*), recalling the penis as generative. The basic processes of fructification in nature are understood as akin to human coitus, as the meeting of female soil with masculine heavens or the inverse (the Egyptian sky-goddess Nut and the male Earth Geb). Of course, a green sexual cosmology does not incorporate solely heterosexual and procreative meanings but recognizes homosexuality and gender diversity as utterly natural and necessary to cosmic processes. The biologist Bruce Bagemihl (1999) documents animal homosexuality and explores the ways that non-heterosexual and non-procreative human and animal sexualities have been respected by many indigenous peoples for embodying exuberance, essential to forces of fertility. Sacred homosexual meetings also can be found in nature: In ancient Babylon the most powerful water for purification purposes was found where the mouths of the Tigris and Euphrates met (Johns 1926: 467). In Babylonian, Eliade tells us, the same word means both “source of a river” and “vagina” (1969: 41); the potent meeting of these sacred rivers at their source can be understood as a veritable Lesbian *hieros gamos*.

Currently, the greediest and ontologically neediest societies demand ever-greater infusions of oil, coal, nuclear power and resources from the rest of the world. Monica Sjöö and Barbara Mor find religious significance in the energy crisis: “The patriarchal West cannot solve its energy problems because our minds and spirits were long ago cut off from the real source of energy, or creative power . . . the sexual-spiritual source of cosmic ecstasy” (1991: 412). Desire is the force that is most akin to divine powers. In Sumerian myth, the “sex goddess” Inanna gives forth the “desire that generates the energy of the Universe.” This energy is known in Hindu cosmology as *Shakti*, the feminine primordial energy, which is the substance of everything, pervading everything, vivifying everything. The manifestation of this power, this energy, is called nature (*Prakriti*). Humans participate in erotic energy through sexual desire as well as creativity, prophecy, intellect, political activism, growth, love, and transformation.

Religious traditions more ancient than the patriarchal often do not hold to a duality between man and woman or between person and nature. They often recognize a primal feminine principle, the inexhaustible source of fruitfulness or greenness, the cosmic matrix from which all are born and to which all return at death. This principle – that of activity, diversity, and creativity exists “in nature and women, as well as men” (Shiva 1988: 48). Patriarchal cultures still recognize this feminine principle (e.g., as Mother Nature or Mother Earth), but degrade it. Ecofeminism finds important parallels between the conceptualizations and treatments of women, racialized groups, and the underclass and conceptualizations and treatments of the non-human world. “Mother Nature,” for example, is cast as the all-forgiving dark mother or “mammy,” perpetually willing to provide unpaid service and clean-up after oppressive children; the sexual slave, forced and reproducing against her will; a nagging and even mad mother whose warnings and rages can be ignored. The Sovereignty/Earth Goddess becomes the pornographic object to be spread, surveyed, mapped and even sniffed. The Sex/Love Goddess becomes the whore to be had, the spicy/dark other to be eaten (Hooks 1992); the virgin to be raped, the slut to be used; the witch or *femme fatale* to be chastened; the exotic primitive to function as “unnamed presence of difference, body which awakens within a space of exotic fauna and flora,” upon whose flesh “the conqueror will write the body of the other and trace his own history” (deCerteau 1988: xxv).

Along with imperial conquest, scientific knowledge gravitates toward the language of sexual violation. Merchant traces the characteristic metaphors of the scientific revolution: mastering, interrogating, disrobing, and penetrating nature as a female form. The twentieth-century language of nuclear physicists similarly relied upon rapist images, seeing themselves as investigating the “most intimate properties of matter,” tearing away “the veils,” and so on. As that technology reached apocalyptic capacities, popular nuclear metaphors emerged centering on father–daughter incest and serial sex murder (Caputi 1993: 117–40).

Arguably, the colonization and exploitation of natural resources begins with the enslavement and exploitation of the erotic force. As H.A. Williams understands it, this mind/body split and subsequent enslavement of the genitals is at the root of environmental disaster:

Being in hell, the place of undead, they are always somehow planning and threatening their revenge,
they may in the end catapult us into nuclear catas-
trophe . . . The body deprived of Eros inevitably
becomes the champion of thanatos (1972: 33).

Williams, however astute, does not take into account the
ways that patriarchal cultures construct men as violence
objects, and women and those identified as feminine
(including some men) as targets for that apocalyptic sexu-
ality. Mary Daly describes this sexuality as “phallic lust,”
the
deadly dis-passion that prevails in patriarchy – the
life-hating lechery that rapes and kills the objects of
its obsession/aggression . . . dismembering spirit/
matter, attempting annihilation . . . Its goal is the
obliteration of natural knowing and willing, of the
deep purposefulness which philosophers have called
final causality (1984: 2).

Its undoing can be found in the release of “Pure Lust,” the
force of vigor and fertility in nature, the Green source of
natural knowing: “pure Passion: unadulterated, absolute,
simple sheer striving for abundance of be-ing. It is
unlimited, unlimiting desire/fire . . . intense longing/
craving for the cosmic concrescence that is creation” (Daly
1984: 3).

Many thinkers call for a renewal of an Earth-based
religion. Roger Gottlieb outlines a spirituality based in
deep ecology that emerges in resistance to environmental
destruction, one that is both passionate and spiritually
orientated, one that seeks mystical communion with the
Earth and its many beings, and recognizes not dominion
over but kinship with those beings. Of course, once we
recognize environmental devastation as a form of sexual-
ized violence, we must add to this project by calling for an
explicitly sexual/animalistic/and elemental cosmology; in
short, one that gets down, one that is earthy.

Green consciousness/cosmology celebrates erotic
expressions based in sexual sovereignty (consensual and
non-exploitative, based in the equality of lovers and a
context of social justice), reveals in our animal souls and
our sexual flesh, both female and male. Carol Christ (1997:
91) has claimed that “In the language of the Goddess, the
female body is an important metaphor for the creative
powers of the earth body.” But what of the male body?

Currently, a distorted and objectified notion of the male
body is the hidden metaphor for God (“The Omnipotent”).
Peeking beneath the robes of the familiar fatherly and
most high god (that is, the most removed from the Earth),
we find him to be modeled upon a fragmented and fan-
tastical organ – the phallus (a permanently erect/potent
penis) – to signify supreme dominance. Of course, the phal-
lus is not a true reflection of the male body. The real, fleshy
penis is sometimes hard but more often soft. When the
fantastical phallus becomes the metaphor for divine
power, power becomes synonymous with weapon-like
power over, separation and not connection. But when the
actual penis, with capacities for both hardness and soft-
neness and its knowledge of and respect for receptivity,
darkness, and quiescence, becomes a metaphor for sacred
power, James Nelson argues, we arrive at a model of
relational power, a “generative power, the power of an
open energy system” (1994: 206).

In Lacanian psychoanalytic theory, the phallus repre-
sents power, authority, the ability to hold rational sway
over desire, to control. It ordains individuation and separa-
tion from the mother, which we can understand not only
as the actual mother, but also as the matrix, the source, the
cosmic yoni, the mother/nature. Human separation from
the matrix has produced some technological marvels and
consumer goods, but also is responsible for ontological
loneliness, alienation, an obsessive orientation toward
sex, fear of death, and an appetite for destruction.

Rather than the phallic imaginary of omnipotence, green
consciousness proposes cunctipotence. Cunctipo-
tence is an archaic English word that means “all-powerful”
(Oxford English Dictionary) and one that some linguists
eytymologically link to the ancient, but now “obscene”
word cunt. The “cunt” is obscene to patriarchal religion
most particularly because it recalls the outlawed feminine
principle, the matrix and source of all life. The Sanskrit
word for cunt is yoni, with various related meanings,
including “vagina, uterus, source, origin, spring, home.”
Yoni is derived from yu (join, unite); yoni is “what joins or
unites.” A cunctipotent imaginary connects; it reattaches
the disembodied phallus to the biological body, where it
becomes the fulsome, relational penis. It recognizes the
kinship, not the opposition, of the cunt and penis. Cunctipotence connects the genitals to the mind, the body
to the land, and human to nonhuman being. The “all-
powerful” defining cunctipotence bespeaks not “power
over,” but participation in the interconnecting power of
the all, the commonplace, the whole.

The Yoruban concept of Aché refers to “the power to
make things happen, the breath that bestows life” (Monroe
1993: 127). Aché is power that “passes through us, is used
by us, and must be replenished by ritualistic means” (Teish
1985: 63). Green consciousness recognizes that we must
nurture the Earth, feed the green as it feeds us. We do this
through prayer, creativity, exuberance, and desire, and
through respecting the sacredness of our bodily processes
including orgasm, eating, excretion, respiration and
finally death. The patriarchal Christian tradition, spear-
headed by Augustine, deems both sexual desire and death
to be essentially “unnatural,” the consequences of original
sin. Yet, life and death are “twin beings, gifts of our
mother” (Allen 1990: 52). Through death we return to the
matrix and become once again dirt/earth, a fate or purpose
that green consciousness embraces.

The teleology of the religious condemnation of fertility/
desire/lust is a sterile world, marked by pornographic objectification, sensory deprivation, contamination, and extinction. Hildegard of Bingen knew that the “fertile Earth is symbolized by the sex organs, which display the power of generation as well as an indecent boldness” (Bingen 1987: 114). Green consciousness reclaims what patriarchal morality has branded as indecent and boldly affirms the sacredness of lustful, safe, just, and sovereign eroticism, humanity’s kinship with the elemental world, and the divinity of nature.

Shakti

In the religions of the Indian sub-continent, shakti is a cosmological principle of power, the life-force of the universe, specifically denoting cosmic creation and divine procreation, and more generally any form of power or energy. The development of this concept is quite complicated, as it is found in a variety of philosophical, grammatical, mythological, and ritual texts beginning with the earliest literature. Shakti develops as the link between a cause and an effect, such as in the order sustained by the fire sacrifice; it is also conceived of as a dynamic force
inherent in nature. Shakti comes to be seen as the female force that acts together with the male force to create and sustain the cosmos. Sometimes Shakti is associated with the principle of materiality or nature (prakriti) in opposition to the male principle of pure consciousness (purusha). When personified, Shakti is always embodied as a goddess: she is the consort of the male god who needs his shakti to act in the world, as in the interdependent pair Shiva–Shakti, wherein Shiva without Shakti is a shava or corpse. Shakti is also seen as the independent, supreme divinity, the complete Absolute, the ultimate source as well as the cause of creation, elaborated most explicitly in the literature of certain Hindu and Buddhist Tantric schools. The highly influential sixth-century Sanskrit text the Devi-Mahatmya is the earliest exposition of the theology of the goddess as the Great Goddess, or Devi. In this text the Goddess, or Shakti, gathers up the powers of all the gods to kill the demons and protect the world. She is portrayed as the eternal, ultimate reality, the power that creates, maintains, and destroys the universe. She is greater than the male gods and beyond all attributes, but she is also embodied as the Goddess who responds to people and events in concrete, specific ways. Shakti is the basic material from which all creation is manifested, and the universe itself; she is also the active force present in all things, including human beings. It is widely held that women, because they are female like the Goddess, contain more shakti than men. Shakti is a power that can be increased, such as through devotion to a chosen deity.

In various versions of a central myth, a grief-stricken Shiva wanders the Earth with the dead body of his beloved wife on his shoulder, until the gods relieve him of his burden by dispersing pieces of the Goddess’ body throughout India. In this system of shakti pithas, or places of power, certain geographical places enshrine parts of the body of Shakti, especially mountains, caves, rivers, and other bodies of water. People make pilgrimages to these sacred places, which are seen as tirthas, or “crossings” between the human and divine realms. In this way local goddess shrines are integrated into the body of the Great Goddess, Shakti, and the Earth, particularly the Indian subcontinent, is unified as a repository of sacred power.

Shamanism – and Art
Shamanism is a complex construct. It is a religious approach of personal orientation and personal authority, or self-autonomy. In shamanic worldviews, the Earth is a place, a source of power, reality, and supra-reality above and below this ground of being. The Earth is itself sacredized. Shamanism is therefore “Earth-centered.” In this context, Earth, nature, and world are often used interchangeably.

Strictly speaking, shamans do not make art. They make the tools of their trade and they record the maps and imagery of their visions in various permanent or impermanent ways. Thus, the shaman makes masks (or directs others in the making of masks), drums and whistles (to obtain and control trance state), and clothing, containers, and other examples of material culture. The objects are all made for non-ordinary reasons and each object is in itself a container of sacred powers. The shaman also inscribes imagery on rocks, on skin, on wood, metals, shells, and other materials in public or hidden places. The imagery and the objects are all documents, maps, and facilitators of non-ordinary realities for the shaman and the shaman’s community.

In Australia today, one may find ancient images of Wandjina, the ancestral beings, upon rock walls. The images look as fresh as if they were painted only last month, which is quite possible. It is the practice of the Aboriginal peoples of Australia to repaint ceremoniously and correctly the ancient images of their Wandjina. Not only are their Ancestral Beings sacred and powerful, they are actually alive inside the paintings. The paintings are not representations; they are powers transfigured. What are the Wandjina doing inside those paintings? Perhaps, say the people, the Wandjina are resting from their primordial Dreamtime work.

Use of Visual Patterns
No typology yet exists for so-called “shamanic” art, nor is there likely to be one. The use of radiances, skeletal motifs, or polka dots (to indicate gateways) are not sure indicators of shamanic art. They are simply motifs. Symbolic context is required. For example, the motifs found in the art of the Tukano, a people of the Amazon forest, are very like the neurological visual patterns, or phosphenes, they see after the ritual ingestion of a local hallucinogenic substance. The meaning of these motifs, and the meaning of the visions is, however, culturally controlled and specific to
the Tukano. The same phosphenes could be “seen” by non-Tukanos ingesting the same drink, but the motifs would be essentially meaningless. Exhaustion, stress, hunger, pain, illness are all well-known mundane sources of intense neurological visual patterns. “Seeing stars” is one thing, and it is another. Neither meaning excludes yet another meaning.

The heart of the shamanic experience is its originality and its personal authority. Its content is culture-bound only in that something is said or done about the experience. In order to understand the shamanic vision, then, one must use the cultural categories at hand. Each image is the mapped solution of a problem, a question asked. For example, the designs used on the huilpil – the embroidered blouses of the Mayan women – are owned by the woman who initially dreams the design. Huilpis made by copying the designs of another woman, even to preserve the design against tropic rot, are locally recognized as uninspired, unsuccessful work no matter how finely the garments have been stitched. The dream authenticates the art.

The Romanian historian Mircea Eliade ably described the shaman as a “specialist in the sacred . . . pre-eminently an ecstatic.” In a small-scale, traditional society the shaman is dancer, poet, artist, storyteller, healer – psychically and physically – and, perhaps most importantly, mediator. The shaman mediates – between this world and other worlds, between one person and another, between here and now, and then and what will be. The shaman’s talents are considerable and the responsibilities heavy.

As a “specialist in the sacred,” the shaman’s knowledge of sacred realities is not knowledge of a reality out there. The shaman’s sacred reality is better thought of as a hyper-reality, or a supra-reality, even as a sur-reality. The sacred reality the shaman knows is a reality located in this world. It is an ecstatic experience of place, of nature, of realms of being – of an upper world and lower world. These worlds are always accessible from this world, this plane of reality. In the traditional societies where shamanism is found, afterlife beliefs do not predominate as they do in societies with belief systems emphasizing creator gods and stories of personal salvation.

**Cosmological designs and function**

The shaman’s moral task is one of rebalancing and harmonizing imbalances. To do this, the shaman uses controlled trance states in order to create a unitary way of seeing the world. The shaman knows any part of the world seen clearly, seen clearly enough, reveals the whole. Thus, the drum is often an important tool that the shaman will use to obtain a controlled trance state in order to travel to another hidden reality.

Among the Saami of northern Scandinavia, the shaman’s use of a drum to induce a trance state for both himself (or sometimes, among the Saami, herself) is well documented. Typically, the drum is painted with a centered sun motif and depicts a tripartite arrangement of the universe. The Saami do not worship the sun. Their cosmological universe is one with three levels. The figures on the shaman’s drum are a cognitive map reminding the shaman’s ego-soul which way to travel; in addition, the drum is inscribed in such a way that it can be used as a seasonal calendar. Thus, for those observing the shaman’s trance state, the drum’s imagery interprets the time and place of the vision for the shaman’s public.

The Haida nation of the northwestern coast of Canada value “coppers” as cognitive maps of the ego-soul’s journey. The coppers are, indeed, made of copper, can be quite large, are collected, and are publicly displayed as wealth. They appear to be shields of a sort, axially oriented. The coppers are interpreted as forms symbolizing the human being facing the sun, thus, the copper creates an axis joining three levels of the universe.

The hunting masks of the Inuit of the Bering Sea are renowned for their inventive, expressive character. Each one is a form first visualized by the shaman before it is translated into a carved mask under the supervision of the shaman, who also supervises the mask’s ritual destruction after it has been danced. The masks are not carved in duplicate. They are, however, stylized according to local understanding. How else could the shaman’s unique vision be communicated to the carver and the community? Thus, the use of holes, polka dots, and hoops on the masks is readily understood by members of the community to represent openings. The openings allow the shaman and food to flow between levels of the universe. The shaman has petitions to make to Tungh’a’ak. The shaman wants to be fed on behalf of the community. Tungh’a’ak must release the seafood through an opening.

The visionary experience of the shaman always includes the place upon which the shaman stands, the Earth. Often the sun’s position matters, too. The Navaho world, for example, is bounded by four sacred mountains. In the sacred geography of the Navaho, the names of the mountains are known; it is not known which geological chunks of terrain carry the sacred names. It does not matter, either, because the world itself is known, and the world is home to the Navaho whose nation today is found in the American southwest.

Similarly, among the Saulteaux of north-central Saskatchewan, Canada, there was once a custom of erecting small wooden figures, called Manitokanac, on the prairie landscape. Not much is known about them, but it is obvious each of the particular placements serves to orient and center the otherwise endlessly flat landscape. One famous Saulteaux shaman explained, “they can make a home out of the world. This is their power.”

On the whole there is little literature on the material culture of shamanism and less on the shaman as artist. The sad state of scholarship in this area is perhaps explicable only if we realize that few anthropologists have been
Shamanism – Ecuador

In Ecuador, the most common terms that people use to refer to local shamans are the Spanish words, curandero, meaning healer, or brujo, meaning witch. However, there are many other words, which vary according to ethnic group and language, which can also be used to describe traditional religious practitioners. A significant number of native Ecuadorians in the Amazon and Andes speak some dialect of Quichua and, accordingly, use the Quichua word, yachaj, for medicine person or religious specialist meaning “he who knows” derived from yachana “to know or learn.” Since Quichua has historically functioned as the primary indigenous trade language throughout highland and lowland Ecuador, we will employ yachaj, rather than “shaman,” as the general term to refer to native tradition’s specialists. Throughout Ecuador it is the yachaj’s responsibility to forge a network of alliances with the souls of the ancestors and the living forces of nature of the Sierra, Costa and Oriente regions on behalf of his or her home community.

Ecuador is a country characterized by extremes. Approximately the size of the state of Colorado, Ecuador is located on the western-most bulge of the South American continent and is divided into three distinct climactic regions – Costa, Sierra, and Oriente – by the Western and Eastern Andean Cordilleras. The tropical effects of the Equatorial belt, combined with extremes in altitude from sea level to the frozen peaks of the active volcanoes (which rise to 20,700 feet on Mt. Chimborazo), and radical variations in rainfall, result in an extraordinary multiplicity of plant and animal life. Across this rugged and varied country, highland and lowland indigenous ethnic groups have created overlapping religious responses to the diverse geographic realities that confront them. In each community it is the yachaj’s role to form crosscultural and cross-creatural alliances in order to attract or repel energies that support or impede the circulatory flow of natural resources in and out of their home place.

In the Sierra, yachajs may form primary alliances with the spirits of the living mountains known as cerros or urcus, living and dead yachajs throughout the country, and Catholic saints. The mountain usually courts the potential yachaj, drawing the person to bathe in springs, which act as eyes, mouths, or doors to the inner mountain world. Once inside the cerro, the yachaj encounters parallel cities filled with Andean plants, animals, and minerals along with the human dead and the unborn. His role as yachaj works to bridge his community on the outside with this world inside the mountain. All creatures are born out of the mountain and return to the mountain upon death. The yachaj draws on his alliance to the cerro in order to direct the flow of life-giving and life-taking energies. The yachaj persuades the mountain to feed and care for its people properly by singing to it and feeding the mountain offerings of chichi (beer made from maize or manioc), cigarettes, rum, flowers, guinea pigs (cuy), and sometimes, llamas or sheep. If this relationship of exchange falls out of balance, the mountain may grow hungry, jealous or angry and may “eat” the people in landslides, earthquakes, or floods, through drowning or falling accidents, or may erode their energies through illness.

In order to draw the mountain energy toward his own community, the yachaj must secure the cerro’s attention away from rival yachajs and neighboring communities. Within this closed circulatory system of limited resources, envidia, or envy, becomes the primary cause of illness and misfortune as yachajs effectively attempt to wrest suerte, luck or energy, from one powerful person or place in order to redistribute it to another. The way that the yachaj accesses and then distributes these mountain energies trained in the analysis of material culture as visual documents and few art historians have been trained in cultural anthropology. The objects on display in museum exhibition cases are silent. The stories they once told to the shamans who fashioned them are unknown.

determines whether he becomes known as a healing or killing yachaj: a curandero or a brujo.

The competitive relationship between yachajs can become deadly. Because of this, in the Oriente, yachajs must learn how to fend off spiritual darts – known to the Quichua as biruti and to the Shuara as tsentsak – which are sent by rival yachajs. He must know how to guide counterattacks and remove biruti or tsentsak from the bodies of his clients. In order to specialize in spiritual weaponry, yachajs from the Napo Runa in northeastern Ecuador go to “school” inside the Colaurcu hills, which they say are made up of many rooms. Inside the hills the yachaj chooses his biruti, his own personalized spiritual weapon that might be a chonta dart, razors, needles or syringes.

For the Napo Runa and the Canelos Quichua, a yachaj’s training also includes fasting, sexual abstinence and drinking ayahuasca, a bitter drink prepared from a hallucinogenic vine of the banisteriopsis genus. The ayahuasca enables the yachaj to journey into the spirit world where he engages the powerful supai or spirits of the mountain, rivers and forest. These may include Amasanga, the spirit master of all souls who appears as a black jaguar or Sungui huarmi (also known as Yacu mama), and water spirit woman who guides the yachaj through her fish-, dolphin- and anaconda-filled world. Ranked according to the length of their training and the proven strength of their power, the sinchi yachaj works with many spirits and has the power to draw on their help at crucial moments. The most powerful yachaj, a bancu, literally the seat of spirits, has trained since childhood and has formed extensive alliances with mountain and river supai and with living and dead yachajs throughout the region.

Once a yachaj has established strong alliances with the spirits of his home place he may periodically leave home to fortify his power by training with neighboring yachajs. Alternatively, he may travel to regional healing centers that emerge from clusters of renowned yachajs working in tandem with powerful natural sites. In the Sierra the most famous healing centers in the north include the Otavalo Runa near Imbabura Mountain and the Quito Runa near Carapungo on the outskirts of Quito; in the west, the Tsachila on the coastal Andean slopes near the city of Sto. Domingo de los Colorados; in the east, the Salasacas near the Volcano Tungurahua, and in the far south, the Cañaris near the city of Cuenca. In the Oriente powerful healers abound in the Native Amazonian communities of the Napo Runa, the Canelos Quichua, the Achuar, Shuar, Cofán, and Siona-Secoya, among others.

Yachajs who want to extend their power to others can exchange stones as a sign of their mutual alliance. Throughout Ecuador the yachaj’s herramientas, or curing tools, include shaped stones, such as pre-Colombian ax-heads, or unusually formed stones or crystals that hold spiritual power. In the Sierra the stones form direct, metonymic links to specific mountains and, like a wedding ring, serve as iconic proof of the marriage between yachaj and mountain. As the basis of the yachaj’s mesa, the stones serve as homing devices for the spirits traveling to assist the yachaj in curing sessions. In the wet decaying jungle of the Oriente, stones represent permanence and function as attractive homes for spirits and ancient souls. The Napo Runa refer to these stones as rumi that may project light or contain suggestive figures of horses or saints. The Canelos Quichua say that these stones are like living soldiers and that the yachaj “with his phalanx of animated shaman’s class stones is like the center of a military formation.”

An experienced yachaj possesses an extensive collection of these stones acquired in the course of his travels as gifts from other yachajs, the cerros, and various spirits (including Catholic saints). The initial acquisition of a stone can serve as a calling to the vocation. The number of stones in a yachaj’s bundle offers concrete proof of the network of connections at his or her disposal. So too, the sudden loss of a stone signals the loss of the alliance that the stone represents and a drastic diminishing of the yachaj’s power.

Shamanism – Neo

“Shamanic discourse” in North America made a decisive new step in the 1960s. Within the context of the so-called “New Age” movement, the figure of the shaman as a religious specialist became an indication of a new understanding in humanity’s relation to nature and the ability to access spiritual levels of reality. Shamanism was no longer regarded as a spiritual path limited only to “classical shamanic cultures.” Instead, the Western rationalistic and mechanistic attitude toward reality and nature was increasingly replaced by a holistic and animated one. This led to a “sacramental view of reality” in which shamanism, like Buddhism, became something considered available to everyone—even to those in urban contexts in which people are largely estranged from nature.

Both practitioners and scholars alike refer to this emergent phenomenon as “neo-shamanism,” to be differentiated from the revitalization of traditional shamanism that has taken place in countries like Mongolia, Tuva, or Korea. Despite its complexity, several characteristics are discernible:

1) With the seminal work of Carlos Castaneda, the popularization of academic knowledge became an important feature of neo-shamanism. Most major shamanic protagonists hold a degree in anthropology, which they try to combine with their spiritual practice outside academia (e.g., Michael Harner, Joan Halifax, Nevill Drury, Steven Foster, Jonathan Horwitz, Felicitas Goodman, Gala Naumova). Furthermore, this interaction between academic research and religious practice began to affect “classical, indigenous shamanism” inasmuch as native people could read ethnographic accounts and react to anthropological systematization.

2) Neo-shamanism is closely related to Western concepts of nature and religion. Although Euro-American conceptualizations of what we now call “shamanism” are indebted to Western discourses from the seventeenth century, new developments allowed for a new description of shamanism. Among these are the Deep Ecology movement, transpersonal psychology and so-called “New Age science.” While neo-shamans tend to refer to deep ecology as “spiritual ecology,” transpersonal psychology places emphasis on the “higher self” and altered states of consciousness. “New Age science” builds on earlier philosophy of nature themes such as holism, non-determinism.

3) From both religious and sociological points of view, neo-shamanism often shares its concepts and practices with various neo-pagan groups. Much of the spiritual background of neo-shamanic ritual practice, including Wiccan chants and rituals of natural magic, have developed from Native American traditions, on the one hand, and from Celtic and other North European religions, on the other.

4) Neo-shamanism, in its more New Age emphasis, tends to deny the reality of intrinsically nefarious spirits. Jonathan Horwitz expresses a perspective similar to New Age when he proclaims that the spirits of cancer and AIDS might be encountered as revoltingly ugly, but are not evil and can be appealed to as respectable entities in the process of extrication. By contrast, in their environments of origin, shamanic practices tend to approach a spirit of illness as something to be killed and destroyed or at least boomeranged back for the destruction of its sender.

5) Neo-shamanism, in general, is oriented toward personal and spiritual empowerment among practitioners. It is less likely to be community-oriented and community-grounded than traditional shamanism.

6) Comparing neo-shamanism with indigenous shamanisms, we can note that in the former there is little attempt to master the spirits. In fact, the aim is to give power directly back to the people and thereby eliminate the specialist altogether. In Horwitz’s explanation, the “new shamanism” is a spiritual discipline that enables one directly to contact and use the spiritual dimension of the universe—one which is based on the animistic understanding that everything that exists in the physical plane contains spirit power. But Horwitz prefers to see this process as a shamanic revival rather than as “neo-shamanism.” Still, he recognizes that there is much confusion of the peak experience as the goal rather than simply the doorway. Consequently, an important difference between traditional shamanism and neo-shamanism is the acceptance of negative realities by the former and its engagement in forms of spiritual warfare, and the denial of evil and the need to fight it rather than love and transform it by the latter.

Nevertheless, vis-à-vis contemporary Western paganism, the shared overlaps that do occur make it difficult to draw a clear line between neo-shamanism and other phenomena of contemporary nature-based spirituality. In this light, it might be more appropriate to speak of a neo-shamanic field of discourse, in which definitions, identities, and concepts are negotiated among different groups. People like Michael Harner describe shamanism as “technique” rather than religion; Wiccans, witches, or crystal therapists may refer to themselves as shamans because of this term’s more positive connotation; Native Americans might attack neo-shamans as attempting to colonize indigenous culture. “Authenticity” becomes a major issue not only with respect to “indigenous wisdom” (can a “Caucasian” urbanite partake in a native spiritual tradition?), but also concerning academic authority (can specialists discriminate “real shamanism” from its “hybrid” forms, or can neo-shaman academics “know both sides,” etc.?). While different neo-shamanic groups may exhibit a detectable “family resemblance,” it is possible—and perhaps advisable—to discern between both wider and
narrower senses of neo-shamanism. For the latter, Carlos Castaneda’s books served for many as a primary reference tool. Another major figure is Michael Harner who coined the term core shamanism and initiated the “Foundation for Shamanic Studies.”

Shamanism – Neo (Eastern Europe)

Neo-shamanism has emerged since the early 1970s following the publication of Mircea Eliade’s book on shamanism, a milestone that received either full anthropological and historical support or, on the contrary, outright rejection. Coupled with Carlos Castaneda’s vision quest, the “archaic technique of ecstasy” has become the solid ground based on which many seekers and supporters all over the world have begun to rejoice and celebrate their newly found spirituality. Thus, it has much to do with New Spirituality and New Age religious phenomena connected to Eliade and Castaneda and a host of anthropological studies on the subject (P. Furst, A. Wallace, I.M. Lewis, and A. Hultkrantz), but especially the work and activity of Michael Harner. The latter has been more influential than others by introducing the possibility of the collage of neo-shamanic practices to Eastern Europe – often emphasizing South American tribal worldviews and their close relationship to Eurasia – and initiating several individuals and small groups into the secrets of shamanic power.

Shamanism, however, is different from neo-shamanism, for the latter term is reserved here for only those religious and psychic practices that are part of the New Age phenomena and may or may not trace their roots to classical shamanism. However, as many neo-shamanic practitioners argue, Eurasian tribal shamanism, its culturally diverse definitions notwithstanding, is a precursor of their art, a practice of syncretism revitalized by poets, painters, musicians and even scientists. This may be one of the reasons why the following terms are often evoked for neo-shamanism: urban shamanism or shamanizing, shamanic trancing, crosscultural shamanism, shamanic spirituality, world shamanism, and even techno or cyber-shamanism. It also freely combines regional or cultural aspects such as Celtic, Norse, Berserk, Siberian, Amazonian, and European. (Berserk is a regional form of present-day shamanism that utilizes archaic Nordic techniques, especially trancing, that is connected to nature and wildlife preservation.) Interestingly, the scholarly world has also responded to this challenge: European witches (Carlo Ginzburg’s benandanti for instance), ancient Greek magicians, werewolves and positive vampires are also known to possess shamanic attributes.

Neo-shamanism in Eastern Europe

In Eastern Europe, neo-shamanistic phenomena may be connected to the collapse of the Iron Curtain, and with it, the dismantling of Soviet domination throughout the former East bloc. This was followed by an instant reemergence of religiosity along with new forms of spirituality. It should be mentioned, however, that in certain instances rural practices, with some shamanistic elements, managed to survive Soviet atheistic ideology. Soviet atheistic Marxist-Leninist ideology, aside from a few state religions, did not tolerate overt religiosity or communitarian church affairs. In the vacuum created by the dismantled state institutions, religions emerged with vehemence. From North Asia and Siberia, to East Central Europe, from the Baltic republics, to the Balkan Peninsula, traditional folkways have been utilized to establish cultural continuity and national preeminence. Coupled with the neo-shamanic world are national myths of Pan-Slavic unity, the pagan–Slavdom, the remembrance of prehistoric empires and ruling dynasties (Dacians for Romanians, Scythians for Hungarians), and homogeneous peasant traditions that bespeak of cultural longevity and the existence of an ancestral terrain that are all coupled with elements from nationalist imagery.

Although neo-shamanism varies from country to country – and Siberia and parts of Russia are especially unique in that there is a conscious attempt to rely on previous (i.e., traditional tribal, shamanic practices – there is a fairly homogeneous ideology and symbolism. In Hungary, Romania and Bulgaria, for instance, historical and folkloric sources serve as sources of inspiration. More often than not, neo-shamanic séances are not so much re-created as imagined and created by the practitioners. Often, late nineteenth- and early twentieth-century folkloric elements (songs, dance steps, pieces of clothing, etc.)
are utilized as substitutes to create “authentic” versions of native shamanistic performances. Yet, the core doctrine holds that nature is sacred and that shamanism must create harmony with nature, people and the universe. Moreover, neo-shamanic believers do not negate other religions and gods, but seek to find common elements for unity. In their practices they often use the water from natural springs, ignite sacred fires, and drink libations made of herbs and medicinal plants; they also locate sacred groves and previously utilized religious sites for their shamanizing rituals.

In Lithuania, for instance, the remaking of Lithuanian identity is oriented toward neo-paganism – Romuva as it is called – with its re-creation of pre-Christian rituals and faith. In Hungary, a former electronic engineer has registered his own shamanic church and school (Táltos iskola), an educational camp where one can gain first-hand knowledge of holistic healing, fortune telling, and supernatural phenomena. Such formal schooling is also coupled with the explanation of an alternative national history not readily taught in formal schools. Compulsory state education, for instance, does not allow for alternative views of ancient history, an area the neo-shamanic practitioners take for granted. For instance, the Scythian and Hunnish archeological remains and historical sources are viewed as direct evidences of Hungarian connections. Novices are required to pass through several stages, or levels, to advance in their spiritual training. Folklore, songs, and knowledge of Hungarian peasant art, runic writing and history are essential constituents of the shamanic training.

In post-Soviet Siberia, new shamans emerge among the elites, mostly those with university and college education, bringing back long-lost spirituality, life-ways and practices. Among the Buryat-Mongols a specific shamanistic institution (the Golomt Center for Shamanist Studies) serves this quest; in Tuva and Udmurtia, practicing shamans are commonly featured in local media. In Sakha-Yakutia, artists openly declare their shamanic family heritage or their quest to attain shamanic powers. Well-known Siberian artists with shamanic powers are often featured attractions in European festivals and artistic shows. The Sakha (Yakut) dancing and singing ensemble, known as Kadylyk, or alternately the Udmurt (Votiak) artist Olga Alexandrova, performing in various Hungarian, Baltic or Western cities, provide not only a lively context to connect neo-shamanism to its traditional precursor, but also reinvigorate interest in shamanistic consciousness and knowledge. Because of the linguistic connection to the Finno-Ugric peoples and languages, Siberian artists and performing groups – Hanty, Mansy, Mari and Udmurt – are frequently featured events in Hungary.

No other explanation serves better the fundamental connection that exists between neo-shamanism and the natural environment than the Buryat Mongolian credo quoted on the Buryat homepage:

From the traditional Buryat point of view, the world is not a dead place, but vibrantly alive with spirits and souls in every thing and in every place, also that all animals and plants have sentient souls much like ourselves. For that reason respect for the spirits of nature and living things shaped a religion and life ethics that minimizes negative impact on the earth. For that reason also, for the many thousands of years that man has lived in Siberia there was minimal negative impact on the environment until the current time. This is a way of life which is radically different from that of European peoples, whose philosophy considers most of the world to be lacking sentience and useful only for exploitation (http://www.buryatmongol.com).

In this sense traditional and late twentieth- and early twenty-first-century shamans are wholly similar. They see, as well as reveal, the fundamental unity of nature and culture. Neo-shamanism differs fundamentally, however, from classical (tribal and prehistoric) shamanism in that it is anchored not to a single culture, people or time and space. It can be found today in milieus where it never existed before; it can possess complexes that never have been previously utilized. Another major difference is the social environment from which novices are selected and into which they are initiated. A collage of symbolic paraphernalia is also symptomatic of neo-shamanists. Urban shamans often use incantations with no real songs or words. As the claim goes, the feeling, rhythm and spirituality are what matters. Rock musicians, however, often invoke images and texts imitating tribal lore or those that are considered by them to be shamanistic. Similarly, in dancing – which could reflect some borrowed steps and figures from tribal dances – connection to indigenous dance forms is neither a requirement nor an important aspect. The neo-shamanic world borrows elements from European folkways, mysticism, Buddhism, Judeo-Christian beliefs, Yoga, Wicca, Daoism, the occult and Paganism. However, as neo-shamanic intellectuals themselves argue, these religious ways could also trace their roots to the more archaic shamanism(s). Neo-shamanists are also concerned with present-day affairs. Specifically, to them all current evils – breakdown of societal values, unbridled capitalism, industrialization and modernization, pollution and the degradation of the natural environment, consumerism, Westernization, poverty, crime, and loss of morals as well as peaceful existence – must be fought with new spiritual strength and vigor. This is based on “traditional values,” love of nature and animals, and a holistic way of living. In the neo-shamanic worldview, practitioners find both explanations for the past and solutions for the present ills of the world.

As practiced in Eastern Europe, neo-shamanistic belief is mildly anarchist. It is predicated upon the belief that the
post-communist and postmodern era is fraught with increasing injustices and inequalities. Their worldview is both liberal and communitarian in that it places the individual – the shaman with powers – at the center to assist the community and work for its welfare. Believers also claim that the present world is out of balance; there is no central harmony any more and political regimes and states are natural enemies of groups with alternative views and marginal positions in society. Neo-shamanic ideology is also based on utopian consciousness for it argues that the present-day realities are harsher than ever before and that paradise on Earth can only be experienced, or achieved, in a magical world of our own creation. Consequently, the neo-shamanic constitutes a cultic milieu that readily accepts magic, science and half-belief at its base.

Regardless of the claims to authenticity, the specific features of neo-shamanism include four important components: 1) spirit mediation or communication to reach the desired aims; 2) healing and initiation rites to conduct various services; 3) the healthy symbiosis between nature and the biosphere; and 4) a culture of rejuvenation that concerns both the individual, the collective, and the Earth. Neo-shamanistic belief is separated from its more archaic form by the very fact that neo-shamanic rituals are now everyday occurrences that do not necessarily require sacred sites, secrecy of affairs or blood-letting through animal sacrifice. In fact, most neo-shamanic rites avoid “hurting the natural world.” Neo-shamans in Eastern Europe may perform in artistic clubs, university surroundings, corporate offices or urban tenement houses. Neo-shamanic religion is also highly diffuse so it may be extended into rural revitalized neo-pagan events, healing rites and syncretic nationalist revival movements. In its more extreme forms neo-shamanic ways may be utilized for nationalistic or political propaganda. Aside from Western and Northern Europe, in the Ukraine, Russia, and Hungary such extremist versions have been recorded recently.

Shamanism – Southern Peruvian Andes

In the southern Peruvian Andes, at an average height of 4500 meters above the sea, live small groups of shepherds who raise large herds of alpacas (Llama pacos), llamas (Llama glama) and sheep. Their traditional religious life is centered on the charismatic figure of the altomisayoq, a practitioner who plays the role of a mediator between humans and supernatural beings, and is capable of influencing the course of events. Generally speaking, he may be called, according to anthropological categorization, a shaman.

There appears to be several popular religions rather than a unique and distinctive one in these traditional societies. Depending on the informant, or on the circumstances, one can be referred to one cosmology or another in order to explain natural or social phenomena. Beyond Christian and syncretic explanations (such as for instance the myth of the “three ages of humanity”), lies a coherent group of beliefs, centered on the spirits of mountains, called apu. According to the people, these apu are the genuine “creators” of the Andean world. Many myths explain the way fauna and flora species were “created” and scattered in the valleys by the apu. Mountains are natural borderlines in the Andean space, and species distribution may be different according to valley geographical features. Apu control, in the day-to-day life, natural and social phenomena – they are godfathers of recently born children, and a myth says they taught women the art of weaving. Thus, apu are the ultimate
explanation of natural and social features, and, at the same time, they are part of this world. The “creators” fully belong to their “creation.” Within this immanence, shamanic dialogue is possible.

Apu, though, are not the only spiritual entities in this cosmological view: they are rather situated at the top of a hierarchy of spirits, which do not hold any supernatural power by themselves. Generally speaking, traditional Andean shepherds consider that everything in the world owns an animo. The word animo itself is derived from the Latin “animus,” which came to their ears through Spanish colonization, but it has a much broader meaning. Animo apparently refers to both the vital strength and what we could call the essence of all beings, whether they are humans, animals, vegetables, or even minerals. Each being has a different, particular, animo, which is also related to the apu, whose animo stand at the top of the hierarchy. The term animo reflects, therefore, the interdependency of all beings, as well as their specificity.

In order for these societies to communicate with the apu and other supernatural beings, an intermediate is needed. This is the role of the altomisayoq, who appears to be mainly a priest, a medicine man and a fortune teller. He directs collective propitiatory ceremonies, offered up to the apu or the pachamama, the goddess-earth, cures sicknesses and tells the future. Although he can communicate with all beings, natural or supernatural, through their animo, his interlocutor is, above all, the apu. In order to become a shaman, one needs to be selected by one apu, and survive a strike by lightning. Novices then go through a long process of initiation, conducted by elder shamans. At one point of this initiation period, they often find, in wild places, the tools of their trade, like small copper bells, which they use to call the apu, or strange anthropomorphic or zoomorphic stones, full of supernatural powers. These are gifts of the apu itself. Apprentices learn the healing powers of plants, and conjuring tricks. This initiation process culminates with the ritual bath in a qochina (a mountain lake), where the shaman-to-be calls his tutelary apu, who answers in a guttural voice that seems to come straight out of the mountain’s heart. Therefore, the shaman’s legitimacy eventually relies on the will of the apu.

Direct communication with supernatural beings is scarcely deemed necessary. Collective propitiatory ceremonies do not need such communication powers and can be directed by a pampamisayoq (a practitioner of an inferior rank). The same stands for fortune telling, which many perform by observing the features and distribution of coca leaves, poured over a small patch of wachala, a traditional piece of clothing. Even when it comes to healing, direct communication with supernatural beings such as apu or soq’a machu may not be considered compulsory: in that case, the healing treatment will consist of offerings to the spirits responsible for the disease as a means of appeasing them. The traditional healer, be he altomisayoq or pampamisayoq, brings together these offerings on a square cloth, ties it up from its angles, and burns this bundle, called a despacho, on some neighboring hill.

Nevertheless, in some cases, direct communication with spirits may be considered necessary. This communication is not the result of extrasensory perception faculties held by the shaman. On the contrary, the communication process always occurs in the world of day-to-day perception. Since spirits are part of this world as well, a conjunction between them and human beings is possible here and now. The altomisayoq are the only practitioners capable of such direct communication, because of the tools inherited from the apu. Shamanic communication flows from the apu, to the shaman. Shamans call for the apu, using, as a call sign, their small copper bells: thereafter, it is the apu which comes to answer the shaman’s questions, in the form of a dove or condor, getting into the room through an open window, and then speaking freely, in a low-pitched or high-pitched voice. Those in attendance hear the sayings of the apu as clearly as the shaman does.

One can say traditional shepherd societies in the southern Peruvian Andes still share one coherent cosmology, centered on the apu, which for this reason we may call an apu-logy. It refers us to very ancient beliefs and practices. It determines the relationship that these societies still hold with natural phenomena, for the apu are ultimately responsible for the course of events in the natural world. For instance, the good health of domestic animals depends on the will of the apu, and needs retribution in the form of a despacho.

Finally, one can say that part of this apu-logy is a sort of theory of knowledge (an epistemology in the broad sense), within which the shaman’s performance is legitimate. We can shed light upon this theory of knowledge through a patient analysis of beliefs and religious practices of these societies.

Shamanism – Traditional

Shamanism is the art and science by which one purposely shifts perspective. There are different means by which perspective-shift is achieved (meditative/contemplative techniques, use of entheogens, abstinences, fasting, sleep-deprivation, other austerities, and/or utilizing an illness or
fever), but the initial impulse is auto-induced rather than imposed upon the individual by others. Shamanism refers primarily to the techniques employed for achieving changes in consciousness – especially ecstatic consciousness – and secondarily to the body of religious thought and practice in which the personage of the shaman plays a central role.

The terms “shaman” and “shamanism” have increasingly developed into three fundamental applications. The first and most narrow understanding applies the designations to specific institutions among the Tungus peoples of Siberia. This would be the original import of the terms. Secondly, the label of the “shaman” has become extended to practices among other peoples that reveal similar animistic or quasi-animistic understandings of nature – whether these peoples are indigenous (American Indian, African), national entities (Japan, Korea, Mongolia) or contemporary (New Age, modern Western Paganism). In this wider and more generally used sense, shamanism designates any religious system centered on “a religious specialist who has great powers derived from ecstatic experiences in which he or she has contact with sacred forces” (Smart 1989: 38). Consequently, the term “shaman” as a generic is applied alike to the North American “medicine person,” the Latin American curandero, the Japanese miko and the practitioner of Michael Harner’s “core” shamanism. Lastly, the expression of “shaman” has come to refer to various New Age and neo-pagan practices in general in which the individual seeks to shift his/her conscious perspective for purposes of health, deeper understanding, ecstasy and social concern – including increase in environmental sensitivities. Consequently, shamanism in the context of its relationship to religion and nature may be loosely classified as traditional, New Age, urban and psychonautic. As distinguishable sub-sets of traditional shamanisms, we have individual geographic expressions ranging from Ecuador, Alaska and Lapland to Nepal and Mongolia.

Possibly Immanuel Velikovsky was the first to use the term “shaman” in the more contemporary sense. The German Schamane had been adopted from the Russian shaman which, in turn, was derived from the Tungus-speaking peoples’ šaman. However, the designation appears among the now-extinct Tocharian peoples of Central Asia as šamāne as well as the Indian Prakrit vernacular as samaṇa. These are to be traced to the Sanskrit term for “ascetic,” namely, śrāmapās. In other words, the term is not originally indigenous to the peoples to whom it retains its primary association.

Pivotal roles in the development of the West’s understanding of shamanism have been contributed by the Russian Sergei M. Shirogokorov and the Romanian Mircea Eliade. Shirogokorov’s seminal work is the Psychomental Complex of the Tungus (1935). Earlier, in 1923, he published his General Theory of Shamanism among the Tungus. Another important early work is Knud Rasmussen’s The Intellectual Culture of Iglulik Eskimos (1929). Eliade’s classic originally appeared as Le Chamanisme et les techniques archaiques de l’extase in 1951. This was subsequently translated by W.R. Trask in 1972 as Shamanism: Archaic Techniques of Ecstasy.

In Siberia, shamanic spiritualism is found among approximately thirty different ethnic groups – with the Yakuts being the largest numerically. The traditional economy is based on reindeer herding. The spirit of the immediate location is believed to enter the stove. Here, with the lighting of the stove, the fire-spirit is offered the first mouthful of food. Recognized spirit places in Siberia include graves, umbilical markers (burial sites of umbilical cords), rivers and mountains. Most shamans were liquidated by the Soviet authorities, and today the resurgence of shamanist elements among the local people is facilitated more by ethnologists, film-makers and the like than by the few surviving traditional shamans in an area roughly the size of the Republic of India and holding a population of approximately one million.

There are countless variations between individual and particular tribal shamanic practices. Nevertheless, there are also certain universal features or patterns that allow it to be considered an identifiable and independent phenomenon in itself. Its basic idea appears to be the institutionalization of a socially recognized intermediary who liaisons between the world of pragmatic realities and the more subtle realm of spirit. From a religious perspective, shamanism is a loose federation of cosmologies. But it is always strictly contextual – relating to the religion and society in which it occurs. Yet despite its many forms and the variety of roles it serves, a certain range of cosmology, religion and society is recognizably conducive to belief in the shaman as someone who specializes in trance techniques during which (one of) his/her souls leave(s) the shaman’s body to enter the otherworld. Whether among indigenous peoples of Australia, Siberia, South America, Central and Southeast Asia, sub-Saharan Africa or elsewhere, there appears to be remarkable similarities between particular elements of shamanic mythologies and techniques.

In traditional shamanisms, the shaman’s entire endeavor is shaped by his or her role vis-à-vis the community. Deliberately sending forth one’s free-soul, exploring the spiritual realms of the otherworld, being beyond the boundaries of the norm and of normal behavior is, in a Western cultural context, to be mad, insane or schizoid. And in the indigenous understanding of soul-duality, if a person’s dream-soul does not “return” to the waking body, the person’s deranged state is a form of mental illness – one that invariably is followed by physical disability as well. For the ordinary person, soul-loss is considered an accident or misfortune. For the shaman, by contrast, the very propensity for entering an altered state of conscious-
ness is his or her trade. But it is still not the *raison d'etre*. The purpose instead is the community welfare.

In navigating the dangers of the world of spirit, within the condition of an altered state of consciousness, even for the experienced shaman there is the risk of soul-loss. It is the very social function of the shaman that provides his or her way back to this world. Community service becomes the anchor that prevents the shaman from becoming permanently lost in the otherworld. So while the mediumship of the shaman is what allows a community an access to the spiritual without which there is the danger of collective madness, it is the community itself and the shaman’s duty to serve it which provides the shamanic safeguard against the specialist becoming imprisoned perpetually in the world of purely analogical and magical effervescence. It is this aspect that is essential in all indigenous forms of shamanism.

Following Shirogokorov’s seminal work in the 1930s, Russian scholars tend to associate shamanism with spiritual healing as its most salient feature. The West, by contrast, under the influence of Eliade, considers the key aspect of shamanism to be its “techniques of ecstasy.” This last is more conducive to the wider application of the term to various magico-religious elements found among many non-literate peoples as well as in some world religions. Nevertheless, the healing aspect of the shamanic vision quest is virtually an inevitable feature all the same.

The shaman, therefore is someone who participates directly in spiritual dimensions in the roles of healer, diviner, clairvoyant and/or psycopomp. For example, the role of the Chinese traditional shaman, designated *wu*, whether male or female, is typically that of seer, healer and keeper of justice in Chinese villages in the context of the popular traditions and/or Daoism. In an induced trance state, the shaman is believed to leave the body and visit other worlds. The purpose of shamanic journeying, therefore, is to convey sacrifices to the gods, to escort the dead to their next destination, to acquire knowledge to heal illnesses, and to return with prophecies. The shaman’s duty is both to instruct people on a proper course of action and to cause good things to happen. The shaman’s overall function is to ensure, maintain and/or restore his/her people’s proper relationship with the natural environment and with the spiritual realm as it manifests itself through that environment. The shaman may also bestow fetishes or sacred objects in the form of feathers, ritual rattles, special drums or ceremonial pipes. These, in turn, are venerated and employed to ensure harmony. Their pragmatic import is to assist their users to be mindful and vigilant concerning the preservation of holistic equilibrium.

The principal means of communicating with the spirit world by the shaman is through the utterance of special words and by rhythmically beating a sacred drum. With the help of healing spirits, the shaman is believed to overcome malignant powers. Shamanism only exists when communication between this world and the spirit world is not deemed to be possible on the part of ordinary persons. Since the shaman’s role is one of intermediary, he or she is often found in cultures in which a high god is believed to have receded and become inactive in the affairs of this world. This relates to the “loss of communication” mythology between human beings and spirits at the close of the primal era. In the void which ensues with the high god’s absence, numerous ancestor spirits and spirits of nature come to intervene, and it is these beings with whom the shaman becomes an adept in communicating and controlling.

In the traditional context, the would-be shaman responds to a call. In some cases, the profession is hereditary. Normally, however, there is a reluctance to assume the Shamanic mantle. While he or she is often highly respected and revered, there is also great fear attached to the shaman who usually lives a relatively isolated life. At first, the candidate undergoes a powerful but spontaneous spiritual experience – one that generally coincides with sexual maturity. This is usually an illness, often mental, which is nevertheless an empowering experience. In many tribal societies, it is not uncommon for many people to suffer an episode of schizophrenic-type illness lasting perhaps six to nine months. Unlike in the West where the mentally ill are sequestered and institutionalized, in the indigenious environment, these people are comforted and integrated as much as is possible into the social framework. Most people eventually recover and assume normal lives thereafter. But those who are deemed to have extra insight and dream-capacity may instead be selected for shamanic training. When viewing contemporary Western forms of shamanism, it is important to keep in mind that traditional shamanic training is often a prolonged and difficult ordeal which, if the candidate succeeds, is followed by an initiation that incorporates themes of death, dismemberment and reconstitution.

Consequently, in the traditional context, there is almost invariably a discernible shamanic trajectory beginning with the call, crisis or initial illness and followed by the training and culminating in initiation and transformation. The shaman then acquires a “spirit-animal” or familiar, demonstrates the shamanic performance and experience of trance, and eventually returns or “re-incorporates” and dispenses knowledge. He or she may finally bequeath implements and information to apprentices. For Western neo-shamans, however, this trajectory is much less rigorous if it exists at all in the first place. While traditional shamans are often initially reluctant to assume the shamanic mantle, for neo-shamans the choice to pursue this path is almost invariably a personal and private preference. Moreover, this decision is rarely made in connection to a supportive social community but reflects the atomization of Western society. Much of the training is self-training, though this can be augmented for some New Age
shamans who participate in various eco-tourist opportunities and pursue occasional ecstatic experience through South American curahólers in the Amazonian rainforest or the mountains and jungles of Peru, Bolivia and Ecuador. For those who do not pursue this psychonautic route, there are the augmentative options of New Age workshops. However, among the more controversial issues to arise for Western would-be shamans is the question of appropriation of cultural property. Many Lakota Indians, for instance, condemn the theft of Amerindian artifacts (e.g., dream-catchers) and practices (e.g., participation in sweat-lodge ceremonies) as threats to the identity and precarious survival of Native Americans.

Russian scholars have argued that the traditional shaman is an individual who suffers from certain nervous disorders or forms of hysteria – especially in the severe Arctic environment. Others see shamanism as the development of skill in epilepsy. The training and initiation that the shaman receives constitutes in effect a cure. For the traditional shaman, the distinctive feature becomes an ability to control ecstasy and enter trance at will. The shaman is deemed by his or her community to have achieved a great mastery of the natural and psychological dimensions. Typical signs of the traditional shaman’s extraordinary superhuman powers include the ability to walk on red-hot coals or even swallow them, to remain unscathed by boiling water, to undergo physical mutilation – including the cutting open of their stomachs which then heal instantly – to release themselves from bonds, and to exercise kinesis.

Nevertheless, despite the various demonstrative signs of the shaman’s abilities, it is the ability of certain individuals to communicate with spirits that is the core aspect of traditional shamanism. This feature is closely linked to hunter-gatherer societies and therefore probably of great antiquity. This near universality of shamanism allowed Ninian Smart to surmise that it is ancestral to both the hunting and gathering and to exercise kinesis.

Nevertheless, despite the various demonstrative signs of the shaman’s abilities, it is the ability of certain individuals to communicate with spirits that is the core aspect of traditional shamanism. This feature is closely linked to hunter-gatherer societies and therefore probably of great antiquity. This near universality of shamanism allowed Ninian Smart to surmise that it is ancestral to both the hunting and gathering and to exercise kinesis.

Shamanism – Urban

Urban shamanism represents the practice of perspective shift within an urban environment and with the purpose of regaining a pantheistic perception. Varieties include New Age, new Pagan, techno-cyber, rave, psychonautic and environmental warrior forms. The underlying question for the urban shaman concerns locating or constructing the sacred from the profane and determining how and when objects and places become charged with holy power. In the urban context, the shaman attempts to implement what Max Weber referred to as the reenchantment of the world. Enchantment is magic, and the urban shaman endeavors either to re-see the world as innately sacred or, actively, to imbue the world with a ubiquitous magical spell. In a sense, urban shamanism represents the attempt to look at one’s home turf as if a visiting foreigner.

All urban shamans, whether New Age or new Pagan, access or relate to at least some aspect of nature, the rural and/or the untamed wild, and their task then becomes one
of extending the inherent enchantment of the natural to the urban, to see and feel the urban as also natural. The urban shaman may learn to view the teeming life of a metropolitan center as a municipal jungle, a human beehive or ant colony and/or a restructuring akin to the reshaping work of a beaver. In principle, the construction of human habitation differs little from avian fabrication of a nest or an animal’s burrowing its shelter. But whereas the bird tends to install its nest in the tree, the human might create his/her home by destroying the living tree. Because of these extreme differences and the consequential environmental impact, the urban shaman attempts to develop vigilant consciousness and readress the balance of natural production and formation, on the one hand, and the impinging costs of metropolitan transformation, on the other.

As with the traditional shaman, the urban counterpart is involved with a perpetual practice of divination in the form of interpreting by signs and wonders. The shaman may resort to such technologies of augury as reading the tarot, consulting the I-Ching, casting cowry shells or lots, constructing a horoscope or deciphering the supernatural as it presents itself in the intensely reshaped human environment of the city. Instead of the emblems and vehicles of the divine that are more readily found in the natural or rural setting, in “reading the spontaneous,” the urban shaman may be forced to resort to the employment of icons from the cultural mythological register that adorn corporate/governmental buildings and public spaces. The miraculous is no less sought in the cosmopolitan locale than it is in the woodlands through the synchronistic and the unexpected and unpredictable coincidence.

Unlike the traditional shaman, the urban counterpart in today’s metropolitan world is less apt to have a supportive community behind him or her practice. At best, today’s Western shaman may form confederative associations with other shamans in the pursuit of his trade. To remain a shaman, shamans form tribes rather than institutions. Nevertheless, even without conscious community support, the urban shaman seeks to serve his or her wider neighborhood through channeling or opening awareness of the numinous and by inciting greater sensitivity to the need for sustainable holistic balance. The urban shaman is no less a guardian of the gateway, and in this function, he or she serves the wider community as an educator par excellence, one who leads others out from ignorance. While New Age or core-shamans may be more involved with personal growth and enlightenment, the Pagan shaman’s principal concern lies instead in combating the “demons” of societal imprisonment, industrial pollution and environmental insensitivity. Even the psychonaut, while pursuing entheogenic and psychotropic changes in awareness, more often than not grounds this pursuit in holistic concern and the further aim of social reform. As with shamans worldwide, the contemporary urban shaman serves the wider community as a vehicle to wider perspectives and as an inspirer toward increased imagination for people in general. He/she also endeavors, in general, to remain sensitive to issues of appropriation. As Dan Noel argued, with its emphasis on the “imaginal” (as opposed both to the imaginary and to Jung’s archetypal), the power and process of imagining becomes a workable way not to appropriate from other cultures.

In its more nuanced general sense, urban shamanism is to be distinguished from New Age neo-shamanic expressions ranging from the “Higher Self” orientation of Patricia Telesco, the adoptive Hawaiian shamanism of Serge Kahili King, the guided imagery of Michael Harner’s “core-shamanism” and the “we must love the spirit of AIDS” approach of Jonathan Horwitz and/or the Native American transplantation of Leo Rutherford. The urban shaman is more independent and individualistic, unconcerned with “lineage” labels, less apt to employ New Age jargon, and more directly preoccupied with “earth-revelations” and “nature-connections” within the metropolitan environment. Practice tends to center on the “arts” of invisibility and flight as well as the cultivation of vigilance and service.

Urban shamanism is also intimately connected to the various forms of techno-shamanism (viz., rave trance-dance, cyberspace ritual, online gender-swapping, techno-mysticism, multi-media/high-tech multi-sensory celebration, emergent artificial intelligence). In this sense, it is part of the growth in the West of non-institutionalized, individually constructed varieties of spirituality or what Thomas Luckmann (1967) calls “invisible religion.” For the techno-shaman, “the postmodern world of digital simulacra is [considered] ripe for the pre-modern skills of the witch and magician” (Davis 1998: 188). The indigenous understanding of a natural world infused with animistic forms of life has been transferred to the “alive” technological world of the metropolitan environment. This fundamental notion of the spontaneous deus ex machina or the emergent organism – whether biological or technological – is increasingly underpinned by explanations based on “complexity theory” being developed at such think-tanks as the Santa Fe Institute. Organisms of digital technology, such as computer viruses and “bots,” suggest a technical world that lies steadily beyond human control as, in many essentials, does the natural world. The contemporary techno-shaman approaches such possibilities more often than not as akin to magical effervescence. The techno-shaman or techno-pagan, along with zippies (Zen Inspired Professional Pagans), cyber-crusties and techno-hippies tends to integrate shamanic and technical thought processes as ways to encounter and incorporate the spontaneous natural with the fruits of techno-urban development.

It is nevertheless important to keep in mind that the urban shaman invariably grounds his or her practice in the
natural world – whether the rave’s conclusion with greeting the rising sun, whether the development of ecological awareness and recycling practice, or whether through timing according to lunar or other natural cycles. The urban shaman has become more often than not an eco-warrior in one form or another. He/she may participate in road protest movements, in campaigns to save woodlands and/or other natural sites, or in demonstrations against multi-national corporations and international agencies perceived as heedless contributors to environmental destruction. The emphasis in urban shamanism is no longer upon the healing aspect of traditional shamanism as it applies to individuals, it is instead upon healing as it pertains to a community as a whole. While individual curing still persists, the contemporary urban shaman is primarily concerned with healing the estrangement between his/her society and the natural environment.

Sheldrake, Rupert (1942–)

Biologist Rupert Sheldrake has become a famous author of “New Age science,” since he proposed his controversial theory of “morphogenetic fields” in the early 1980s. The “hypothesis of formative causation” postulates the existence of invisible organizing fields that are able to transmit information to seemingly independent parts of reality (e.g., to the genes of other members of the species on another continent). This is made possible by what Sheldrake terms “morphic resonance.” Although his theory has been refuted by the majority of empirical scientists, a set of independent experiments show it to be at least not improbable. Like Wolfgang Pauli’s doctrine of “synchronicity,” the concept of morphogenetic fields is able to explain phenomena that seem to be mysterious to traditional physics and biology. If the theory’s propositions were accepted, the consequences would totally change our view of nature and the cosmos. Therefore, Sheldrake elaborates a neovitalist, holistic theory that is empirical at the start and purely metaphysical in its implications. In the end, the universe for Sheldrake is a conscious and creative power, which brings forth morphogenetic fields. All single, yet resonating, entities take part in this cosmic “dance” of creativity, including the human mind.

As can easily be imagined, this proposition enthralled environmentalists and theorists of ecological concerns. First, it provides an explanation for the mutual dependency of all levels of nature; second, it places the human in a cosmos of encompassing energy and the vitality of cosmic intelligence; third, it appreciates all forms of life – humans, animals, and plants – as equally intelligent and therefore as carrying intrinsic value. All three conclusions are crucial elements of “deep ecology.”

Shepard, Paul (1925–1996)

Paul Shepard was an ecological thinker and father of the field of human ecology. Until his death in 1996, he was Avery Professor Emeritus of Human Ecology at Pitzer College and Claremont Graduate School in southern California. Shepard should be considered one of the most original thinkers in contemporary history insofar as his work explored the primordial relationships between being human in a more-than-human world of animals, plants, and insects. Shepard’s work influences the thinking of deep ecologists, bioregionalists, wild-lands advocates, and environmental philosophers.

Shepard’s exploration of the path toward a more intimate and compassionate treatment of the living world we inhabit can be found in his books The Tender Carnivore and the Sacred Game, Thinking Animals, Nature and Madness, The Others: How Animals Made Us Human, and his
final book *Coming Home to the Pleistocene*. In this last book Shepard wrote,

Everything I have written since [the early 1970s] was influenced by what I uncovered in my research on *The Tender Carnivore*: our perception of animals as the language of nature in *Thinking Animals and The Others*; the “natural” way of childrearing in *Nature and Madness*; and the bear as a dominant sacred animal connecting people ceremonially to the earth in *The Sacred Paw* (Shepard 1998: 2–3).

Shepard’s work was founded on the theme of the bioculture of early and present-day hunter-gatherer societies, and the cultural dynamics, religious practice, and psychology of mythmaking, ceremonial dance and storytelling of tribal peoples. At one time, nature spoke and a detailed knowledge of place and ecology was passed on from generation to generation by oral tradition through myths – each myth of a particular place and a people frames human belief structures and religious practice in a context of ancestors and intergenerational communion. Human beings lived within a “sacred geography” of place and political understanding that consisted of a deep and shared vision of place, terrain, and the sacred plants, animals, and insects that are embedded in “a phenomenology of seasonal cycles.” “During prehistory,” Shepard believed,

which is most of the time that humans have been on earth, the dead and their burial places were venerated and mythic ancestors were part of the living present, the dreamtime ones whose world was also the ground of present being. Ignore them as we will, they are with us still (1998: 8).

In examining the lifeways and ecological knowledge of tribal societies, Shepard informed us that the best expressions of our humanity can be found in the prehistorical cultures that precede industrialization and globalization. We can recover a shared ecological identity, Shepard argued, if we recover the sense of wonder and delight that comes with being human in a greater circle of animals, plants and insects.

Shepard’s emphasis on the link to our more Pleistocene ecological roots has drawn a mixed response from intellectuals and philosophers. Shepard explored the foundation of human interaction with the natural world. His central thesis was that our relationship with the greater circle of animals, plants and insects – in short, the landscape – is a product of our shared genetic heritage, which has been formed by various religious, animistic, sacred, and institutional practices. Since the dawn of the Pleistocene period, being human has always been shaped by a shared ecology of identity, which is reflected in an array of mimetic dances, rituals, songs, ceremonies, and chants that celebrate the interdependence and relationship with others. For the many he influenced, Shepard provides the foundation for a new (old) way of interacting with the more-than-human world; his scholarship places human beings with nature as an equal participant. Nature is more than a mere simulation of industrial production, something more than an “environment” to behold, being a wondrous world of interconnections that cannot be forgotten. For others more critical of Shepard’s work, the return or renewal of the hunter-primitive cultural identification and worldview is impossible, given our technological and scientific understandings of the world. Moreover, critics of Shepard’s central thesis believe that it is based on a form of ecological determinism, as if the natural laws of ecology and genetics are the sole determinants of our way of being in the world.

The influence of his ecological thinking continues to shape new ways of relating to the natural world and human beings. As Shepard put it,

In the face of predominant anthropocentric values, the vision of natural humankind seems eccentric, regressive, even perverse. Our idea of ourselves embedded in the context of the shibboleth of growth places us at odds with the notion of kinship with nature. When we grasp fully that the best expressions of our humanity were not invented by civilization but by cultures that preceded it, that the natural world is not only a set of constraints but of contexts within which we can more fully realize our dreams; we will be on the way to a long overdue reconciliation between opposites that are of our own making (1998: 5–6).

Shiva, Vandana (1952–)

A prominent Indian physicist turned environmental thinker and activist, Vandana Shiva criticizes the dominant Western model of science and development and details its social, ecological, economic, and political impacts. She claims that, since the Enlightenment, the sanctity of this model of scientific knowledge and economic development has replaced the sanctity of life. The current development paradigm, which Shiva refers to as "maldevelopment," effects an epistemological colonization by denying the value of other traditions of knowledge. In contrast to the exclusion and exploitation of the anti-life "maldevelopment," Shiva highlights the knowledge and productivity of indigenous people and Indian cosmology as sources of renewal and sustenance of life.

In Staying Alive: Women, Ecology and Survival in India (1988), Shiva details the difference between the goals of Western development and the productivity of Indian women. Western development treats nature and women as a resource to be used for the accumulation of capital; whereas women in sustenance economies share in partnership with nature, using their holistic and ecological knowledge for social benefits and sustenance needs.

The recovery of the feminine that Shiva recommends in Staying Alive includes both the knowledge inherent to women’s activities of producing life and providing sustenance and the productive feminine force of Indian cosmology. According to this cosmology, nature is an expression of a creative feminine principle (Shakti) and a masculine principle (Purusha). A dialectic of the two allows the creation and renewal of life. Maldevelopment "ruptures the co-operative unity of masculine and feminine" and renders nature and women as passive objects (1988: 6).

According to Shiva, cosmological harmony provides a basis for ecological thought and action in India.

In her other writings, Shiva explores more fully the various forms of violence effected by Western science and technology. She argues in The Violence of the Green Revolution: Ecological Degradation and Political Conflict in Punjab (1989) that modern science and technology is the source of violence in politics and ethics. To dispute the assumption that science and technology inhabit an objective, value-free domain, Shiva details the connection between political instability and agricultural practices which deplete genetic diversity, soil fertility and water supplies.

Most recently, Shiva has explored the challenges of globalization and increasingly centralized agriculture and natural resource control. Stolen Harvest: The Hijacking of the Global Food Supply (2000) chronicles the effects on food production of seed patent laws and genetically engineered food. She sees the dwindling biodiversity in food production as a threat to a global food supply and as a means of further disenfranchising indigenous people and the poor. Similarly, in Water Wars: Privatization, Pollution, and Profit (2002), Shiva argues that greater democratization of water and other natural resources is necessary to promote sustainability and to address the causes of inter-ethnic and inter-religious hostilities and violence.

Shiva frames the issues of globalization and natural resource rights within the context of Indian religious and spiritual traditions. Water, for example, is sacred in India. She explains in Water Wars, “[R]ivers are seen as extensions and partial manifestation of divine gods” and that Rigvedic cosmology associates the possibility of earthly life with the release of the heavenly waters of India, god of rain.

Some of her critics counter that globalization and technologically advanced agriculture can promote expanded economic opportunities for many of the world’s poor. Others believe her feminist religious ethics is grounded on an untenable view that women are inherently closer to nature than men. Nevertheless, she has become an influential and sought-after spokesperson for the international anti-globalization movement in particular, and for green politics in general. Her influence was recognized in 1993 when she was awarded the Right Livelihood Award, known by some as the Alternative Nobel Peace Prize. In addition to donating regularly to the work of the International Forum on Globalization (formed and funded in part by activists with the San Francisco-based Foundation for Deep Ecology) she is the Director of the India-based Research Foundation for Science, Technology and Natural Resource Policy.

Shona Women and the Mutupo Principle

When the British entered the territory of present-day Zimbabwe around the turn of the nineteenth century, the Shona and Ndebele viewed and experienced the world through the Mutupo principle. The foundational basis for the Mutupo principle is the relationality of all of existence. The principle focuses on fostering the primary relationships between animals and humans, animals and the deity, humans and humans, nature and humans, deity and humans, women and men, the dead and the living. It attempts to enumerate and approximate the ideal mode of life, which assures a sustainable future for all of existence. In this worldview women and nature are prominent participants who are viewed as equals in all matters concerned with shaping the future destiny of a people. Shona praise poetry is an example of oral sacred literature deriving out of the Mutupo worldview. It shows that, at the turn of the nineteenth century, women were givers and receivers at every level of their society.

The relationship between the clan and its Mutupo is axiomatic in the Shona worldview. This relationship is not only understood as the vantage point from which one experiences and comes to know the world, but it is also the source of a moral code that governs the nature of relationships in existence. In its myth, the Mutupo principle creates a cosmology that is non-anthropocentric, but at the same time celebrates as unique the experience of being human, female, and male in the universe. To the Shona, the mention of one’s Mutupo evokes sacral meaning. It resonates with every dimension of human experience, such as worship, security, justice, love, community life, romance, praise, dance, learning, motherhood, beauty, the living, the dead, and the yet-to-be-born.

The substance of Shona praise poetry is the recitation or celebration of an individual’s commendable acts. Using classical, bold, flattering, metaphoric language, one’s heroic acts are described. Designed to affirm and sanction the tenets of egalitarian relationships in human living, the giving and receiving of Shona praise poetry is not an exclusive male preserve/privilege. Neither is it only for the strong and powerful. In this tradition women are givers and receivers of praise poetry, so are the weak and the powerless. An overriding theme in this wisdom literature is that the web of life is sustained by a reciprocal balance of giving and receiving. Acts of self-giving became heroic acts, symbolizing beauty, truth, joy, freedom.

The function of praise poetry is not only social but also psychological. For Shona women the social function is critical in that it is an affirmation of gender equality in the politics of bonding and solidarity. At the psychological level, praise poetry inspires and affirms the personal worth of the individual. The bold flattery and metaphorical language of Shona praise poetry celebrates commendable acts done by an individual for others. This exercise is also meant to invoke from deep within the individual an awareness of their potential and capacity to shape personal and communal destiny. Praise poetry places an individual’s personal accomplishments and triumphs in a historical scheme of a people’s destiny in the universe.
It is important to realize that the recitation of praise poetry does something to the poet and the receiver. Highly charged with diction, with powerful, startling metaphors, its effect is reciprocal. It confers status on both the individual who uses it and the one who receives it. It raises the individual to the level of the victor one celebrates. Praise poetry does not merely say something, it does something, psychologically and socially.

At the individual level it serves to build the self-esteem of its object, creating a sense of identity and worth in that person. Mutupo praise poetry is used to excite, delight and affirm. Shona women as agents shaping personal and communal destinies were subjects of this sacred literature. They were expected to give of self, as much as they expected to receive in the web of existence. Even in matters of intimacy, they celebrated the art of giving as they did of receiving. For example, excerpts from love praise poems for the Tembo Mazvimbakupa (Zebra/Lion) celebrate giving and receiving equally for both woman and man:

Hekani Matendera
Maita VaMupanedende
Zvaitwa Mupiyaniswa
Muuya wangu munakunaku
Anenge muvisivi wouchi
Kagwedu kenyama kanosara pasi
Maita VaMuroro
Hakani VaNyemba, Mubvana wa Chivazve.

Well done Zebra!
Hail, you who gives permission.
Thank you, Your Highness, generous giver.
My deepest gratitude, to you the interlaced one,
My elegant, exceedingly beautiful woman,
Who is like distilled, liquid honey.
Even my little piece of juicy steak is surpassed!
Thank you You Muroro,
Hail, you who belongs to the Nyemba Dynasty,
You mother of my child, yet forever daughter of Chivazve clan.

Male Tembo Mazimbakupa

VaChipanegombe, mombe njuma,
Mukanditi, “Siya amai,
Tizoswera tichirezvana”
Nanhashi nyama tinongodya,
Nehorwe zvose zviripo,
Uchi tinongotamba nahwo,
Maita Matendera.

You who give by the big ladle, you hornless bull,
You invited me, “Leave your mother,
So that we can spend our days in each other’s arms.”

To this very day we are feasting on meat.
Francolins we have aplenty.
As for honey, we are swimming in it.
You have performed wonderfully, Matendera.
(Pongweni 1996: 126–34)

Mutupo praise poetry as a source among many encapsulates the Shona views on women in society. In this blueprint, women are to be givers and receivers at all levels of social experience. In this worldview all existing entities – women, men, nature, deity, animals – attain freedom and bliss through giving and receiving.

Shoshone (Western North America)

Western Shoshone territory extends from what is now northern Wyoming into eastern Nevada and central Idaho, part of the North American cultural area known as the Great Basin. Great Basin cultures were based on water, the most vital component in a primarily desert region. The traditional Western Shoshone were also a nomadic people acclimatized to this diverse environment, seasonally harvesting such foodstuffs as seeds, berries, roots, piñon nuts, and other plant foods growing at known locations. Group names were commonly derived from geographic features and especially predominant local food resources.

Bighorn sheep were the most important hoofed mammal in the economy. Hunters monitored bighorn movements to determine the best spots in which to construct hunting blinds. The Western Shoshone also hunted dove, mockingbird, sage hen, quail, waterfowl, and rabbits, another important source of food and fur harvested seasonally. Black-tailed jackrabbits were found throughout Western Shoshone territory; white-tailed rabbits were scarcer. Two species of cottontail were also taken, as well as pocket gophers and ground squirrels. Antelope were generally hunted by communal driving. The Western Shoshone hunted both antelope and rabbits in an alternating schedule, giving them time to recover. The drives were one of the few occasions during which large groups of people gathered for festivals. Festivals, which generally included the Round Dance, were held whenever food was

Shoshone 1541
among the elements of the universe, including types of air,

Power exists and can move between three levels of the

Power derives from the moment of creation and perme-

Power is networked. Different elements are connected,

Power varies in its uses; it determines what different

power. A few general statements can be made about

1) Power exists throughout the universe, but like differ-

ences in human strength, it varies in intensity from

element to element.

2) Power varies in its uses; it determines what different

elements can do.

3) Power is networked. Different elements are connected,

disconnected, and reconnected in different ways,

occurring largely at the will of the elements with the

power.

4) Power derives from the moment of creation and perme-

ates the universe like spiderwebs ramifying power rela-

tionships between humans and the environment into

one spiritual conformity.

5) Power exists and can move between three levels of the

universe: upper (where powerful anthropomorphic

beings live); middle (where people now live); and lower,

where monsters reside.

Power disperses through networks of relationships

among the elements of the universe, including types of air,

water, rocks, minerals, topographic features, plants, and

animals. Each element and its types make their own rela-

tionships, much like people do and for similar reasons of

purpose and attraction. Elements have different person-

alities, intensities, and relationships with people and other

elements, relationships that resemble spiderwebs. At vari-

ous points in the web power gathers, producing powerful

places which humans recognize and employ in rituals.

Power flows like water and often follows water, yet they
two are not identical. Human intervention can alter these

networks of power; thus, the Western Shoshone are very

concerned about the proper uses of natural resources

(elements) of their environments. Improper uses can result

in loss of access to such resources. Therefore, the Western

Shoshone believe they must establish respectful relations

with their environment and its resources in order to sur-
vive and maintain the balance of the universe. Every

Western Shoshone child is admonished to explain his or

her actions before touching, picking, hunting, or otherwise

disrupting the element’s balance: “do not move a stone

without asking its permission”; “a plant will not give

medicine or nourishment unless you explain why it will be

picked”; “animals killed without their permission will not
give themselves to a hunter again”; “never speak loud on

the mountain or throw rocks in the water”; and “think of

why things are as they are before you change them for

personal needs.” Rituals accompany all changes in rela-
tionships between humans and elements of the universe

in order that an essential balance be preserved.

For the Western Shoshone the physical and spiritual

interactions among people, places, and resources create a

phenomenon which anthropologists now call the cultural

landscape, an idea that people, through repeated inter-

actions with their surroundings, develop images or ideas

of the land and share an understanding of its form and

content that is transferred over generations. In the cultural

landscape of the Great Basin of the Western Shoshone,

power moved over the open deserts, along a web of

waterways and connected the mountains to the sky and

the depths of the Earth. Establishing and maintaining spir-

itual relationships between the elements in the Basin

enabled the Western Shoshone to develop a nomadic life-

style able to follow the waxing and waning of resources,

to utilize their diverse landscape, and to maintain an

essential balance of respect for the resources that enabled

survival in a very challenging environment.

an Institution, 1986.

“Basin-Plateau Aboriginal Sociopolitical Groups.” Bureau

of American Ethnology Bulletin 120. Washington,
Siam’s Forest Monasteries

Forest monasticism has been established in Siam, currently called Thailand, for at least eight centuries. According to the historical record, this tradition was transmitted from Sri Lanka in the thirteenth century. Since then the Siamese Sangha (monastic order) has been categorized into village dwelling (gamavasi) and forest dwelling (araññavasi). While the former were entrusted with the task of studying scriptures, the latter were concerned primarily with practicing meditation.

The tradition of forest monasticism can be traced back to the time of the Buddha, who regularly admonished the monks to live in seclusion and practice meditation for the sake of enlightenment. Many monks developed the custom of forest wandering and living in caves for intensive periods of practice. Although permanent monasteries were eventually established where monks could settle for long periods, many of them were built in the forests, far from the villages and towns. Over time, these forest dwellings developed into a distinct tradition, one quite different from village dwelling.

In forest monasteries, monks are expected to live austere and to observe the monastic code (Vinaya) strictly. Contact with the outer world is discouraged, except for daily alms rounds in nearby villages and occasional teachings, while periodic wandering in remote forests is an important part of the spiritual training of such monks. The forest is conducive to meditation practice because its solitude not only brings calmness to the mind but also helps develop insight into the profound nature of life and the world. According to the Buddha, the external nature or environment is inseparable from the inner nature of mind. Contemplating the true characteristics of the former can lead to the realization of the latter’s true nature, and thus enlightenment.

Further Reading

Buddhadasa Bhikkhu (1906–1993) is another major contributor to the revival of Siamese forest monasticism. His monastery, Suan Mokkh, in the south of Thailand, has been a distinguished attempt to restore monasticism as practiced in the Buddha’s time when monks were close to nature, meditated amidst nature, and developed insight from nature. He also combined scripture study and social awareness with meditation practice, instead of the sole focus on meditation followed by most forest monks.

During the past few decades, forest monasteries have increased in number. They are frequented by people from all walks of life who come with different purposes ranging from practicing meditation to merit making and seeking amulets and sacred objects from the forest monks who are believed to possess supernormal powers.

Apart from their spiritual value, forest monasteries in Siam nowadays play a significant role in ecology. Amidst the widespread deforestation, forest monasteries are rare places where forests have been preserved. Many forest monks not only conserve forests in their own temples, but have also become leaders in protecting community forests in various parts of the country.

Phra Paisal Visalo
Sierra Club

Founded in 1892, largely through the labor of John Muir in order to protect the wildlands of California’s Sierra Nevada Mountains, the Sierra Club has become a recognized name worldwide for its efforts in conservation. Though steering a course free of any formal religious affiliation, the organization has nonetheless been influenced in its decisions and bolstered by the strength of its founders’ and members’ religious perceptions, beliefs and identities.

It was Muir’s mix of sacred metaphor, along with a perception of the aesthetic, spiritual and intrinsic value of wilderness, which served as a fundamental inspiration for the Club. The mountains were the “cathedral” that John Muir trafficked, and nature was forever his house of worship, as he described in My First Summer in the Sierra (1911): “In our best times everything turns into religion, all the world seems a church and the mountains altars” (Muir 1987: 250). His pilgrimages in the Sierra Nevada Mountains led him to champion their protection, for they were his place of revelation, where God became visible:

Every hidden cell is throbbing with music and life, every fibre thrilling like harp strings, while incense is ever flowing for the balsam bells and leaves. No wonder the hills and groves were God’s first temples, and the more they are cut down and hewn into cathedrals and churches, the farther off and dimmer seems the Lord himself (Muir 1987: 146).

Remnants of Muir’s Protestant upbringing are still evident in such passages and he continued to use metaphors borrowed from Christianity throughout his life. Recent scholarship, however, has found his religious beliefs had more affinity with pantheism, animism, and Daoism, although during his time, Muir’s religious sentiments remained largely unknown, leading Stephen Fox to conclude:

Muir lived in a Christian society and wrote for a Christian readership. Not wishing to offend, he generally kept the precise nature of his religious ideas to himself, confining them to journals, letters, and private discussions (Fox 1981: 80).

This may help to explain why for Muir and later generations of the Sierra Club, the spirituality of the movement has been complicated and often obscure, perhaps especially to outsiders, more the subject of conversation around campfires during wilderness outings than in Club publications and position papers.

Muir was, of course, a fervent evangelist for what has been called the “out-of-doors gospel of wilderness.” Attentive readers of his writings have long perceived something other than orthodox Christianity animating them. Muir trekked through what he called a “terrestrial eternity” in the California hills, urging those who shared his vision to join him in proclaiming, not a kingdom in heaven, but a kingdom of Earth. For Muir, the sacred was woven into earthly life, and he expressed this famously in his metaphysics of interdependence:

When we try to pick out anything by itself we find that it is bound fast by a thousand invisible cords that cannot be broken to everything else in the universe. I fancy I can hear a heart beating in every crystal, in every grain of sand and see a wise plan in the making and shaping and placing of every one of them. All seems to be dancing to divine music . . . (John Muir Papers, University of the Pacific: Journal, 27 July 1869, in Fox 1981: 291).

This worldview was echoed a century later in The Sierra Club: A Guide:

The history of the Sierra Club is the history of an idea . . . Wild places are not just inconvenient parcels of land to be exploited for human use; they are – along with humans themselves – integral parts of a universe in which everything is hitched to everything else. That was John Muir’s creed, and it is what we believe today (Carr and Foster 1989: 48).

While such metaphysics of interdependence have animated the Club for generations, its mission statement evolved with the times, along with new challenges and perceptions. The Sierra Club’s mission, as signaled in its incorporation documents, was:

- to explore, enjoy, and render accessible the mountain regions of the Pacific Coast; to publish authentic information concerning them [and] to enlist the support and cooperation of the people and the government in preserving the forests and other natural features of the Sierra Nevada Mountains (in Cohen 1988: 9).

At the time, the notions of “rendering accessible” and “preserving” worked in tandem, and the primary interest of the Club was to create and maintain national parks as “scenic resources” as opposed to economic properties. More importantly, the parks were to be sites of spiritual insight. As Muir once put it, “The clearest way into the Universe is through a forest wilderness” (Muir 1954: 312), and this sort of perception undergirds his and much of the Club’s subsequent spiritual epistemology: to hear the divine music, one must pilgrimage into wilderness.

The Sierra Club therefore became famous for its “outings” (also known as High Trips) – backcountry excursions
into the stunning wilderness areas of California – trailblazing, mountaineering, and seeking direct communion with nature. The outings functioned not only to bind together the community of faith but also to evoke a reverence for wildlands and empower members to ethical action, namely, the defense of wild places. Indeed, for Muir, domestication of sheep, humans, and other animals was a form of desecration. When describing wild mountain sheep Muir glowed; but tamed sheep he dismissed as “hooved locusts.” Likewise, he passionately believed that the "gross heathenism of civilization," which destroys "nature, and poetry, and all that is spiritual," could be purged from the body by “a good hard trip" (in Fox 1981: 13-14), for what both men and sheep need is “a little pure wilderness" (in Oelschlaeger 1991: 200).

The outings thus offered not only adventure but also spiritual therapy for humans who had become spiritually impoverished by domesticated lives in oppressive, profane cities. “Service trips” were later added to help clean up or restore wildlands desecrated by those who visited them without the proper wilderness reverence and ethics. Empowered by the wilderness, Muir and his progeny returned to the city and struggled to influence government land-management practices.

The Sierra Club’s first major public battle, led by Muir, involved plans to dam Hetch Hetchy valley in Yosemite National Park in order to provide water for the city of San Francisco. The United States Forest Service Chief, Gifford Pinchot, and other “progressive conservationists” favored the dam, which they considered a “wise use” of public land for the benefit of all. Muir viewed the dam as a sacrifice and its proponents as “temple destroyers” (in Cohen 1988: 28). Muir died a year after losing the battle to save the valley from inundation, but the Sierra Club gained a reputation as a strong voice contesting the unrestrained rush toward economic development by asserting that the non-material benefits of nature outweigh the social benefits that might result from such desecration.

Many ironies inher to the Club’s preservationist philosophy and spirituality. Fighting to keep the National Parks immune from ski resorts, dams and timber interests has often involved compromises in which the Club agreed not to contest the projects outside of park boundaries, oftentimes sacrificing these areas before realizing the consequences. The rise of automobile use in post-war America, which brought more visitors to the Parks to experience these scenic wonderlands, delivered a different type of tourist who demanded new roads and amenities that compromised the terrain. In 1951, partly in response to these trends, the Club mission statement was altered: “rendering accessible” became “preserve.” This reflected anxiety about the impacts of the growing number of tourists, as well as the long-standing ambivalence of mountainers and wilderness lovers toward those outside of the wilderness church. As Linda Graber observed, “wilderness purists,” including Sierra Club members, “resent the outsider’s presence in sacred space because his ‘inferior’ mode of perception” leads such a person to “desecrate wilderness” (Graber 1976: 28, 81).

Throughout the 1950s in the United States the very idea of wilderness management was being reformulated, and the Club was instrumental in this process. In 1949 Aldo Leopold’s classic, A Sand County Almanac, was published and reviewed in the Sierra Club Bulletin. Dave Brower, who would go on to be a crucial and controversial figure in the Club, attributed his change in outlook from recreational ideas of wilderness to ecological ideas of wilderness directly to his reading of this book (Cohen 1988: 117). The Bulletin itself, under Brower’s leadership, also changed its emphasis, from articles about outings to issues of wilderness policy. Biennial wilderness conferences, beginning in 1949, were hosted by the Sierra Club and brought together several conservation groups and government organizations to hammer out common strategies and goals. Bestor Robinson, a Sierra Club member and member of the advisory committee to the secretary of the interior at the time, recognized two different philosophies emerging among participants at these conferences. For some, “the sole function of wilderness is to contribute to the inspiration and wellbeing of people,” while for those more in synch with Muir himself, “wilderness itself has a personality – a soul – and should be preserved for its own sake” (in Cohen 1988: 128).

Brower, whose term as executive director began in 1952, and Richard Leonard, a long-time member and Club President in 1953, spearheaded another campaign reminiscent of the Hetch Hetchy battle, calling for the protection of Dinosaur National Monument in Utah in the face of another dam proposal. While the Club argued that the dam was not the only economic alternative, a central aspect of the campaign was to portray Dinosaur as a sacred place. The religious nature of the language used is evident in Brower’s plea to Congress:

The axiom for protecting the Park System is to consider that it is dedicated country, hallowed ground to leave as beautiful as we have found it, and not country in which man should be so impressed with himself that he tries to improve God’s handiwork (in Cohen 1988: 182).

Wallace Stegner was successfully recruited to edit a photographic book about the site to sway popular support and advertisements were placed in newspapers. These sorts of publications would become a powerful tool of persuasion for the Sierra Club in the future – particularly notable was the stunning landscape photography of Ansel Adams, who was himself motivated by his spiritual connection to the land. The victory at Dinosaur was considered a “David over Goliath” event (Cohen 1988: 160),
and the Club achieved recognition as a political force to be reckoned with. However, because the Club did not oppose projects outside of National Parks or Monuments at the time, it did not fight the proposal to build a dam at Glen Canyon on the Colorado River. This decision was later lamented by Brower, who vowed never again to restrict his concern in such a way, thus marking a further broadening of the mission of the Club.

Many of the disagreements between the Sierra Club and the government, including a decisive break with the United States Forest Service in 1960, had much to do with nature-as-sacred religion. Sierra Club members such as Brower, among others, believed that in saving the wilderness, they were protecting the only thing that, in the final analysis, could save humankind (Cohen 1988: 257). According to Nancy Newhall – who wrote the text to complement Ansel Adams’ breathtaking photography in the Sierra Club’s This is the American Earth (1960) – America still held Edenic possibilities and in the freedom of wilderness there were “answers to more questions than we yet know how to ask” (Newhall in Cohen 1988: 258). Club publications began to attract critical acclaim and some reviewers recognized their religious dimensions. John B. Oakes of the New York Times, for example, wrote about This is the American Earth that, “Essentially it is a song of praise to the Earth, a prayer and supplication for its endurance. We can use such songs and prayers” (in Cohen 1988: 259).

The Glen Canyon Dam taught difficult lessons. When proposals for further dams in the Grand Canyon were submitted, the Club responded with a barrage of advertising, both in the form of new books and newspaper ads taken out in the Washington Post, the Wall Street Journal and the New York Times. Responding to the supposed recreational benefits of lakes for Canyon tourism, one memorable Sierra Club advertisement in the summer of 1966 asked: “Should We Also Flood The Sistine Chapel So Tourists Can Get Nearer The Ceiling?” (poster reproduced in The Sierra Club: A Guide (1989: graphics insert). This kind of publicity resulted in the rapid growth of club membership and enhanced the Club’s reputation for challenging commercial interests and government policy. The Sierra Club’s publishing program continued to play an important role in the latter decades of the twentieth century by publishing not only ecological texts but also works by prominent figures promoting nature spirituality of one form or another, including books by Thomas Berry, Wendell Berry, Jerry Mander, Theodore Roszak, and Paul Shepard.

As Club membership became more geographically diverse, advocacy efforts expanded to include a wide variety of environmental issues, such as population growth, energy use, pollution, and human rights. In the late 1990s, the Club began to recognize the potential alliance between religious institutions – particularly Christian ones, whom Club leaders had previously written off as unimportant – and environmental protection. In 1997, for example, Carl Pope, who was then the executive director of the Sierra Club, attended a symposium at the University of California campus in Santa Barbara. On this occasion, Bartholomew I, the patriarch of the Orthodox Christian Church, broke new ground in labeling environmental degradation a sin. In his address to those gathered, Pope apologized for the failure of environmental activists to reach out to the religious community. He later wrote,

After all, many of the environmental challenges we face today are moral ones. The sin of pride tempts us to imagine that the world exists for our use alone, and Mammon, the god of greed, leads us down the path to environmental destruction (Pope 1998: 14).

Pope also compared environmental issues to the social changes brought about during the civil rights era in which religious organizations led the way. “Yet,” he stated,

for almost 30 years most professional environmentalists stubbornly, almost proudly, denied the need to reach out to the religious community . . . We failed to realize – as some eminent scientists now tell us – that science and religion offer two distinct approaches to knowledge, and that neither has a monopoly on the truth . . . We acted as if we could save life on Earth without the same institutions through which we save ourselves (1998: 14).

Indeed, some Club members have joined their activism and their faith, as is evidenced by various collaborations on urban sprawl, calls for ending commercial logging, political lobbying, and promotion of renewable energy. One example of such collaboration, from a recent article in the Sierra Club Newsletter, noted that priest and Sierra Club member Father Charles Morris conducted a dedication and prayer ceremony for the installation of solar panels and a wind turbine (Heim-Jonson 2001).

No group is immune from criticism, and the Sierra Club has often been criticized sharply from within the environmental movement and from without, and internal debates are likewise often fierce. One long-standing external critique applies not only to the Sierra Club but to the wilderness ideal itself: that the notion of a pristine wilderness absent of humans inappropriately separates human beings from nature. This separation occurs not merely in an abstract, philosophical sense. It separates some humans physically, as with the National Parks model that the Sierra Club helped to spawn, which facilitated the removal (sometimes by murder) of Aboriginal peoples from their land. Moreover, critics argue, with the globalization of the National Park’s wilderness ideal and model, deracination from the land and cultural genocide has often followed the development of wilderness-oriented National Parks. Many
contemporary Sierra Club and National Park advocates, however, recognize the validity of such criticisms and are now promoting community-based models of environmental protection that promote both biological and cultural diversity. The United Nations’ biosphere reserve model, which endeavors to incorporate rather than exile people while protecting biologically sensitive areas, suggests that the criticisms of the inherited wilderness ideal have been undergoing their own globalization.

Other criticisms are explicitly or implicitly religious. Some critics of the Club argue its members care more for nature than people and even promote an irrational if not pagan spirituality that is an affront to God. Meanwhile some avowedly Pagan environmentalists believe the Club has strayed from Muir’s spirituality and uncompromising passion to preserve wilderness. Such perceptions have contributed to the emergence and proliferation of radical environmental groups, such as Earth First! and the Earth Liberation Front. This has also served to inspire internal reform movements in the Club that endeavor to return to and revitalize the original charismatic vision of the Club’s founder.

The most important of these revitalization movements has been the “John Muir Sierrans,” which was founded in 1993 and funded in part by David Brower through organizations he launched after being ousted from the Sierra Club. Led by Chad Hanson (who eventually served on the Sierra Club board) and David Orr, the John Muir Sierrans ran a slate that helped turn the Club in a more radical, biocentric direction. They won membership approval for a strong position against commercial logging on public land in 1996, despite strong opposition from figures they considered the conservative “old guard” of the Club. And trying to reverse the earlier, much lamented capitulation over Glen Canyon, they even urged the draining of Lake Powell, which had been created by the Dam. Moreover, they pushed strong, uncompromising positions across the environmental spectrum, in ways considered misguided, divisive, and counterproductive by more pragmatic Club members. By the turn of the twenty-first century, however, the Sierrans and other biocentric activists, such as David Foreman (co-founder of Earth First!) and Captain Paul Watson (of the Sea Shepherd Conservation Society) had come close to controlling the Sierra Club board. This reflected a large increase in membership support for strong if not radical positions, and arguably, for biocentric spirituality.

In the early twenty-first century internal Club politics continued to be divided largely along the lines of those who considered themselves pragmatic (some of whom were more theistic in their religious sensibilities and anthropocentric in their axiology) and those who confessed that nature is sacred and believed that compromise is cowardly and taboo. Another fault line persisted between environmentalists with a strong social justice agenda, who considered morally wrong many approaches to population stabilization and reduction, including anti-immigration policies, and more biocentric activists, such as Paul Watson, who argued that nonhuman life should not suffer because anthropocentric social justice agendas hinder strong advocacy for policies that would reduce human numbers.

Criticisms from environmental radicals both inside and outside of the Club have helped push it to take increasingly strong positions in defense of the Earth’s biodiversity. Left unclear is whether the Club’s new-found interest in building bridges to religious communities – many of which have strong anthropocentric, social justice-oriented concerns – will broaden the Club’s appeal and influence or exacerbate internal tensions, some of which are religion-related. If the latter dynamic proves decisive, nature-related religion could, ironically, weaken the Club’s environmental protection efforts.

Nash, Roderick Frazier. Wilderness and the American
Sierra Treks

Begun in the late 1960s, Sierra Treks exemplifies a new form of environmental concern within evangelical Christianity. The letterhead of Sierra Treks' parent organization, Wild Hope, proclaims Wild Hope's Sierra Treks and Littlefoot Expeditions' programs to be "Wilderness Trips for People" and "People Trips for Wilderness." Combining environmental concern with Christian faith, this small outdoor/public lands advocacy group combines strong belief in the value of wilderness with the idea of God as Creator/Redeemer.

Started in 1968 by Robin Wainwright for the Mount Hermon Association, an evangelical camp and conference center in California, Sierra Treks initially combined wilderness camping/fishing trips with evangelistic Bible studies. Given Wainwright's Boy Scout background and Mount Hermon's conservative Christian ideology, trips until 1973 were open only to boys. Sierra Treks expanded and developed its more advocacy-oriented environmental mission under the leadership of Dave Willis, hired as the program's director in 1972. Willis brought a Sierra Club and Outward Bound approach to Sierra Treks, as well as a developing Christian faith that led him to a Bible-based theology that recognizes God's love for all creation.

In 1973, Sierra Treks expanded to include both girls and coed wilderness trips. The activities of all Sierra Treks continued to be modeled after Outward Bound courses. Greater expansion occurred in 1974 when Willis began hiring staff shaped by the environmental movement and progressive evangelical Christianity. Sierra Treks began offering winter mountain courses in 1976 and winter desert treks in 1980. Over the years Sierra Treks has offered courses for colleges, seminars, churches, women's groups, couples' groups, high school and junior high students, youth-at-risk, seminars for rock climbers, trips for the hearing-impaired, and others. Trips have been in the Sierra Nevada Range in California, the Cascade Mountains in Oregon and Washington, Joshua Tree National Monument in California, the Oregon/California Siskiyou Mountains, and elsewhere.

Sierra Treks and Dave Willis left Mount Hermon in 1983. By 1985 Sierra Treks added a sister organization, Littlefoot Expeditions, that offers custom trips for targeted individuals to endangered wildlands. Politicians, government officials, environmental leaders, media representatives, and foundation staff have all participated in Littlefoot Expeditions, becoming allies in ongoing efforts to protect the areas they visit by experiencing those areas personally. Many years of Littlefoot trips in southwestern Oregon's Soda Mountain backcountry led to President William Jefferson Clinton's June 2000 proclamation of the Cascade-Siskiyou National Monument.

The nonprofit organization Wild Hope was formed in 1988 to incorporate both Sierra Treks and Littlefoot Expeditions. Sierra Treks remains the "Wilderness Trips for People" branch in which students participate in Outward-Bound-type wilderness trips encouraging Christian faith development. According to Dave Willis, Sierra Treks believes in the "value of a wilderness experience for its own sake, while attempting to point to a God who is faithful to all creation." Littlefoot Expeditions remain the "People Trips for Wilderness" branch, emphasizing public lands advocacy. During the late 1970s and early 1980s, Sierra Treks ran up to thirty wilderness trips per year. As Willis has become more involved in wildlands advocacy, more Littlefoot Expeditions (and fewer Sierra Treks) have been offered.

The environmental concern common to both the trip program and the advocacy branch combines a deep belief in the value of wilderness with an all-creation theology. This theology proclaims hope in a Creator/Redeemer God whose faithfulness to humanity is inseparable from faithfulness to all creation.

Sikhism

According to Sikh tradition, after many years of traveling throughout India and preaching Sikh doctrine, Guru Nanak, the first Sikh Guru, founded and settled in the town of Kartarpur in modern-day Pakistan. Here he put into practice his teachings about honest labor, truthfulness, and charity by taking up a life of tending land. The Guru’s first disciples followed their master’s teachings and example and like him many became farmers. Though one discerns in these traditions no overt statements about nature itself, clearly there are implications which have become manifest in today’s Sikhism. Nature (qudrat) and all of its manifest glory is one of the most obvious creations of Akal Purakh (God) and as such must be responsibly tended with care and respect.

Over the centuries land and nature have directly provided many Sikhs their livelihood. Such reverential attitudes toward these thus require no concise positions or statements as these are familiar enough to be taken for granted. Indeed, within the normative Sikh Code of Conduct finalized in 1945 and published in 1950, the Sikh Rahit Maryada, as well as within earlier, eighteenth- and nineteenth-century Sikh rahit literature from which the Rahit Maryada derives, such statements are altogether absent. This is worth pointing out as even today congregations of Sikhs throughout the world often refer to the Rahit literature to position themselves vis à vis other Sikh congregations or the state on such controversial issues as Sikh identity and abortion among others.

Sikh thoughts toward nature may nevertheless be distinguished from within the principal source of Sikh theology, the Adi Granth, the Sikh scripture, in which we find the hymns of the Sikh Gurus. I do not mean to reduce Sikhism to its scripture, of course, but an “ecological exegesis” of the Adi Granth has nevertheless provided many Sikhs a number of ways with which to begin addressing the dawning environmental crisis. This is logical from the Sikh perspective as it is a firm Sikh belief that the scripture is not merely a book bound with the wisdom of the Sikh Gurus but that within its pages one can discover the mystical presence of Akal Purakh. In many symbolic ways in other words the scripture is alive and must be treated with the respect accorded to both living, human gurus as well as that bestowed upon the eternal Guru or God. Its more popular title therefore is the Guru Granth Sahib, the Granth as the eternal Guru. And so it comes as no surprise that every pamphlet or article delineating Sikh attitudes toward ecology begins here.

As a farmer in his later years, Guru Nanak’s hymns abound with scenes from the agricultural rhythm of the year, particularly scenes reminiscent of seeding and harvest times. Sensitive to natural beauty Guru Nanak speaks of deer living and eating in the forest, of swimming fish, birds singing in the mango trees, and of snakes slithering along the ground (Guru Nanak, gauri bairagan 19; Adi Granth 157) all of which contribute to the wonderful ecological balance established by Akal Purakh. The eternal Guru is himself described in ecological terms:

“He is the Master Blossomer, He who has made the world bloom; He makes the Universe blossom forth, fresh and green. He binds together [and separates] both water and land. Great is [the glory of] the Lord Creator” (Guru Nanak, Siri Rag 28:1; Adi Granth 24).

In this light it is thus logical that natural scenes illuminate the first Guru’s theology and are deployed as more than just symbols. It is through nature that one may discover the mystical presence of Akal Purakh who is not just the Creator but is also immanent throughout creation. Human beings are intimately connected to nature and the entire cosmos in this cycle as within them too the pious Sikh may experience the presence of the eternal Guru. Guru Nanak’s hymn in rag dhansari, for example, implies as much in its symbolic ritual of aarti, the waving of lamps in the presence of a divine image. Here the natural universe participates in the worship of Akal Purakh:

The skies are the dish; lamps are the sun and the moon. The stars are pearls; the breeze, incense. All the world’s vegetation form the flowers offered [to the divine]. What a wonderful aarti ceremony! O You who eliminate all fear. This is Your aarti. The unstruck melody is the sounding of the temple drum (Guru Nanak, Dhansari aarti 9; Adi Granth 663).

The unstruck melody refers to the “celestial music” that resounds throughout both humanity and nature. It is often compared to the shabad, the “word” or the divine self
expression of Akal Purakh which is "heard" at the height of the Sikh spiritual discipline, nam simran. Nature therefore is not just valued for its worth to humans but has intrinsic value unto itself. As such nature must be revered and protected. Failure to do so in Guru Nanak's thought is tantamount to sin and ignorance of the true nature of reality.

How these ideas influence everyday Sikh practice toward the environment should be straightforward but it is not. On the one hand, human beings have a moral responsibility to protect and nurture the environment. As Guru Nanak claims in one of his most famous hymns, "Truth is indeed the highest of virtues. Higher still is living truthfully" (Siri Rag Ashtapadian 14:5; Adi Granth 62). As Akal Purakh, the ultimate Truth, permeates the natural world, which is his creation, it is incumbent upon all Sikhs to strive toward maintaining and preserving this Truth. Yet, on the other hand, Sikh farmers have perhaps benefitted the most of all Indians from the large-scale introduction of harmful pesticides and chemical fertilizers which engendered the Green Revolution of the 1960s and 1970s, a clear contravention of the Adi Granth's insistence on the preservation of nature. Indeed, to this day it is very common to see the use of such chemicals in the fields of the Punjab.

Even during the Green Revolution, however, a number of Sikh and non-Sikh voices rose in protest against the chemical introduction and the so-called benefits of the Green Revolution. Of these none were louder than that of Puran Singh (1904–1992). A Sikh, Bhagat Puran Singh was often discovered outside the entrance to the Golden Temple in Amritsar handing out literature dealing with a number of contemporary, interrelated issues. The one for which he is today legendary is the care of India's disabled, destitute, poor, and sick. To support his concern for these marginalized groups he founded the All-India Pingalwara Charitable Society in 1947 against the backdrop of the horrors of Partition. Today this institution and Puran Singh (often referred to as India's Mother Theresa – though technically Mother Theresa was an Indian!) are both internationally recognized.

Puran Singh's interest in saving the environment began, according to his own admission, in the 1920s in light of India's increasing deforestation. It was at this time that he recognized, in part through the hymns of the Gurus and his own interests, the interconnectedness of all life and the harmony of the universe. A self-professed Gandhian Sikh, especially in his rejection of harmful technology (i.e., motor cars, etc.) and a prolific writer, many of Puran Singh's pamphlets deal with the environment and its degradation and offer solutions to its restoration. One solution which is outlined in his pamphlet Apane Viah (Our Marriages) is celibacy. It must be noted however that celibacy was promoted not within the Gandhian program of purity and bodily control leading to national control but rather because celibacy would eliminate an increase in the population which would therefore lessen the strain on natural resources.

Among his better-known works is Khatre di Ghanti (The Death Knell). This pamphlet of just over sixty pages informs Sikhs of the harm engendered by modern technology, soil erosion, pollution hazards, and deforestation. In this he often makes reference to the hymns of the Gurus underscoring Guru Nanak's dictum in his famous composition Japji that "the Earth was created as a dharamsala, an abode of righteousness" (Guru Nanak, Japji 34; Adi Granth 7) which must remain undefiled, in order to persuade Sikhs particularly and people in general to protect the environment and adopt less harmful technologies (bicycles as opposed to automobiles or scooters, for example, and home-spun khadi cloth for clothing as opposed to textiles manufactured with harmful dyes). Pollution in these pamphlets is thus equated with sacrilege and waste tantamount to disrespecting the eternal Guru and his creation (Khatre di Ghanti, 11).

After his death in 1992, the All-India Pingalwara Society has continued to champion Puran Singh's views and thus easily leads the way amongst Sikh institutions in broadcasting concerns about environmental degradation. It does this through conferences and seminars, which take place both within the Amritsar institution and within surrounding villages; through the celebration of Environment Day during which members of Pingalwara visit village schools to instruct children on environmental protection; and through the printing of numerous pamphlets by leading Indian and European environmentalists in Punjabi, Hindi, and English. The works of Sunder Lal Bahu-guna who began the protest against the construction of the Tehri Dam in the Indian state of Uttar Pradesh may be cited as example.

The pioneering work of Puran Singh and Pingalwara and the clear message of the Adi Granth notwithstanding, little has been done from the Sikh perspective regarding environmental protection nor as yet has a formal Sikh position, one sanctioned and mandated by the principal Sikh religious institution, the Shiromani Gurdwara Prabhandak Committee, been enunciated. Yet all the sources for such a policy and the lifestyle to which it gives voice are very much available.

Louis E. Fenech

Further Readings
Silko's subsequent novels address themes of global dislocation. The apocalyptic epic Almanac of the Dead (1991) retells the 500-year history of the conquest of the Americas, the dispossession of its native peoples, and their continuing resistance. Almanac traces the roots of that violent history to the philosophical, religious, and scientific discourses of Western patriarchy that split human from nature, body from spirit, and dismember the world to produce consumer goods and atomic bombs. The novel ends as armies of indigenous people gather to retake the stolen land, prophesying the “end of all things European.” However, as Silko tells interviewers, the retaking of the stolen land, prophesying the “end of all things European.”

If Almanac of the Dead diagnoses Western culture’s ills, Silko’s 1999 novel Gardens in the Dunes offers a cure. A historical novel set at the turn of the twentieth century, Gardens in the Dunes suggests how humans may participate in Earth’s recovery from the devastation of colonial and capitalist greed. Seen through the eyes of a young Indian girl, the gardens cultivated in the desert by her Colorado River tribe and those she experiences on a European tour with the white couple who foster her constitute an extended metaphor for the reverent, reciprocal relationships between humans and nature that can restore human contiguity with the world. The novel also heals breaches between EuroAmerican and native cultures, drawing parallels between the indigenous spiritual traditions of the Americas and those of pre-Christian Europe and Gnostic Christianity. Dissolving boundaries between spirit and matter, nature and culture, Silko’s work calls for humans to reinvent their relationships with nature and to participate in the creation of a new, more balanced world.

Singer, Peter – See Environmental Ethics; Radical Environmentalism (and adjacent, Rodney Coronado and the Animal Liberation Front).

Joseph Sittler, an American Lutheran theologian, was a pioneer in relating Christian theology to environmental concerns, giving an ecological reinterpretation of the traditional theological language of “nature and grace.”

Born in Upper Sandusky, Ohio, in 1904, Sittler served as a Lutheran pastor before embarking on a teaching career which brought him in 1957 to the University of Chicago Divinity School, where he taught until his retirement in 1973. At the time of his death in 1987 he was...
Distinguished Professor in Residence at the Lutheran School of Theology, which now houses the Sittler archives.

Sittler’s 1954 article, “A Theology for Earth,” and his 1961 address to the World Council of Churches Assembly in New Delhi, “Called to Unity,” are both landmarks in the history of ecological theology. In the former, he argues that the theology of his time had “repudiated” the Earth, and that a theology that acknowledges the significance of the nonhuman world is needed if we are to care for the Earth rather than “use [it] as a godless warehouse or to rape [it] as a tyrant.” In the latter, he calls for a “Christology of nature” that would overcome the Western dualism of nature and grace and bring the material universe itself into the sphere of redemption.

He carried forward and developed these themes in later writings. His sermon “The Care of the Earth” (1964) asserts that “abuse is use without grace” and contrasts an “economics of use only” which destroys the Earth and degrades human life, and an “economics of joy,” in which receiving the world “sacramentally” makes possible also its intelligent use. “Ecological Commitment as Theological Responsibility” (1970) proposes an ecological understanding of grace as “built into the whole constitution of the world” of nature and society as the basis for an environmental ethic. That essay also contains his provocative assertion that environmental degradation is “blasphemy,” because it denigrates the grace inherent in creation.

His most comprehensive statement is found in Essays in Nature and Grace (1972), which traces the theme of nature and grace through the Bible, the theology of the Eastern and Western churches, the Enlightenment, and into the modern period and the environmental crisis. The impact of Eastern Orthodox theology on Sittler, and his attentiveness to the artist’s “unaccredited witness” to creation as a “theater of grace,” are evident in this book.

Although he was not a “systematic” thinker, and his published output consists of a few slim volumes and numerous articles scattered among scholarly journals and church publications, Sittler had a profound influence on the following generation of “eco-theologians” (e.g., H. Paul Santmire and John B. Cobb, Jr.). While theological interest in ecology has perhaps to some degree “caught up” to Sittler, his focus on the doctrine of grace remains distinctive and illuminating, and his writings continue to be fresh and evocative invitations to explore the depth and breadth of the relationships between nature and grace.

Sivaraksa, Sulak (1933–)
Sulak Sivaraksa, Thailand’s prominent lay Buddhist social activist and author, is widely known as a major figure in the international engaged Buddhist movement. In 1961, upon his return to Thailand from England where he completed university and law degrees, he became a publisher, university lecturer, and founding editor of the Social Science Review, Thailand’s leading intellectual journal until 1976 when it was suppressed by the government. In 1971 he organized the Komol Keemthong Foundation with the help and support of Sanya Dhammasakti, chief justice of the supreme court, and Dr. Puey Ungaphakorn, rector of Thammasat University and governor of the Bank of Thailand. Its purpose was to inspire young Thais to dedicate their lives to social justice and the common good rather than solely the pursuit of their own personal gain. The Foundation was the first of many non-governmental organizations (NGOs) Sivaraksa has inaugurated. Prominent among them are the Thai Inter-religious Commission for Development (TICD) and the International Network of Engaged Buddhists (INEB), sponsors of the tri-annual publication, Seeds of Peace; the Santi Pracha Dhamma Institute (Institute of Peace, Democratic Participation, and Justice); and the Spirit in Education Movement. Through these and other organizations and networks, Sivaraksa has devoted his life to the pursuit of economic and educational reform, social and environmental justice, human and civil rights. He also founded the Sathirakoses-Nagapradipa Foundation, which promotes cultural, educational, and artistic projects, and numerous publications including the Pracharayasara journal, the intellectual successor to the Social Science Review. Sivaraksa has authored hundreds of essays and articles in Thai and several collections of essays in English, most notable among them are: Seeds of Peace: A Buddhist Vision for Renewing Society, A Socially Engaged Buddhism, Religion and Development, and Siamese Resurgence: A Thai Buddhist Voice on Asia and a World of Change. An abbreviated version of his Thai autobiography was published under the title, Loyalty Demands Dissent: Autobiography of an Engaged Buddhist. The American Friends Service Committee nominated him for the Nobel Peace Prize and he is the recipient of the Right Livelihood Award, regarded internationally as the “alternative Nobel.”

In numerous writings, Sivaraksa has spoken forcefully on the issue of environmental destruction, especially in his own country. Equally important are organizations and movements he has created to promote environmental preservation and environmental justice. Most of the NGOs
founded by Sivaraksa include an environmental agenda but for one, in particular, the preservation of the natural environment is uppermost. Sekhiyadhamma (Students of the Dhamma), is a network of Buddhist monks working in their communities to preserve local environments, principally forests that are essential to village economies. Their efforts are both educational, teaching villagers better ways to conserve natural resources, as well as political, protecting local social, cultural, and natural environments from the encroachment of commercial, industrial, and urban development. On the outskirts of Bangkok, Sivaraksa has established a conference center, the Wongsanit Ashram, to exemplify the ideal of simple living close to nature, or, as he fondly quotes Gandhi, “living simply so that others may simply live.” The Ashram serves as a center for the practice of a mindful, non-consumerist, other-regarding way of life.

Like one of his spiritual mentors, the noted Thai monk, Buddhādāsa Bhikkhu, Sivaraksa grounds his environmental ethic on a holistic understanding of the Buddhist principle of interdependent co-arising conducive to a deep respect for nature. This knowledge of inter-becoming, a term he borrows from Thich Nhat Hanh, is achieved through the development of mindful awareness and leads naturally to an empathetic identification with and compassionate action toward all life forms. On this foundation, Sivaraksa builds a guide for compassionate action using traditional Buddhist teachings — the Four Sublime Abodes (love, compassion, sympathetic joy, equanimity), the four Bases of Sympathy (generosity, kindly speech, life of service, impartiality), and the five precepts (sīla). For example, he applies the first precept against killing to the structural violence engendered against the poor and the natural environment by global corporate power.

Sivaraksa brings to his environmental agenda a sharp critique of governmental and commercial exploitation of nature at both global and Thai national levels. Applying the principle that power corrupts and absolute power corrupts absolutely, he believes that the global economic structures of free-market capitalism facilitate the concentration of wealth and power at the expense of the poor and the environment, a scenario that he characterizes as structural violence. Free-market capitalism also creates a culture of consumption driven by greed, selfishness, and acquisitiveness rather than promoting the qualities of simplicity, responsibility, and care that are essential to the preservation and conservation of nature. He finds in the culture of consumerism the illusion of autonomous, individualized selves undermining both human community and the mindful-awareness of the interdependence of human beings and nature.

Sivaraksaidealizes the rural Thai environment of relatively small self-sustaining communities living in harmony with the natural environment, not in a naive, antique sense, but as a practical example of a more humane, caring, and harmonious society. Rather than unrealistically advocating a return to a pre-modern, less complex era, he forges alliances and networks among people from many walks of life — academics, laborers, farmers, activists, civil servants, and even the business community — dedicated to the building of a more democratic, egalitarian, inclusive, and compassionate society. He strongly supports the Assembly of the Poor that emerged as a nonviolent, grassroots democratic force in Southeast Asia in the mid-1990s with nearly as half-million members in Thailand. At the core of the Assembly are urban and rural agriculturists and manual laborers with support from the middle-classes. In recent years he has challenged numerous government and private projects that have dislocated villages or undermined traditional ways of life and the communities that support them. These projects include hundreds of dams constructed without prior consultation with local populations geared mainly toward making abundant water supplies for industries at the expense of small-scale agriculture; the destruction of local forests in north and northeastern Thailand for the promotion of commercial enterprises, especially wood-pulp eucalyptus plantations; and land loss around followed by subsequent pollution of Songkhla Lake, Thailand’s largest inland body of water.

Sivaraksa’s Buddhist environmental philosophy owes a special debt to the thought of Buddhadāsa Bhikkhu and Thich Nhat Hanh. Yet, in contrast to their more reflective and contemplative styles, he aggressively fights in the trenches for the cause of human and environmental justice. On 6 March 1998, he was arrested during a sit-in protest against the construction of the Burma-Thailand Yadana pipeline in Kanjanaburi province, south Thailand. Typical of Sivaraksa’s style as an engaged Buddhist, he was putting his life on the line to protest both human rights abuses and the pipeline’s potential for ecological damage.

involved in the feminist, anarchist and anti-Vietnam War movements in Sweden and Britain in the 1960s. Sjöö states that her “political activism always grew out of my spiritual understandings of the Earth as the living Mother because the Goddess is injured wherever there is injustice, wanton cruelty, poverty, and pollution” (1987: xix).

Some of her earliest images, “God Giving Birth” (1968) and “Women’s Mysteries” (1971), led to the publication of her first pamphlet in 1975, in which she begins to explain her concepts of the Great Mother as the generative force of the universe. Sjöö’s work is also influenced by the deaths of her two sons – one from cancer, one killed by a car.

During the 1990s Sjöö’s writing critiqued the gurus of New Age religion. In Return of the Dark/Light Mother or New Age Armageddon?, she contrasted the New Age focus on transcending Earth and ignoring political activism, which exacerbates Earth’s destruction and exploits indigenous spiritualities, with ancient and reemerging Goddess cultures. Sjöö’s visual art has been exhibited throughout the United States and Europe; she has contributed to myriad journals, and has led workshops at conferences and festivals throughout the world.

Sky

This entry considers 1) the position of the sky in our perceptual environment and its religious symbolism, 2) sky-gods, 3) the personification of celestial objects, and 4) the disenchantment of the sky in the modern era.

1) The sky is a rich source of religious meanings and symbols. In our perceptual environment it is “the above,” a realm of infinity, brightness and purity, something “other” than humanity’s environment on Earth. It is a source of water and thus fertility and life. Not only does the Bible mention a sphere of water beyond the heavens (e.g., in Gen. 1:7, Job 38:37), but in many cultures sky-dwelling deities have been propitiated for rain. The sky is a source of wind, thunder and lightning. These are symbols of power and death. Thus, Odin, the Germanic god of storms and tempests was said to reside in the sky. In the daytime, the sky may be shrouded in clouds or may radiate a gleaming blue light. In Hinduism and in Mahayama Buddhism this blue was understood as a symbol of purity of mind and spiritual enlightenment. At sunrise and sunset the sky often abounds in warm, red hues. Greek mythology linked these colors to Iris, the goddess of dawn and twilight.

In the day and at night, the sky is the arena for celestial bodies and phenomena: sun and moon, stars, Milky Way and the planets are commonly seen. These were often regarded as divine or mythical beings (particularly sun and moon) or even the spirits of deceased humans (e.g., among sea-nomads in Southeast Asia). East and west, being the directions of sunrise and sunset, are often imbued with particular meanings. In India, east is considered as an auspicious direction, west as inauspicious. These meanings have influenced sacral and domestic architecture. Rainbows, eclipses, comets, meteor showers, auroras and supernovae are rare and have been impossible or difficult to predict. They are the subjects of a rich mythology and have often been regarded as harbingers of extraordinary events, misfortune or droughts. While the sky’s cloud covering may seem to change at random, the motion of sun and moon, and the apparently perpetual revolution of the starry night sky are manifestations of regularity. These seasonal changes in the appearance of the starry night sky parallel annual climatic change.

When brought into relation to the human body, the sky, in being “up” or “above,” may be linked to the head as the center of consciousness and mind. Similarly, it may express ideas of hierarchy: divinity as being distinct from, and usually superior to, humans. If deities in a pantheon can be localized in the environment, the superior ones tend to be in the sky. Earthly rulers may claim to derive their power from these sky-gods. Examples are the Inca (Peru) and the Mongolian ruler Genghis Khan. But even in monotheistic religions, God may be thought to reside “above” in the sky. In Christianity, for example, this is
where the Bible (Gen. 11:5) and the Lord’s prayer locate God. The sacrality of the Earth has been often understood to derive from the sacrality of the sky. Meteorites in particular, which have literally fallen from the sky, may become centers on Earth where sacrality is manifest, which may otherwise be peculiar to the sky. The Qa’bah in Mecca (Saudi Arabia) is probably the most famous example. According to a ninth-century text, this particular meteorite fell through a hole in the sky. As such, the Qa’bah symbolizes the permeability of sacrality at this place.

2) The belief in sky-gods is, or has been, common to many cultures. These beliefs vary from conceptions that are impersonal or barely personal to anthropomorphic ones. While the material sky has been claimed to be identical with these deities (e.g., in ancient Babylonia, among the Ewe of Ghana or in old China), in other cultures the sky has been considered a space in which the sky-gods reside (e.g., Zeus in Greek mythology). Foucart (1920) considers the universality of sky-gods and the uniformity of their essential characteristics as the “logical consequence of the constant uniformity of the primitive system of cosmogony” (1920: 581). He notes that in many cultures sky-gods have been considered as the creators of the world. If considered the sole agent of creation, the sky-god is usually understood as being male (as in many pastoral societies), but sometimes as female (e.g., the Egyptian goddess Hathor). In other (often agrarian) cultures the world is created in the union of a (male) sky-god and a (female) Earth-goddess. Examples are the Polynesian myth of Rangi and Pepe, and the Greek myth of Ouranos and Gaia. The separation of sky and Earth after the act of creation is a common mythological subject. For example, a myth of the Ewe (Ghana) relates that a cooking fire lit by their ancestors caused the sky-god Mavu to feel a burning sensation in the eye and to withdraw thereupon.

Historians of religion have advanced a variety of ideas about the role of sky-gods in belief systems. Wilhelm Schmidt argued that primitive monotheism stems from the idea of a supreme sky-god. This hypothesis has resulted in a long-lasting debate that remains unresolved. Mircea Eliade notes the tendency of sky-gods to disappear from cults. In general, they become less and less important in ritual and sacrifice. In some cultures, the sky-gods are pleased with their creation and perhaps even tired of the hard work involved (cf. the mythology of the god Puluga on the Andaman islands in the Indian Ocean). While sky-gods may sometimes remain at the head of a pantheon (e.g., the Zoroastrian Ahura Mazda), in other cases they have been replaced by a sun-god. In general, Eliade remarks, sky-gods show little interest in the concern of humans and thus they are often replaced by active deities with more proximity to human life. He also notes, however, that the sacredness of the sky and the stars usually remains unchallenged.

3) The attribution of religious, mythical or symbolic meanings to the visible sky or objects discernible therein is known in virtually all cultures. In an abstract way, the blueness of the sky has been related to the skin color or the dresses worn by sky-gods. Examples are the blue-skinned Tengri (Mongolia) and Mavu of the Ewe (Ghana), who was claimed to wear a blue robe adorned by white clouds. In a number of cultures, sun and moon are imbued with an amazing variety of meaning. They often appear as husband and wife or as siblings and are linked to myths of creation. Among the planets, Venus has been commonly linked to divine or mythical beings. The Pleiades (a conspicuous cluster of bright stars in the constellation Taurus) is probably the most widely identified constellation around the world. Their first visibility in the eastern evening sky (October) marks the beginning of the rainy season in many equatorial regions. At first sight, the night sky may seem like an arbitrary distribution of stars. However, akin to a projective Rorschach test used by psychologists, the patterns discerned in the sky may be considered as projections of symbols which are, or have been, important to a culture. Thus, the symbolism of Greek mythology and everyday life is still inscribed into the sky as seen through (knowledgeable) Western eyes.

4) The disenchantment of the world in the modern era has been debated at least since Max Weber first published The Protestant Ethic and the Spirit of Capitalism in 1905. Not only have the physical sciences progressively restricted the realm of divine influence. Celestial phenomena and objects could also now be understood by a unified physical theory. Scientific progress has affected the perception of the sky in a profound way. It came to be looked at as a wasteland, a mute witness to human doings and wrongdoings (e.g., in expressionist poetry). The twentieth century has brought human appropriation of the sky into focus. In the 1920s, a British engineer used diesel fumes to inscribe advertisements into the blue sky (first for the Daily Mail, then for “Lucky Strike”). Already in 1893, at the Chicago World Exhibition, slides had been projected onto clouds. Then came the jet trails. In the 1960s, air pollution emerged as a global problem. The discoveries of the Antarctic ozone hole and of global warming have left no doubt about our influence on the sky. Once the abode of deities, it has come apparently under human control. Such a viewpoint is enforced by international law: up to an elevation of 83 kilometers the sky has been declared the territory of any sovereign state.

Slavic Neo-Paganism

Slavic neo-paganism is a scholarly term for a very broad category of religious groups that see themselves as the legitimate continuation of the pre-Christian religious beliefs of their Slavic ancestors. This legitimacy is largely based on perceived “natural” ways of being for Slavs as a whole or as separate historical nations, which include concepts of intimate ties with certain landscapes and geographical areas as well as broader notions of humanity’s place in the natural environment.

Although most Slavic neo-pagan groups are familiar with the scholarly category of “neo-pagan,” very few are quick to use it about themselves. They often prefer labels such as “the native faith” (Czech: rodná víra, Polish: rodzima wiara, Ukrainian: ridna vira) or “Slavism” (Russian: Slavianstvo). Unlike neo-pagan groups in English-speaking countries, neither magic nor feminism are important parts of Slavic neo-paganism, although they may be present.

Belarus, the Czech Republic, Poland, Russia, Serbia, Slovakia, Slovenia and Ukraine all have documented Slavic neo-pagan movements of larger or smaller sizes. In all of these countries, neo-paganism remains a small minority of the population (under 0.5 percent) and is usually marginalized as a New Religious Movement by the dominant churches and the population at large, regardless of claims of ancient traditions. Some of these countries may also contain even smaller autochthonic non-Slavic neo-paganisms (vigorous Finno-Ugric neo-paganisms in Russia, Baltic Prussian neo-paganism in Poland) as well as a few scattered representatives of imported Western neo-paganisms (Asatru, Wicca and Druidism). Slavic neo-paganism may also be found amongst Slavic émigrés, especially from Ukraine and Russia.

A number of neo-pagan groups were founded throughout Central and Eastern Europe in the 1920s and 1930s. They typically built on a base of nineteenth- and early twentieth-century Romanticism which, along with colorful speculation about the primordial religions of Europe, made influential assumptions about the “noble savage” and the primacy of nature. Although this burst of activity was not limited to the Slavic peoples (important Germanic and Baltic groups were founded at this same time), one of the first organized and explicitly religious groups to appear was the Polish “Święte Koło Czcicieli Sławianstwi” (The Holy Circle of Worshippers of Sławianstwi) in 1921. Many of these groups did not find favor with the communist authorities after the Second World War and their leaders either fled their home countries (as did Volodimir Shaian from Ukraine) or were sent off for lengthy prison terms (as was Jan Stachniuk of Poland).

Elements of Slavic neo-paganism were echoed under communism, including nationally televised (non-Christian) seasonal holidays and the encouragement of Slavic rituals among the scouting movements. With the “fall” of communism after 1989, Slavic neo-paganism blossomed again, drawing into its ranks a new generation. Although surviving members of the pre-war organizations often returned from exile, Slavic neo-pagan groups have retained a younger demographic than similar groups in Western Europe.

The radical immanentalism of Slavic neo-paganism (as opposed to the transcendentalism of the dominant Christian Churches) is a key factor in understanding its complex assumptions about what are “natural” ways of being. Explicit worship of divine beings that correspond to natural phenomena, such as the god of thunder, Perun, or the goddess of Earth, Mokosh, are only part of their return to an immanent Sacrum. The blood-ties of families, the Nation (and sometimes the Race), the sovereignty of the State, traditional folkways, traditional language, the seasonal turn of the calendar and biodiversity are all examples of things that may be considered sacred. It is interesting to note that the god Rod (literally: “birth” or “kin”): related to concepts of “native” and “nation”) is considered the highest of the gods, the “God of gods” by some Ukrainian neo-pagans, and the goddess Slava, the eponymous mother of the Slavs, is accorded vast import-ance by the controversial Book of Veles.

This has led some outside observers to argue that all Slavic neo-paganisms are fundamentally nationalistic or based on ethnic chauvinism. Such authors assume that all other concerns are secondary or insincere smokescreens for their true goals. Other authors have emphasized the strong current of environmentalism, while discounting the nationalists as a minority radical fringe. The reality lies somewhere between the two, as the Slavic neo-pagan celebration of the physical world can take on many different overtones even in close proximity. Typical is a Slovak neo-pagan magazine that contains an article on dwindling wolf populations, a tutorial on how to sew a traditional Slovak shirt, and a political protest against EU membership as dangerous to Slovak sovereignty, all on the same two-page spread.
The immanent-environmental current in Slavic neo-paganism often sets itself explicitly in conflict with the emphasis put on transcendence in Christianity, blaming it for the degradation of the environment and humanity’s alienation from nature. Jan Stachniuk and Volodymyr Shaian were particularly vehement in the 1930s in their condemnations of Christianity as a dangerous distraction from the realities of this world. By the end of the twentieth century, many Slavic neo-pagans were also familiar with Nouvelle Droite spokesman Alain de Benoist’s arguments that Christianity was “unnatural”, even if they were not familiar with similar lines of thought from the more left-oriented neo-pagans in the English-speaking world.

In some cases, Slavic neo-pagans seem to prescribe a sort of turning back of the clock as the cure to modern ecological ills. Many Slavic neo-pagans are ardent medieval reconstructionists, meeting for festivals in which they dress in medieval clothes and demonstrate pre-Christian handicrafts. Many are also keenly interested in archeology, history and folklore survivals. “Do-it-yourself” is often preferred to “store-bought,” as is the homemade wine produced by the congregation in Kaluga, Russia, for ritual purposes. The legacy of nineteenth-century Romanticism is felt strongly in the assumption that modern consumerism and technology is decadent and meaningless when compared with the ancient Slavic arcadia. Extreme Luddite variants, however, are rare and the comfort that many Slavic neo-pagans have with modern technology is visible in websites dedicated to their interests.

Slavic neo-pagans may be found as staunch supporters of the “secular” ecological movement, and the ecological movement often returns the favor by borrowing neo-pagan imagery in their publications and neo-pagan ritual in their events. However, neither side of this equation could be said to hold a controlling interest in the other’s activities. Notably, other than some small-scale organic farming, there have been no attempts to create exclusively neo-pagan environmental initiatives such as sustainable housing, recycling programs or nature preserves outside of the framework of the broader environmental movements of the various Slavic countries.

Slavic Religion

“The Slavs,” like “the Celts,” are a modern construct. Since languages spread not only vertically, through ancestry, but also laterally, through conquest, diffusion, assimilation, and other means, “Slavic religion” refers not to the religion of a single transhistorical community of “Slavs,” but to the multiple religious practices of Slavic speakers. That caveat aside, archeologists generally consider Slavic-speaking cultures to have emerged in the territory between the Dnieper and Vistula rivers in Eastern Europe sometime in the first millennium B.C.E. Over the course of the mid-to late first millennium and early second millennium, accompanied by territorial migrations to the north, east, and southwest, Slavic-speaking tribal groups combined, transformed, and differentiated into the peoples known today, commonly distinguished into three language groups: East Slavs (Russians, Ukrainians, Belarusians), West Slavs (Poles, Czechs, Slovaks), and South Slavs (Slovenes, Serbs, Croats, Macedonians, Bulgarians).

The reconstruction of pre-Christian Slavic religion draws on three primary types of sources. Written sources include classical writings, Arab travel accounts, Christian teachings (generally aimed at discouraging pagan practices), and medieval chronicles. Archeological sources are plentiful, though debates continue over the identification of Slavic and non-Slavic cultures, the extent of migration and diffusion as opposed to autochthonous development, and so on. Finally, folklore and ethnography, drawing on a wealth of oral and folk traditions, including epic poems, fairytales, ritual songs and dances, have provided scholars with plentiful material from which to reconstruct pre-Christian beliefs, since many of these are thought to have continued in modified and fragmentary forms as late as the beginning of the twentieth century.

The earliest known beliefs of the Slavs reveal strong affinities with neighboring linguistic groups, especially Balts, Indo-Iranians, and Thracians. Linguistic and structuralist approaches (such as those of Vyacheslav Ivanov and Vladimir Toporov) have convincingly identified an Indo-European substrate underlying Slavic beliefs. Following from the work of philologist Georges Dumézil, this includes a tripartite conception of the social order (priests, warriors, and farmers-commoners), the duality of a sky god and his adversary, and worship of the sun, fire and light, and ancestors. More controversially, archeologist Marija Gimbutas has argued that Slavic pre-Christian
beliefs represent a mixture of Indo-European patriarchal ideas and an earlier, “Old European” stratum of matrifocal, Earth-centered imagery and practice, the latter reflected in a widespread reverence toward the Earth, sometimes personified as Maty Syra Zemlia (Russian/Ukrainian: “Mother moist Earth”). Other scholars, such as Boris Rybakov, emphasize the slow evolution of Slavic religion from simple animistic beliefs in life-giving spirits (Ukr. berehyni, or protectresses) and life-threatening ones (upyri, or vampires), ancestral cults, and personifications of fertility and communal order (Lada, Kupala, Rod, and others), to the “higher mythological” pantheons of the late pre-Christian era.

Slavic peoples considered the world to be animated by a wide variety of spirits, ranging from those that inhabited the rivers and waters (such as mawkas, vilas, and rusalkas), forests (Russian: lesy, Ukrainian: lisovyk, or “be of the forest”), fields, and households, to personifications of illness, climatic forces, abstract principles (such as fate, bad luck, and the community or Rod), and souls of the dead. Typically, springs and wells, rivers, groves of oaks and other trees, the rounded tops of hills, and raised flat areas overlooking rivers, seem to have been held with particular reverence. Some scholars have sought to explain fairytale characters, such as the East Slavic Baba Yaga (the Old Hag) or Koschei the Eternal, as relics of ancient gods or goddesses, but these can perhaps more parsimoniously be explained as products of the folk imagination.

Calendrical rituals were commonly connected to the periodic return of the ancestors, the comings and goings of nature spirits, and the agrarian fertility cycle. Seasonal festivals display a rich semiotics of agricultural and ancestral symbolism: decorations of greenery to welcome the return of the ancestors or nature spirits in springtime, food set aside for the souls of the dead and sheaves of grain and bundles of straw representing ancestors during winter rites, and so on. Late nineteenth and early twentieth-century calendar customs show a synthesis of pagan and Christian elements, typical of the peasant religiosity that scholars have called “double-faith” (Russian: dvoierie). The Christmas period is marked by Koljada rites: the lighting of fires, processions of masked carolers performing ritual theatre and offering greetings and wishes for a bountiful harvest, offerings of food and drink to the “visitors” (representing the ancestors). Fire and water figure most prominently in springtime and midsummer rites, often centered around such figures as Yaryla (or Yarovit), Kupalo, and Marena. (The names vary among different ethnic groups.) Kupala’s festival, celebrated at midsummer (St. John’s Day in its Christian incarnation), included ritual lighting of fires, bathing, divination, songs, dances, and, traditionally, the dressing and sacrifice (by burning or sinking in water) of an effigy representing the deity.

Analysis of Slavic folklore has allowed researchers to reconstruct the archaic mythological image of the Slavic World Tree, a three-tiered vertical structure whose levels correspond to a heavenly world, represented by birds, sun and moon; an earthly world represented by bees and humans; and an underworld represented by chthonic creatures such as snakes and beavers. This structure is arguably preserved in late-pagan statuary; for instance, a four-sided temple statue found near Zbruch in western Ukraine includes, in its top level, representations of distinct deities facing the four cardinal directions, a human khorovod or ritual community in its middle level, and a three-headed underworld figure (most likely Veles) holding up the world.

Numerous remains have been found throughout Slav-occupied territories of temples with upraised platforms, frequently located on hills, with wooden or, less frequently, stone statues of deities: some with three or four heads facing the cardinal directions, some holding a drinking horn or decorated with emblems such as sun symbols, incised horse figures, and the like. Twelfth-century chronicles name several deities as having been worshipped in Prince Volodymyr’s (Vladimir’s) late tenth-century imperial capital, Kyiv. The most prominent of these was Perun, god of thunder, law and war, associated with oak trees and groves, and commonly identified with the Germanic Thor. Veles, or Volos, god of horned livestock, wealth, and the underworld, is thought by some to have been his adversary (the duality being analogous to the Indian gods Mitra and Varuna, locked in an eternal combat between sky and underworld). This is attested perhaps by the fact that he was excluded from Volodymyr’s temple atop the Kyivian hills, but worshipped in the lower merchant’s town of Podol below. Other deities reflect an unmistakable Iranian (Scythian or Sarmatian) influence, while the female Mokosh was likely a fertility goddess. Svarog and Dazhbog both clearly have elements of sky and sun gods known from other Indo-European speaking peoples. Most of these deities can be traced back to earlier forms as personifications of natural forces.

It seems probable that Volodymyr’s pantheon was established in the decades preceding Christianization in an attempt to cement together a religion appropriate to a growing empire. By 988, Volodymyr himself rejected that religion in favor of Byzantine Christianity. Late pagan practices continued in isolated and more northerly areas, most notably at the temple-stronghold at Arka on the island of Rügen (now in Germany), destroyed by the Christian Danes in 1168. Despite intense efforts, however, beliefs and practices changed slowly in rural areas. Gods were replaced by saints (Perun by St. Elijah, Veles by St. Blasius, Yarylo by St. George), pagan festivals by Christian feast days, sacred sites by churches, and magical and divinatory practices were accommodated to new understandings.

**Smuts, Jan Christiaan (1870–1950)**

Jan Smuts served as Attorney-General of the Zuid Afrikaansche Republiek, Boer General, South African Prime Minister, international statesman, scientist (botanist), President of the South African Association for the Advancement of Science, Fellow of the Royal Society (and its President), Rector (St. Andrew’s, Scotland), Chancellor (Cambridge University), and philosopher. He was born in the Cape hamlet of Riebeek West on 24 May 1870, and it was here that he acquired his deep, mystical love of nature and, in particular, mountains.

He came from a devout Dutch Reformed Church family deeply influenced by the evangelistic piety of Dr. Andrew Murray. His mystical appreciation for nature he traced to a mystical experience he had when he climbed the peak of Riebeek Kasteel and later, in 1923, he related the significance of “The Spirit of the Mountain” at Maclear’s Beacon on Table Mountain. Such was his love for mountains that one of the paths to the summit of Table Mountain that he often climbed is named for him. In later life he was influenced both by the teachings of the Society of Friends (Quakers) and the mystical theories of Evelyn Underhill.

A brilliant student, he spent only four years at school before being awarded the Ebden Scholarship to attend Cambridge University. He was deeply influenced there by the philosophical and sociological thought of the German professor H.J. Wolstenholme, and in addition completed a manuscript on the American Walt Whitman (unpublished, entitled “A Study in the Evolution of Personality”). His studies and especially his reading and study of Walt Whitman, moved him from his earlier pessimistic Calvinism to a more optimistic view of humanity, to conceiving of human personality as a process of becoming, and as the supreme part of nature.

Aristic out of his own war experiences of personal and national conciliation and his scientific work in biology, he developed a philosophy of the relatedness of all things, and coined for it the term holism. The kernel of the idea of holism came from his earlier study of Walt Whitman and it developed in the light of Darwin’s understanding of evolution. Smuts rejected mechanist and materialist views and held that through a holistic evolutionary process, cosmic individuation was in process, extending from the inorganic through to the spiritual level. Thus he held that the whole of being was moving toward greater freedom, recognition of its relatedness, and personalism. Holism influenced his politics, in that he was an internationalist, rather than a nationalistic leader – a unifier of Afrikaans and English-speaking South Africans; a founder of the Union of South Africa, the League of Nations, the British Commonwealth, and the United Nations. His United Party lost to the Afrikaner Nationalist Party in 1948 and, leaving politics, he died on his farm Irene at Doornkloof, on 11 September 1950.

**Snakes and the Luo of Kenya**

Influenced by Western Christianity’s diabolization and Freudian phallicization of snakes, many Westerners otherwise concerned with animals, animal rights, endangered species, ecology, and ecofeminism have not expressed similar interest in or impassioned concern for snakes. Joluo (Luo people) of Kenya, in contrast, display
keen interest in snakes, particularly pythons. Luo are one of the largest ethnic groups in Kenya, with a population of over 3 million. They are related to Lwoo (Nilotic) people of Uganda and the Sudan, with whom they share some batalian, piscatorial, and serpentine symbolism. Luo are now predominantly Christian, with affiliations divided among Roman Catholicism, various Western Protestant groups, and membership in African-instituted churches. Several thousand are Muslim. Movement between various denominations is not uncommon and commitment to some indigenous spiritual beliefs coexists with these other affiliations. Historically Luo have been an “agrico-pastoral-fishing people.” Their homeland since their migration from the Sudan, which followed along the Nile and its tributaries for much of the time, has been around Lake Victoria. One of their auto-appellations for themselves is Jonam, “the people of lakes and rivers.” Their interest in snakes who flow their footless forms through several elements can be linked to their history, ecology, and cultural background.

The type of poisonous snakes found among Luo include rhinoceros vipers, Gabon vipers, puff adders, several types of cobras, boomslangs, mambas, hissing sand snakes, and blind snakes. Non-poisonous snakes include African rock pythons, egg eaters, brown house snakes, wolf snakes, green grass snakes, and file snakes. Some people will use buya, a word for weeds and tond bungu (rope of the forest), as euphemisms for snakes (thuol, thuonde), hoping to avoid calling snakes other than the python to them. Snakes tend to keep their distance from humans but occasionally venture onto paths, fields, termite mounds, pit latrines, and other places where snakes and humans meet.

In the past, big snakes, sometimes said to be cobras, were held to have control of wells. Neglect of the big snakes was believed to lead to drought. Some Luo placed offerings to the snakes by dry wells so that the wells would produce again. It was said that snakes had occasionally even demanded the sacrifice of a virgin (or an old woman substitute) in exchange for water. Cobras, along with hyenas and leopards, are clearly associated in Luo thought with night-runners (“night-witches”) who are said to cast spells to harm neighbors under the cover of darkness. Black mambas are believed to dislike having humans look at them. Before becoming Christian or Muslim, some Luo made sacrifices to mambas as compensation for disturbing them. The ashes of mambas are still used in medicines made by some doctor-diviners for clients involved in bitter disputes with others. Cobras and mambas are male symbols in Luo thought because of their shared capacity for being dangerous, poisonous, and bitter. If a pregnant woman has a dream with a cobra or black mamba in it, indigenous beliefs hold that this predicts she will give birth to a son.

Luo tend to distinguish pythons from other snakes and to want to have pythons nearby. Prohibitions on humans killing pythons are widespread in Africa, and found among Luo. Pythons’ preferred habitat is savannah but they can also be found in or close to water. Pythons are the largest and most aquatic of Africa’s snakes. Bodies of water are a female symbol for many ethnic groups around the world, including Luo. Pythons are highly dimorphic; females are much longer and heavier than males. While the saying “power is eaten whole” has been applied to men involved in African politics, the trope has applicability to pythons. Male and female pythons have structural features which enable them to consume animals larger than themselves. Their food includes hare, baboons, jackals, antelopes, porcupines, wild and domesticated pigs, calves, sheep, goats, dogs, doves, water fowl, fish, chickens, rodents, and snakes of other species. Since rodents are responsible for high annual loss of stored grain which is used to make the Luo staple, koon (stiff porridge), pythons feeding on rodents counterbalance predation on domestic livestock. Pythons have the “maximum internal capacity” of all of Africa’s snakes. A male python slowly digesting a large meal can resemble a pregnant human female.

Female pythons are highly prolific in the number of eggs they produce each pregnancy. They brood over their eggs protectively. They are not receptive to males while doing this. Their greater size and the position of their cloaca makes forced insemination impossible. While their maternal care is not lengthy, female pythons show the greatest parental care of all snakes. Luo have some interest in male pythons but more in females. This can be linked to beliefs about women’s reproductive, healing, and spiritual powers. One Luo term for the uterus (nyiseche) is the plural of a word for the Supreme Being (Nyasaye). The womb can also be called nyasach dhako (the “godliness” of a woman). The Luo inflection of patriline, polygyny, and the house-property complex makes each mother the head of her own house and of the matricentric segment that comes from her womb. Polygyny enables a long post-partum taboo and period in which women, like their python counterparts, are not receptive to males.

Luo make a distinction between people and animals, but this anti-Linnaean line can waver. Some Luo contend that the prohibition on killing pythons, which is still largely observed, exists because of the Luo belief that pythons were once people. It is said that some women had sought out doctor-diviners for medicine so that the women could be transformed into female pythons. In the present when a python is seen encircling flora, it is said to be signaling to humans that “the best” healing medicine is there. Before they became largely Christian, Luo built shrines at places where pythons stayed and made offerings concerned with increase. Men would pray at the site for a productive wife, women for children. Both would ask for rain and good yield for crops. Milk, which was something commonly offered to pythons, is a word in Luo hom-
ophonus with their word for creation and creative powers. Today, Luo no longer build python shrines but continue to respect pythons. Pythons are still linked to the old boons as well as success in business and elective politics. The prohibition on killing pythons is still honored by most Luo. Respect for pythons, like that for ancestors, persists along with belief in imported religions. The effort of clerics to link pythons with the diabolic still meets resistance.

Certain pythons are believed to be larger and to have greater spiritual powers than other pythons. Kit Mikayi (Stone of the First Wife), a “natural” megalithic formation of several rocks located about 17 miles from the city of Kisumu, is believed to have sacred python protection. Luo oral narratives recount that Kit Mikayi came into being during a storm and earthquake that occurred where a first wife had gone to reflect, after her husband had rejected her for their child’s nursemaid, whom he had taken as a second wife. The first wife, her husband, the second wife, and her child are believed to have been turned into the megalithic formation. One or two pythons are said to guard it. Of those who believe there are two pythons, some speak of a male–female pair. More Luo believe there is a pair of females or one female python, regarding "all snakes responsible for blessings" as female. The python stays in a large pool in the interior of the rock formation. Some say its waters, like those that drip from the rocks, have healing properties. A few hold that the python guards both water and new wealth, contending there is also a pool of petrol inside the rocks protected by the python. People still leave offerings at the site for the python. Nyamgondho and Lwanda Magere, two Luo men who are the subjects of Luo oral narratives, and who met unhappy deaths because they did not treat a first wife well, are said to have come to the python-protected monument as unhappy ghosts, hoping to make redress for their errors. Luo political leaders have visited Kit Mikayi and its environs into the late twentieth and even the twenty-first century, recognizing that the multiple powerful images attached to the site remain central in Luo consciousness, and are a resource to be drawn upon for each generation. Members of several churches including Legio Maria, an African-instituted Catholic church, visit Kit Mikayi. Some Legios contend that Mary, a protector of women, provider of healing, and proponent of the use of holy water (“Mary’s medicine”) came to Kit Mikayi and increased the healing properties of its waters, making them holy. Some Luo contend that the pool of water in which the python lives goes all the way to Lake Victoria, where the python goes to drink and to visit other snakes. People say the python sometimes flies through the air to get to Lake Victoria accompanied by bats, the flying mammal.

In indigenous spirituality, Lake Victoria is seen as the home of powerful possession spirits who can take the form of pythons or, as is found elsewhere with snake symbolism, rainbows. When they rise from the lake to pierce the sky, their activity is believed to bring rain. Unlike ordinary rainbows, those of the python-rainbow spirits are held to be visible to devotees from dusk into deep night. Three of these python-rainbow spirits, Mumbo, Sumba (Sumba Adongo), and Rabudi, had devotees who came together in early anti-colonial political-religious movements. They grew their hair into long, "wild" or "snake-like" locks. Mumbo was gendered as male; Sumba and Rabudi as female. One of Mumbo’s titles was Min Rech, “the Mother of Fish.” Maternity is so highly valorized by Luo that Min (Mother of) is an honorific that can be applied to that which is deemed “the best, biggest, most important, or preeminent,” regardless of gender. While all three movements died out before colonialism’s end, possession by Mumbo and Sumba has persisted. Sometimes called a consort of Mumbo, Sumba has been seen as a powerful python-rainbow spirit in her own right. She is regarded as the leader of other female possessive spirits. Her female devotees carry flywhisks, symbols of leadership throughout Africa. Ideally, bristles for Sumba’s flywhisks come from the tail of a waterbuck. Nyawigolwe, who dwells above Lake Victoria, is a spirit whose rainbow character is more developed than her snake-side. Nyalkoi is a snake-spirit with an affinity for water spouts.

Nyang’idi, the “daughter-messenger of God,” is a python-spirit whose home is Lake Kanyaboli, the largest of the three Yala swamp lakes. Luo have believed she periodically leaves her lake to visit families in the area. If properly welcomed, she will let people touch her. She is said to bless those who present her with food such as hens, cocks, and milk with rain and good yield. One origin legend states Nyang’idi is the mistreated elder wife of a Luo leader who had left her behind on his migration into Yimbo. She turned into a python whose peregrinations took her from Lake Kanyaboli to her husband’s Yimbo home as well as other areas of “Luoland.” While there have been periodic accounts of her being stoned and killed as she moves around the countryside, Nyang’idi has reappeared over the decades. As with the python who guards Kit Mikayi, Nyang’idi can be seen to embody the understanding that the “outsider” women upon whom Luo patrilineal homes and the female-headed farming system are so dependent can be transformed rather than crushed by abuse. Luo women who find powers and resources within themselves have proven themselves capable of casting off husbands and unhappy lives for new opportunities, much as pythons periodically shed their skins.

Omieri (also called Omweri) is yet another prominent python in Luo life. She is associated with Nyakach location, and in 1987 she was accidentally burned by men who had been clearing land. She was brought to the Kisumu Museum, whose animal specialists tried to save the burned python. Omieri finally died from her injuries. She was given a funeral and coffin as though a person had died. In
1999, the National Museums of Kenya exhumed Omieri and built a special display for her at the Nairobi Snake Park attached to the National Museum. This exhibit was part of the Museum Society’s 1999 Arts Festival. Stories of Omieri’s “fantastic divine powers” were recounted at the display’s opening, and subsequently reported in Kenya’s press. In March 2003, after the advent of full multiparty democracy in Kenya with the election of Mwai Kibaki as President on the National Alliance Rainbow Coalition ticket, Omieri was sighted in Nyakach brooding over her eggs. The election, which brought Luo out of the political cold after long-standing political opposition to the Daniel Arap Moi and Jomo Kenyatta regimes, and the return of Omieri shortly thereafter, were linked in the minds of Luo. The NARC Minister for the Environment made a promise in Kenya’s Parliament that Omieri would be protected by the new government through the efforts of a committee guided by officials of the Kenya Wildlife Service and National Museums. Omieri again received extensive coverage in the Kenyan press. This time she also made her way into internet discussion lists for Kenyans, online sites devoted to snakes and spirituality, the BBC, and American and other international newspapers. For many Luo, this python who has fascinated so many is not the “daughter” of the old Omieri who “died” of her 1987 injuries, but the same snake as the old Omieri, who was herself the same as the python of Kit Mikayi, Lake Kanyaboli, and the female pythons of Lake Victoria. Snakes are a perduring symbol for Luo.

Snyder, Gary (1930–) – and the Invention of Bioregional Spirituality and Politics

Gary Snyder is one of the most influential green poets and prose writers of the second half of the twentieth century. He became one of the leading intellectual architects of several green religious movements, including bioregionalism and green anarchism, deep ecology, ecopsychology, radical environmentalism, and what could be called neo-animism. Yet for some he will always be most known as one of the “beat poets” during the second wave of the San Francisco Poetry Renaissance of the 1950s and 1960s. What distinguished him and fellow poets Michael McClure and Kenneth Rexroth from the rest of the beat movement was a deep sensitivity to nature, a perception of its sacredness and “intrinsic value.” In those and the following years, Snyder’s influence grew throughout environmentalist sub-cultures and the counterculture more widely.

Born in San Francisco and raised on a farm in Washington near Mt. St. Helens and Mt. Rainer, three long streams of his life may be traced to his early years. First, his childhood experiences encouraged both a profound reverence for wild nature and a concern about its destruction:

From a very early age I found myself standing in an indefinable awe before the natural world. An attitude of gratitude, wonder, and a sense of protection especially as I began to see the hills being bulldozed down for roads, and the forests of the Pacific Northwest magically float away on logging trucks (1977: 15).

And this wonder involved what for Snyder has been an enduring perception.

I was born a natural animist. It wasn’t a moral or intellectual thing, from early childhood, I felt the presence of other beings, and I enjoyed being out in the woods right back of our farm . . . I think most kids are natural animists (unless otherwise cited, all quotations are from author’s interview with Snyder in Davis, California, June 1993).

Second, Snyder had friends with the left-anarchist Industrial Workers of the World and a grandfather who “soapboxed for the Wobblies” when he was a young adult (1990: 124), and such ideology left an imprint that would emerge in his political writings. Third, he graduated from Reed College with a degree in literature and anthropology, which undergirded much of his future poetry, prose, and activism. Snyder worked a variety of outdoor jobs as a
young man, including one as a logger and another briefly with the United States Forest Service after college, a position from which he was dismissed due to his association with leftists during the anti-communist purges of the time.

A New (Old?) Religion and Politics
Snyder's anthropological studies helped draw him to both Native American and East Asian religions, leading him to once contend that they constitute "one teaching" (1980: 67). But finding American Indian cultures inaccessible to non-Indians, "its content, perhaps, is universal, but you must be Hopi to follow the Hopi way" (1980: 94), he chose to study Buddhism intensively, which he did for twelve years beginning in 1955, especially focusing on Zen Buddhism in Japan. In Buddhism he found metaphysics of interdependence and kinship ethics with the nonhuman world that resonated with his own animistic perceptions. But while he also found teachers of "Buddhist anarchism" and formed a commune with fellow anarchist Nanao Sakaki while in Japan, he was disappointed with the more prevalent martial and bureaucratic Buddhism that he encountered there, concluding that world religions primarily function to "reinforce the societies they are in" (1980: 2).

Upon his return to the United States his lifework really began, as he sought to integrate religion and politics into a new, bioregional spirituality that he hoped would, over time, reconnect humans to nature and nudge them to develop ecologically sustainable spiritualities and political arrangements. Snyder first came to public attention as a beat poet, and to those in the know, as the model for the character Jaffe Ryder in Jack Kerouac's Dharma Bums (1958). He was deeply influenced by these enclaves, which he described later as rich "with anarchist and Wobblie connections and full of anti-authoritarian leftists." Yet Snyder's influence soon began to extend beyond those enclaves and into environmentalist sub-cultures and the counterculture at large. This was in part because he was offering something innovative, both spiritually (an earthen spirituality to a culture feeling alienated from nature and anxiety about this) and politically (an alternative to an impersonal, technocratic, centralized nation-state).

Buddhist–Animist Spirituality and Deep Ecology
Once back in the United States, fed by and feeding the countercultural ferment of the time, Snyder began to develop and promote a distinct religious perspective and became a major contributor to the "deep ecology" movement, which also expresses a reverence for the Earth's living systems and asserts that nature has inherent value. He concluded that in Western cultures it is probably more politically astute to promote "deep ecology" rather than Paganism (or perhaps even Zen Buddhism). Yet he nevertheless contended in discussions with deep ecology proponents that Zen expressed deep ecological ethics with unsurpassed philosophical sophistication. This is certainly one reason that Buddhism has remained central to his identity. In 1973, he called himself "a practicing Buddhist, or Buddhist–shamanist" (1980: 33), and twenty years later, after first indicating that he considered himself a "fairly orthodox Buddhist," he also labeled himself a "Buddhist-Animist."

Clearly, his enduring animist identity is as central to his nature spirituality as is his Buddhism. When asked in 1993 about interspecies communication, which he had periodically alluded to, he told a story about a woman named Ella, an Irish Mystic he knew in the 1950s, who once accompanied him on a walk in Muir Redwoods, north of San Francisco. Hearing the song of a yellow crown warbler, Ella turned to him and reported that this song was a special gift to her from that bird. Reflecting on this and my follow-up questions about what animism meant to him and what an animistic perception was like, Snyder answered

Its not that animals come up and say something in English in your ear. You know, it's that things come into your mind . . . Most people think that everything that comes into their mind is their own, their own mind, that it comes from within. It may come from someplace deep within or less deep, but everybody thinks it comes from within. That's modern psychology. Well, some of those things that you think are from within are given to you from outside, and part of the trick is knowing which was which – being alert to the one that you know was a gift, and not think, "I thought that." Say [instead], "Ah, that was a gift!" . . . I have a poem about a magpie giving me a song (Magpie's song). That's just one [example] . . .

And like many environmentalist proponents of animism and Buddhism, Snyder criticizes monotheistic religions. Reflecting on the metaphysics of interrelatedness, which permeates his writing, Snyder said

Interrelatedness is a commonsense observation. We should remind ourselves that ordinary working people, traditional people . . . notice that things are connected. What's not common is the mind–body dualism that begins to come in with monotheism. And the alliance of monotheism with the formation of centralized governance and the national state, that's what's unnatural, and statistically in a minority on Earth. The [most common] human experience has been an experience of animism. Only a small proportion of people on Earth have been monotheists.
Snyder's spirituality and politics are thus linked in his dual critique of monotheism and nationalism. Arguing that these “do seem to go together” he concluded,

Jews and Muslims are the only pure monotheists, Christians hold to it in a very qualified and tricky way . . . Everybody else in the world is a multifaceted polytheist, anist or Buddhist, who sees things in the world [as alive].

It is easy to understand why Snyder liked the influential article and book by Christopher Stone, “Should Trees Have Standing?” (1972, 1974), which argued that trees should be represented in the courts and other democratic processes. Reflecting on Stone’s argument, Snyder noted that he had long resonated with the “animistic idea that you can hear voices from trees” and commented that this makes it easy to move from the idea that trees should have standing to “nonhuman nature has rights.” Snyder came to understand that his own role as a poet was to promote such rights and to speak for the nonhuman world, “to speak for these things, to carry their voice into the human realm” (1980: 74).

For Snyder, these are sacred voices, although he periodically has cautioned against overuse of the word “sacred,” noting that this term can devalue what it signifies. Yet his work unambiguously conveys his reverence for life. Indeed, a central theme in Snyder’s writings is the sacramental nature of life itself, even the process of eating, and eventually, being eaten.

Eating is a sacrament. The grace we say clears our hearts and guides the children and welcomes the guest, all at the same time . . . (1990:184). To acknowledge that each of us at the table will eventually be part of the meal is not just being “realistic.” It is allowing the sacred to enter and accepting the sacramental aspect of our shaky temporary personal being . . . (1990: 19). And if we do eat meat it is the life, the bounce, the swish, of a great alert being with keen ears and lovely eyes, with foursquare feet and a huge beating heart that we eat, let us not deceive ourselves . . . (1990: 184).

Such a reverence he brought forcefully into poetic movements and the counterculture in general, first in the western United States, then much more broadly.

**Anarchism, Bioregionalism, and Radical Environmentalism**

While Snyder’s spirituality resonated with many in the environmental movement and Western countercultures, he has been equally influential in promoting radical environmental ideas and decentralism in green social philosophy. Specifically, he helped pioneer the green social philosophy now known as “bioregionalism,” which promotes decentralized participatory democracy within the contours of different (reconfigured) ecosystem types. Bioregionalism, for Snyder, represents an “exercise of ignoring the presence of the national state” if not an effort to overturn it outright, although he views this not as a violent, short-term revolutionary ideal, but as an evolutionary hope dependent on a transformation of consciousness.

As with his spirituality, Snyder’s bioregional perspective was deeply influenced by his understanding of Native American cultures. His reading in the 1950s of the studies of Anthropologist A.L. Krober, who concluded that Native American cultural zones paralleled regional ones, was especially influential on his thinking. Equally so was the anarchist writer Peter Kropotkin, whose thinking Snyder was introduced to in the early 1950s “as part of the poetry and political circles of San Francisco culture.”

Reflecting on such tributaries, bioregionalism drew, according to Snyder, on the history of anarchist thought . . . [on the conviction] that we do not need a state, and that the state or government is not necessarily synonymous with the social order and organization inherent in society. By anarchism I mean a nonviolent political philosophy that finds order in the possibilities of a free society, and not in the imposed order of a state structure operating with a monopoly on violence . . . not . . . wild-eyed bomb throwers . . . So North American bioregionalism is an extension of anarchist thought, combined with much appreciation of American Indian culture areas, the recognition of the virtues of decentralization, and the insights of “field ecology” (Woods and Schoonmaker 1985: 115–16).

From such sources and many discussions occurring within the cultural underground of the United States, Snyder and other bioregionalists surmised that small-scale societies, which live for a long time close to the land in specific ecoregions, can best figure out how to live there properly, both culturally and ecologically, listening to the land itself, and learning good environmental manners. Fairly rapidly, such ideas grew into the bioregional ideal, especially once a now-obscure figure, Allen Van Newkirk, invented the term in 1975. Snyder and the actor Peter Coyote, as well as Freeman House and Peter Berg (both of whom founded bioregional organizations and wrote widely in support of such ideals), for example, brainstormed together many of the ideas and tropes of the emerging movement – such as “rehabitation,” the idea of rehumanizing land after being away and estranged by it in order to learn to live there sustainably. Snyder and McClure may also have coined the slogan “Back to the Pleistocene,” believed to have first appeared in print in an interview republished in *The Real Work* (1980: 57), which
would later be adopted by Paul Shepard, one of the premier theorists of both ecospsychology and radical environmentalism. In the early 1980s, the slogan was used by Dave Foreman, one of Earth First!’s co-founders, and in a new kind of primitive marketing, it soon adorned T-Shirts and bumper-stickers. That Snyder also put the Australian Buddhist and rainforest activist John Seed in contact with Foreman in the early 1980s further illustrates Snyder’s influence on the evolution of radical environmentalism. Seed became one of the world’s leading proponents of deep ecology spirituality and radical environmental action. Indeed, close reading of Snyder’s Turtle Island (1969), which was awarded a Pulitzer prize in 1975, reveals nearly every idea and theme that would later erupt and find expression in the 1980s in the radical environmental movement, including the idea that industrial civilization is like “a cancer . . . eating away at the breast of mother Earth” (1969: 104–5). The radical environmental novelist Edward Abbey, who was familiar with Snyder’s writings, would further promote this metaphor, proclaiming through one of his characters in The Monkeywrench Gang that modern society’s obsession with growth represented “the ideology of the cancer cell” (1975: 186).

**Criticisms and Rejoinders**

Despite Snyder’s respect for Native Americans and what he believes are their nature-sympathetic cultures, some Indians have criticized him. In The Remembered Earth (1979) the Cherokee critic, Geary Hobson, criticized Snyder for “inadvertently” starting a “white shaman fad” with some poems “in which the poet speaks through the persona of an Indian shaman” (Hobson 1979: 105). Hobson was easier on Snyder than many others in his article, acknowledging Snyder’s appreciation for Indian culture and that he was “one of the finest poets in America . . . when he is not pontificating about Indian things” (Hobson 1979: 107). But he clearly felt that Snyder and others should leave Indian things alone, so that “contemporary Indian writers” could speak for themselves, and certainly not assume the persona of a shaman. One of his contributors, the American Indian novelist Leslie Marmon Silko, was harsher, arguing that Snyder was a willing participant in a “two-part” attack on Indians, first by assuming in a racist way, along with many other white poets, that he could understand the mind of an Indian and express it in poetry; and secondly, by borrowing widely from Indians in his book Turtle Island, even its title, while failing properly to acknowledge “this land he is occupying . . . is not his land” (Silko 1979: 215). Silko takes offense that ethnographers and artists, including Snyder, then collect royalties on what she considers “plagiarized materials” (1979: 212).

While Snyder received some of the earliest criticisms of cultural theft from indigenous voices, by the mid-1980s, most of such criticism shifted to those in the New Age movement who fabricated an Indian identity to sell books or profited financially by selling “Native American” ceremonies or other experiences.

But Snyder had understood his spirituality in shamanic terms, so the criticisms cannot be considered off-target, even for those who do not find them compelling. Snyder himself did not duck the issue or distance himself from his worldview, which he saw as cohering with shamanism. In a 1979 interview that brought up the criticisms in Hobson’s book, Snyder responded directly. Shamanism comes from powerful experiences and wisdom that flow from making contact “with a totally nonhuman other” (1980: 154), he contended, “that is what I’m talking about when I talk about shamanism, which is a worldwide phenomenon and not limited in a proprietary sense to any one culture” (1980: 155). No one bothers Native American writers who speak in genres derived from European culture, Snyder continued, concluding,

> As artists we are all free to write about anything we like. And if it is inauthentic it will show up sooner or later. If it really works, then people will trust it (1980: 155) . . . The practice of shamanism . . . at its very center is a teaching from the nonhuman, not a teaching from an Indian medicine man, or a Buddhist master. The question of culture does not enter into it. It’s a naked experience that some people have out in the woods (1980: 156).

For Snyder, then, authenticity resides in the experience; and the value of ritual rests in its power and efficacy. The emergence of new truths and practices are possible because they can be learned from the dynamic, changing, multivocal Earth, and time will judge their authenticity.

Gary Snyder’s work has also been criticized for its anarchistic, bioregional social philosophy. Some consider such ideology naive and utopian or devoid of a concrete strategy for bridling either corporate power or nation-states themselves. Others assert such social philosophy cannot adequately address global issues, such as the destruction of marine fisheries or atmospheric pollution. The political theorist Robyn Eckersley, in Environmentalism and Political Theory (1992), criticized anarchistic and bioregional thinking for assuming humans should take their cues from nature, arguing this would actually produce a world where the strong dominate the weak. Eckersley also argued that local communities often oppose ecological flourishing, so promoting regional autonomy often makes little ecological sense. Another political theorist, Dan Deudney, agrees that vesting political autonomy in a bioregion will often not serve either equity nor environmental well-being, arguing that bioregionalism has not explained how it could keep resource-rich bioregions from dominating those less well endowed.

Snyder views such criticisms as based on a misunder-
standing of what anarchism means and on a caricature of bioregionalism:

Nobody ever said that anything was going to be autonomous, or that we were going to live [exclusively according to] bioregions. We’re talking about theatre. Everybody has to get this into their heads. This is theatre, mythology, visionary praxis. This is forming a new society on the shell of the old. It doesn’t mean the old society goes away, but it means you have some alternatives with which to act on the old. And nobody is thinking literally – aha! bioregions! autonomous nations! – or anything like that. There is a whole fluid way of looking at community relationships and jurisdictions. None of that is a useful discussion in terms of twenty-first-century politics.

Here and elsewhere Snyder’s rejoinders indicate that he is not a naïve utopian who is expecting to see the nation-state fall in the near future, ushering in an ecological new age. Yet he remains hopeful that bioregional spirituality and politics might, “nullify some things or lead to joint management committees between government managers and local people,” and that such developments could provide valuable models for an environmentally sustainable and socially just future.

Snyder complains that critics intend “to demolish something that was never created, a theory or proposal that doesn’t exist” and fail to apprehend that “bioregionalism is an educational proposal to see where we are.” But if people could begin to see bioregional spirituality and politics in this way, Snyder thinks, “we might begin to see some cultural effects [and then] we might see political effects.”

Conclusion
For decades Snyder has been traveling widely from his home in the Sierra Nevada foothills to deliver lectures and poetry readings around the world, sometimes upon the occasion of receiving one of the numerous literary awards he has won. Since 1985, he has also influenced many college students as a professor in the English Department and Nature and Culture program at the University of California, Davis. Meanwhile, in no small measure because of his influence, watershed protection groups have swept across America and local green coalitions in a number of instances have taken over regional governments, including in Snyder’s home county.

If Snyder is correct that the proof is in the pudding, then it appears there is something ecologically and socially salutary to be found in the emergence of bioregional politics in America. And if he is correct metaphorically, then there will always be hope because the land and its creatures will always be speaking their truths, and all humans have to do is learn to listen.

I’m not really worried about what white people are going to do on this continent. If anybody lives here long enough, the spirits will begin to speak to them. It’s the power of the spirits coming up from the land . . . That’s what taught us, and it would teach everybody, if they’d just stay here. The old spirits and the old powers aren’t lost; people just need to be around long enough to begin to [let them] influence them.

Snyder recalled this “elegant . . . if overly optimistic” view from a Crow Indian Elder during a 1985 interview (Woods and Schoonmaker 1985:116). In doing so he showed his ability to temper hope with cautionary realism and a sense that living long and attentively in place will be needed if humans are to reharmonize their lives with the wider natural world.

Social Construction of Nature and Environmental Ethics

Recent scholarly arguments about the “social construction” of various elements of human experience build on long-standing debates in Western philosophy, with roots in William of Ockham’s nominalist claim that there is no intrinsic link between words and what they signify. Nominalism makes clear the disjunction between things and the terms we use to describe them, and thus provides the crucial insight for theories of the social construction of nature: there is no intrinsic, universal quality that is captured in the terms we use. Instead, those terms are conventions of particular cultures and times, intelligible because of the meanings and values of those cultures. Developing this insight in relation to social institutions and meanings, Peter Berger and Thomas Luckmann argue in The Social Construction of Reality (1966) that society is built up by activities that express meaning, such as language and ritual.

Theories of social construction have influenced religious studies in many ways, particularly through the appropriation of sociological approaches, such as that of Berger and Luckmann, which perceive religious rituals, symbols, practices, and texts as key elements in a culture’s creation and maintenance of social meaning and legitimation. In the study of religion and nature, the idea that nature is socially constructed has been important in light of debates among theologians and philosophers who believe that nature has objective, even divinely ordained, value prior to any human activity, on the one hand, and those who argue that the significance of natural processes

and entities arises from human, rather than "natural" or sacred, processes.

Contemporary scholarship includes a wide range of social constructionist approaches, including Marxian, Foucauldian, deconstructionist, and feminist perspectives. Most of these contend that categories such as sex or race are not universal or natural, but instead depend on particular cultural contexts for their power and significance (Haraway 1991; Peterson 1999). Scholars in various disciplines have also applied this insight to the natural environment. They suggest that, not only are such clearly human phenomena as race socially constructed, but that this is true also for the wild or nonhuman. In this view, cultural contexts influence the ways people interpret and value nature and the diversity that results in understandings of moral responsibilities toward nature.

In the growing literature on the social construction of nature, it is possible to identify two distinct, though not necessarily contradictory, ways in which nature can be viewed as socially constructed. First, different individuals, times, and societies “construct” particular versions of nature insofar as they interpret it in different ways in and through cultural categories and values. Many scholars insist that this type of construction is universal and unavoidable: we cannot experience nature except through the lens of meanings assigned to it by particular cultures and periods. As English literary critic Raymond Williams has noted, “the idea of nature contains, though often unnoticed, an extraordinary amount of human history” (1980: 67). Conceptions of nonhuman nature are historically and culturally determined, and there is no single, essential “nature” that people in all places and times recognize as such. This insight has been elaborated in contemporary ethnographic work, which shows that dominant Western ideas of nature and wilderness often make no sense in different cultural contexts. This meaning of the social construction of nature might more accurately be described as construals or interpretations rather than actual “constructions” of nature. What is “constructed” in this sense is not natural entities or objects but rather their meanings in particular contexts.

There is a second sense of the social construction of nature, however, in which nature is seen as being literally, physically created or changed by human activity. Some social constructionists argue that most of what is called natural, from city parks to rainforests, has been shaped by human actions. Very little of the world remains “natural,” of course, if natural means free of human intervention. Such intervention includes not only the obviously inhabited areas but also many places commonly viewed as wilderness. For example, Europeans have sometimes viewed lands occupied by indigenous people, especially in the Americas, as untouched by humans, even though hundreds of generations of human inhabitants have helped shape forests, fields, and waterways. Modern industrial cultures, of course, have had much more far-reaching effects on the nonhuman world. This leads British philosopher Kate Soper to assert, “In our own time the human impact on the environment has been so extensive that there is an important sense in which it is correct to speak of ‘nature’ as itself a cultural product or construction” (1995: 152).

This view of the social construction of nature can inform an evaluation of the varying environmental impacts of different forms of life, from those that remain invisible to outsiders, like the hunting, gathering, agriculture, and forestry practiced by pre-Columbian peoples in much of North America, to those with obvious, and undeniably negative, consequences for both humans and nonhumans, such as the paving, clear-cutting, and burning of modern industrial societies. This perspective also challenges the erasure of native peoples, whose “invisibility,” evidenced by the apparent absence of marks of their habitation, has helped justify exploitation of the lands they occupied. Further, awareness of human impacts on the environment is an important step toward critical analysis of those impacts and possible solutions.

Just as awareness of the ways that nature is physically shaped by human cultures enriches environmental ethics, so does an understanding of the symbolic construction of nature. The recognition that interpretations of nature are culturally mediated can challenge established ways of thinking about the nonhuman world and human relations to it. Understanding the diverse ways that nature is humanly shaped in both physical and symbolic ways can help avoid dualistic visions of an eternal, universal, and unmediated nature as the realm of physical relations counterposed to a human realm ruled by symbols. Most importantly, perhaps, both versions of social constructionism remind us that nature, culture, and religion, in their myriad forms, interact with each other, in our minds and also in the physical world.

Despite their benefits, social constructionist interpretations of nature carry certain risks. These are most notable in writings that suggest that the nonhuman has been “invented” by humans and human culture. If all nature is constituted by human interpretation or intervention, for example, then there is no basis for evaluating one environment as better or worse or for resisting certain forms of human intervention in nature. Against this “hard” version of social constructionism regarding nature, several writers have offered a qualified or “soft” realism. Soper argues that while it is true that any distinction we make between the reality of nature and its cultural representation is itself conceptual, it does not follow that “there is no ontological distinction between the ideas we have of nature and what the ideas are about” (1995: 151). Soper argues that there is a nature out there, although she remains agnostic about our capacity to “know” this nature. Holmes Rolston III, one of the earliest philosophers
to focus attention on environmental ethics, defends a “harder” realism regarding nature. While acknowledging that “All human knowing colours whatever people see, through our percepts and concepts” (1997: 38), Rolston believes that we can still know nature “out there” in a (relatively and locally) accurate manner. Thus, commenting on Neil Evernden’s description of nature as “a category, a conceptual container” (Evernden 1992: 89), Rolston contends that we invent the category nature and put things into it because “there is a realm out there, labeled nature, into which things have been put before we arrive” (Rolston 1997: 42). The word “nature” thus emerged in response to the need for a “container” to match the non-human “forces and processes” that exist prior to and apart from human intervention. Even if terms like “nature” are not universal, they may still have real referents, which we can come to know in a meaningful way.

For many religious thinkers and practitioners, nature has objective reality because it reflects divine powers and processes. To believe that creation has value or meaning only as a result of human activities, in such religious perspective, is thought to entail arrogance about the power and significance of humans in relation not only to nature but also to transcendent or sacred dimensions of life. Thus for the study of religion and nature, strong versions of social constructionism might need correction not only from naturalistic perspectives but also from theological ones. The goal might be to appreciate but not overestimate the significance of human symbolic and discursive activity in regard to nature.

Social Ecology

Social ecology is a contemporary social theory that investigates the interrelationship between social institutions and the natural world. A major project of social ecological analysis has been its attempt to demonstrate that local, regional and global ecological problems are created by authoritarian, hierarchical and exploitative social institutions. As a political ecology, social ecology has been concerned with promoting social changes that could end exploitation and domination within human society and establish an ecologically sound relationship between humanity and the natural world.

Philosophically, social ecology has adopted a holistic and dialectical position, while its politics have tended toward communitarianism, decentralism, anarchism and libertarian socialism. Its dialectical roots can be found in the tradition of Hegel, Marx and critical social theory, while its holistic and organicist dimension is in the tradition of thinkers such as Elsié Reclus and Lewis Mumford. Political theorist Murray Bookchin is its best-known contemporary proponent. Although some have used the term generically to describe all leftist political ecology, and there is also a rather eclectic interdisciplinary academic field of social ecology, the present discussion focuses on social ecology as a political ecology with a libertarian and communitarian social perspective.

Social ecology has gained widest recognition through the writings of Bookchin. Although Bookchin once expressed sympathy with various forms of spirituality, he and his collaborator Janet Biehl have over the past decade developed a strongly anti-spiritual and anti-religious position. On the other hand, some commentators (such as David Watson, Joel Kovel, and John Clark) have argued that various forms of ecological spirituality are not only compatible with the values of social ecology, but also can make an important contribution to its further theoretical development.

In his earlier work, Bookchin emphasized the ecological dimensions of many spiritual and religious traditions. He praised the nondualistic worldview of tribal societies (and specifically their concept of the “way”) for uniting custom, morality, sensibility and nature. He suggested that animistic imagination offered modern society an outlook that is not only complementary to that of science but also more “organic” than the latter, and looked forward to a “new animism” based on a respect for and symbiotic relation-
ship with other living beings. He also praised the libertarian, communitarian and ecological values of various radical Christian sects from the Middle Ages and early modern periods. And he wrote of a telos and a “latent subjectivity” in substance that led it to develop in the direction of mind and intellect, concepts that from the standpoint of mainstream philosophy have obvious connections with idealist metaphysics and spirituality.

Beginning in 1987, Bookchin began to attack what he saw as irrationalist, anti-human, regressive tendencies in the Deep Ecology movement. His criticism soon broadened into a general indictment of what he typified as “mystical” and “spiritual” ecology. For example, he characterized ecofeminist Goddess spirituality as an attempt to depict women as naturally superior to men and to replace male chauvinism with female chauvinism. In addition, he condemned “mystical ecologists” for a multitude of evils, including rejecting political activity, fostering passivity and fatalism, promoting neo-Malthusianism, encouraging anti-immigrant feelings, exalting irrationality, opposing civilization and technology, devaluing humanity, and believing in an illusory “pristine” nature unaffected by human beings.

Some have questioned the objectivity of such attacks. It has been pointed out that in dismissing ecological thinker Thomas Berry as “misanthropic,” Bookchin cites Berry’s reference to humanity as a “demonic presence” while failing to note that this depiction of human destructiveness was part of a larger discussion recognizing humanity’s capacities for joy, wonder, and celebration of the universe. Bookchin’s use of such selective quotation and the kind of sweeping generalities mentioned above have led critics to charge that his attacks on spirituality and religious thought are without scholarly merit.

Bookchin’s collaborator Janet Biehl is also a harsh critic of spiritual and religious thought. Biehl contends that theistic spirituality places people in a condition of dependence and subservience and turns ecological politics into a form of “therapy” that makes meaningful political action impossible. However, she focuses her attention heavily on non-theistic feminist, and especially ecofeminist, spirituality. She maintains that many ecofeminists idealize Neolithic Goddess religions and the cultures that produced them, thus promoting irrational beliefs and distorting the history of societies that were in many ways repressive and hierarchical. More generally, she criticizes ecofeminist spirituality (which she characterizes, even in its pantheistic and panentheistic versions, as “theism”) as a form of superstition with politically reactionary implications. Thus, she has attacked spiritual ecofeminists, including the well-known writer and political activist Starhawk and ecofeminist theologian Carol Christ, for adopting a spirituality that rejects any idea of historical progress, denies the possibility of development in nature, uses obfuscatory metaphors, and fosters fatalism and political passivity.

Despite the campaign by Bookchin and Biehl against spirituality and religion, a number of theorists who are sympathetic to social ecology as a general perspective have argued that it is compatible with certain spiritual and religious traditions. Joel Kovel, for example, argues that social ecology should pay attention to what can be learned from mysticism, which he holds to be in touch with a primary, pre-linguistic relationship to nature that is unavailable through ordinary consciousness. Kovel rejects what he sees as an overly simplistic ecological outlook that conceives of the relationship between nature and humanity purely in terms of “unity in diversity.” He contends that such an outlook, which has been advocated by Bookchin, overlooks the irreducible negativity within human experience and the necessary tension between humanity and the larger natural world. Kovel distinguishes between an ego that is associated with domination of the other, rationalization of experience, and dualistic splitting of the self, and spirit, which refers to the individual’s experience of relatedness to larger and deeper realities, including the whole of humanity and the whole of nature. The concept of spirit, according to Kovel’s formulation, expresses a negation of the dominance of the ego and connects the problem of human emancipation to the question of humanity’s relationship to larger realms of being. In Kovel’s view, an awareness of this connection was at the core of the insights of Lao Tzu, Jesus and Gandhi.

In making a case for a “deep social ecology,” David Watson argues that the spirituality of many tribal societies has embodied a view of reality that is more social and more ecological than that of civilization. Watson contends that social ecology must pay more careful attention to the voice of nature as expressed in the myths, rituals and shamanistic practices of tribal peoples. He sees tribal spirituality as an integral part of the egalitarian, cooperative nature of these societies. Watson cites examples, including the Hopi salt expedition, of rituals that are not mere practical or instrumental activities, but are also an expression of the quest for a harmonious relationship with nature and the sacred. According to Watson, animistic religion contained greater truth than the classic modern scientific and technological worldview. He notes that contemporary science has confirmed the animistic view that humans are physically and psychologically continuous with nature.

In arguing for a radically dialectical social ecology, John Clark argues that part of the task of a social ecology is to investigate the physical, psychological and ontological aspects of humanity that link it to other living beings, to the Earth, and to a primordial ground of being. He contends that some concepts of “spirit” have been a means of expressing humanity’s relationship to the constantly changing, non-objectifiable reality of nature and to its deeper ontological matrix. He argues that social
Social Philosophy

Social Science on Religion and Nature

Religion: Good or Bad for the Environment?

“We shall continue to have a worsening ecologic crisis until we reject the Christian axiom that nature has no reason for existence save to serve man.” So argued historian of technology and medieval/Renaissance scholar Lynn White, Jr. (1967: 1207), who effectively set the terms of debate over religion and environmental concern for the last three and a half decades. White did not mince words – “Christianity is the most anthropocentric religion the world has seen” (1967: 1205) – and his powerful condemnation of Christianity as the ultimate cause of Western environmental crisis prompted the coming out of allies, as well as the inevitably countervailing response as believers, sympathizers, and reformers scrambled to bring out Christianity’s greener hues.

Most scholarly commentaries on Lynn White’s bald thesis have fallen somewhere between the two poles of attributing either outright guilt or utter innocence to religion – scholars generally prefer, rightly or wrongly, to complexify such matters – yet none has come close to the stature of White’s 1967 publication. An early collection of top scholars of the era included arguments running parallel in some ways to White’s thesis, qualified rejections of White’s equation of Christian theology solely with domination over nature, and a prototypical complexification argument claiming that capitalism, democracy, technology, urbanization, wealth, population growth, and resource tenure have all had environmental impacts on the Earth, with religion (in particular Judeo-Christianity) bearing only tenuous connections to this suite of causes. More recent responses have included philosophical and theological developments of the connection between religion and environment, attempts to bring science, religion, and environmental concern into closer dialogue, and inquiries into the ecological dimensions of a broad array of world religions and spiritual traditions.

Enter social scientists into the fray – after all, White’s argument, and the counterarguments of White’s opponents, are empirical claims concerning social and cultural reality, and thus could in theory be tested by means of rigorous, often quantitative, social science methods. Perhaps the debate over religion and environment would be settled by means of controlled empirical studies, or analysis of data from existing studies, using the powerful statistical methods social scientists routinely deploy. Perhaps science can help us decide whether White’s thesis is correct.

This is the aura of science, but not the reality. Social science has done a tremendous service to the study of religion and environmental concern, but it has failed to deliver the conclusive chapter to the story. To understand why, we must first consider how social science approaches this topic, then examine applications of social science to the environmental dimensions of organized religion as well as the religious dimensions of environmentalism.

The Social Science Approach

The world sketched by White is one in which what he termed the “marriage” of Western science and technology,
not entirely consummated until the mid-nineteenth century, has wreaked environmental havoc in recent generations at a hitherto-unknown scale. The roots of these two institutions in Christian thought are deep: White traces the development of a distinctly scientific form of natural theology back to the thirteenth century, and large-scale technology back to the eleventh century, though with much earlier ties to the Christian doctrine of mastery over nature. By way of a causal model, then, White’s argument moves from culturally-diffuse ideas inherent in Christian-ity to the powerful institutions of science and technology to the environmental impacts so obvious today.

The world sketched by a good deal of quantitative social science is rather stark in comparison to White’s world. Not only is the timescale reduced to that for which data can be generated – in the case of surveys, the last several decades at most – but the societal complex of differentially powerful persons, ensconced in and carrying forth a wide realm of cultural and political institutions, often turns into a relatively undifferentiated mass of individuals. Virtually all social science tests of the White thesis operate in a world of self-reporting minds, participating – willingly or reluctantly, self-aware, self-deceived, or intentionally deceptive – in surveys designed to capture salient individual-scale characteristics. This rather ubiquitous doctrine of methodological individualism thus leads to a quite different causal model, which statistically aggregates patterns between the self-reported religious and environmental characteristics of individuals. Ideas are culturally diffuse only to the extent that a certain number of individuals claim to share them; institutions do not effectively exist; and impacts are assumed to follow based on expressed intent or concern of individuals – a not altogether convincing surrogate.

The challenges faced by social scientists, who wander this depauperate world in hopes of illuminating the much richer, though far less quantitatively tractable, world to which White referred, are understandably immense. Their strategies have been ingenious, and their accomplishments impressive. At the heart of their project have been three methodological questions concerning how to measure individual religiosity, environmental concern, and the relationship between the two. Though the common assumption is that individual religiosity is well described in terms of theological beliefs, religious scholars running from Otto (1923) to Eliade (1959) to the present have emphasized that religious experience and practice are equally if not more relevant. Thus have followed innovative means of characterizing religiosity as a function of individual beliefs, belonging, and behaviors. More directly relevant has been the desire adequately to capture the religiously based idea White blames for environmental destruction: examples have included notions central to White’s thesis, such as dominion-over-nature, or related religious characteristics such as fundamentalism, and conservative eschatology. Similarly, individual environmental concern is best captured by a variety of measures, including attitudes and beliefs, policy concerns, and behaviors, though these items do not necessarily produce a consistent picture. Yet many of these factors are omitted in social science analyses due to data restrictions or the view that not all are relevant.

Once the measurement of religiosity and environmental concern has been addressed, the question remains as to how to characterize their relationship. The obvious point of departure is correlation: do individuals who score higher in certain religious characteristics also score higher in certain environmental characteristics, and vice versa? Yet correlation is not causation: if A (in this case, a religious characteristic) and B (an environmental characteristic) are correlated, perhaps A caused B, but perhaps B caused A, or perhaps C (possibly a demographic characteristic such as income or education) caused A and B. Most social scientists translate the White thesis into their world as A (religiously based attitudes toward nature) causes B (lack of environmental concern). Few social scientists are concerned that perhaps B causes A (since A is arguably more general than, and thus includes, B); yet there are two exceptions. If one means not “environmental concern” but “the natural environment,” the latter certainly has been assigned causal properties in socio-biological and related accounts. Additionally, if one considers A and B in at the institutional scale of organized religion and environmentalism, there is some evidence for the “greening” impact of the latter on the former in recent decades. Nonetheless, a remaining concern is that A and B may jointly derive from C. Thus most studies proceed from simple correlations to regression analyses in which demographic and other factors are added as “controls” – a method of effectively holding C constant to determine whether A has any independent effect on B. This method appears to be much more rigorous than the simple correlation, and has revealed a number of very important complications to the White thesis. But it should be remembered that, given the effective disappearance of institutions (not just science and technology, but, for instance, language and politics) and the reliance upon sample surveys, religion and environmental concern are understood as dimensions of individual human thought and action, alongside potentially complicating demographic and other dimensions of individuals. Even if, in the social science world, A does not seem to cause B, White’s world may remain relatively unexamined.

Religion and Environment
There have been many empirical social science studies of the White thesis, but a small number of themes emerges from this literature. The first is that the connection between religion and environmental concern – as evidenced in surveys of sampled individuals – may be
statistically evident, but it is substantially weak, especially when demographic (e.g., age, education, gender, social class) and other controls are taken into consideration. The weakness of the religion-environmental concern association has led some of these social scientists to declare the White thesis null and void, and others to reserve judgment until further studies sort out currently unsolved puzzles— as but one example among many, religiosity as defined by behavior appears negatively to influence environmental attitudes, but it positively influences environmental behavior. What is unarguable, however, is that not one single social science study has provided powerful and unqualified vindication of the Lynn White thesis.

The second theme is the theoretical point that, in regards to the relationship between religion and environmental concern among individuals, things are more complicated than they seem; or, put less generously, White’s thesis is conceptually simplistic. For instance, several studies have called for some form of denominational disaggregation of Christianity, arguing that religiously based ideas of nature are by no means uniform across the spectrum, and some social scientists have joined other scholars who have argued that there are more ideological options available to Christians than the stark opposites of dominion over nature versus unity with nature.

A third, and quite provocative, theme is that ideas of dominion, and even related attributes of theological fundamentalism, may not be fundamentally religious— or, more broadly, religious affiliation may not itself be strictly religious. If so, White may be barking up the wrong tree in placing sole blame on Christian theology. As just noted, a whole suite of ideas of nature may be theologically available to Christians; perhaps, as these social scientists argue, certain ideas are mobilized by certain religious groups as a part of broader political agendas, and individuals accept these ideas as a part of their political—not merely religious—commitments. This in part explains why political orientation is often a stronger predictor of environmental concern than religiosity. Religious identity may thus play an important role in providing individual support (or opposition) to the larger political-economic project of the domination of nature.

Environment as Religion

The above has assumed that religion and environmental concern are, as A and B, separable entities. Yet what if A and B are coextensive? Rather than consider whether religion has implications for environmental concern, some social scientists have taken a different tack in examining religious dimensions of environmentalism itself, or even more broadly, to explore whether something like nature religion exists. To many people, this phenomenon should be called nature spirituality, since the very term “religion” denotes organized religion, yet characteristic features of religion are indeed found among those for whom nature, not God, serves as sacred locus. Catherine Albanese notes four varieties of nature religion in American history: the Transcendentalist legacy inherited by contemporary environmentalism, metaphysical forms of spiritualism (e.g., Theosophy) reaching to contemporary New Age practices, a revitalized emphasis on bodily healing and well-being grounded in nature, and Enlightenment-style natural religion and natural theology, expressed in peculiarly American forms such as pragmatism. The broad concept of nature religion thus includes, but moves far beyond, environmentalism per se.

Empirical work in environment as religion is relatively scarce, however. Most exists in the form of qualitative interviews, which have revealed strong religious dimensions of environmental thought and practice. One major study of American environmental values suggested significant and diverse connections with religion, ranging from nature as “God’s creation” to a source of spiritual experience.

But how widespread is this phenomenon? Some indication comes from a question on nature sacredness included in the 1993 International Social Survey Programme (ISSP) environment module, which asked respondents to state whether to them nature is sacred as created by God, inherently sacred, or important but not sacred. Given these three options of transcendent sacredness, immanent sacredness, and non-sacredness, nearly one in four U.S. respondents agreed with immanent sacredness, a strong support of nature religion which raises to nearly two in five (a plurality) among members of environmental groups.

One quantitative study of British responses to the ISSP question discovered that those supporting immanent sacredness in nature scored highest in questions of environmental and scientific knowledge. This finding runs contrary to allegations that nature religion threatens to rob environmentalism of its grounding in scientific rationality. Using other variables from British responses, two scales were constructed, one representing a respondent’s “romantic” (anti-scientific, spiritual) inclination, and the other representing a “materialist” (pro-science and economy) stance. Though a negative correlation would be expected there was actually little correlation between the two, and in fact those who scored high on the materialist scale also tended to score high on the romantic scale.

Further social science research on environment as religion may offer a new set of perspectives on the White thesis. Preliminary results from a nationwide survey we administered during spring and early summer 2002 to slightly over 1000 adult Americans suggest that attitudes toward nature sacredness may be a defining feature of American environmental concern. Fifteen candidate statements on nature sacredness were narrowed down to six in a pilot survey. These six statements were included in the final survey, which together with extended respondent
interviews indicate that transcendent sacredness and non-sacredness are opposing positions (i.e., two poles on the same underlying factor), but immanent sacredness is a relatively separate factor: those who believe that nature is inherently sacred thus may or may not (despite possible logical contradictions) ascribe to transcendent sacredness or non-sacredness.

Of these three positions on nature, responses regarding immanent sacredness proved to be quite strongly associated with environmental concern among adult Americans. We measured environmental concern in three ways: self-identification as environmentalist, average concern for a suite of six environmental issues, and average participation in six sets of pro-environmental behaviors. Correlations between immanent sacredness (as measured by a factor score of three related variables) and these three measures of environmentalism are given in Table 1. The table gives results of both zero-order (i.e., uncontrolled) and partial correlations controlled for demographic characteristics, political orientation, and theological fundamentalism. For demographic background, we included age, gender, income, and educational level; political orientation was indicated by self-rating on a liberal-conservative scale, and theological fundamentalism involved belief regarding the Bible as the literal word of God. Zero-order correlations are somewhat stronger in all cases, but the reduction following correction for demographic, political, and theological characteristics is minor. The strong association between belief in nature as sacred locus and environmental concern thus cannot be explained in terms of underlying demographic, political, or theological characteristics. In short, nature religion is a phenomenon in its own right, and closely linked with contemporary American environmental concern.

These correlation results are corroborated by a regression analysis, in which demographic, political, and theological characteristics were entered in successive blocks prior to the inclusion of the immanent sacredness factor. Results, using each of the three measures of environmental concern as dependent variable, are given in Table 2. Even following introduction of these other candidate explanatory characteristics, immanent sacredness alone accounted for between 41 and 59 percent of total variance explained in environmental concern. The closest runner-up, political orientation, explained between 29 and 43 percent, and much of this is due to its inclusion in the model before theological fundamentalism, which is highly correlated with political orientation and thus would have absorbed more of the variance if it were included first. (It is worth noting that, even in the strongest case, only about 20 percent of total variance in environmental concern was explained by all of these characteristics combined; environmentalism is thus by no means fully explained by them.) Beta weights (standardized measures of relative importance) of immanent sacredness also were much higher than political orientation, theological fundamentalism, and demographic characteristics.

These preliminary results admittedly suffer from the same limitations of social science analysis noted above. Yet, they suggest that American environmental concern is more closely tied to nature religion, in which nature serves as sacred locus, than demographic background, political orientation, or degree of theological fundamentalism. Religion and environment are connected in broadly the manner White suggested, but not necessarily in the manner explored by most social science studies. It is thus possible that environmental concern will ultimately be aided both by the progressive greening of institutional Christianity, and the growth of religious expressions rooted primarily in nature and not Judeo-Christian theism. White’s preferred “patron saint,” Saint Francis of Assisi, may well have felt at home in both camps.

### Conclusion
The social science literature on the relationship between religion and environment has concentrated preponderantly on the “Does religion influence environmental concern?” interpretation of the White thesis as noted above, and primarily in the context of Christianity in the United States. While this literature has suggested important complications and elaborations of the White thesis, it has generally been inconclusive. A second interpretation, where environmentalism itself is a form of religion, is promising as suggested by the results of our study and others, yet requires further social science elaboration. And other interpretations have scarcely been explored: as but one example, it is quite possible that Protestantism has played a decisive role in nature-society relations in the West, though whether that role has been religious or more broadly cultural, and positive, negative, or both is open to debate.

One of the great limitations in social science research in

this area has been not only the relative paucity of qualitative studies, but also the virtual absence of coordination between quantitative and qualitative research. Both are important, and play complementary roles: quantitative research tends to be extensive in that it seeks generalities across populations, whereas qualitative research tends to be intensive in that it seeks depth of understanding in particular groups or individuals. Qualitative studies are also well suited for analysis of institutional forces, and not simply individual attitudes and behaviors. Our recent study mentioned above involved a dual, extensive-intensive methodological approach, in which approximately ten percent of all survey respondents were contacted afterward for open-ended interviews. The principal advantage of this dual methodology is that quantitative and qualitative data are linked by respondent; each component can thus directly shed interpretive light on the other.

What is needed is for social scientists to recognize in their analyses that the world of religion and environment is more than one populated by sampled individual survey respondents. Social science has brought great rigor to the religion-environment question, but at the expense of a highly simplified domain. It could well be, as social scientists have not yet offered a conclusive indictment nor a compelling alternative. In their absence, popular culture is deluged with right-sounding proclamations on religion and environment; bookstores are overflowing with new titles. Lots of sweeping theories are being advanced. Many have rather naively suggested that the solution lies in non-Western religious traditions, despite the evidence of serious ecological problems faced in non-Western parts of the world. Social science offers an important empirical check on these notions, but only if it remains mindful of its current limitations and works harder to develop a fuller theoretical and methodological base.

The task is huge, as huge as the scope of religion and nature–society relations. No wonder social science has not yet offered the conclusive word on White’s argument! As White himself admitted, “There are many calls to action, but specific proposals . . . seem too partial, palliative, negative . . . What shall we do? No one yet knows” (White 1967: 1204). Though some have ventured that, given this confusion, “It would probably have been better if the Lynn White debate had never occurred” (Hargrove 1986: xvii), academic research on the relations between religion and environment has surely been enriched. The “ecologic crisis” that so concerned White is still a concern for many of us today; we all want solutions. Yet, to the extent that any solution lays claim on the empirical reality of humans and
their relations with the nonhuman world, social science will play an indispensable role.

Soelle, Dorothee (1929–2003)

Dorothee Soelle is a pioneering figure in German Lutheran theology. She has made significant contributions to post-Holocaust, feminist, and liberation theology from the 1970s to the present. Ecological concerns are reflected throughout her theology, poetry and political activism on behalf of anti-nuclear, anti-war, and anti-capitalist causes. Soelle criticizes traditional Christian theology for conceiving of God as the transcendent ruler of the world who subordinates weak, sinful human beings to “his” omnipotent will, and for conceiving human beings as dependent on God for salvation which implies human passivity in the face of global injustice.
In contrast, Soelle develops the idea of God’s suffering with creation. Her panentheistic theism conceives God as immanent wherever sharing and community, rather than domination, occur among living beings. God is a transcendent force enabling persons to heal, forgive and move toward freedom from ideologies of self-interest and profit. She defines sin as a social, not purely individual, phenomenon. Influenced by Karl Marx, Soelle identifies the remedy for sin as the salvation of creation from exploitation, alienation and injustice. She rejects Christian other-worldly understandings of salvation centering on heaven and the immortality of the soul. All of creation can manifest the reality of God’s presence, including the beauty of nature, human actions and political action against the exploitation of the human body and nature. Salvation entails the survival and flourishing of all life forms and the ethical awareness that human beings are co-creators with God. Nature is the site of a mystical I–You relation reflecting the non-personal dimension of the divine in beauty, form, and radiant light. Combining an aesthetic and political perspective on nature, Soelle equates faith with resistance against exploitation, and stresses a mystical participation in reality that binds together nature, humanity and God.

Sohappy, David (1925–1991) – and Salmon Spirituality

The relationship between religion and nature, and the quest for justice that links them, is exemplified in the story of David Sohappy, Sr., a spiritual leader and healer who fought for human and treaty rights in the Northwestern U.S. and beyond. While Martin Luther King, Jr., marched for civil rights for African Americans, and Cesar Chavez fought for Mexican American farmworkers’ rights, David Sohappy led the Indian (“Native American”) fishing rights struggle. He was a Wanapum (“River People,” after “Che Wana,” the “Great River” as the Columbia was first known) seeking to restore rights guaranteed by the 1855 Fort Yakima Treaty. In the treaty, the region’s native peoples were forced to cede some nine million of their ten million acres of land to the federal government, but reserved exclusive fishing rights on their reservations, as well as rights to hunt, to gather roots and berries, and to fish at “all usual and accustomed places.” David Sohappy noted that in the treaty, “We gave to non-Indians the privilege to fish for salmon to feed their families, while we retained the right to fish. A privilege can be regulated, a right cannot” (interview by author, 1988). Reflecting on his people’s longevity on the river, he observed that, unlike archeologists, the Wanapum did not have to dig in the ground to know their history; it was preserved in their ceremonies. He declared that it has been evident through history that “fishing is our way of life” (interview by author, 1988). The salmon were special to the Wanapum. The first catch of the season was celebrated with a great feast of thanksgiving in which the whole community shared, and all subsequent catches ensured fresh and smoked fish for subsistence purposes and trade with other peoples.

Native peoples’ fishing-rights struggles initially attracted little attention outside of the Columbia River region, until David Sohappy’s successful suit against the Oregon Fish Commission and the Oregon Game Commission was upheld by the U.S. Supreme Court in “Sohappy vs. Smith” in 1968. A complementary ruling by federal judge George Boldt in 1974 in “U.S. vs. Washington” stated that native fishers were entitled to 50 percent of the catch on the Columbia.

Populations of fish species and sub-species had continuously increased over the approximately ten thousand years that native peoples had lived and fished on the Columbia River. Scientists estimate that some 16 million salmon swam upriver in the 1880s. But in the twentieth century, overfishing by the fish factory industry severely depleted migrating salmon populations in the Pacific Ocean, while mining, logging, other industrial operations and the construction of hydro-electric dams eliminated spawning grounds and habitat for the fish; the dams also impeded the flow of salmon smolts downriver toward the Pacific Ocean, and the return of mature salmon upriver to spawn at their birthplaces. In the past quarter-century in particular, more than a hundred species and sub-species of salmon were rendered extinct. In this context, David Sohappy sought to save the salmon and his people.

David Sohappy was born near Harrah, Washington on 25 April 1925 and raised in a traditional Wanapum family. He attended a few years of elementary school until he was taken out so that he would not lose his native heritage and way of thinking. He grew up in the pacifist Washat or “Seven Drums” religion, some of whose members became “dreamers,” visionaries who lived at times alone along the Columbia and were sought out for spiritual guidance and sometimes for practical advice on where to fish for salmon or hunt for deer. He worked to support his birth family, did
military service, married Myra and had several children, and worked at different jobs. When he was in his thirties, he had fallen into the Columbia and felt a hand pull him out. A voice told him that his work was not yet finished. On another occasion, he heard a voice tell him that he was to be a spiritual leader. He would say later of these and similar experiences:

If the Creator wants you to know something he'll tell you. We never see the Creator, only hear him. I was asleep at one time and I heard this voice tell me, "Listen to this, here is a chant you have to repeat all the time" (Sohappy letter to Hart, 1987).

He and his wife, Myra, joined the Feather Religion, a stricter version of Washat, and become healers. He observed that

When we go to our services to help heal people we pull down the power of the universe. People that can see, can see it coming. You've got to go the way you're supposed to all through your life. If your worst enemy comes over and asks you for help, you've got to help him. As long as you're asked to help, then you've got to help (interview by author, 1988).

David became recognized as a Dreamer who had been called by the Creator to teach, to heal and to struggle for justice. He was following the ways of his great uncle Smo-halla, a Washat prophet who had led a resurgence of native spirituality in the late 1800s. During David's healing ceremonies, his patients felt a magnetic force coming from his hands; it was said of him also that he had power to control storms and other natural forces. Referring to his role as a Dreamer, he said "We're told in a dream what's going to happen. You hold services and tell people, 'Here's what I dreamt, here's what we have to do next' " (interview by author, 1988).

During World War II, the River People were forcibly relocated from some of their lands, with little warning by the federal government, so that the Hanford Nuclear Reservation could be established for nuclear weapons development. Today Hanford is known as the most polluted place in North America because of its radioactive sectors and the chemical toxins that are seeping into the Columbia River from its storage sites.

When the Dalles Dam was constructed in 1957, its backed-up waters covered over Celilo Falls, the largest native fishing site in North America. The Dalles and other dams covered native villages, burial sites and petroglyphs. The federal government promised “in lieu” sites to replace the flooded villages and fishing places, but the sites were never constructed. Native fishing was restricted to Zone 6, some 113 miles between the Bonneville and McNary dams: the amount of fish Indians might catch was reduced by ocean factory fishing and by non-native fishers (commercial and sport) in the five zones downriver. David Sohappy and other River People occupied Cook's Landing as their “in lieu” site, and sought to have a permanent fishing village there. He observed wryly later: "They keep trying to tell me that we were only supposed to stay there temporarily. I told them that I'm on this Earth only temporarily, and so is everything else." He noted further, "We're supposed to have our own community, our own beliefs, our own longhouses, the traditions that have come to us" (interview by author, 1988). When federal and state governments tried to restrict the rights of the River People even after his successful court cases, David Sohappy used civil disobedience to fight for those rights. He fished openly and sold fish at the site of an old riverboat dock, Cook's Landing in Washington, which he and other Wanapum had occupied in the 1960s.

In 1982, David Sohappy, Sr., his son, David Jr., and other native fishers were arrested for fishing illegally and selling their fish to undercover agents in an operation the federal government called "Salmonscam." Initially, they were indicted for catching 40,000 fish. The fish were missing from Zone 6, based on the first fish count at Bonneville Dam and the second upriver at McNary Dam. It was discovered later that most of the fish had gone up different rivers to spawn because of effluents from aluminum plants along the Columbia, and were not missing after all, but David and the others still went to trial. They were prosecuted under the Lacey Act Amendments, introduced into the U.S. Senate by Washington's Senator Slade Gorton, whose family owned a major seafood company, while "Salmonscam" was already underway. David was accused ultimately of selling 317 fish to the federal agents, convicted in federal court in 1983 and sentenced to five years in prison. In his trial and appeal, David was not allowed to invoke provisions of the 1855 Fort Yakima Treaty or of the 1978 Indian Religious Freedom Act to justify his activities. The Ninth Circuit Court of Appeals turned down his appeal in 1985.

David and the other fishers were tried and acquitted in Tribal Court in 1986, but the federal government demanded that they remain in federal prison. In his trials, and throughout his appeals, David declared that his people's ancient religious laws, which included teachings about fishing responsibly for salmon, took precedence over the federal and state laws that denied him his fishing rights:

Lots of people couldn’t understand what I was talking about when I told them that I follow Unwritten Laws. They didn’t understand. I told them I follow a law that is higher than any written law. So they told me, "So you’re above the laws!" I said, "I didn’t say that, I follow a law that is higher than any written..."
law.” Their laws can’t stop me. Their laws can’t stop
the storm (interview by author, 1988).

When he taught Washat traditions, David Sohappy
spoke about honoring all creation: “Water, the Mother
Earth, the Sun and the Wind: without any of these there
would be no life on Earth . . . The belief is that if we don’t
honor these things we will have no more; everything will
fade away” (interview by author, 1987). His major focus
was on his people’s responsibilities to be faithful to their
religious beliefs. The Wanapum were to respect the sal-
mon, pray to the salmon spirits, act responsibly toward the
salmon, and express gratitude to the salmon for providing
food for the people. “The salmon was created for the
people to have for their own food . . . We are taught that if
we honor our food, it will come back. If we stop, it won’t
come back” (interview by author, 1988).

While in prison, David Sohappy suffered a stroke (an
event initially denied by prison officials, who declared
that he was suffering from the “hysterical paralysis” which
native peoples sometimes have when confined), and his
physical condition deteriorated. Human rights groups
around the world urged his release, including at United
Nations International Human Rights Commission meet-
ings in Geneva, Switzerland through interventions by
Myra Sohappy. Then Senator Daniel Inouye, Chair of the
U.S. Senate Select Committee on Indian Affairs, used his
political influence to secure David’s release in May 1988
after he had been imprisoned for twenty months. On his
release, he said, “My life is for the salmon. After my work
is done, I will move on” (Treaty Council News). His health
was poor, and after resuming life at Cook’s Landing with
limited activity, he suffered another stroke and was hospi-
talized in Toppenish, Washington. He died there when
struck by a third stroke on 6 May 1991.

His people and other natives of the Americas remember
David Sohappy as a powerful spiritual leader and healer,
as well as a courageous champion of natural rights and the
rights of nature.

Soka Gakkai and the Earth Charter

Soka Gakkai is a lay Buddhist organization founded in
Japan in 1930 as an educational reform movement by
school principal Tunesaburo Makiguchi (1871–1944) and
inspired by the teachings of Nichiren Buddhism. Makiguchi
was committed to the development and happiness of each
individual student and affirmed the symbiotic relationship
between the individual and the environment in his 1903 book, Jinsei Chirigaku (The Geography of
Human Life). Key principles of Nichiren Buddhism and the
Lotus Scripture that guide Soka Gakkai practice are engi
(dependent co-origination of all things), esho funi (the
oneness of life and its environment), and striving to fulfill
one’s Buddha-nature in this life on Earth.

While all Buddhists teach the balance of wisdom and
compassion, Nichiren (1222–1282) is famous for adding
the virtue of courage that inspires members of Soka
Gakkai to be socially active. Makiguchi died in prison for
not cooperating with the military government, and in the
1960s Soka Gakkai formed a political party that became
the third largest in Japan by the year 2000. But SGI activ-
ism and growth has been controversial among established
religious groups.

Soka Gakkai spread worldwide in the 1960s and formed
Soka Gakkai International (SGI) in 1975. SGI grew to 12
million members in 180 countries and territories by 2002.
The emergence of the Earth Charter was seen by SGI as a
modern expression of the Buddhist teaching of the inter-
connectedness of all life. As a result, SGI members have
globally sponsored discussion of the Earth Charter, and
ecological consciousness has become an integral part of
SGI teaching.

SGI has an affiliated research center in Brazil, the
Amazon Ecological Research Center, which undertakes
tree planting and agroforestry as well as environmental
education. SGI also co-sponsored an Earth Council video,
A Quiet Revolution, which illustrates the importance of
grassroots action to rehabilitate the natural environment.
SGI organizations are involved in numerous practical ini-
tiatives such as energy-saving campaigns, tree-planting
activities, environmental exhibitions, and recycling pro-
jects. In addition, SGI members in several countries under-
take regular “clean-up” campaigns in their local areas.
When SGI-USA built a retreat center, most of its acreage was designated as a permanent nature reserve and it was named the Florida Nature and Culture Center. Because of the role of corporations in damaging nature, an educational Round Table seminar was organized by SGI at the World Bank in Washington, D.C. in April 1998, followed by regular Earth Charter Dinner Dialogues in Washington since March 2001. SGI-USA has presented the Earth Charter at interfaith activities as a common ground that can be shared by all spiritual traditions, and organized a presentation at the World Parliament of Religions held in South Africa in 1999. SGI-USA also sponsored Earth Charter Community Summits in 12 locations in 2001, and by 2002 over 60 local SGI-USA district meetings had discussed the Earth Charter.

In 2000 SGI co-sponsored an “Earth Charter Asia Tour” with exhibitions, panels, and youth forums in the Philippines, Thailand, Singapore, Malaysia, Hong Kong, Korea, and Japan. In response, SGI-Philippines held a Waste Management Seminar on Earth Day, 2001, and in 2002 their women’s peace forum discussed the relevance of the Charter to peace. In Thailand, the “Before It’s Too Late” environmental exhibit toured nine cities and was seen by 180,000 people. In Malaysia a recycling project was cosponsored, and SGI has developed an Earth Charter exhibition. Beginning in 2002 a regular column called “Love the Earth” was started in Hong Kong SGI’s magazine to give information on the Earth Charter. In Korea the Charter was promoted in seminars and photo exhibitions were organized by the SGI student division. In Japan, an environmental group was formed by SGI members in Osaka called KEEP. SGI members in the Netherlands, Australia, France, South Africa and Belgium are also actively promoting the Earth Charter.

Institutionally, SGI has developed several specialized organizations to develop further its mission to promote peace, culture, and education. The Boston Research Center for the 21st Century (BRC) was founded in 1993 by SGI as an affiliate organization. In 1997 the BRC began a program of environmental awareness focused on the Earth Charter that resulted in a series of conferences and several booklets, namely, Buddhist Perspectives on the Earth Charter (1997), Women’s Views On the Earth Charter (1997), and Human Rights, Environmental Law, and the Earth Charter (1998). Also, in 2001 Soka University of America was opened in California on a site surrounded on three sides by a 4000-acre nature preserve.

“Soka” means “to create value,” and Daisaku Ikeda, president of SGI, emphasizes the value of nature in his writings and in his photographic exhibits. He emphasizes that education at its best involves an inner transformation of values to enable people to recognize their kinship with the environment and build a lasting peace.

At the World Summit on Sustainable Development in Johannesburg in August/September 2002, SGI’s proposal for a decade of education for sustainable development was included in the Summit’s agreed-upon Plan of Implementation. SGI co-produced the video A Quiet Revolution on local ecological initiatives, and SGI linked with the Earth Charter Initiative for “Educating for Sustainable Living with the Earth Charter.” By 2002 study of the Earth Charter and ecological responsibility had become important elements of SGI practice worldwide.

Somé, Malidoma Patrice (1956–)

Acknowledging the sanctity of nature is the centerpiece of Malidoma Patrice Somé’s message. In his own words, “[n]ature is the foundation of indigenous life” (1998: 37) and

[i]f you peek long enough into the natural world – the trees, the hills, the rivers, and all natural things – you start to realize that their spirit is much bigger than what can be seen, that the visible part of nature is only a small portion of what nature is (1998: 47).

Malidoma Somé is a shaman of the Dagara culture of West Africa, a former college professor with two doctorates, the founder of the nonprofit organization, Echoes of the Ancestors, and an active voice in the Men’s Movement. According to Somé, opening one’s sensitivity to the intricacies of nature allows one to experience the natural environment in a more intimate way, ultimately allowing one to utilize its placid, powerful and healing traits. Proper rituals and communal support bolster the power and healing that nature provides to the enlightened individual. It leads the adherent to reunite with the vast forces of the universe that were unleashed during one’s birth, or as a Dagara elder once said, to return to one’s own center.

Somé’s message challenges the machine, monetary, and textual culture of the West. He presents the indigenous culture as fit to embrace the salubrious power of nature,
because it recognizes the spirit behind nature. The reliance on modern technology for spiritual fulfillment fosters an internal struggle within the Western spirit. To the Dagara, this type of chasm needs to be mended. A ritual is the typical procedure to reconnect the individual with his or her self, ancestors, and the spirit world, in order to realize one’s own life purpose.

The Baor ritual – initiation – is the essential step for a Dagara male to reunite his spirit with his corporeal body. The neophytes are required to perform particular exercises that strengthen their awareness and adjust their sensitivity to the natural environment of the bush. These tasks are performed individually and individually under the auspices and guidelines of the elders and their ancestors, and typically lead to the participants entering into a transcendental state. Out-of-the-body experiences allow the spirit to have the necessary maneuverability to connect to the individual soul. The ability to sense and feel one’s environment is central to success in the Dagara world because it enables one to enter into the sacred realm of the spirit.

Somé was an atypical participant in Baor, because at the age of four, he was taken away by French missionaries and sent to a Jesuit school and seminary for 15 years. He walked back to his village at age 20, indoctrinated with colonial Christianity. Baor is a dangerous undertaking in which all aspects of the body are vigorously challenged – every year there are participants that never return to their families. Somé was especially disadvantaged because he was considered “initiated” into the white man’s world, therefore his ancestral spirit had withdrawn from his body. Analytical thought, especially literacy, suppresses the ability to access certain traditional knowledge, because it occupies a space within one’s psyche that is reserved for something else (Somé 1994: 178). Of particular importance to Somé was his experience during the “tree exercise.” This event enlivened his ability to feel his surroundings in an animated way, rather than just see them in a mundane level. After two tedious days of staring at a yila tree, he eventually came to realize its sacrosanct character as he saw a vision of a green lady composed of a green fluid, from the inside out, whom, in her embrace overcame his body with an immeasurable amount of love. This green lady is symbolic of Mother Nature, a conscious embodiment; Somé believes that the relationship between Earth and humans is represented in an intimate mother/child bond of nurturing and love. Thus, humans have a natural spiritual link to the Earth.

These apertures into the otherworld are commonplace in the Dagara experience; there is little distinction between the physical and metaphysical. Going into the other realm is a conduit to understanding, and entering these other realms is ritualized in a communal setting, yet all participants have their own personal experiences, from which they can draw their own personal meaning.

Somé’s is a crucial voice to describe to Westerners the relationship between religion and nature in Dagara culture because of his dual citizenship in the modern and traditional worlds. His popularity is evidenced by the diverse circuits that embrace his work. At “spiritual” retreats he promotes the need for elders in the industrial society. Grief ceremonies, ritual initiations for boys and girls, connecting with the ancestors training, and anger-management courses, are among the activities that he encourages under the theme of finding identity and balance.

Somé speaks out to the gay audience by comparing their secondary position in the West with their primary position as “gatekeepers” of the Dagara tribe’s relationship with the gods and the spirits. Some women’s conferences and groups have placed him among their speakers or added him to their required reading lists. Somé’s wife, Sobonfu, also conducts seminars and workshops on the relevance of indigenous ideas and practices to modern problems.

According to Somé, the indigenous cultures of Africa are ideal places to seek pacification and restoration with nature because they are formatted to coordinate with their natural environment. The Dagara rely on each other to survive in the harsh environments of certain places. Somé extends this reciprocal relationship through his work in the Western world. He shares the wisdom of the Dagara, in exchange for the supply of necessary resources like the construction of water reservoirs and the means to fight extreme poverty and sickness to preserve indigenous culture. Moreover, he asserts that indigenous African spirituality can provide a necessary model for people of industrial cultures to develop their own spiritual awakening and healing in their own ritual, communal, and natural environments.

Southeast Asia

Southeast Asia is a vast, diverse, complex, and dynamic mosaic of interacting religions and ecologies. Geopolitically, the region encompasses all of the countries East of India and south of China. The region is usually divided into two major parts: the mainland or continental parts
Southeast Asia is extraordinarily rich in biodiversity as a result of being a crossroads, the prevalence of tropical forests, and insularity. Biologists refer to Southeast Asia as the Oriental realm, but it is heavily influenced by the adjacent biogeographic realms of the Palearctic (mostly East Asia), Ethiopia (northern Africa into the Middle East), and Australasia. Each of these three realms has a distinctive natural history including a combination of plant and animal species. The three realms overlap in Southeast Asia. The natural vegetation cover of Southeast Asia is composed mostly of varieties of tropical forest. (Cambodia is the only country in the region with extensive savannas or grasslands.) Insularity is another important factor. For example, Indonesia is composed of 13,677 islands, and the Philippines of 7100 islands. Geographical isolation, a prime characteristic of islands, stimulates speciation through adaptive radiation as populations competing for limited resources develop distinctive niches. Thus, it is no coincidence that within Southeast Asia, the country with the highest biodiversity is Indonesia. It contains over 20,000 species of plants, 515 mammals, 1519 birds, 270 amphibians, and 600 reptiles. A significant number of these species are endemic; that is, limited in distribution to parts of Indonesia and not found elsewhere.

Cultural diversity refers to the number of cultures in an area and is often estimated by the number of associated languages. Religion, as part of the socio-cultural system, is also part of cultural diversity. In general, there is a correlation between cultural and biological diversity. In areas where cultural diversity is high, so is biodiversity (number of species). In areas where cultural diversity is low, so is biodiversity. Exceptions occur, but this diversity principle reflects a general tendency. As a related generalization, diversity is highest in equatorial regions (especially tropical rainforests), and lowest in polar regions. Indonesia illustrates the diversity principle. It has not only the highest biodiversity in Southeast Asia, but also the highest ethnic, linguistic, and religious diversity. No less than 672 different languages are spoken in Indonesia, most associated with a different ethnic group, and many of these with their own distinct religion.

In Southeast Asia, cultural identity is usually closely related to a particular geographic place and one or more biomes. (A biome is a category of similar ecosystems, such as lowland tropical rainforests.) Indeed, to some degree each culture is a distinctive adaptive strategy for relating humans to their natural environment. Technology, economy, religion, and other components of culture as an adaptive system are all intimately related to the ecosystems in the habitat of a society. Accordingly, in characterizing cultures in Southeast Asia these general types are often recognized – coastal fishers and traders, lowland wet-rice agriculturalists along river floodplains and valley bottoms, and swidden (shifting) horticulturalists and foragers (hunter-gatherers) in the hill and mountain forests. The great rivers of mainland Southeast Asia are the Irrawaddy, Salween, Chao Phraya, Mekong, and Red. These rivers not only supply water to rice paddies, but together with land and sea routes also link the different regions within Southeast Asia and beyond through extensive networks of trade and commerce. The distinctive systems of food production in Southeast Asia are correlated with sharply contrasting levels of population density (individuals/square kilometers): foragers (less than 1), swidden horticulture (dozens to a hundred), and wet-rice agriculture (hundreds to over two thousand). The highest population densities are associated with rice farming on the rich soils of volcanic islands like Java in Indonesia. The higher the population density, the greater the complexity of social, political, and religious institutions as well as other aspects of culture. Furthermore, higher levels of population density cause greater environmental impact through more natural resource extraction and consumption with resulting waste and pollution.

As societies deplete their own natural resources, they must extend their reach to those of other areas through trade or conquest, and states do this far more than any other kind of society. The state, or civilization, is a variety of culture which includes some combination of a centralized government, bureaucratic administration, police and military, cities, monumental architecture, writing, craft and other specialists, and social stratification (socio-economic classes). The earliest states in Southeast Asia began around 500–1 B.C.E. However, only later, starting around the eleventh century, did the famous theocratic cities develop such as Borobudor, Angkor Wat, and Pagan, located respectively in Java, Cambodia, and Burma of the present day. They were among the societies heavily influenced by the spread of the Hindu religion and other aspects of culture from India.

Throughout insular Southeast Asia, the most important form of political organization was often connected with controlling trade and commerce, and the independent harbor principalities headed by chiefs, sultans, or sultans with small territories focused on river estuaries or seaports along the coasts. International commerce developed in Southeast Asia by the first year of the Common Era and flourished from the fifteenth century onward. China was the main market, until European colonialism began to change the dynamics of the political economy in the sixteenth century. For millennia, sporadic wars were fought for the control of routes of trade and commerce, such as the many conflicts between Burma and Thailand.

Religious conversion often accompanied the expansion of trade and commerce from South Asia, with Hinduism and later Buddhism spreading into most parts of mainland

include Vietnam, Laos, Cambodia, Thailand, Burma (Myanmar), and peninsular Malaysia; and insular (island) parts include the Philippines, Singapore, Brunei, Indonesia, and parts of Malaysia.
Southeast Asia, and Islam into much of insular Southeast Asia. The introduction of a new religion may have influenced local and regional ecology significantly, but this possibility requires further research.

It is noteworthy that rapid population growth did not begin in Southeast Asia until the sixteenth century or even later. For example, in Thailand, as late as 1825, the population was less than one million, whereas today it is more than 60 million. In the past, the fact that traditionally most Thai males became monks for some period of time, ranging from a few months to years or even a lifetime, combined with the fact that monks are supposed to be celibate, must have helped reduce population growth. However, future population growth in Thailand, and elsewhere in Southeast Asia, is likely to continue well into the next century before it stabilizes, thus putting increasing pressure on the land and resource base, on the ability of the environment to absorb waste and pollution, and on economic, social, political, and religious institutions.

In many parts of Southeast Asia, there have been occasional tensions and conflicts between the Highlanders and lowlanders, the former marginalized in almost every way, and the latter more powerful economically, politically, and militarily. Throughout the region today with increasing population, the need for agricultural expansion, and national security concerns, the Highlanders, who usually live in border areas between countries, are often victimized, including through military attacks, involuntary labor, forced relocation, and pressure for conversion to Theravada Buddhism as the dominant state religion, such as in the case of the Karen along the border between Burma and Thailand. For instance, in Thailand the Highlanders compose only about 1 percent of the national population, but occupy nearly 20 percent of the national territory. Accordingly, they are destined to continue coming under increasing pressure from lowlanders and the state in the future. As another example, in contemporary Vietnam, economic development in the highlands is controlled by the lowlanders, often with negative impact on Highland societies and their environments.

Religion is an extremely ancient, pervasive, and powerful force in society, politics, and history. Furthermore, traditionally religion is usually the primary means whereby the individual and society as a whole orient to the world, find meaning in life, and are guided and motivated. There is a remarkably rich diversity of religions in Southeast Asia.

The mainland is predominantly Buddhist and mostly of the Theravada sect, while the insular portion is mainly Muslim, except for the Philippines which is 80 percent Catholic, a reflection of its long Spanish colonial history. Underlying these mainstream religions, however, are elements of the prior indigenous religions of animism, a belief in multiple spiritual beings and forces in nature. Hinduism has flourished mainly in Bali, and Hindu influences remain in the popular religion of many in Java, southern Sumatra, Cambodia, southern Vietnam, and Thailand. People of Chinese ancestry in Southeast Asia may practice aspects of Confucianism, Daoism, and/or ancestor worship in addition to, or instead of, other religions like Buddhism. Thus, whereas in Western societies an individual usually ascribes exclusively to only one religion, in Asian societies an individual may actually practice more than one religion without any sense of incongruity.

The Indonesian island of Java illustrates the complexity of religion in Southeast Asia. Islam is the main religion of Indonesia. However, on Java, orthodox Islam is mainly practiced by the merchant class, urban bureaucrats emphasize forms of Buddhism and/or Hinduism, and animism is common among farmers and others in rural areas. Furthermore, in Southeast Asia there are enclaves of Muslims in countries that are otherwise dominated by another religion, as is the case for the Malays in southern Thailand and the Cham in Cambodia.

The impact of European colonialism has been more economic and political than religious in Southeast Asia. Christianity has not been as influential there as it has elsewhere in places like Latin America. Nevertheless, today there are millions of Christians in Indonesia and Vietnam as well as in the Philippines. In addition, new religions have developed, or old ones have been revived and revised. For instance, Cao Dai emerged in Vietnam in the early twentieth century as a mixture of Confucianism, Daoism, Buddhism, and Christianitly. In part it was a reaction against French colonialism and was outlawed, although now it is an officially accepted religion. Because religions are different in the way they relate to nature, these changes in religion may have ecological consequences, and this possibility needs to be researched.

Religious differences may allow different ethnic groups to coexist in the same environment by promoting niche separation rather than resource competition. For instance, in southernmost Thailand, it is common to find adjacent Buddhist and Muslim communities who use the same environment differently mainly because of their religion. As an illustration, Buddhists exploit a far wider spectrum of wildlife species than do Muslims who consider many species to be unclean and taboo.

Religion can also contribute to nature conservation. For instance, in many parts of Southeast Asia there are individual trees, groves, and forests that are believed to be sacred. Consequently, resource exploitation in such sites may be significantly reduced or even avoided or prohibited entirely. Whether intentionally or inadvertently, sacred places in nature may serve as conservation areas that protect some species as well as portions of ecosystems and landscapes. As a case in point, caves associated with Buddhist monks are considered sacred. Bats which roost in these caves during the day fly far beyond them in feeding
at night and are important agents in pollination, seed dispersal, and insect population control. The sacred status of caves may help protect the bats in them and thereby the ecological functions of the bats. However, in many regions Christian and Islamic missionization has threatened or even destroyed sacred places in nature as pagan, and therefore diminished or eliminated any value they might have had in conservation.

The people on the island of Bali in Indonesia remain mainly Hindus, but practice a syncretic religion that also includes elements of animism and Buddhism. Temple priests function through rituals as regulators of the flow of water for irrigating wet-rice paddies. The water is derived from a sacred lake in the volcanic mountain at the center of the island. Also temples in Bali, Thailand, and other places in Southeast Asia often provide sanctuaries for macaque monkeys and/or other species. The animals and plants in temple yards are protected by virtue of their association with the sacred space.

The subject of the relationships between religion and nature has barely started to gain attention in the last two decades in Southeast Asia. However, there have been some significant public initiatives. One is the Siam Society international symposium in Chiang Mai on culture and environment in Thailand. The main conclusion reached by the Thai and foreign participants was that Thailand is experiencing serious environmental degradation because of a decline in adherence to its culture and religion through uncritically and unselectively embracing so-called modernization. In another regional symposium, international participants at the Buddhist Institute in Phnom Penh, Cambodia, explored the environmental crisis and environmental ethics from the perspectives of the Buddhist, indigenous, and Islamic religions. Such initiatives may be indicative of an emerging realization that spiritual ecology has some practical potential to contribute to the reduction of environmental problems in Southeast Asia.

While “modernization” has contributed to the secularization of societies in many ways, religion still remains important in the lives of most Southeast Asians. It is really quite amazing that religions have persisted for millennia under such very different circumstances, yet they have obviously provided meaning and useful guidance in the lives of many people to this day.

At the same time, however, there is the perennial obstacle of the discrepancy between ideals and actions. The core principles of Buddhism and Hinduism can be applied in ways that are environmentally friendly. For instance, both share the ideal of ahimsa or avoidance of harming other beings. However, in practice there is natural resource depletion and environmental degradation or even destruction throughout most parts of Southeast Asia. Such discrepancies are nothing new, but have intensified with the pressures of the accelerated growth both in population and materialist consumerism, especially in recent decades with economic development and now globalization. Accordingly, today one of the greatest challenges is for individuals, communities, and nations to identify and more closely follow the ideals in their religion in ways that are most conducive to developing more sustainable and greener societies that conserve, promote, and enhance biodiversity and ecosystem vitality instead of degrading them.

Space Exploration

Loren Eiseley called the return to Earth from space “the last miracle” in his book The Invisible Pyramid (Eiseley was a renowned paleontologist at the University of
Pennsylvania; the most well received of his eloquent popular writings on evolution was *The Immense Journey*). But that is not the first thing that needs to be said in a discussion of space exploration, religion, and nature. So let me return to Eiseley’s important insight later on. I want to begin, instead, with astronaut Michael Collins’ comment about the Apollo program: he said it was all about leaving.

It is hard to avoid the conclusion that space exploration entails the abandonment of the Earth and its nature, leaving it behind in a technological thrust onward and upward. Surely technology, not nature, has been the emphasis of space exploration, and arguably technology has always been about surmounting nature. Of course, an otherworldly religious orientation in the West has helped to generate such an Earth-denying agenda on the part of technology, so that a film with a fast cut from Gothic cathedral spires to Cape Canaveral gantries would not lack semantic continuity. And Loren Eiseley’s book title suggests an even longer history for our superhuman drive to be up, up, and away.

To be sure, the technological mission was eventually meant to *supplant* the spiritual priorities that fueled it, based as it was on scientific perspectives that scarcely allowed for gods in heaven above, let alone in Earth’s sacred groves. Thus it was entirely consistent with such perspectives when a Soviet cosmonaut derisively observed the lack of angels visible along his flight path transcending terrestrial skies. By the same token, the U.S. astronauts’ Christmas reading from lunar orbit sounded sincere but sentimental – and seriously out of keeping with the mechanistic attitudes they were triumphantly embodying. In spiritual terms their accomplishments were rather a defilement of whatever sacred attributes either the Earth or the moon were thought to possess by more traditionally religious cultures.

Even the mediating image of the garden, representing a more gentle technology in relative attunement with nature, is jettisoned by our recent rocket launches into space. Buckminster Fuller’s “Spaceship Earth” idea – described in the inventor and philosopher’s 1969 work *Operating Manual for Spaceship Earth* but made public by Fuller even earlier – had already imagined our home planet as a totally technological environment, and a mechanistic vision was no less dominant in dreams of a future in space: gardens completely surrounded and tightly controlled in floating biospheres; space colonies on the moon or Mars, allowing only a life-sustaining minimum of neo-nature, purged of all wildness; “terraform-ing” fantasies in which heavenly bodies would be scarified in an engineer’s caricature of earthly ecology. A 1979 article by George Woodcock summed up these technohorticultural visions as “the garden in the machine,” reversing Leo Marx’s earlier notion of American environmental history as “the machine in the garden.”

Surely, however, venerable American archetypes of advancing frontiers and Manifest Destiny continued to shape the efforts of NASA as well as the eloquence of John F. Kennedy in pursuing the space race with the Soviet Union, which propelled us to the moon. Woodcock’s essay appeared in a special issue of the *Michigan Quarterly Review* commemorating the tenth anniversary of the first lunar landing. Most of the articles and poems in the issue noted the emphatically technological auspices of the space venture, along with the unreflective if not robot-like behavior of the astronauts, trained to a technical perfection which excluded, with rare exceptions, any philosophical or poetic, let alone religious, musings on their unique experiences in space.

Several contributors to the issue decried this response to space exploration as dehumanizing, but all noted the focus of NASA and its astronauts on finding the factual
information and acting on it efficiently, with seldom a thought given to the romance of the journey. The exceptions were indeed rare: Edgar Mitchell returned from space a spiritual seeker with transpersonal psychology interests and founded the Institute of Noetic Sciences; James Irwin splashed down as a Christian evangelical who started a “High Frontier” ministry. These two responses were in stark contrast to the military overtones of the “New Frontier” competition with the Soviets or the later “Star Wars” dreams of missile defense. Mitchell and Irwin saw something sacred in space but also turned back to look at the Earth. And, through the media, so did we.

Certainly it was the view of Earth afforded us by space exploration that led to Loren Eiseley’s “last miracle.” Of course, this view suggested different things to different onlookers. Some, like President Carter, saw its message as laudably pacific but largely political: no national boundaries were visible on the Earth from space. Others found this an incitement to mystical dreams of Oneness. Some were struck aesthetically by the beauty of a blue-and-white planet that looked like a precious jewel or Christmas tree ornament. May Swenson, in her poem “Orbiter Five Shows How Earth Looks from the Moon,” found a dancing woman, a temple celebrant, in the outlines of clouds and continents.

In this poetic perception we begin to get intimations of archaic spirituality, Earth-oriented rituals, myths, and ceremonial sites which once involved reverence for the immanently sacred that aligned us with nature and its cycles. Even popular films with space themes hinted at this deep sense of terrestrial reconnection, as I pointed out in my 1986 book, Approaching Earth. The black monolith, modeled on Stonehenge, in 2001: A Space Odyssey; a Mayan temple that provided the rebel base in the first Star Wars; and the Native American sacred mountain serving as the rendezvous point for earthlings and aliens in Close Encounters of the Third Kind all bespoke earthly imperatives which counterbalanced the spacefaring quests of the films’ main characters and the Space-Age culture they represented. In each case, through these ancient religious rallying sites, a closeness to terrestrial nature seemed the surprising accompaniment to an ostensibly outward-bound focus.

It is fair to say that a renewed connection to nature did not occur in any specific and full-blown way to the Earth’s outer-space onlookers until the Whole Earth Catalog emerged with the famous photograph on its cover and a message of ecologically sustainable living in its pages. Here a green consciousness was blended with a techie sensibility: technology can yet return to heal the Earth it has sought to abandon.

Still, the whole-Earth photo was pivotal, even miraculous, in reorienting our attention toward the terrestrial environment. When the first Earth Day was proclaimed in 1970 following a decade of manned space flight and the first lunar landing, Earth and its nature became the most significant discovery – or rediscovery – of the Space Age. It seems more than a coincidence that 1970 was also the year that The Invisible Pyramid was published.

Loren Eiseley’s post-Apollo vision, set forth in this text with the same eloquence he had displayed in The Immense Journey, involved his having been shown Halley’s comet in the night sky when he was a small boy in 1910. He knew that Halley’s would be returning in 1985, and he saw that return – which he did not live to witness – as a metaphor for the conscious and caring re-entry he felt a technological culture in the Age of Space needed to make into the green world, the “sunflower forest,” of nature’s processes. With characteristic evocative power, The Invisible Pyramid set forth his hope for this “last miracle” of technology, the realization of earthly nature and its tending as the first priority of space exploration.

The attitudes of the 1970s in many ways followed the lead of Earth Day and Eiseley’s hopes, replacing the attitudes of Earth-denial in the 1960s. In 1974 Lewis Thomas’ The Lives of a Cell envisioned the Earth as a fragile one-celled organism within which human beings are a kind of nervous system. A year later English geochemist James Lovelock presented his “Gaia Hypothesis,” a more scientifically grounded version of Thomas’ metaphor, in an article that was succeeded in 1979 by his book with the arresting subtitle Gaia: A New Look at Life on Earth.

Lovelock, with biologist Lynn Margulis, had taken his inferences from observing the surface of Mars in work with NASA and applied them to the Earth. He proposed that the latter was an autonomous being creating and adjusting the organic conditions, from the atmosphere to human life, for its own continued existence as a global biosphere. Lovelock got the name for his hypothesis, the pre-Olympian Earth goddess of ancient Greece, from his neighbor in England, the novelist William Golding.

And it has to be said that, at least initially, the Gaia Hypothesis resonated more positively (if often vaguely) with aesthetics and spirituality than with strict science. In fact, Lovelock was taken aback by the outpouring of agreement from those who knew little or nothing about ecology as a science.

Nevertheless, this proposal further underscored the terrestrial reconnection that space exploration had quite amazingly begun to foster: not only was this a redirection of our attention, but also, for many, a reenergized reverence for nature. Sally Ride, the first U.S. woman in space, may have had the extraction of “natural resources” more in mind than a Gaian spirituality, but it was evocative for her to speak in favor of a “Mission to Earth” a few years after the last lunar landing in 1972. The testimony of contemporary literature, too, was for the most part supportive of earthward rather than of spaceward ideals, as Ronald Weber concluded in 1985 in his Seeing Earth: Literary Responses to Space Exploration.
By 1986, on the other hand, several reassessments tempered any totally upbeat view of our Space-Age rebirth as eco-earthlings. In the papers from a conference on ecofeminism, Yaakov Jerome Garb raised questions about whether our vantage point from outer space represented “perspective” or, after all, “escape.” He deconstructed the whole-Earth photograph to find an alienating distance, a literalistic image, and a disturbingly univocal sign of the “one-true-story.” Peter Bishop weighed in with a Jungian critique of “the shadows of the holistic Earth,” fears of immensity, loss, and fragmentation hidden in our Space-Age fantasies of environmental harmony and order. I contributed a milder warning with a piece called “Getting Back to Gaia,” a prelude to my Approaching Earth book, in which I pointed out Lovelock’s ignorance of the implications of the name he borrowed for his hypothesis – and the consequent need for a non-scientific sophistication about the myths and metaphors at play in our Space-Age reconsiderations of Earth lest these be lost in exclusively cybernetic strategems.

The explosion of the Challenger space shuttle that same year was another disquieting factor, turning us away from space exploration and toward earthly agendas, to be sure, but offering a reminder that our reconnection could be tinged with tragedy.

In the end, though, as appraised from the dawn of a new millennium, when millionaire Dennis Tito has just returned from orbit with an “ordinary citizen’s” reiteration of the inspiration the whole-Earth view gave him to be a born-again earthling, the most striking lesson to retain from our first forays into space is clear. They eventually provided the angle of vision that galvanized a new environmentalism, including an emergent ecofeminism, which “greened” most religious expressions, while perhaps as well specifically promoting a resurgent neo-paganism. Admittedly these movements have not swept aside the arguably patriarchal politics of pollution and exploitation. But space exploration provided a new start, and new hope, for the forces seeking ecological sanity and spirituality in a technological future.

Or perhaps it was Earth herself who was calling us back, teaching us that at the height of our highest technological leap beyond her bounds, our humanness required a seemingly outmoded grounding in the dark wet soil of home, Eiseley’s ancient sunflower forest. A miracle indeed – a last one, we are well-advised to imagine, in that it is, finally, a remarkably positive legacy from the end of the troubled century when we first ventured into space.

Spinoza, Baruch (1632–1677)

Few thinkers have been as controversial, both in their lifetime and long after, as the philosopher, theologian, and Torah scholar Baruch (or Benedict) de Spinoza, usually referred to simply as Spinoza. At the age of 23 (on 27 July 1656) Spinoza was excommunicated from his synagogue in Amsterdam, in the ceremony known as the cherem, for his denial of the personal immortality of the soul and his doubts about the divine origin of the Torah. He was put under a ban that forbade any member of the congregation from communicating with him or reading any of his future publications. During his subsequent years as a self-supporting lens craftsman living in the southern part of the Netherlands, Spinoza experienced a more subtle form of censorship and was often accused of being an atheist for his anti-supernaturalism and his affirmation of the power of reason to disclose the nature of God. While he was able to get one of his works published in Latin, he had to modify his main work, Ethics (published posthumously in 1677) to get it ready for a Dutch language edition. Specifically, whereas in the Latin version Spinoza equated God and nature (Deus sive natura), in the sense of power but not in the sense of materiality, in the intended Dutch version he felt that he would have to drop out this correlation with nature. In his political and hermeneutic text Theological–Political Treatise (published in 1670) the correlation of God and nature is more boldly asserted, but again, in the sense that each is the power and the manifestation of being as infinite substance.

In the eighteenth and nineteenth centuries, the charge of Spinozism, which carried the taint of pantheism and even atheism, would appear when thinkers of the Protestant left struggled to articulate a more naturalistic conception of the divine. A famous instance occurred when the German Reformed theologian Frederick Schleiermacher (known as the grandfather of liberalism) was accused of importing this dangerous non-biblical and heretical doctrine into the church in his 1799 On Religion: Speeches to Its Cultured Despisers. Schleiermacher, while publicly
affirming the influence of Spinoza on his thinking, was able to deflect this charge and get his early work past the censor. Yet decades later Schleiermacher's colleague at the University of Berlin, G.W.F. Hegel, strongly criticized any hint of Spinozism in religion – going so far as to say that Eastern religion was actually a form of Spinoza's pantheism because of its alleged corollary belief in one substance. For Hegel, Spinoza's substance was devoid of spirit or self-consciousness and thus could not be a worthy religious object. Even in the twentieth century both Jewish and Christian theologians have often had to tread lightly around any affirmation of the clear pantheism in Spinoza's Ethics. Yet Spinoza's positive impact on the Enlightenment, with its quest for a universal religion, and Romanticism, with its hunger for the hidden abyss of nature, can be measured by the courageous ways in which a few major thinkers of this period revivified the study of nature as a religious theme in its own right.

It is often assumed that Spinoza lived an isolated life that was cut off from contact with the creative minds of his time. In fact, he frequently entertained visitors of distinction in his home and was fully aware of what was taking place in the major universities of the Netherlands and beyond. He engaged in lengthy correspondence with noted philosophers and scientists and was able to answer some of the first criticisms of the pre-published manuscript version of his Ethics. He was an early champion of the ideas of René Descartes, and continued to teach the Cartesian philosophy to private students who visited him from Leiden University during the period in which such thought was effectively banned from Dutch universities – further damaging his reputation in the eyes of both Jewish and Christian theologians. Yet his championing of Descartes did not unquestioning, especially concerning the ideas of soul and substance.

For Descartes, the world is constituted by two fundamentally different modes of substance, whose interaction is somewhat shrouded in mystery even though he held that there may be a link between them through the pituitary gland in the brain. On one side is extended substance, which exists in three spatial dimensions and can be plotted on a three-axis (x,y,z) coordinate system. This is the realm of matter that can be analyzed using the principles of a mechanistic physics. On the other side is non-extended substance, the realm of mind, which has no spatial traits and is not located within any type of coordinate system. Non-extended or thinking substance provides direct evidence of its own existence through a process of introspection and self-conquering doubt of external reality. From a self-evident foundation of pure internal intuition consciousness can establish both its own immortality and the existence of a perfect deity.

For Spinoza, this dualism produced severe problems that he set out to resolve in his own metaphysics of substance. Unlike any manifest order within the world, substance is that which bears traits, while not having traits of its own; that is, “A substance is prior in nature to its affections (Ethics).” Yet for Spinoza there could only be one substance, not two or more. The one infinite substance has an infinite number of affections or modes, only two of which are immediately knowable by us; namely, the physical and the mental modes. Consequently, contra Descartes, there is one substance with two known modes, not two separate substances with a dubious connection. Mind and matter were simple, different modalities of the one nature or God. Further, Spinoza distanced himself from the atomism implicit in Descartes' vision of nature and affirmed a deeper unity that he denoted by the Latin and medieval term "natura naturans" or nature naturing – somewhat akin to his use of the Latin concept of conatus or striving. Given the principle of unity in his fundamental ontology, Spinoza argued that the most basic value of life, and the foundation of ethics, was the intellectual contemplation of the divine infinite substance. Spinoza did not have any personal or social religious practices that pointed to an experience of the holy as a part of nature, but he did articulate a kind of liturgy of the mind that sought a deep parallelism between the human understanding of the infinite (via two of its modes) and the infinite substance itself. By rejecting supernaturalism and any notion of a personal immortal soul, Spinoza came very close to a kind of nature mysticism in which the distance between the human individual and the divine is overcome through the human instrument of reason. This model provides no place for special historical revelation or for the sacredness of any test, as neither is necessary for the intellectual contemplation of God as nature.

Specifically, Spinoza argued that God (as nature) was unique, a necessary existent, the necessary cause of all things, and was devoid of will or intellect. Further, all things, no matter what their attributes, have their being in and are sustained by God. Again, the distinction between a creator and its creation is denied since both dimensions of nature are part of the same infinity. Interestingly, Spinoza’s form of pantheism is necessitarian and denies anything like free will (both in God and in human beings). One implication of this is that, “... all final causes are nothing but human fictions (Ethics).” God as nature has no lack in its infinite reality and hence can neither have nor hold forth any unfulfilled goals. This view of the divine puts Spinoza on the opposite side of the divide from contemporary process perspectives, which affirm teleology and incompleteness in the divine and in the human order as it relates to the divine.

For centuries the epithet “Spinozism” has been a term of rebuke, yet very few thinkers have actually probed into the meaning of so-called Spinozism and into its key role in the evolution of our understanding of nature. While Spinoza has had little impact on contemporary eco-feminism, he has had a strong influence in two areas of
thought that are of growing importance. In the French postmodern milieu he has appeared as a crucial dialogue partner and goad to the reflections of Gilles Deleuze who developed a non-linguistically centered ontology of nature and its inner dynamisms. This has opened up an avenue of reflection that is not ensnared in the stifling debate between French structuralism and deconstruction. In the revival of classical Euro-American pragmatism, which rethinks the late nineteenth- and early twentieth-century texts of Charles Sanders Peirce, John Dewey, and William James, there is now a movement to unfold a metaphysics of nature that has clear and conscious ties to Spinoza. Among thinkers who have acknowledged this tie are Justus Buchler, Don Crosby, Jerome Stone, and this author. Process metaphysics is less open to a dialogue with Spinoza because of the latter’s perceived eternalism and static view of the one infinite substance. However, insofar as process thought focuses on the extensive continuum, creativity, or the Platonic container, it may find itself more open to an appreciation of the power of Spinoza’s key concept of nature naturing. By compelling us to take the concept of immanentism with the utmost seriousness, Spinoza makes it possible for us to unfold a fully radical concept of immanence with the utmost seriousness, Spinoza nor leaves it in the hands of an alien creator God.

**Spirit and Nature**

A theological term analogically borrowed from early natural sciences – namely, stoicism and Platonism – Spirit remains intimately correlated to a culture’s philosophy of nature. Inasmuch as the philosopher William James once observed that “[r]eligion is our manner of acceptance of the universe” (Goodenough 1998: 47), a given culture’s sense of embeddedness or, conversely, self-exclusion from ecological systems may be deduced from its articulation of spirit. Despite the affiliation of dust and spirit in the creation stories of the Hebrew Bible, predominant correlations of Spirit and nature in the twenty centuries of Western Christianity have tended to legitimate an aversion of the Earth through the evocation of Spirit’s transcendence.

Early Semitic stories, like many indigenous cosmologies, employed the concept “spirit” (in Hebrew, *ruach*, translated as “breath” or “spirit”) without substantively pulling the sacred out of the ecological matrix. Spirit, rather than forcing the value of life to stand away from or against nature, conspired with the physical: quite simply as the air is indivisible, so the breath (spirit) of life that God breathes into the first human is indistinguishable from the human’s own breath (Gen. 2:7). Among the Jesus movements of the first century, “Spirit” was a predominant name for the experience of the immanent power and presence of God, that which promised the renewal of creation.

During the first centuries, Christian theologians, philosophically girded with Platonic and Stoic dynamic materialism, capitalized upon Spirit as causal agent or efficacy of the sacred. Yet, two significant tidal turns in Spirit’s affiliation with nature transpired during these transitional centuries: 1) Spirit was, given its later Semitic affiliation with prophetic word and textual inscription, increasingly construed as a human, rational phenomenon; and 2) the apocalyptic cosmology of communities politically resisting the Roman empire, which had seemingly returned the Earth to “waste and void” (see Gen. 1:1–2), construed Spirit as another viable life region to which they might immigrate. Later Christian theologians read “the fall” of the Earth not as Earth’s conscription by empire, but as an ontological devolution of matter itself. Quite simply, nature, having once been a paradise, wasn’t itself any more, but had taken on qualities averse to life in the Spirit – namely, transience, temporality, and suffering.

While Stoicism and Platonism considered Spirit to be the most refined, purified form of matter, with the onset of neo-Platonism in the fourth century, “spirit” (*pneuma*, in Greek, affiliated with “air” or “wind,” and “spiritus,” in Latin, meaning “breath”) came rather to designate that which was by definition immaterial. To invoke Spirit as the causal agent of a “new Earth” (Rev. 21) henceforth signaled Christianity’s revulsion toward the conditions of finitude, spoiliation and mortality. These psychic aversions were simultaneously visited as the occasion of women’s subjugation, since (according to Aristotellean sensibilities) while manrationally ensouled, the human woman bequeathed to it its flesh-body. Consequently Spirit, Western Christian theologians up to this twenty-first century have claimed, liberates nature from its “bondage to transience” (Rom. 8:21), its temporal and finite constitution. Spirit’s promised “second birth” through baptism lifted “man” out of the history of the animal, organic body, a conviction which has consequently legitimated Western
culture’s ignorance of and indifference to ecological limits.

Where Spirit was affiliated with human reason, as it has been in Cartesian rationalism, the concept of Spirit can hide humanity’s tendencies toward ideological control of nature. Christianity’s primary distinction between the sacred and the world, typically invoked as the distinction between “the Creator” and “the created,” easily led to Descartes’ distinction between the thinking mind and objective bodies of matter. As Divine Spirit was absolutely transcendent over the creation, so the human mind or “spirit” assumed its governance over the material world. This rationalistic aversion to the Earth, carried forward as modernity’s cosmological spirit–matter dualism, was accompanied by the fifteenth- to eighteenth-century persecution of those who practiced a vitalistic worldview – herbalists and witches, but also so-called pagans and heathens.

This early modern dualism was countered by the late modern immanent Spirit of Hegelian Idealism in which Spirit dynamically catalyzed cosmic becoming – as evidenced in the modern notions of history, progress, evolution, and development. Nevertheless, Hegel’s idealist philosophy – because Spirit was still platonically configured as the inverse of gravity – has had a similar history to that of Cartesian dualism. Both philosophical postures effectively open a psychic fault line between humanity and Earth. To be sure, some twentieth-century theologians have defended this as a necessary distinction between the Creator and the creation. Indeed some theologians like Nicholas Berdyaev have affirmed Western technology for instrumentally interrupting humanity’s temptation to commune with elemental spirits, and other theologians have affirmed technology’s capacity for rehabilitating “fallen” or devolved nature, for alleviating suffering, death and toil, and for reclaiming the Earth as paradisiacal garden. Still others, like French philosopher Luce Irigaray, critique this stance, asserting that two life economies are thereby created – a metaphysical and capitalistic superstructure of immaterial spirit that disregards the Earth, including the human body, and a material substrate to which this superstructure denies spiritual value. In such an assessment, spirit–matter dualism, like its idealist parallel, constitutes a social technology – namely, ways of relating to the Earth that legitimate androcentrism and the commodification of natural resources, at the same time occasioning ecocide, genocide, and the suppression of Earthkeeping peoples.

If neither the Cartesian dualism nor philosophical idealism encouraged humanity to live well with the Earth, modernity has – from another perspective – been viewed as a time of “disenchantment” or “despiritualization.” Phenomenologically speaking, belief in a “supernatural” world of Spirit forms when humanity’s sense relations have been psychically truncated, such that belief comes to be seen as replacing direct or immediate experience. Modern commitments to instrumental rationalism and methodological objectivity presume that human consciousness is neither organically given nor emergent from sensuous participation in the field of life relations. Neither allows room for sacred value within the material world. Because mechanistic materialism assumed Spirit to be superordinate to nature – or, “supernatural” – and because rationalist empiricism dismissed claims to supernatural phenomenon, Spirit itself seemed during modernity to become irrelevant.

Nevertheless, given twentieth-century physics and revised cosmologies based upon them, it has become possible to think about Spirit without recourse to supernaturality and therefore without abandoning care for the Earth. Given its valence as a term of energy and vitality, Christian theologians, like Jürgen Moltmann, Mark Wallace and Elizabeth Johnson, have been reconstructing the notion of Spirit with the goal of greening Christianity. Philosophical theologians, like Thomas Berry, consider Spirit to be an emergent order of nature – as the Transcendentals also seem to have contended. Process theology’s relational ontology allows theologians to think an immanent order of Spirit, which, while active in cosmic becoming, is nevertheless distinct from and respectful of the world’s own creativity. In yet other suggestive proposals, Spirit, analogically like the quantum vacuum or the vessel of the Tao, pours forth the rare, fragile and wonderful flowering of a material universe, such that – now inverting Platonism – we experience the material world as privilege.

Johnson, Elizabeth A. *She Who Is: The Mystery of God in
Spirit and Nature Walking Paths

Early in 1998, a group of central Vermont environmentalists, activists, and naturalists from a variety of faith backgrounds, began planning a series of woodland paths that they called “Spirit in Nature.” The trails, eventually located on the spine of the Green Mountains just a few hundred yards from the poet Robert Frost’s summer home in Ripton, Vermont, wind through the forest interspersed with small groves of beaver meadows and abandoned apple orchards. These paths, designed to foster reflection and insight for visitors, have begun to adopt the idea, building permanent or temporary versions of the paths.

Paul Bortz, a Unitarian Universalist minister, left his pulpit in 1996 and began pursuing his vision of a union between faith and environmentalism. Bortz, an accomplished organizer, moved to the Middlebury area where he married Catherine Nichols, pastor of the local Episcopal church. Together they began forming the initial nucleus of the group, drawing on local church members and also students and faculty from nearby Middlebury College, which boasts the nation’s oldest environmental studies department. The college eventually leased the group the land it needed to proceed with construction of the trails.

There are now nine trails winding through the beaver meadows, abandoned apple orchards, and riverbanks that mark the site. They represent the Bahá’í, Quaker, Jewish, Muslim, Pagan, Unitarian Universalist, Christian, Hindu, and Buddhist traditions; there is also an interfaith path. All end at a common “sacred circle” furnished with benches and used for occasional ceremonies.

Spirit of the Sage Council

Unique in its origin and inspiration, Spirit of the Sage Council was brought together by the ancient whisperings of a most sacred plant of indigenous people of the Americas – White Sage (salvia apiana). Operating from a small office in Pasadena, California and a historic farmhouse in Carthage, North Carolina, it seeks to preserve sage scrub habitats wherever they occur, and the indigenous cultures and religions that depend on them.

Endemic to portions of Southern California and Baja, Mexico, the sacred White Sage dominates the less than 2 percent remaining of the Riversidean Alluvial Fan Sage Scrub natural community in the United States. Globally imperiled, this habitat continues to be greatly threatened by human settlement and commercial enterprise. As a nurse, student of natural medicine and indigenous healing methods, I first became “familiar” with the ethnobotanical use of native sage in Lakota Inipi ceremonies conducted by Wesley Black Elk and his father Wallace and cousin Stephen Red Buffalo in the 1980s. As a participant in the ceremony, the sacred sage is not only for cleansing of the bodies of “two-legged” people but also for healing the mind and spirit.

The spiritual connection I made with the sage led me to other indigenous people. I felt as though, whether in waking hours or during sleep, that the Sage spirit took over my life and led me from one person to another who would help protect its areas of residence. Through my connection to the sage, I became extremely sensitive, feeling threats to the sage’s existence like a threat to my very own.

In 1986 a commercial harvester, Alfred “Red Sky” Saverilli came into my life and showed me where to find and how to recognize the White Sage. I felt intoxicated and delighted any time I was with the White Sage in the wild. As I began to recognize the plant from miles away, the internal dialog with my sage familiar became stronger.

Saverilli came into my life and showed me where to find and how to recognize the White Sage. I felt intoxicated and delighted any time I was with the White Sage in the wild. As I began to recognize the plant from miles away, the internal dialog with my sage familiar became stronger.

I sought out the remaining descendants of the indigenous Shoshone “Gabrielino” people to discuss the threats to the White Sage habitats and eventually was steered to Vera Rocha, who some considered Chief. Meeting with her and her husband – the tribe’s spiritual leader – Manuel Rocha, we decided quickly to form a group to protect the sage. When I asked them what the conservation group should be named, Manuel Rocha said, “It is the Spirit of the Sage that has asked for our help and we have heard it.” Vera Rocha added,

There has been too much destruction – of the Sage, of our Land and the people keep taking till the Sage can give no more. It is time now for us to give back to the Sage. We need to get people to come together that want to help protect the Sage. We can have our own council meetings for the Sage.
Over the years as the health of the Gabrielson elders diminished and Manuel Rocha passed on, I assumed much of the work in consultation with Vera Rocha. We have worked through diverse venues, and in alliance with a variety of groups (including the American Indian Movement, Earth First!, The Green Party, the Rainforest Action Network, the Nation of Islam, and the Aztec Mexica) to convince decision-makers of the cultural and biological significance of sage habitats. Tactics used have included direct-action blockades against destructive practices and survey stake removal, public education, and lawsuits.

The Spirit of Sage Council has been recognized for its cutting-edge work based on the Endangered Species Act, especially in Southern California, where, in part in response to the Council’s work since 1990, the U.S. Fish & Wildlife Service and California Department of Fish & Game began to give the conservation of Coastal Sage Scrub natural communities their highest priority. Coming from the place of respect and reverence for the Earth, the work of Spirit of the Sage Council has directly led to the preservation of over 2000 acres of Coastal Sage Scrub habitat in Southern California, and has set up a nonprofit land trust to receive and manage lands protected through lawsuits.

Part of the argument the Spirit of Sage Council has made is that development that destroys the sage habitats also endangers the culture and religion of the Shoshone Gabrielson Band and other indigenous peoples. We also believe that our connection to Earth and Spirit guides our decisions. The sage even led us to challenge plans by the Los Angeles Catholic Archdiocese to build the largest cathedral in the United States on a site that had indigenous burial remains.

Spretnak, Charlene (1946–)

Charlene Spretnak’s work, as a writer, a teacher, and an activist, flourishes at the meeting place of feminism, green politics, spirituality, and ecological postmodernism. Spretnak suggests that the modern worldview, shaped by the Enlightenment, is giving way to an emergent worldview that connects bodies and nature, a view she refers to as “the real.” Her work is groundbreaking as it moves to connect spirituality and activism in pursuit of this paradigm shift.

Born 30 June 1946 in Pittsburgh, Pennsylvania and educated at St. Louis University and the University of California, Berkeley, she was inducted into the Ohio Women’s Hall of Fame in 1989 and teaches at the California Institute of Integral Studies. Her earliest works focused on women and religion. Lost Goddesses of Early Greece explored pre-Hellenic Goddess mythology, and provided creative, feminist retellings of these myths. With The Politics of Women’s Spirituality she brought together a collection of writings addressing the intersection of feminism, religion, and politics, including works by many of the most influential feminist theologians, such as Carol Christ, Mary Daly, Naomi Goldenberg, and Starhawk.

Perhaps her best-known book, Green Politics, co-authored with Fritjof Capra, explored the holistic, non-exploitative ideology of the German Greens and how such politics could be brought to the United States. With this holistic approach in mind and with the goal of carrying on the vision of the German Greens, Spretnak co-founded in 1984 the Committees of Correspondence, named after grassroots groups that existed in the United States during the Revolutionary War.

The Spiritual Dimension of Green Politics and States of Grace returned Spretnak’s writing to a more overtly spiritual focus. Her call to the reader is not to any new or even specific religion. She herself has practiced Vipassana meditation, and has appeared in the Canadian film Full Circle, which showcases environmental concerns and women’s spirituality. Spretnak urges others to turn to the resources within one’s own existing tradition that mesh with a post-humanist, postmodern, and post-patriarchal worldview. She devotes considerable attention to all three of these theoretical constructs, in both these books and later writing, to clarify her unique understanding of their meaning and practice.

More recently her essay “Radical Nonduality in Ecofeminist Philosophy” and Resurgence of the Real examined the importance of paying attention to body, nature and place. She suggested a move beyond modernism, not to deconstructionist postmodernism, but to what she calls ecological postmodernism. In “Radical Nonduality” Spretnak questioned the tendency of deconstructionist postmodernism to deny any “unitive dimensions of being.” She then presented a theory of ecological postmodernism that includes a relational ontology, thus questioning the deconstructionist idea that there is “nothing but social construction in human experience” (1997: 427).

Her scholarly analysis in Resurgence of the Real is supplemented at the end by a fictionalized account of how her visions for the future are no mere flights of fancy, but concrete possibilities for an integrated world honoring the
significance of nature, gender, and spirituality in sustainability.

St. Katherine's Monastery (Mt. Sinai, Egypt)

The spectacular fortified monastery of St. Katherine, often described as “the most perfect relic of the 4th century left in the world,” still looks much as it did on completion in 565. It is located at the foot of Mt. Sinai in the central Sinai desert, Egypt, has been continuously inhabited since the fourth century and is the oldest Christian monastery in the world in continuous existence. The monastery derives its name from the third-century Christian martyr St. Katherine (or Catherine) whose relics were found on the nearby summit of Mount Katherine (Gebel Katherine). The monastery itself is believed to be built on the site of the Burning Bush, where God spoke to the prophet Moses, in the shadow of Gebel Musa (Mount Sinai) where Moses received the Ten Commandments. Its construction started in the year 337 when the Empress Helena, mother of Emperor Constantine (under whom Christianity became the official religion of the Roman Empire in 313), decreed that a monastery was to be built on the site. The original building became a refuge for increasing numbers of hermits and pilgrims, and between 537–562 the Emperor Justinian expanded its site by adding two churches and building the great walls and fortifications that still stand today. The monastery walls, built of dressed granite, rise to a height of 20 meters in places and are 2–3 meters thick. Inside them, the monastery covers an area less than 70 × 80 meters with a multilevel labyrinth of living quarters, twelve chapels, an icon gallery, hospice, ancillary buildings and the famous library, second in historical significance only to that of the Vatican in Rome. Famous sites within the monastery include Jacob’s Well, which never dries up and is supposedly where the prophet Jacob met his future life, as well as the descendant of the original Burning Bush (much vandalized for cuttings) and St. Catherine’s Church, built between 542–551 in memory of Justinian’s wife, and famous for its wonderful sixth-century doors and 12 enormous pillars covered in icons.

The monastery has survived for centuries as a Christian oasis in an Islamic state as a result of a legend which said that the Prophet Mohammed himself was once kindly received there. In return he issued a letter protecting the monastery for ever, a copy of which can still be seen in the gatehouse entrance. Continuous protection by Roman emperors, Islamic conquerors, Napoleon and various middle-eastern governments account for the survival, unlooted, of the great treasures of the monastery including its spectacular collection of 2000 of the most important icons in the world. The 5000 books and 300 valuable manuscripts in the library have steadily accumulated since the sixth century and are written in Greek, Arabic, Syrian, Georgian, Armenian and Slavonic languages and are now housed in the spacious new concrete library building, constructed between 1930–1942 and occupying most of the southern side of the monastery. Until its removal in 1859 by Constantin von Tischendorf, the library also included the Codex Siniaticus, the oldest and most complete Greek manuscript of the Bible ever found, now in the British Museum in London.

During the Crusader period (eleventh–twelfth centuries) the site became a major pilgrimage center, but since medieval times the size of its monastic community has steadily declined. However, it is still a working monastery whose community of around 25 monks start their day of prayer and devotional work with matins at 4 a.m. and liturgy until 7:30 a.m., finishing with evening prayer between 3–5. The Sinai monastic order, independent since the sixth century, observes the Canons of the Eastern Orthodox church under the control of an archbishop of Sinai. The community works in partnership with local Gebalaya Bedouin communities, the descendents of workers of Slavic origin imported in the sixth century by Justinian to construct and protect the monastery. The monastery still operates a guesthouse, offering simple accommodation for pilgrims and those on retreat, but it has now also become a major leisure tourist destination.

During the period 1600–1920, both people and supplies entered the monastery only via a basket drawn up on a ten-meter-long rope over the north wall. Until the 1960s, it probably received less than fifty visitors a year. By the year 2017, it is thought that this may reach half a million a
year. The development of St. Katherine’s as a tourist destination postdates the Israeli occupation of southern Sinai which took place between 1967–1979, and is related to the rapid expansion of beach resorts such as Sharm el-Sheikh on the nearby Red Sea coast. In 1996, mindful of concerns over the lack of protection for the environment and buildings of St. Katherine’s, the European Community made a grant of 6.5 million ecus which financed a study of the area, and helped create the 4300-square-kilometer St. Katherine’s Protectorate, forming an integral part of the southern Sinai protected area system. The St. Katherine’s Protectorate includes not only Mt. Sinai itself but many other religious cultural and archeological sites in the surrounding landscape, such as the valley of Wadi Hebran, supposedly the place where the Israelites camped to wait for Moses to return from Mount Sinai with the Ten Commandments. The development of this system of protected areas was instrumental in getting World Heritage status for the monastery and surrounding landscape, finally achieved in 2002.

Concerns for the future revolve around the issue of managing the growth of tourism to the site. Currently, the monastery is open without charge five days per week (except weekends and church festivals) and it now receives nearly 100,000 tourists each year, 80 percent of whom are day-trip visitors and many of whom stay less than half an hour. This is projected to rise to 500,000 visitors by 2017, placing severe pressure on the fabric of the monastery and the ability of its inhabitants to maintain their normal routines. In addition, the area around the monastery is increasingly popular with hikers, many of whom climb Mt. Sinai (Gebel Musa) which, at 2285 meters overlooks the entire area. St. Katherine’s still remains a center for pilgrimage, a place of retreat and a combination of working monastery, museum and art gallery – much as it has been for 1500 years – but unless visitor numbers can be controlled it is difficult to see which of these functions will remain in the future.

Starhawk (1951–)

Starhawk is an ecofeminist activist, author and Witch, and a founding mother of the Reclaiming Witchcraft tradition in San Francisco. Starhawk, who was born in 1951 of Russian Jewish descent with the given name Miriam Simos, met Witchcraft in the early 1970s. She was first introduced to Z. Budapest’s *Dianic* Witchcraft tradition and later (in 1975) initiated into the Faery tradition by Victor Anderson. The Witches’ magical view of the world as a living being made a profound impact on her. Her feeling was not that of hearing something new but of finally being given names and interpretive frameworks for experiences she already had. She also felt empowered by the concept of a religion that worshipped a goddess – the immanent life-force. This hermeneutic distinction between direct experience and cultural symbol has been fundamental to her theological and political thinking ever since, and guided her major work as leader for a new non-dogmatic version of neo-pagan Witchcraft and as a political activist.

According to Starhawk, all modern Witchcraft traditions have their spiritual roots in the tribal religions of Europe some 10,000 years ago. Therefore, in spirit, they are related to the surviving shamanic “Earth religions” of the contemporary West, including those of Native Americans, African Americans, the Sami and the Inuits. She has also adopted Marija Gimbutas’ disputed thesis that the old Europeans originally worshipped a Great Goddess as divine giver of life, death and fertility, and her son-lover, the Horned God. The fall and regeneration of this Old Religion is comprised by Starhawk as follows: Neolithic Europeans celebrated the immanent life-force and the cycles of the seasons, and their religion provided tools to establish bonds between individuals, the community and the Earth. Just as religion was goddess-centered, society was woman-centered and organized around the mother and her kin as a basic social principle. These matrifocal and matrilineal cultures were egalitarian, peaceful, just
and creative, and laid the foundation of our civilization. In time, patriarchal warriors corrupted the cultures, either by internal warfare or through invasion. This long-lasting event conquered or drove out the matrilineal goddess-worshippers and laid the foundation for oppressive societies and patriarchal religions in Europe. But goddess religions continued to live in folk customs, esoteric traditions and among those persecuted as Witches. Finally, in the twentieth century, the Witches’ Craft has again emerged from hiding.

Even though scholars have criticized Starhawk for having invented an erroneous historical lineage to contemporary Witchcraft, the narrative has been important in the building of (Reclaiming) Witches’ identity. It also gave a platform from which feminist Witches or goddess-worshippers could perceive themselves as freedom fighters from any patriarchal religion, and reach out to other oppressed people, such as Native Americans, without necessarily being accused of having colonialist intentions: by claiming heritage to a common symbol system, such as the four directions/elements, the concept of the circle and reverence for the Earth, they could create bridges based on commonality, not just difference.

Yet, Starhawk’s approach to tradition is fundamentally eclectic and anchored in a radical analysis of power: she insists on the freedom of thought, belief and style of organizing to any Pagan group or person and believes that non-hierarchy is the only ethical leadership structure that may support a view of the world that sees the Earth and everything living as interconnected and interdependent. Her version of Witchcraft is also famous for having reduced the role of the Horned God in favor of the Goddess – the argument being, that to value Goddess above God is not narrowly to define or rank gender, but a means to continually be reminded that what is of value is life not narrowly to define or rank gender, but a means to continually be reminded that what is of value is life brought into the world.

In addition to doing the "work of the Goddess" as teacher, writer and ritualist, Starhawk is a community builder, perma-culturist, political organizer and activist, campaigning in particular for environmental, feminist and anti-war issues. In the 1980s she participated in and trained people for large anti-nuclear actions and was arrested several times as a civil disobedient, both in the Diablo Canyon and Livermore Lab actions in California. During the 1990s she has been active in the anti-deforestation campaigns, especially in the redwood biome of California. In 2000 and 2001 she joined the anti-globalization movement, both as organizer and activist, and was at the forefront in the large demonstrations against a neo-liberalist world economy in Seattle, Washington and Genova (Italy). Through all these activities she has had a major influence on groups such as Earth First! and those whose primary work is nature protection. She has also been important for the growth of goddess spiritualities and neo-paganisms in general and for the cross-fertilization between feminist and non-feminist Witchcraft traditions; by 2001, *The Spiral Dance* had sold more than 300,000 copies.

Steiner, Rudolf (1861–1925) – and Anthroposophy

The relationship between nature and the spiritual side of humanity occurs increasingly within an arena dominated by a rationalistic objectivity based on sense perceptions and critical thinking. The religious dimension can vary from the Cathari view that nature is evil to that of animism, which sees spirit in all aspects of nature. Rudolf Steiner argued for a distinction between religion resting on dogma or belief and spirituality founded on a complementary perception that augments the physical senses. Steiner claimed to have this direct apprehension superseding received revelation, dogma or even simple belief. Born in Kraljevec, Lower Austria, now Croatia, at an early age he became extraordinarily aware of the non-obvious energies within vegetable and animal life describing an insight into nature beyond the normal purview of the senses. He came increasingly to perceive two worlds: an outer, ever more technical one, and a subtle world of formative forces. He was interested in both, and his quest was to bridge the two. The results of his initial efforts of inquiry culminated with the publication of *The Philosophy of Freedom* in 1895. In this work, he stresses the possibility of experiencing thinking as a spiritual activity rather than as an epiphenomenon of the brain. Upon this basis, he subsequently developed his "spiritual science" as the scientific investigation of spiritual worlds.

As Steiner matured he became ever more involved in
the social, artistic, educational and scientific issues of his time and, in particular, the potential contribution spiritual science could make. Having graduated in mathematics, chemistry, and natural history he earned a Ph.D. in philosophy and acquired considerable academic respect by the end of the nineteenth century. However, knowing that the academic establishment would shun him, he nevertheless decided in 1902 to begin speaking openly about his spiritual observations. He became General Secretary of the German Branch of the Theosophical Society until 1912 when he independently founded the Anthroposophical Society dedicated to developing a scientifically based esotericism. He also developed what he termed *eurythmy* – a system of rhythmical body movements and silent gestures portraying poetic speech, song and music. Deeply affected by the First World War and the social/spiritual questions it raised, he re-founded the Anthroposophical Society in 1923 on the basis of his spiritual science and sought to bridge the inner and outer worlds as a means toward finding an authentic humanity.

Steiner's spiritual science endeavors to cultivate additional forms of perception beyond those based solely on the senses. He wanted to treat non-ordinary perception in a scientific manner and hoped to revolutionize humanity's relation to nature. Steiner's spiritual science, instead of constituting a religious approach to spiritual affairs, is meant to be a scientific method that compliments the spiritual. The mission of the Anthroposophical Society is to promote spiritual science and facilitate its application to various practical fields of endeavor. Its worldwide membership is now over 50,000, and it sponsors approximately 10,000 institutions such as schools, colleges, artistic groups, homes for those with special needs, clinics, medical practices, farms, research institutes, etc.

Highly influenced by Goethe, Steiner edited the German poet's nature writings. His own nature-inspired research attempted to delineate a spiritual coevolution of humanity, Earth, nature and what Steiner designated the nine hierarchies of angels and archangels. Steiner proposed a symbiosis between the spirituality of both nature and humanity and felt that angels are not only instrumental in the development of the Earth but also in our evolving along with it. On a practical level, there are consequences for agricultural practice, and, foreseeing the results of a purely materialistic approach, Steiner founded "bio-dynamic agriculture" in 1925. This is a non-chemical organic method of farming that enlists spiritual agencies (or beings) claimed to be active in nature and cooperates with these health-giving forces to improve food and, consequently, the health and spiritual potential of consumers.

Steiner's methodological approach to nature as a spiritual manifestation seeks cooperation in exchange for exploitation. Its goal is a spiritually based ecology founded on natural interdependencies and the spiritual interworking of creative beings.

**Stevens, Wallace (1879–1955)**

Nature, for the great American poet Wallace Stevens, is variously that which Is, that which is constructed by imagination, at times consoling, at times impersonal and remote, sunny south or frozen north, a "firecat" in one of his first lyrics, "Earthy Anecdote," and a bird's "scrawny cry" in one of his last poems, "Not Ideas about the Thing but the Thing Itself." Stevens' entire literary production might be thought of as a poet's circling of the object of attention, noting the changes that occur as one moves each degree of the circle, changes colored also by the passage of time and the shifting qualities of consciousness.

In these kaleidoscopic exercises, Stevens is at his most intense when considering the extremes, nature as given and nature as construct. One of Stevens' most celebrated poems, "The Idea of Order at Key West," is at base a singing contest between a woman and the ocean. In the end, the woman's song proves not simply superior to the monotonous song of the sea, but winds up consuming nature altogether:

> And when she sang, the sea,  
> Whatever self it had, became the self  
> That was her song, for she was the maker. Then we,  
> As we beheld her striding there alone,  
> Knew that there never was a world for her  
> Except the one she sang, and singing, made (Stevens 1997: 106).

Here, and in many other poems, including the often-anthologized "Anecdote of the Jar," Stevens echoes Oscar
Wilde’s cynical Vivian in “The Decay of Lying” who wittily observes that the more he knows of art, the less he cares for nature. Nature is always sending ants to picnics whereas art can selectively remove such nuisances. If anything, Stevens is even more outrageous than Wilde, suggesting that nature is not simply a nuisance but a vanished memory, that which is utterly consumed by imagination and then forgotten.

Equally intense is the Stevens who attempts to possess nature without interference by the imagination and its attendant illusions. As the poet moves to this “green apogee” (1997: 323) of the circle, he supposes it possible to capture the elusive prize, the world seen rather than the world as seen. With the icy mind of the snow man who sees “nothing that is not there” as well as the “the nothing that is” (1997: 8), the poet seeks to “trace the gold sun about the whitened sky / Without evasion by a single metaphor” (1997: 322).

The poet’s victory, however, is soon seen as an achievement in rhetoric rather than reality: “… the absence of imagination,” he discovers, “had itself to be imagined” (1997: 428). And so the poet begins his movement down from the apogee, through each measured degree, in the “ambiguous undulations” (1997: 56) of intricate and endless circling. The poet’s function is to articulate these oscillations and, if prodigiously gifted, “help people to live their lives” (1997: 661).

In the end, the poet becomes something of a secular priest who constructs a new religious reality watched over not by the old angels who, it turned out, came to nothing, but new, necessary angels of “reality,” completely understood as fictional creations, and in whose sight we “see the Earth again” (1997: 423) as it is, changing, imperfect, tragic and lovely, the site and source of all pleasures and all pains, and all of paradise that any of us will ever know.

Stewardship

The term “stewardship” derives from “steward,” one who looks after property belonging to another, such as a household or estate. It has been increasingly used in Judaism, Christianity, and Islam as a basis for a religious environmental ethic. (It is, however, generally considered to be alien to Eastern and indigenous traditions.) In this usage, human beings (individually or collectively) are the “stewards,” God is the “owner,” and the “property” is the created world (or that part of it which humans can affect). Humans are thus responsible for rightly using and conserving natural resources as gifts from God, or for caring for creation on behalf of its Creator.

How typical such a view has been in past Western religious thought has been a matter of some dispute. The idea that humans are stewards of the Earth is not stated explicitly in the Bible, but can be supported by the injunctions to “have dominion” (Gen. 1:26) and to “serve and keep” the Garden of Eden (Gen. 2:15), and in the example of Noah (Gen. 6–9). Scriptural warrants are also found in the recurring themes of God’s “ownership” of creation (e.g., Ps. 24:1) and Providential care for it (e.g., Ps. 104), as well as human accountability in the covenantal relationship binding God, the Hebrew people, and the land (e.g., Lev. 25:1–7). Similar grounding can be found in Sura 2:30 of the Qur’an, where Allah says to the angels, “I am placing on the Earth one that shall rule as my deputy.”

The explicit use of the concept finds historical precedent in the Protestant reformer John Calvin’s interpretation of Genesis 2:15: “… Let everyone regard himself as the steward of God in all things which he possesses. Then he will neither conduct himself dissolutely, nor corrupt by abuse those things which God requires to be preserved” (Calvin in DeWitt 1998: 32). According to the English Chief Justice Matthew Hale,

In relation therefore to this inferior world of Brutes and Vegetables, the End of Man’s Creation was, that he should be the VICE-ROY of the great God of Heaven and Earth in this inferior world; his Steward, Villicus, Bayliff, or Farmer of this goodly Farm of the lower World whose charge is “to preserve the face of the Earth in beauty, usefulness, and fruitful-
more aggressively anthropocentric understanding of human “dominion.”

Ecocentric critics argue that stewardship implies an “absentee God” and a desacralized creation; it separates human beings from the rest of nature, inflates their importance in creation, and exaggerates their competence to manage or improve the biosphere. Defenders of the concept of stewardship have replied that environmental concern only makes sense on the assumption that humans have a unique kind of power and responsibility. Some appeal to the moral conviction that human beings are of greater value than other species, and affirm the transformation of nature as part of humanity’s divine calling. Some share many of the ecocentric critics’ concerns, but believe that the concept of stewardship is flexible enough to accommodate them. They affirm the nonhuman creation’s independent (though not necessarily equal) value for God, and define stewardship as loving service to the creation, rather than as simply the management of resources for long-term human benefit. They understand stewardship primarily as the protection of the Earth rather than as its improvement, and as deepening humans’ involvement with nature rather than detaching them from it.

Others, while using the language of stewardship, believe that the views of stewardship presented by religious environmentalists are imimcal to human interests, a threat to economic freedom and individual property rights, and overly pessimistic about technological and market-based solutions to environmental concerns. It is possible, however, to minimize the need for moral or legal constraints on the human use of nature to such an extent that “stewardship” becomes a mere euphemism for exploitive domination in pursuit of short-term economic gain.

Stewardship is likely to remain a persistent but contested concept within theological environmental ethics. The simplicity and familiarity of stewardship make it both understandable and appealing to many religious people outside the environmental movement. At the same time, it is both adaptable and elusive, subject to contrasting interpretations. Critics sometimes concede that it is at least an improvement over irresponsible exploitation and that it may have its uses; proponents may allow that it needs to be complemented by other understandings of the human–nature relationship.

Stone Circles

Stone circles are a special manifestation of raised or upright stones (menhir, peulvan, orthostats) in contrast to isolated standing stones as well as those aligned along a straight axis. They are associated in particular with the British Isles but may be found elsewhere, such as the two stone circles forming a figure eight on the island of Er- lican off Brittany near Carnac or the sepulchre circles of Sine-Ngayene in southern Senegal. This last is a necropolis, and the idea of the British stone circle is sometimes conjectured to be a derivative of the stone kerb surrounding various megalithic collective tombs. However, the Brit- ish structure is clearly related to the henge monument: a special type of stone or timber ceremonial circular edifice enclosed by earthen banks with one or more entrances and sometimes a ditch or ritual pits inside or outside the bank. The earth-banked henge is found only within the British Isles. Those containing stone circles are known as circle-henges. Archeologically, “stone circles” proper have no ditches. They evolved as separate from the henge in the late Neolithic times (ca. 3200–2200 B.C.E.), some associated with stone rows or avenues and some appearing in group-clusters (Stanton Drew and Avebury being perhaps the foremost examples). Avebury, for instance, “consists of a huge bank and inner ditch, with four entrances, enclosing a stone circle round the ditch, with inside it two smaller circles and a ‘setting’ at the north entrance” [Wood 1963: 131]. There are 702 extant stone circles in Britain and 261 in Ireland. An identifiable type is known as the recumbent stone circle. These are found in northeast Scot- land (Aberdeenshire, etc.) and consist of two tall standing stones flanking a recumbent “altar” stone in the southern arc with the remaining stones progressively diminishing in size.

The purpose of stone circles for their builders is not known. Some are obviously funerary, but most are described as ritualistic in the sense that, while often
involving much organization and labor in their construction, they reveal no apparent purpose or logical function. Many are aligned to natural features and were possibly used for solar, lunar and astral observation. In contemporary times, the conjectured calendrical function of the stone circle has given rise to a field of study known as archeaonstronomy, which nevertheless retains a dubious status within the branches of the more established sciences. As Hutton points out, none of the late Neolithic and early Bronze Age monuments “displays any synchronization of the Earth with heaven as stunning as that at Newgrange” (1991: 118).

Some of the more renowned circles include the cross circle of Callanish in the Scottish Hebrides, the Ring of Brodgar at Stenness in the Orkneys, the Arbor Low henge of approximately fifty recumbent stones in Derbyshire, Keswick Carles of Castlerigg in Cumberland, the Rollright Stones of Oxfordshire and the Nine Maidens of Boskednan in Cornwall. Unique, however, is the complex of Stonehenge, built in several stages from possibly 2600 to 1800 B.C.E. and culminating with the horseshoe arrangement employing the trilithon (two orthostats capped by a horizontal lintel). Following the Druidic renaissance first promoted by antiquarian William Stuckeley (1687–1765) and Edward Williams, a.k.a., Iolo Morganwg (1747–1826), the Albion Lodge of the Ancient Order of Druids first met at Stonehenge on 24 August 1905 for a mass initiation. Stonehenge has been ever since associated with the contemporary Druid movement – particularly in association with the summer solstice.

The modern-day use of stone circles relates to the discipline of geomancy that Pennick defines as “The detection of various subtle qualities of the land and place, and the modification of those qualities so as to harmonize human activity there with the inherent natural character of the place” (1991: 118). For Hutton, while the circle might be an obvious unit of sacred space mirroring the sun, full moon and bounds of the horizon, “Earth mysteries” adherents tend non-critically to reflect “an intense sense of the romance and beauty of the prehistoric past and an equally profound impulse to identify personally with it” (1991: 118). This usually translates as an intense distaste for the present world and its ecological shortcomings. But whether the stone circle provides or not an access to redeeming ancient gnosis, to a connection with the “golden age of the Goddess” or one with ley-line “Earth energies,” its “sacred space” encapsulates what Van Gennep refers to as liminality – here as a tangible place of transition in which the contemporary spiritual seeker might contemplate and/or incorporate the numinous dimension that refreshes humanity’s ultimate link with mystery and nature.

Stonehenge

Stonehenge is an arrangement of large standing stones within a circular enclosure located on Salisbury Plain in southern England. It is one of the most visited ancient or historical monuments in Europe, and is recognized by UNESCO as part of a World Heritage site. Among the visitors are many with “spiritual” reasons for being there, although there is considerable variation in what this might mean.

While ancient arrangements of stones are far from rare in Western Europe, Stonehenge is unique in being the only megalithic circle with lintel stones above its standing stones. This makes Stonehenge instantly recognizable, even iconographic of ancestral and sacred places, and perhaps contributes to its immense popularity.

Visitors currently approach Stonehenge from a busy road and find it on chalk grassland. An interested visitor would have to walk around neighbouring sheep-pastures to see it against the skyline. The best place to do so is from within an embanked processional avenue leading to and from the enclosing circular bank and ditch around Stonehenge. From within the circles of stones themselves that avenue is a key part of the site’s orientation toward midsummer sunrise.

Most visitors to Stonehenge devote almost all their attention to the stones rather than to the many other interesting features of the surrounding landscape (including burial mounds, and linear, circular and monumental earthworks). There are heated debates and tense rivalries about how to interpret Stonehenge. Almost all that is agreed upon is descriptive facts about the origin of the stones (most were brought from near another circle at Avebury, some twenty miles away, while others came from southwest Wales) and the order in which they were arranged and rearranged over a lengthy period over four
thousand years ago. For some interpreters Stonehenge is solely an ancient monument of archaeological importance, for others it is primarily a sacred temple that should be devoted largely to spiritual activities. But there are many alternative positions between these polarized positions. For insight into the contested debates about Stonehenge’s interpretation and usage see Chippendale, et al. (1990), Bender (1998), and Wallis and Lymer (2001). For a fine example of interpretation rooted in the disciplines of sacred geometry, sacred geography and archeo-astronomy see Dames (1992).

John Michell has said that Stonehenge is a model of the cosmos and therefore, just like the cosmos, it can provide evidence for any theory one might hold. Certainly there is common ground in the understanding that Stonehenge has something to do with the summer solstice sunrise. What this meant to those who erected and re-erected the stones may not be certain, but it is a key to many current visions of the place. For many centuries (and perhaps without a break since it was constructed) people have found Stonehenge to be a significant place from which to observe and celebrate that sunrise. Arguments have been offered for observations of other significant sunrises and sunsets, moonrises and moonsets, various planetary and stellar phenomena, and eclipses.

Archeological excavation has revealed further dimensions of the monument, including cremation burials and offerings within mounds and holes within the site. When the visitors’ car-park was being improved a series of post-holes were uncovered that proved to be evidence of the earliest human change in the landscape, long pre-dating the construction of the stone circle. Three white painted blobs now mark the location of enormous wooden posts erected in what was then a clearing in a forest. Only rarely is attention directed to this earliest ancestral engagement with the natural environment, one that swiftly led to the clearing of the forest and the evolution of extensive grasslands. In short, Stonehenge has been and continues to be a prime location for considering human relationships with the cosmos and the immediate environment.

By way of example, Stonehenge is the focus of considerable interest for Pagans and other nature-celebrants. Gatherings at each of the eight festivals vary in size, now reaching tens of thousands at midsummer. Access to the center of the site has been a matter of conflict, but seems now to be negotiable. In 1973 Wally Hope and companions initiated the first Peoples Free Festival at Stonehenge, seemingly reviving Stonehenge’s medieval fairs and carnivalesque games. For weeks surrounding successive summer solstices increasing numbers of people gathered. Many came principally to hear music, some to experience the last flowering of 1960s “flower-power.” But Wally’s vision of a tribal gathering to reestablish respectful relationships with the Earth and the land affected many. After his somewhat mysterious death, and especially after his ashes were scattered in the center of Stonehenge in 1976, Wally’s name has frequently been invoked reverently. Wally became ancestor to many who had never met him in life but had found the festival to be conducive to engagement with liberative, socializing and environmentalist lifeways. Some of Wally’s possessions (e.g., a flag) and the box that once contained his ashes have been part of many ceremonies. Statements he issued that encouraged everyone to act respectfully toward the Earth are reprinted and repeated by many within the festival and countercultural movements.

The banning of the midsummer gathering between 1985 and 2000 effectively diffused a large gathering across Britain and generated many smaller seasonal festivals elsewhere. It has also resulted in much wider popular knowledge about solstices and equinoxes. Meanwhile, various direct, action groups concerned with ecological issues (e.g., those protesting new roads and quarries) benefited from experiences gained in campaigns to regain access to Stonehenge for festivals. With a return to a more tolerant approach to the summer gathering, it is clear that what might once have been a hippy gathering is now more diverse and popular. Stonehenge continues to be the location for rites of passage (including child-namings, weddings, and the scattering of ashes) as Druids, other Pagans, and many diverse celebrants continue to engage with a diffuse popular spirituality that variously honors cosmic and environmental connections. Debates about the concerns of the tourism and heritage industry and of religious visitors continue to demonstrate that perceptions of sacrality, and appropriate responses toward it, are problematic.

Storytelling and Wonder

In the prosperous land where I live, at this dangerous and delicious moment on the cusp of this new millennium, a mysterious task is underway to invigorate the minds of the populace, and to vitalize the spirits of our children. In a strange and curious initiative, parents and politicians and educators of all forms are raising funds to bring computers into every household in the realm, and into every classroom from kindergarten on up through college. With the new technology, it is hoped, children will learn to read much more efficiently, and will exercise their intelligence in rich new ways. Interacting with the wealth of information available online, children's minds will be able to develop and explore much more vigorously than was possible in earlier eras – and so, we hope, they will be well prepared for the technological wonders of the coming century.

How can any child resist such a glad initiative? Indeed, few adults can resist the dazzle of the digital screen, with its instantaneous access to everywhere, its treasure-trove of virtual amusements, and its swift capacity to locate any piece of knowledge we desire. And why should we resist? Digital technology is transforming every field of human endeavor, and it promises to broaden the capabilities of the human intellect far beyond its current reach. Small wonder that we wish to open and extend this dazzling dream to all our children!

It is possible, however, that we are making a grave mistake in our rush to wire every classroom, and to bring our children online as soon as possible. Our excitement about the internet should not blind us to the fact that the astonishing linguistic and intellectual capacity of the human brain did not evolve in relation to the computer! Nor, of course, did it evolve in relation to the written word. Rather it evolved in relation to orally told stories. Indeed, we humans were telling each other stories for many, many millennia before we ever began writing our words down – whether on the page or on the screen.

Spoken stories were the living encyclopedias of our oral ancestors, dynamic and lyrical compendiums of practical knowledge. Oral tales told on special occasions carried the secrets of how to orient in the local cosmos. Hidden in the magic adventures of their characters were precise instructions for the hunting of various animals, and for enacting the appropriate rituals of respect and gratitude if a hunt was successful, as well as information regarding which plants were good to eat and which were poisonous, and how to prepare certain herbs to heal cramps, or sleeplessness, or a fever. The stories carried instructions about how to construct a winter shelter, and what to do during a drought, and – more generally – how to live well in this land without destroying the land's wild vitality.

So much earthly savvy was carried in the old tales! And since there was no written medium in which to record and preserve the stories – since there were no written books – the surrounding landscape, itself, functioned as the primary mnemonic, or memory trigger, for preserving the oral tales. To this end, diverse animals common to the local Earth figured as prominent characters within the oral stories – whether as teachers or tricksters, as buffoons or as bearers of wisdom. A chance encounter with a particular creature as you went about your daily business (an encounter with a coyote, perhaps, or a magpie) would likely stir the memory of one or another story in which that animal played a decisive role. Moreover, crucial events in the stories were commonly associated with particular places in the local terrain where those events were assumed to have happened, and whenever you noticed that place in the course of your wanderings – when you came upon that particular cluster of boulders, or that sharp bend in the river – the encounter would spark the memory of the storied events that had unfolded there.

Thus, while the accumulated knowledge of our oral ancestors was carried in stories, the stories themselves were carried by the surrounding Earth. The local landscape was alive with stories! Traveling through the terrain, one felt teachings and secrets sprouting from every nook and knoll, lurking under the rocks and waiting to swoop down from the trees. The wooden planks of one's old house would laugh and whine, now and then, when the wind leaned hard against them, and whispered wishes would pour from the windswept grasses. To the members of a traditionally oral culture, all things had the power of speech . . .

Indeed, when we consult indigenous, oral peoples from around the world, we commonly discover that for them there is no phenomenon – no stone, no mountain, no human artifact – that is definitively inert or inanimate. Each thing has its own pulse, its own interior animation, its own life! Rivers feel the presence of the fish that swim within them. A large boulder, its surface spreading with crinkly red and gray lichens, is able to influence the events around it, and even to influence the thoughts of those persons who lean against it – lending their thoughts a certain gravity, and a kind of stony wisdom. Particular fish, as well, are bearers of wisdom, gifting their insights to those who catch them. Everything is alive – even the stories themselves are animate beings! Among the Cree of Manitoba, for instance, it is said that the stories, when they are not being told, live off in their own villages, where they go about their own lives. Every now and then, however, a story will leave its village and go hunting for a person to inhabit. That person will abruptly be possessed by the story, and soon will find herself telling the tale out into the world, singing it back into active circulation .

There is something about this storied way of speaking – this acknowledgement of a world all alive, awake, and aware – that brings us close to our senses, and to the palpable, sensuous world that materially surrounds us. Our
animal senses know nothing of the objective, mechanical, quantifiable world to which most of our civilized discourse refers. Wild and gregarious organs, our senses spontaneously experience the world not as a conglomeration of inert objects but as a field of animate presences that actively call our attention, that grab our focus or capture our gaze. Whenever we slip beneath the abstract assumptions of the modern world, we find ourselves drawn into relationship with a diversity of beings as inscrutable and unfathomable as ourselves. Direct, sensory perception is inherently animistic, disclosing a world wherein every phenomenon has its own active agency and power.

When we speak of the earthly things around us as quantifiable objects or passive “natural resources,” we contradict our spontaneous sensory experience of the world, and hence our senses begin to wither and grow dim. We find ourselves living more and more in our heads, adrift in a set of abstractions, unable to feel at home in an objectified landscape that seems alien to our own dreams and emotions. But when we begin to tell stories, our imagination begins to flow out through our eyes and our ears to inhabit the breathing Earth once again. Suddenly, the trees along the street are looking at us, and the clouds crouch low over the city as though they are trying to hatch something wondrous. We find ourselves back inside the same world that the squirrels and the spiders inhabit, along with the deer stealthily munching the last plants in our garden, and the wild geese honking overhead as they flap south for the winter. Linear time falls away, and we find ourselves held, once again, in the vast cycles of the cosmos – the round dance of the seasons, the sun climbing out of the ground each morning and slipping down into the Earth every evening, the opening and closing of the lunar eye whose full gaze attracts the tidal waters within and all around us.

For we are born of this animate Earth, and our sensitive flesh is simply our part of the dreaming body of the world. However much we may obscure this ancestral affinity, we cannot erase it, and the persistence of the old stories is the continuance of a way of speaking that blesses the sentence of things, binding our thoughts back into the depths of an imagination much vaster than our own. To live in a storied world is to know that intelligence is not an exclusively human faculty located somewhere inside our skulls, but is rather a power of the animate Earth itself, in which we humans, along with the hawks and the thrumming frogs, all participate. It is to know, further, that each land, each watershed, each community of plants and animals and soils, has its particular style of intelligence, its unique mind or imagination evident in the particular patterns that play out there, in the living stories that unfold in that valley, and that are told and retold by the people of that place. Each ecology has its own psyche, and the local people bind their imaginations to the psyche of the place by letting the land dream its tales through them.

How basic and instinctive is the imaginative craft of telling a tale! And yet how little we exercise these skills in the modern era. Of course, we’ll read a story to a child before sleep, but we won’t take the time to really learn to tell the story ourselves (without reading it), or to improvise a fresh version of an old tale for our neighbors and friends. We have too little time for such frivolities: a world of factual information beckons, a universe of spreadsheets and stock comparisons. If we crave entertainment, we have only to click on the television or the computer, and straightaway we can synapse ourselves to any one of the rapidly multiplying video games and virtual worlds now accessible through the glowing screen. Surely this rich and rapidly shifting realm of technological pleasures is the niftiest magic of all!

Perhaps. Yet for all their dash and dazzle, the inventions of humankind can never match the complexity and nuance of the sensuous Earth, this breathing cosmos that invented us. The many-voiced Earth remains the secret source and inspiration for all the fabricated realms that now beckon to us through the screen. Let us indeed celebrate the powers of technology, and introduce our children to the digital delights of our era. But not before we have acquainted them with the gifts of the living land, and enabled its palpable mysteries to ignite their imaginations and their thoughts. Not before we have stepped outside with our children, late at night, to gaze up at those countless lights scattered haphazard through the fathomless dark, and sharing a story about how the stars came to be there. Not before they’ve glimpsed the tracks of coyote in the mud by the supermarket, or have sat alongside us on the banks of a local stream, dangling a line in the water and pondering an old tale about the salmon of wisdom... Spoken stories, when we listen to them, or when we make them our own and tell them ourselves, wake us up to our immersion in a dreaming universe – to the vast and enigmatic story deliciously unfolding all around us. They induce us to taste the icicles dangling from the roof, and to smell the breeze, and to wonder: what’s going to happen next?

Sufism

Sufism (Arabic: Ṭasawwuf) deals with the inward, esoteric, mystical, and spiritual dimensions of Islamic beliefs and practices. Historically, this aspect of Islam has given rise to diverse traditions of spiritual techniques, individual and collective rituals, metaphysical and Theosophical expositions, hagiographic writings, and mystical love poetry, as well as institutionalized forms of discipline, education, and mentoring – all of which have been collectively called Sufism.

The environmental movement in its present form is often perceived in the Muslim world as essentially Western in its form and origin, and is therefore linked with the bitter memory and continuing legacy of colonialism or with a perceived conspiracy to keep the Muslim world backward in the fields of industry and technology. In order to be effective in Muslim societies and communities, an indigenous Islamic environmentalism will have to be built on the basis of an eco-theology and environmental ethics that are recognizably Islamic. The rich traditions of Sufism offer invaluable resources that may be actualized for achieving this authenticity. However, Sufism’s own legitimacy is often debated and contested by Muslims.

Contemporary Islamic revivalists and Muslim modernists share a tendency with early Orientalists that views Sufism with great suspicion. Revivalists find Sufism otherworldly and therefore incompatible with political activism; modernists find Sufism irrational and therefore unscientific; both agree with early Orientalists who maintained that Sufism was a foreign introduction to Islam. It has often been noted that Sufism arose in the eighth and ninth centuries in part as a reaction against the worldliness and materialism of imperial Islam on the one hand, and against an overemphasis on ritual and legal formalism on the other hand. The followers and sympathizers of Sufism contend that it represents the very soul of Islam; bereft of Sufism’s vitalizing energy, Islam would be reduced to a bland set of rational propositions and legal rulings. Without denying that socio-historical circumstances and influences from Greek and neo-Platonic sources played important roles in its development, they insist that Sufism in its essence, inspiration, and goals is derived from the very foundations of Islam (i.e., the Qur’anic revelation and the Sunnah [or practice] of Prophet Muhammad [570–632]) and is therefore intrinsic to Islam.

It can be argued that Sufism in its essential sense – as the spiritual dimension of Islamic beliefs and practices – has always been an integral part of religious life in Muslim societies. The spiritual aspects of Islam were neither absent before the twelfth century, when organized Sufi orders started to play a major role in Muslim societies, nor were they ever confined within such orders. In other words, whatever Muslims believe, experience, or perform as religious beings almost always has a spiritual dimension, even though this dimension is not always labeled or institutionalized in a distinctly identifiable “Sufi” form. It is the manifestation of this spiritual dimension of Islam in the beliefs and practices of Sufism as a more or less specialized discipline that represents, in some ways, a contested area. This is hardly surprising, for Sufism is not a simple and monolithic entity but a collection of rich and diverse traditions with numerous currents that sometimes compete with each other.

Distrust for Sufism among some Muslim jurists and theologians was originally provoked by certain varieties of Sufism that they saw as deviations from Islamic norms. In most cases, however, Sufis themselves have been the first to oppose such tendencies, thereby generating a tradition of self-criticism and internal reform within Sufism. For their part, Sufis have criticized what they viewed as the narrow perspectives of theologians and jurists in general, who, according to the Sufis, were unable to gain a personal apprehension of ultimate reality because of the limited reach of their exoteric disciplines. At the same time, many prominent theologians and jurists in Islamic history have been practicing Sufis as well. Perhaps the most influential of them was Abu Hamid Muhammad Al-Ghazali (1058–1111) who was among the first to defend the Islamic authenticity of Sufism.

Traditionally, a proper knowledge of Islam’s exoteric disciplines has been considered a prerequisite for embarking upon the Sufi path; this requirement, however, was not always followed in practice. According to the self-understanding of Sufism, its esoteric framework does not stand in opposition to Islam’s exoteric teachings but represents a stronger and more intensified inner experience of their truth. Such a personal apprehension of the nature of
reality (taḥqīq) is opposed to naïve faith in ascribed beliefs (taqlīd), and provides the vital energy for sincere and creative religiosity. Al-Ghazali notes that what is most distinctive about Sufism cannot be grasped by study, but only through immediate experience and personal transformation: “What a difference there is between knowing the definition of health and satiety, together with their causes and presuppositions, and being healthy and satisfied!”

At least part of the opposition to Sufism in Muslim societies has come from governments. Muslim (and later colonial) rulers often recognized that the strong bond of loyalty and commitment that typically develops between master and disciple in institutionalized Sufism, as well as the strong organization and motivation of Sufi orders, could be threatening to their political power. Institutionalized Sufism suffered some setbacks in recent centuries due to Islam’s encounter with Western modernity and consequent social transformations, as well as due to its patronage and control by colonial and post-colonial bureaucracies for political reasons; both have led to numerous adjustments and adaptations, or, according to critics, to Sufism’s degeneration in many cases into superstitious and exploitative forms of popular religion. Despite its contested nature, however, Sufism in its myriad forms continues to thrive in the contemporary world among Muslims belonging to diverse socio-cultural backgrounds. Perhaps an important reason for Sufism’s continuing influence and attraction lies in its ability to address religious yearnings at a deeper existential level and to affirm and channel certain emotional states, a need that receives minimal attention in more rationalized Islamic disciplines like Sharīc (Islamic law) or Kalam (theology).

Like most forms of human religiosity, Sufism has the potential both to serve and hinder the cause of the environmental movement. Optimistically speaking, Sufism’s hold on the lives and imaginations of a large number of Muslims could very possibly make it one of the most powerful allies of the environmental movement. The realization of this potential will require the fostering of an ecological consciousness among those traditionally trained scholars and Sufi mentors who represent the best aspects of the Sufi tradition and who enjoy a widespread following. The development of an authentic “eco-Sufism” will also require an environmentally informed critical evaluation of classical Sufi teachings and practices. A deliberate effort will have to be made in order to identify those themes in Sufism that may contribute positively to Islamic environmentalism as well as those that might obstruct its development.

Sufi asceticism (zuhd) is a theme that can have both positive and negative consequences for the natural environment. In its extreme manifestation, asceticism can lead to an excessive otherworldliness and withdrawal from the world – an attitude that could lead to a disregard for the concrete social and ecological reality in favor of personal union with the divine. In its mild and moderate forms, however, asceticism can be an asset for Islamic environmentalism, with its potential for fostering spiritual discipline and combating the temptations of consumerism.

Typically, most Sufi teachers would not recommend actually renouncing the world – which is seen as contrary to the vision of Islam – but would encourage the cultivation of a state of mind in which one is only outwardly involved with material possessions and concerns while focusing one’s inner attention solely on God. This kind of asceticism often involves living at a subsistence level, taking from the material world only that which is unavoidable for living a life of spiritual and moral purity. Ideally, Sufis would be actively involved in family and community lives, in accordance with Islam’s normative ideals, yet they would avoid acquisition of material possessions or enjoyment of material comforts for their own sake. This happy balance, if self-consciously cultivated at a mass level, can have far-reaching economic and ecological consequences.

The attitude of Sufism toward nature may be explored through several themes, one of which is the doctrine of Wuhdat Al-Wujud, or Unity of Being. Because of the complex nature of this doctrine, brief descriptions are inherently imprecise and potentially misleading. Nevertheless, Sufi ontology based on Unity of Being has important implications for an Islamic eco-theology, as it cultivates the sanctity and intrinsic worth of nature, irrespective of its utilitarian or instrumental value. A Sufi perspective informed by Unity of Being would approach nature with the knowledge that all things and phenomena are interrelated at the deepest ontological level, for they are nothing but the loci of the self-disclosure and self-revelation of the same Ultimate Reality. In Sufism, nature is often seen as being imbued with immense spiritual significance. According to the Persian poet Sacdi (d. 1292): “I love the whole cosmos, for the cosmos is from God.” This approach can inculcate an extraordinary love and fascination, as well as awe and reverence, for nature. Since everything in nature is a theophany, service to God’s creatures is service to God and crimes against them are sins against God. At the same time, however, certain other – and perhaps less sophisticated – interpretations of the Unity of Being have led to the conclusion that the material world is a mere illusion with which enlightened human beings need not concern themselves. An ecologically conscious Sufism would have to guard itself against such tendencies.

The ecologically beneficial attitudes present in much of Sufism are yet to be translated into heightened environmental consciousness and activism. Even when recognized as environmentally relevant, such attitudes are likely to remain abstract ideals so long as they are neither supported by contemporary culture nor actualized in social institutions, both of which tend to inculcate environmentally destructive behaviors. Hostility against Sufism and the penetration of Muslim societies with
Western capitalism further restrict the effectiveness of such ideals in shaping concrete reality. The classical age of Sufism did not encounter the environmental crisis as it is being experienced now; at best, Sufism’s approach to nature can be effective at an individual level, but the power of the collective order to shape individual consciousness and behavior has tremendously increased in the meantime, so much so that it even influences the hopes, fears, desires, and dreams of individuals living under its sway. Consequently, Sufism cannot contribute toward an Islamic environmentalism without making certain adjustments in its theoretical and practical focus, so that it becomes able to direct the spiritual and moral energy generated at an individual level into socially transformative channels.

Achieving a living experience of divine presence is both the goal of Sufism and a prelude to its higher aspiration, which is to find spiritual intimacy (qurb) with the divine beloved. The Islamic tradition identifies two ways of achieving this spiritual intimacy, which are by no means mutually exclusive. The first (taqarrub bi-fara’id, achieving intimacy through obligations) has a strong social dimension, for it emphasizes the fulfillment of one’s duties toward God (huquq Allah) and God’s human and nonhuman creatures (huquq al-cibad). The second (taqarrub bi-nawafil, achieving intimacy through supererogatory acts) has a strong individualistic element, for it emphasizes contemplation and private rituals of meditation, devotion, and worship. In general, Sufi thought and practice has shown a marked predilection for the latter way, sometimes at the cost of the former. In order for Sufism to become relevant to the environmental movement, and to movements for social justice in general, a shift of emphasis is needed in the direction taqarrub bi-fara’id.

This implies that Sufis, as real or would-be friends and lovers of God, will have to pay greater attention to alleviating the suffering of the creatures of their divine beloved. In other words, Sufism will have to focus its attention on the attainment of spiritual intimacy with God primarily through service to God’s creatures – who constitute “God’s family” according to a famous hadith – without devaluing individual worship. According to the Qur’an, the experience of divine presence can be sought in the world of nature as well as within the human spirit; a shift of emphasis from the latter to the former may also help raise an ecological consciousness among followers of the Sufi path.

While Sufism has been criticized for its tendency to produce passivity, fatalism, and political quietism, its history simultaneously displays a remarkable engagement with social and political reality. For instance, virtually all nineteenth-century anti-colonial movements in the Muslim world revolved around Sufi orders and were led by Sufi masters. While Sufism is certainly not without its problematic aspects, it does contain significant resources that can be actualized for organized activism and movements for social change – a potential that needs to find worthwhile, authentic, and indigenous causes, an eco-Sufism being one very important possibility.

Sun Worship

Worship of the sun as god, goddess or spirit has been a regular feature of indigenous and pagan religions from ancient to contemporary times. Solar deities appear among the peoples of Siberia, Africa and North America. Solar worship is also strongly associated with the ancient Egyptians, Japanese Shinto and Vedic Indians. The sun is still worshipped by Hindus today – either as Surya or under the later identity of Vishnu in the Puranas, especially his manifestation as Satya Narayan. In the pre-Christian and pre-Islamic Levant, we also find sun-gods as regular features of various worship. The Romans imported the cult of the Nubian sun-god Mandulis. Another import was Sol Invictus (“the invincible sun”), a Near Eastern sun-god brought to Rome during the Punic wars. In late imperial times, under Elagabalus, he was identified with Mithras and later became important for Julian. The Christian festival of Christmas represents a transformation of the original solstitial festival of Mithras/Sol Invictus. For the earliest Roman, however, the sun was honored under the names of Vediovis and Sol Indiges (the indigenous sun of the Quirinal Hill).

As an Indo-European people, the Romans reflect the persistent sun worship found also among their linguistic cousins, namely, the Greeks, Hittites, Armenians, Slavs, Balts, Norse and Celts. As a male figure, the sun is usually considered a god of judgment. But the sun could equally be recognized as a goddess and progenitrix. In his Masks
of God, mythologist Joseph Campbell argues that the rise of the solar metaphor in worship reflects the development of consciousness as an emergence from the uroboric and lunar matriarchal matrix of Neolithic times (see further, Neumann 1954). A similar argument is put forward by Julian Jaynes (1977).

If the position of Amaterasu-O-Mi-Kami among Japanese Shinto represents the most developed solar cult in the world today, for the Mahayana Buddhists the name of the dhyanibuddha, Vairocana, is also suggestive and signifies “coming from the sun.” Among contemporary Western nature religiousists, the sun is likewise emerging as an increasingly important focus. But this development faces the onus of associations and abuses in the name of solar worship committed under the Third Reich. Based on the philological studies of Max Müller and Ernest Renan, the German Volkstumbewegung developed a practice of sun worship that included nude sun-bathing and celebration of the solstices. It had been prompted by a popular sense of estrangement from nature in the face of early nineteenth-century urban industrialization and machine-based civilization. The Völksische movement turned toward pre-Christian beliefs in which ancient sun worship was considered more consistent with scientific modernism than were the prevailing Christian and Jewish theologies. The contemporary Western Pagan solar focus and solstitial/equinoctial celebrations are based on similar reactions, but, unlike German “folk” paganism, the more liberal and/or left-wing spiritual bias of nature-centered religiosity rejects any notions of ethnic purity or eugenics. But whereas Wicca and Craft manifestations honor the Neolithic totality of light and darkness, Druidic and other reconstructed forms of Paganism, despite their use of stone circles, are decidedly post-Neolithic in their preference for solar orientation and metaphor. This last, similar to what occurs in Shinto worship, often involves ritually witnessing the rising sun. In the milieu of Pagan affinities and contemporary youth culture, all-night dance parties typically culminate at daybreak with ravers greeting the emerging solar orb. This suggests the possibility of convergence between traditional indigenous practice and spontaneous sun-worship developments in the Western world.

Surfing

To the casual observer surfing is an adventure sport not a religion. Such observers would certainly not expect that surfing might promote a veneration of life and a corresponding environmental activism. For many surfers, however, surfing is a ritual, a practice; a way of life that evokes experiences akin to what some scholars have labeled “oceanic” or mystical feelings of oneness with the cosmos. The perceptual alterations that come with surfing, many of its devotees confess, leads them to recognize their obligations toward the Earth’s living systems, especially “mother ocean.”

Certainly this is not the experience and ethics of all surfers, and popular culture often accurately portrays surfing not as a religious quest producing environmental sensitivity, but as a hedonistic sport sometimes so charged with ego that territorialism leads to brutal fights over the best waves. Meanwhile most religious studies scholars have largely ignored the practice. The popular image and scholarly disinterest has produced a widespread lack of understanding of surfing’s history, spirituality, and transformative power. Here two surfers, one religion scholar (Bron Taylor) and a founder of two nonprofit surfing organizations (Glenn Hening), go tandem in an effort to explain what surfing has to do with religion and nature.

Editor’s note: This co-authored entry is unusual because Glenn Hening is both a contributing expert as well as an important figure in the contemporary evolution of modern surfing and thus a subject of the analysis. It proved best to draw on his first-person writing in the first two sections, to co-author the third section, and for Bron Taylor to lead-write and quote Hening during the last three sections. The role of the writers in each segment is signaled in the subheadings themselves, and it should be understood that Taylor worked up this introduction and the entry’s framework.
The Endless Energy of Surf "Stoke" [Hening]

When I first wanted to be a surfer in the early 1960s, Mom and Dad said, "No way – you'll just end up a beach bum." And at the time, their fears were well founded, given the public image of surfing driven by the Beach Boys and the popular American television program Gidget. Now, four decades later, we’ve come a long way from the motion picture Beach Blanket Bingo to a discussion of surfing in this Encyclopedia of Religion and Nature. Or have we? Wild rites of passage, zealots wandering in the emptiness of nature, sacred objects and icons, vestments for holy rites, cloistered believers versus the great unwashed – sounds like surfing to me! And why? Because from beginners experiencing the effortless motion of their first ride to those who’ve ridden thousands of waves around the world, the fundamental experience of surfing is inner joy, leading to a transformation and, for many, a transcendent or religious dimension. (In surf cultures worldwide, “stoked” is the verb most often used to capture the joyful and sometimes ecstatic experience of surfing.)

Of course, it is always a high-wire act when talking about what is “religious” in our lives outside of our church, synagogue, temple or other formal places of worship. One misstep and next thing you know even brushing your teeth could qualify as a religious experience. However, with surfing, we can make some statements that are wholly unique, and from them these threads of truth that are unbreakable no matter where waves break or who is riding them.

The first locus and center point for surfing is, of course, surf. Each wave is born in the marriage of wind and water, but exactly how that birthing occurs is still not fully understood. Every wave is unique, and no two can ever be exactly the same. And wave events, or swells, cannot be predicted with complete accuracy.

It must be remembered that waves are all around us all the time: sound, electricity, light, emotions, are all understood in terms of waves. So waves are not a foreign concept in the real world: there are light waves bouncing off this page and stimulating your eyes, for example.

But the waves of a surfer are a unique energy form in that we can ride them. They occur only where ocean and land combine to transform energy into entities that will exist momentarily before they are gone forever. A surfer’s waves exist first in wind-shaped infinitesimal patterns that coalesce into groups, then as walls of water that often march across thousands of miles of ocean. When we witness the final moments of a wave’s journey, or participate in its death throes by transforming the energy into personal motion through time and space, we are in contact with the initial center of the surfing “religion.”

Surf and Ancient Peruvian Culture [Hening]

In the late 1980s I was invited to an ocean festival in Northern Peru dedicated to honoring the traditions of coastal fishermen and their connection to modern surfing. Because they still use small craft made from bundles of reeds to push out through some of the longest rideable waves in the world, I was very interested in the possibility that a new version of surfing could be found that would pre-date the first accounts of surfing from Hawai’i.

Well, not only did I have a chance to ride waves using craft essentially unchanged since 1000 B.C.E., but I also visited archeological sites where incontrovertible evidence of “surf stoke” can be observed. I have since returned to Northern Peru several times to study the Moche and Chimú societies whose temples, cities, and lifestyles provide a fascinating insight into ancient human relationships with the power of the ocean, breaking waves, and possibly even surfriding itself. Based on this research I have concluded that the pre-Columbian coastal cultures of Northern Peru provide the earliest example of how surf can affect a civilized society.

This may be a bold statement to some. Given that humankind has inhabited coastlines around the world for millennia, how can we talk about a “first” in such a context? Quite easily, I think. The Southern Hemisphere is more water than land, and the storms of the “roaring 40s” (the southern ocean from latitude 40 degrees south to latitude 60 degrees south) circle the planet unimpeded by land masses. This zone of energy is the spawning grounds of more waves than any other oceanic area on the planet. Those waves sweep primarily from west to east as well as northward toward the coast of Peru. Along that coast flows the Humboldt Current, a cold water “river” in the ocean that is one of the richest fishing grounds in the world, a source of protein easily accessible to coastal inhabitants using fishing craft made from reeds, and there is evidence of this going back three thousand years before the Spanish arrived. The ancient Peruvians lived in one of the rare places on Earth where food and waves were omnipresent.

I do not find it surprising, therefore, that sea life and sea energy resonate through the belief systems, architecture, jewelry, weavings, and ceramics of ancient Peruvian coastal cultures. Temple walls, ceremonial courtyards, deities in reed boats gliding through the heavens, even the iconography of specific priesthoods and theocracies suggest a fascination and veneration for what must have been, to them, the unlimited sources of food and sheer power of waves.

The ancient Peruvians didn’t know about the causes of storms or big waves. They didn’t have satellites or weather buoys. All they knew was that the power of waves was beyond anything else in their world – and that a hundred waves, a thousand waves, a million waves, an infinite number of waves – were coming toward them throughout their lives from a source that was unknown.

To the best of my knowledge, it is in Northern Peru that we find the earliest known graphic design that consist-
ently depicts oceanic waves in their two most easily visible forms: long walls of water moving across the open ocean, and curved, liquid forms that arc forward and explode when the ocean’s energy meets terra firma. As Thor Heyerdahl, the famous Norwegian adventurer best known for his kon-tiki and ra expeditions, said during an interview I had with him in 1990,

Here in Northern Peru we find the earliest examples of large societies living in close proximity to consistently big waves. Of course, the Egyptians and Babylonians also developed the reed boats. However, there is no surf on the Nile, and you’ll never see groundswells marching from the horizon in the Mediterranean or the Persian Gulf.

Thus the ancient Peruvians may have been the first to formally consecrate a human connection to waves, a fundamental connection that exists to this day. All this suggests, I think, that a primal constant lies at the center of surfing: endless and immense power formed into beautiful patterns constantly moving towards us.

There is a second fundamental reality of surf: the breaking wave itself. The physics and geometry of how waves break present observers with a striking fact: depending on the underwater topography and the character of the incoming swell, the curves of a breaking wave are the same curves of a nautilus shell, the pattern of seeds in a sunflower, the arms of a storm, the spiraling of a galaxy. And not only does the water spiral over in a beautiful curve, but that curve continues to form as the wave moves along the coast, thus providing a continuous view inside nature for as long as the wave is alive. And when its energy is finally expelled, there is another wave right behind it providing the same vision.

On my expeditions to Peru, most recently in 2002 as a tour guide for “thinking surfers” interested in new perspectives on the sport, I focused on possible origins of surfing spirituality in ancient Peruvian depictions of the curves of breaking waves in their art and architecture. There is a temple complex 500 miles north of Lima, for example, built on a promontory overlooking a corner of the coastline where incoming waves bend into the beach and tube over perfectly. Along one wall of the temple a frieze depicts the arcs of breaking waves connected one to another. Further to the north a Pre-Incan society was ruled by kings who would ring their crowns and their raiment with waves as if to suggest that they drew their royal power from the waves themselves, the most endless source of energy they knew.

Endless energy in motion culminating in perfect natural curves – the ancient Peruvians seemingly had a unique vision of the natural world, perhaps as rich and even earlier than was had in the better-known case of Hawai‘i, where there is greater documentation of a culture’s deep connection if not veneration of the surf, where riding waves was a significant part of the daily lives and rituals of a people.

**Surfing in Hawai‘i** [Hening with Taylor]

There are those such as former world surfing champion Felipe Pomar who would like to trace the reed craft rituals of the Peruvians through Easter Island and then throughout Polynesia and all the way to Hawai‘i. Given the available evidence this is a tenuous connection at best, although Thor Heyerdahl’s investigations in the early 1950s did turn up stone carvings of reed craft on Rapa Nui (Easter Island). Moreover, we know that ancient Polynesian wayfinders were able to sail across great distances. We also have an early account from the missionary William Ellis, first published in 1836, who reported that in 1823 the Tahitians had a god of the surf called Huaouri. But moving beyond curiosity and speculation regarding the possibility of a Peruvian diffusion of reed craft into the Pacific, the recorded history of surfing certainly begins with the Hawaiians, and dates to the 1600s.

Hawai‘i is unique in that it is exposed to swells from all directions, and there are literally hundreds of places to surf on all the islands. Ellis mentioned that the surfing he saw in Tahiti in 1823 was nowhere near as developed as what he witnessed in Hawai‘i. This is supported by the recorded references to surfing and evidence of a strong connection between the Hawaiian islanders and the waves around them in the reports from the earlier expeditions to Hawai‘i by Captain Cook and by subsequent accounts from Europeans and Americans arriving in Hawai‘i throughout the nineteenth century.

In Hawai‘i, however, as James Houston and Ben Finney explain in *Surfing: A History of the Ancient Hawaiian Sport*, there was no god of the surf, as there was in Tahiti. Nor was surfing specifically a religious observance. It was, however, like other aspects of Hawaiian life, integrally involved with the culture’s gods, spirits, and rituals. There may not have been a special god for surfing, but making a surfboard was very much a ritualized process, starting with offerings to the soul of the tree to be cut down.

Houston and Finney also discuss a stone temple heiau, apparently dedicated to surfing, which is located directly in front of a good surfing break. They also note the existence of a surf chant:

```
Arise, arise ye great surfs from Kahiki
The powerful curling waves
Arise with pohuehue
Well up, long ranging surf
```

It would be tempting to conclude, in the light of such evidence, that Hawai‘i provides an example of surfing’s religious presence in a culture. But if this is true, then why
did the practice plummet and nearly go extinct there? It is commonly believed that missionaries were responsible for the near death of surfing in the 1800s. Houston and Finney, however, argue that the missionaries did not see surfing as the problem, but object to the betting and sexual freedom that accompanied the pastime. They believe that when the betting and mixing of the sexes was prohibited, the Hawaiians lost interest in surfing, which if true, seems to cast doubt on the idea that surfing was religiously important to the Hawaiians.

Consequently, it appears we are on shaky ground if we would ascribe to the Hawaiians any sort of deeply held religious beliefs when it came to breaking waves or the act of riding them. Indeed, we have less evidence of such beliefs in Hawai‘i than we do from Northern Peru.

But what we do have emerging from Hawai‘i is the beginning of a continuum that we can stretch to the present day, where surfing comes to dominate the lives of many people in ways that exemplify certain forms of worship and ritual, providing some of them meaningful, liminal experiences. The aloha spirit of giving, personified by the father of modern surfing, Duke Kahanamoku, is one of the touchstones of surfing’s soul. The Duke promoted surfing around the world, and modern surfers see him as the embodiment of an ethical spirituality that may be just this side of a religious belief system.

**Surfing Spirituality and Experience [Taylor with Hening]**

The key to understanding surfing as a religious experience, of course, is to understand the experience itself.

The archetypal experience in modern surfing, made possible only in recent decades with the advent of relatively lightweight surfboards, is riding inside a perfect wave. The first lightweight surfboards were crafted of balsa wood in the early 1950s and by the end of the decade, boards built with foam cores and resin shells were invented. But it was not until the mid-1960s that boards under 10 foot long became popular, and only in the late 1960s that they shrunk in such a way as to provide an entirely new experience. Suddenly the best surfers could visit a space on the planet never before experienced by humankind: the spinning interior of a perfect wave, a place where time actually seems to stand still. This experience was first depicted in a 1970 film called *The Innermost Limits of Pure Fun*. In it one sees the vision that previously only a skilled surfer would have: that of flying through a liquid cylinder – an experience surely outside the boundaries of ordinary reality.

Glenn Hening, who has had extensive experience inside the tubes of perfectly shaped waves, described during our “surf writing” collaboration, how riding inside the tube can alter one’s experience of time:

In the tube one has no frame of reference except the cylinder of water spinning above, around, and below you. The only thing in your vision that provides a sense of place is the opening, or mouth of the wave in front of you. What can happen next is truly remarkable: if the wave starts peeling faster than you are surfing, the illusion is created that you are either not moving at all, or are moving backwards. And in relation to your only visual frame of reference, you are. So you can be going at top speed forward, but the sensation can be that you are going backward.

As 70s surfing explorer Kevin Lovett wrote after discovering and surfing one of the most perfect waves in the world in Indonesia, “One of the most amazing aspects of the surfing experience is the view of life looking out from inside a breaking wave. These unique, intense, timeless, moments help shape consciousness and are carried with you forever” (Lovett 1998).

Commenting on such experience, Hening finds a corollary in how worship can be thought of in ways outside many traditional connotations associated with the word. In this quote from *The Urantia Book*, a text purportedly given through a dream to a Chicago Psychiatrist in the 1930s that Hening considers a guide to enlightened Christianity, Hening found an apt description of the peak surfing experience. For Hening the book suggests that we think of worship as

the act of a part identifying itself with the whole, the assumption of refreshing, creative, fraternal and romantic attitudes by the human spirit. It is self-forgetting, it is superthinking. It is effortless attention, true and ideal soul rest, and yet a form of restful spiritual exertion . . . It is the yardstick which measures the extent of the soul’s detachment from the material universe and its simultaneous and secure attachment to the spiritual realities of all creation. Worship is identifying . . . the finite with the infinite, time in the act of striking step with eternity (Urantia Foundation 1955: 1616).

Indeed, “From the unique and extraordinary vision while riding inside a perfect wave,” Hening believes, “the mystic kernel of the religious in surfing grows.” And he thinks this is the “first source and center of surfing’s spiritual power” even for many of those without the requisite skill to directly experience this vision. This certainly seems plausible, for indeed, in surf film, art, and music, this archetypal experience is presented as somewhat of an experiential holy grail.

Many surfers, such as former world champion Shaun Tomson, report that “time is expanded inside the tube,” a place where one can experience space/time relativity, where time seems literally to stand still. Hening’s descrip-
tion of the physical reality of a tube ride (above) allowed him to find in Albert Einstein’s relativity theory a scientific explanation for the experience. Other well-read surfers find that authors such as Fritjof Capra (The Tao of Physics) help them understand their heightened sense of perception while inside a breaking wave. It is remarkably common for surfers to reflect on experiences that for them are satori-like, that resemble the spiritual awakening sought in Zen Buddhism, whereby the practitioner feels as though the universe is flowing through him or her or his body as the self of self dissolves into that universal, eternal energy.

Although no great surfer, I (Taylor) have had a few hints at such experience. One particularly memorable one was while surfing a southern hemisphere groundswell (waves created by storms thousands of miles away) in northern Malibu. Taking off on a steep wave in an unfamiliar area and making the bottom turn, the wave suddenly pitched up, revealing a rocky reef immediately below the intended, liquid pathway. Suddenly “making it” appeared clearly as the one way to survive the ride; but at the same time I realized that the wave breaking immediately behind me was so fast that survival seemed unlikely. Just as this realization came into consciousness, I had an experience as though I was surfing by automatic pilot — time seemed to stand still and I somehow made the break — then in slow motion, perfectly, I emerged safely out the other side to the hoots of nearby friends. It occurred to me then, as it does now, that the experience was kindred to that which John Muir once had on the North Face of Mt. Ritter, where temporarily frozen in fear and stuck, unable to climb up or down, he suddenly felt the universe take over and flow, climbing, through him, enabling his escape to the mountaintop. It occurs to me that without religious studies lenses, few surfers would interpret such experiences in metaphysical ways. But nevertheless, some do.

It is not difficult on many levels to apply religious categories to an analysis of surfing sub-cultures. Surfers do, for example, engage in elaborate and ritualized pilgrimages all over the Earth, as The Endless Summer (1964) and countless other surf films depict — as they go “in search of the perfect wave.” The places where spiritual epiphanies occur are constructed in the minds of some surfers as sacred places — self-consciously in some cases and implicitly in others. These places are venerated in many of the same ways that other sacred places are today: they are named, written about, photographed, and fought over. Battles over them are sometimes among surfers coveting the experience and at other times between surfers and those engaged in commercial enterprises that threaten them. These latter types of disputes can be framed as battles between agents of desecration and those having a proper humility and spiritual appreciation of them. Thus are surfing spots, and the surfing experience, made sacred by human action. Two examples of this can, perhaps, be found in the organizat

The Surfrider Foundation and Groundswell Society [Hening and Taylor]

Given the experiential power of surfing and the history of religion it should not be surprising that many would try to exploit the practice commercially. Surfing has become a multi-billion dollar business, extending globally in many manifestations, from surf contests and promotions, to apparel, to the media, music and more. A number of surfing organizations have formed, however, to resist these trends and focus attention on the reasons surfing took off in the first place, the value and power of the oceans.

In 1984 Glenn Hening founded the Surfrider Foundation by forming a team of surfers that included Lance Carson, Tom Pratte, Steve Merrill, Chris Blakely, and Dan Young. Their mission was to create a new respect for the wave and beach environments and to protect them from polluters and developers. The organization chose, fittingly enough, a logo designed by David Moeller, a Huntington Beach (California) graphic artist and Surfrider board member, that depicts the vision from inside a perfect wave. Twenty years later, Surfrider has over fifty chapters in the U.S. and affiliates around the world.

In the late 1990s Hening co-founded the Groundswell Society with Jericho Poppler and Matt Meyerson. “With Surfrider, the problem was surfers getting sick from the ocean. But now, given surfing’s explosive growth, the problem is surfers getting sick of each other.” Formally incorporated in 2001, the Groundswell Society adds two dimensions to Surfrider’s original mission. First, a peace-making mission, seeking to reduce the violent territorialism that had come to characterize the sport as it became more popular. Second, frustrated by Surfrider’s identity as an increasingly mainstream environmental organization, Hening has shaped the Society’s annual publication to serve as a “voice of conscience” that highlights individuals and groups that contribute to a positive future for surfing while forthrightly identifying elements in modern surfing that profit from surfing’s energy and growth while failing to nurture and protect the oceans and surfing communities from which they ultimately draw their substance. Surfrider and the Groundswell Society, along with others such as Europe’s Surfers Against Sewage and the Surf Education Committee, represent a nonprofit, nascent and fledgling institutionalization of the spirituality and ethics that characterize surfers and surfing at their best.

One of the best examples of this is the Clean Water Classic, an event held annually at Rincon in California beginning in 1997, which raises funds to fight ocean pollution, and tries to promote a more cooperative and non-commercial surfing culture. Rincon is a place where you can ride inside a perfect wave, and usually the place is very crowded and the attitude in the water very aggressive.
and intense. But the Clean Water Classic combines environmental and social ideals into a memorable experience unique in the world of modern surfing.

**Surfing into the Future? [Taylor]**

There is much in surfing and its sub-cultures that, if anything, works against the kind of spirituality and ethics that we have suggested is sometimes involved. As Hening has insightfully written, there are aspects of surfing that can work against a spirituality that connects people with each other and the wider natural world:

The fundamental problem with surfing will always be how powerfully it drives the ego. There is nothing inherently social in surfing’s purest moments, because riding a wave is 100% personal. There is nothing “team” about it. So cooperation and humility takes a back seat to aggression and arrogance . . . As with every powerful experience that involves self-inflation amongst individuals in a crowd, surfing can go from the sublime to the ridiculous in an instant . . . from a generous free natural environment to a monstrous example of human greed and enmity. Surfers are the blessed sons and daughters of Kahuna gliding through Neptune’s kingdom, until they start acting like troops of baboons defending territory against outsiders while engaged in internecine conflicts typical of lower order primate communities (Hening in Young 2000: 137).

This critique is found in an article Hening titled “The Stain on the Soul of Surfing,” and it reminds me of the Western prophetic tradition, suggesting that surfing may have its first prophet. In it Hening reminds surfers of their unique blessing, that they are privileged to ride “aqua blue energy in warm water along beautiful coastlines, where the power and the visions provided by our mother ocean combine to make surfing an almost religious experience.” But he chastises his fellow surfers for forgetting “that waves are living magic” and argues that the internecine violence they too often engage in will “ruin our heaven on Earth.” He continues with, essentially, a call to repentance, suggesting that sharing and generosity must become definitive characteristics of surf culture.

Until these instincts become definitive of our surfing culture, starting with the surf industry and those making a living off the sport, surfing will suffer from a cancerous sore that won’t go away. The pro tours, contests, magazines, videos, surf star reunions, big-wave exploits, and guided trips to remote perfection will all mean very little until the leaders of our sport/art publicly make a commitment that says, “Enough! We leave our egos on the beach, and we enter the ocean with humility and a true sense of brotherhood.”

In a way, Hening is calling surfers back to their roots, or at least to those of the patron saint of modern surfing, Duke Kahanamoku, who more than any other figure was responsible for the globalization of the sport, and its original aloha spirit. *Longboard Magazine* has commented, “Groundswell Society’s idealism could be surfing’s new voice of conscience” (Holmes 2002: 73). Its founders and members, along with Surfrider Foundation, are inventing a surfing style that blends surfing’s nature spirituality with environmental and social conscience to create a positive legacy for future generations of surfers.

**Sustainability and the World Council of Churches**

The word “sustainable” has been a normal part of the English language for a long time. It has had obvious applicability to agriculture, forestry, and fishing, and other human activities that use natural resources. It means that
the activity is conducted in such a way that the resource is not exhausted and its use can continue indefinitely. However, the word did not become prominent in the literature until 1975. The event that lifted it to centrality in the discussion was its use by the World Council of Churches Assembly in Nairobi.

The preoccupation of the churches had long been with issues of justice. Many of the member churches were located in Third World countries that were struggling to overcome the legacy of colonialism. They needed assistance in economic development, but they found the economic and political structures of the world arranged to benefit the First World powers. The World Council was sensitive to their concerns, and called for a "just and participatory society." When, around 1970, the ecological crisis became a focus of attention in the First World, many in the Third World saw this as another distraction from the really urgent problems of the Third World. The World Council stood aloof from the 1992 United Nations meeting on the environment in Stockholm.

Nevertheless, many in the World Council were convinced that failure to consider the destructive impact of human actions on the natural world was unacceptable. They made their case at Nairobi. Justice and participation are certainly important, but if a society destroys its natural base so that it cannot survive, these virtues by themselves are radically insufficient. A society must live in a way that is sustainable. The Council added "sustainable" to its slogan, which now called for a "just, participatory, and sustainable society."

In the following seven years the Council organized meetings all over the world to discuss the meaning of "sustainability." These discussions heightened consciousness on the part of many participants as to the destructiveness of many current practices. On the whole it was recognized that the requirement of sustainability imposes limits on economic growth and that the First World might already have exceeded those limits. There was often a strong sense that recognition of the requirements of sustainability pointed to the need to redistribute access to natural resources so that the Third World would have a chance to develop economically. There was some recognition that population increase was also a threat to sustainability, but this topic has always been difficult to discuss in the churches.

Despite seven years of emphasis on sustainability, the next World Council Assembly, in Vancouver in 1982, turned its attention to the topic of peace. Fear of war between the First and Second Worlds had long informed the WCC agenda, and it returned to dominance at this session. Third World delegates saw that this directed attention away from their concerns for justice. The debates centered on peace and justice. Relations to the natural world faded from consideration. However, they were kept alive in the new slogan that emerged from this Assembly: "peace, justice, and the integrity of creation." This led to further conferences all over the world and to less anthropocentric reflection about nature, but it removed "sustainability" from the focus of attention in the churches.

Meanwhile, the term had been adopted widely in the international community. This became apparent especially at the United Nations "Earth Summit" at Rio de Janeiro in 1992. Out of that meeting, the idea of "sustainable development" has taken hold as the overall rubric under which policy is to be formulated.

In this context, however, the implications are quite different from those drawn by the World Council of Churches. "Development" means global economic "development," and economic development means economic growth. Instead of suggesting a society should live within limits, the term "sustainable" now calls for evading limits, making economic growth sustainable. This puts the focus on technology as the instrument through which limits can be pushed back again and again. This approach also sets aside the question of redistribution of resources, since the problems of the Third World are to be solved by overall global growth, which takes place best when the great economic actors are given free reign.

In some contexts, the quest for sustainability still functions to discourage excessive use of resources. An interest in the sustainable use of forests and oceans, for example, sometimes leads to the acknowledgment of limits and to attempts to stay within them. Unfortunately, the origin of the current use of the term in an anthropocentric context restricts its usefulness even in these cases.

**Swadhyaya**

Swadhyaya is a spiritual and social movement centering upon the teachings of Rev. Pandurang Shastri Athavale, known to his followers as Dada, or Dadaji, meaning elder brother. Teaching over the past five decades from a center
in Mumbai (India) called Shrimad Bhagavad Geeta Pathshala, his purpose is the recovery of the insights and values of India’s cultural heritage. Because he recognizes that ancient Indian civilization placed a high value upon nature, the activities of Swadhyaya that address ecological issues are of interest to contemporary environmental theory.

To most specialists in Vedic literature, the term Swadhyaya refers to the recitation of Vedic texts to oneself. For the adherents of the movement known by that name it has the more literal connotation of the examination or study of oneself. Based on ancient Indian religious texts, and the Bhagavadgita in particular, Swadhyaya, invites one to recognize the divinity within oneself and within all persons, giving rise to self-respect, esteem for others, and grateful devotion to God. The teaching that God dwells within every person, and that all persons are spiritual brothers and sisters in the family of God, has been spread by means of devotional tours (Bhaktipheri), which Athavale initiated in 1957, wherein adherents visit villages to share the teachings of the ancient tradition with the local people. Without hierarchy or paid workers, Swadhyaya has spread to roughly 100,000 villages in India.

While Athavale accepts no funding from any source, his teaching is that labor is devotion (Shrambhakti) and his recommendation of offering one's time, talent, and expertise for one day a month as devotion (Bhakti) to God has supported a wide variety of experiments in farming, forestry, fishing, water-resource management, sanitation, education and other areas. Endorsing neither fundamentalism nor politics, Athavale teaches that devotion (Bhakti) is a social force that can be effective in solving any human problem.

In 1979, Athavale initiated a phase in the restoration of India’s classical heritage that addressed the depletion of the forest cover that had supported Indian civilization from ancient times. He pointed out that the ancient sages of India saw trees as the dwelling of the Lord who pervades the universe. The ancients enjoined the people to see God in trees because of the capacity of trees to instill noble qualities of selflessness and magnanimity. Athavale established Tree Temples (Vruksha Mandir) to cultivate the perception of trees as the dwelling and image of divinity. At the establishment of the first Tree Temple, he invited local farmers to offer their expertise to plant and care for the new trees as a devotional activity, and to perceive their tools as sacred implements. People from various villages within a region spend 24 hours at a time in the temple not as workers but priests (Pujaris) of the temple of trees. Without the use of chemical fertilizers or pesticides, the participants enter the temple with an attitude of worship, and feel the presence of God in their activities of watering, weeding, and caring for the seedlings, and the growing trees. Coming from differing castes and classes of society, they visit, sing hymns, and eat together, breaking down traditional barriers between sectors of society. The tree temple program now extends to thousands of villages across India.

The initiative known as the Farm of God (Yogeshwar Krush) is a village-based agricultural enterprise in which participants cultivate land leased or purchased with the purpose of recognizing the presence of divinity in the Earth as well as in other aspects of nature. Activity on the Farm of God is understood as worship, and the produce of the soil is distributed anonymously to those in need not as charity but as benediction (Prasad) from God, obviating the distinction between donor and recipient. An analogous program called Floating Temples (Matsya Gandha) has addressed the depressed material and social conditions of many fishing villages. Capital that enterprises such as the Floating Temples generate is understood to be the outcome of active community devotion, and is acknowledged to belong to God alone. It is called Impersonal Wealth (Apaurusheya Laxmi), to be employed for the uplift of the whole community as the family of God. Offering one a month as active devotion, Swadhyaya communities have undertaken projects of ecological restoration that have produced extraordinary results. In the arid regions of the state of Gujarat, the Pure Water (Nirmal Neer) program has recharged abandoned wells and impounded run-off water in ponds, achieving a 300 percent increase in farming productivity at a tenth of the cost of government programs.

Swadhyaya is the revival of an ancient way of life, in which an ancient attitude toward nature is embedded. While the accomplishments of Swadhyaya in the area of environmental concern is a living example of the relevance of Indian religious traditions in the care of nature, ecological restoration is but one manifestation of this religious movement that has had significant positive economic and social implications at the village level and beyond.

Swedenborg, Emanuel (1688–1772)

Next to the botanist Carl Linnaeus (1707–1778), Emanuel Swedenborg is perhaps Sweden’s most famous son. He was a multifaceted genius who made a name for himself in the first half of his life as an inventor, scientist, philosopher and mining expert. He served on Sweden’s College of Mines from 1724 to 1747. His first major work focused on mineralogy and cosmology. He published the three-volume work entitled *Opera Mineralia* in 1734 in Leipzig and Dresden. The first volume contained his cosmology and the other two volumes were scientific studies of iron and steel, copper and brass. His last major work of this period was an exploration of the human body entitled *Regnum Animale*. Two volumes were published in The Hague in 1744 and the third volume was published in London in 1745. In this work he had hoped to demonstrate the reality of the soul to the very senses.

A religious crisis in mid-life was the defining experience of his life and created his place in history. His reputation and influence rest on the 18 religious works he published during the second half of his life between 1749–1771. His works claim to reveal the inner meaning of the Bible and the true nature of reality—spiritual and natural. In number 68 of his first work *Arcana Coelestia* (1749), he states he was able to do this because he had had direct experience of the spiritual world, “I have seen, I have heard, I have felt” (1998a: 45). He believed that he was only called to write and publish these revelations and he never attempted to organize a religion based upon them. After his death, others, however, did and today there are a variety of Swedenborgian or New Church (from Rev. 21:2) organizations worldwide.

Despite their relative obscurity currently, Swedenborg’s religious teachings have had considerable impact on modern Western culture. He was read by philosophers such as Kant and Emerson, painters like Gauguin, Inness and Keith (a friend of John Muir), poets as diverse as Blake, Baudelaire, Whitman and Borges, founders of new religions like Joseph Smith, Eddy, and Moon, and commentators on religion such as Corbin and Suzuki.

His new Christian religion provides an integrated and complementary view of the relationship between spirit and nature. In a work entitled *Interaction between Soul and Body* (1769), Swedenborg states that the universe is both spiritual and natural and that there are two things that produce all the effects in it, life and nature. In the divine design, they were created so that there would be a perfect correspondence between life and nature, from first to last, from inmost to the ultimate. Mutual love is the organizing principle of life. Space and time are the fundamental features of nature. Nature is a theater representative of the spiritual world and it is from this that all things in nature subsist. In the order of creation, only human beings are a microcosm of the universe, being both spiritual and natural, and therefore they are created to serve as the medium of conjunction between heaven and Earth. In order to fulfill this role, human beings are endowed with freedom and rationality. Conjunction with heaven is theirs to choose. The more spiritual and motivated by mutual love they are, the more they treat Earth as the perfect correspondent of spiritual affections. Thus, the more it is infilled with life. The more natural they are and the more they choose to abuse the heavenly principle of mutual love, the more the Earth is treated as an object for domination.

While nature is not in itself sacred in the teachings of Swedenborg, it plays an essential role in his understanding of the divine design, and therefore it must be preserved and cherished, so that the canvas of correspondences is available for all future generations.

The human race is enjoined in Swedenborg’s religious writings to participate in the preservation of the created world. In a work entitled *Conjugal Love* (1768), Swedenborg states that two principles emanate from the Lord for the conservation of the universe. In number 386 he writes that “one is the principle of procreating and the other is the principle of protecting what is procreated” (1998b: 465–6). The desire to protect what has been created is implanted in humans and animals, according to Swedenborg, and can even be seen in the vegetable and mineral kingdoms. This is elaborated in number 389, which states “that seeds are protected by shells, like swaddlings . . . and that there is something like this among minerals appears from the matrices and coverings, wherein noble gems and metals are concealed and guarded” (1998b: 468). He continues in number 391 that it is part of the plan of creation “that the things created must be preserved, guarded, protected, and sustained” (1998b: 468).

This idea is also discussed in his work *Divine Providence* (1764) in number 3:3 where it is written that the preservation of all created things “depends upon the conjunction of the Creator with the human race” (1996a: 4). This number makes it clear that human beings are invited by the Lord to help preserve the universe. According to Swedenborg, this is best done by shunning as sins the evils enumerated in the Decalogue.

Swedenborg’s concern for the environment is witnessed by his view that human beings, who genuinely seek spiritual life, will treat everything created by the Lord with honor and respect.

*Jane Williams-Hogan*

Swimme, Brian (1950–)

Brian Swimme, a mathematical cosmologist, is one of the prime articulators of “the new cosmology,” a scientifically informed, mythic, religious narrative of the provenance and progression of the universe and the role of the human within it. An educator noted for his dynamic, energetic presentation style, Swimme holds a Ph.D. in gravitational dynamics from the University of Oregon (1978) and serves on the graduate faculty for the California Institute of Integral Studies in San Francisco. Dr. Swimme’s ideas have been featured at conferences sponsored by the American Association for the Advancement of Science, the United Nations, The World Bank, UNESCO, and the International Montessori Association, and have been very influential among secular and religious groups in fostering an ecological awareness, especially among Roman Catholic women’s religious communities.

Swimme’s research centers on the evolutionary dynamics of the universe, the relationship between scientific cosmology and more traditional religious cosmological perspectives, and the role of the human in the unfolding of the cosmos. In 1990, he established the Centre for the Story of the Universe, an international forum for scientists, artists, ecologists, ecofeminists, educators, and religious thinkers interested in pursuing the new cosmology.

In exploring the new cosmology, sometimes referred to as “the New Story,” Swimme has brought his expertise in gravitational dynamics to bear on the relationship of scientific cosmology with more traditional religious cosmological understandings. Informed by an ecological awareness and concern, Swimme has helped interpret the work of cultural historian and “geologian” Thomas Berry, as well as collaborate with him, as evidenced by their co-written book, The Universe Story. This book attempts to tell the story of the universe – from the “primordial flaring forth,” the Big Bang, to its present development – as a dramatic narrative, portraying the universe is a primordial source of human inspiration and religious imagination.

Unlike Berry, however, Swimme concentrates on scientific data surrounding the unfolding of the universe. Whereas Berry endeavors, in part, to lead religious traditions into a scientifically informed cosmological perspective, Swimme attempts, through his writings, public lectures, and video presentations, to deepen this process by reaching a broad, educated public.

For Swimme, the universe is not a calculable puzzle, but a wondrous mystery, manifesting the presence of the divine in each moment of its emergence. Swimme depicts the emergence of the universe as a spellbinding drama, replete with suspense, valor, tragedy, and celebration that took place eons before humans ever stood erect to behold an evening sky. As an undergraduate at Santa Clara University, a Catholic university in California, Swimme encountered the work of Jesuit paleontologist and theologian Pierre Teilhard de Chardin (1881–1955), whose theology addresses a universal, evolutionary perspective, and is also foundational for Thomas Berry.

For Swimme, the divine is not extrinsic to the scientific study of the universe. On the contrary, the divine is what both sustains and transforms the universe, the energy that supports as well as shapes all emerging reality. He equates the quantum vacuum of space with the “all-nourishing abyss,” (Swimme 1996), a term which echoes other descriptions of the divine, such as Paul Tillich’s “ground of our being.” Wellsprings of Swimme’s insights continue to be a sense of awe and wonder engendered by mystery of the universe, and a sense of horror at the human destruction of the Earth.

In addressing the role of the human, Swimme cites two poles that must be eschewed. On the one hand, there is the status quo idea that all creation is here solely for humans as resource and playground that Swimme claims we need to avoid. On the other hand, there is the view that says that the human is just one species among others, which Swimme terms overcompensation. Accepting such a view would cause the rest of the Earth community to suffer immensely, since other species seem incapable of cleaning up our mess. We must somehow, Swimme argues, retain humility in regard to our particular status while at the same time be responsible concerning our unique power as a species.

For Swimme, the human is the locus where the universe becomes conscious of itself. No other species, he contends, that we know of, can reflect on all that is and its place in the universe. The human role, then, becomes accepting our responsibility for learning and perpetuating the principles of the universe, as we perceive them.

Moreover, Swimme trenchantly uses the new cosmology to critique the culture of consumerism, the economic and cultural system that suggests, in Thomas Berry’s words, that the “universe is a collection of objects rather than a communion of subjects,” and is according to

Swimme argues that such a consumerist worldview, promulgated by global and ubiquitous advertising, seals off conscious contact with the powers at work in the universe and the Earth, leaving us deeply unsatisfied and turning to other stimulants to deal with our sense of alienation.

Some critics, including Gregory Baum, have suggested that the work of Swimme and Berry lacks a place for social-justice concerns and a plan for social action (Baum 1987). In addition, the “universe story” appears as a supreme metanarrative, one decontextualized from specific social, moral, political, economic, and cultural factors. Swimme and Berry in their more recent work appear to be incorporating such concerns, and the creative integrations of social-justice outreach and cosmological themes in the communities they have influenced, especially women religious involved in ecological ministries, suggests a growing nexus between the new cosmology and social-justice advocacy.

Tantra

Tantra, a current of religious doctrine and practice found mainly within Hinduism and Buddhism, emerged in India in about the sixth century. It evolved greatly over the subsequent one thousand years, changing in form and content as it spread outward into every Asian region into which Buddhism was practiced including China, Japan, Tibet, Nepal, and Indonesia. While later forms of Tantra tend to be abstract soteriologies (understandings regarding salvation) grounded in internal, meditative identification of the self with some form of the absolute, Tantra emerged in India out of the worship cults of local deities often identified with natural phenomena and the forces of nature. In India, these Tantric deities were very often (but not exclusively) female spirits of the land — mountains, forests, rivers, and pools— and were often identified with or depicted as wild animals, birds, trees, and flowers. Furthermore, when Tantra was exported to other parts of Asia, local deities of those countries were often transformed into the guardians of the mandalas of the Tantric high gods, and into semi-divine intermediaries between the worshipper and those gods. In Japan, for example, the sanrinjin (literally, “three bodies with discs”) theory, which divided the Buddha’s appearances in the phenomenal world into three types, allowed for the transformation and appropriation of the indigenous Japanese kami deities into so many “propagators of Buddhism.” In this way, deified aspects of the Japanese natural landscape became both Buddhist and Tantric, even as they remained Japanese. Parallel to this was the “translation” of certain Indian Tantric deities into their foreign homologues. So, for example, the dakinis of Indian Buddhist Tantra — who were at once semi-divine female intermediaries and human “witches,” and who were sometimes identified in India with jackals — were qualified as “fox spirits” in Chinese and Japanese Tantric traditions.

Natural vegetation plays a prominent role in Tantra, beginning with the use of the term “seed” (bijā in Sanskrit) for the most powerful class of mantras, the sound formulas used in Tantric ritual: the practitioner actually generates the divinity with which he will identify himself by “planting” its seed through his mantric utterance. This image is expanded in the circa tenth-century Kaulājñananirāyaya, a foundational Hindu Tantric text, in which Śiva, the supreme deity and creator god states that “Just as there is in an individual seed the origins of a tree possessed of flowers, roots, fruit, leaves, and branches, so it is as well

with the other beings that are generated within my body” (16:42). The coeval Netra Tantra (12:11–12) assigns this role to a class of female deities called the Mothers, who hold the world inside of themselves, in the form of seeds that they will sow again at the beginning of a new world age, in order that creatures might reappear. Vindhyavasini, the “Goddess Who Dwells in the Vindhya Mountains,” one of the earliest and most important Hindu Tantric goddesses, is described in terms of her habitat, which is an extension of herself: a vast forest teeming with plant and animal life. Similarly, the energy of the Hindu goddess Kubjika is described in a twelfth-century Tantric text as flowing outward through the transmission of her teachings, whose conduits are represented as living plants: trees, creepers, roots and vines. A number of later Kubjika texts depict her as a tree with orange or red-colored blossoms— either a tamarind (ciñca), a kimsuka, or a kadamba. This identification, of the female principal, with a flower, is extended to the female consort in numerous Tantric sexual rites, in which she is often called “Lotus Maiden,” and whose vulva is called “lotus” (padma).

It would be a mistake, however, to qualify the Tantric view of nature, or indeed of the feminine, as a static and passive source of life. In the early medieval Indian context, wild nature was, like feminine sexuality, threatening and antinomian, the polar opposite of the security and order of male-dominated human society. Here, nature was not a peaceable kingdom, but rather an alien wilderness, a place of savage energy, at once alluring and terrifying, nurturing and deadly to anyone who would venture into it, and populated by ravening female entities in the form of predatory animals and rapacious or carrion-feeding birds. In this context, the male practitioner of Tantra par excellence was termed a “hero” (vīra), because he alone dared to confront and master wild feminine nature, energy, and sexuality. So it was that on specific nights of the lunar month, male Tantric practitioners would assemble on lonely mountaintops (pithas) or in forest clearings (ksetras) to await the coming of Tantric yoginis or dakinis, who would descend on them in the form of lionesses, she-jackals, she-wolves, vultures, crows, cobras, etc. The non-initiates who stumbled into these gatherings (melakas) faced certain death: they would be torn apart by these Tantric animal-goddesses or their human counterparts. The Tantric hero, however, empowered by his controlling mantras and ritual knowledge, could control these dread feminine entities and, more than this, actually appropriate their multiple energies — the forces of nature — for himself,
in order to have a share in their supernatural powers. This was, in fact, the principal aim of early Tantric practice: to dominate nature by subjugating wild feminine sexuality as a means to gaining supernatural powers. The most important of these was flight, a “natural” capacity for bird-goddesses whose energy was said to come from their consumption of human flesh.

This Tantric goal lay at the foundation of the most important monumental edifices of early Hindu Tantra in India. These were the Yogini temples, of which approximately 15 ruins remain extant today on lonely hilltops or remote forest tracts, mainly in the Vindhya Mountain belt of central India where Hindu Tantra emerged. These temples were circular and roofless constructions: open to the heavens, they served as landing fields and launching pads for the airborne Yoginis. Carved into niches on the inner wall of these temples and facing an image of Siva or Bhairava at the center were images of the Yoginis, whose near-naked, sexually alluring bodies were crowned by the heads of predatory birds, wild animals, or fanged, terrible human “witches.” It was these dread man-eaters that the heroic male Tantric practitioner called down and sought to bend to his will by transforming them into his lovers, in imitation of the Siva or Bhairava at the center of their mandalas.

Over the centuries that followed its South Asian origins, Tantra was exported into Nepal, Tibet, China, Japan, and Mongolia; and in the past several decades it has made its entrance into Europe and the United States. In certain of these export settings, and most particularly in the post-industrial societies of Japan and the West, Tantra has been appropriated by a variety of New Age movements that have adapted the original tradition to respond to their own concerns. Such is natural in these contexts, in which the world of nature is no longer threatening, but rather under threat.

century that Tantrism began to enter the Western world in a significant way, with the foundation of the first “Tantrik Order in America” in New York City by Dr. Pierre Arnold Bernard in 1906. A contemporary of Sigmund Freud, Bernard saw modern Western society as terribly repressed in its attitudes toward the human body, sexuality and the natural environment. Tantrism, he believed, offered the most effective means to liberate these oppressed powers of sexuality and nature.

Beginning in the 1960s, Tantrism entered in full force into Western popular culture, first with the early Beat movement, and then finding a welcome home among the sexual revolutions of the 1960s and 1970s. In the words of Alan Watts – the ex-Anglican priest turned Zen master and psychedelic guru of the Beat generation – Tantrism is “a marvelous and welcome corrective to certain excesses of Western civilization.” In contrast to Western society, with its patriarchal domination of nature and its separation of spirit from matter, Tantrism can bring us an “understanding the creative power of the female” and an appreciation of the inherent goodness of the natural world. Perhaps the first great high priest of “Neo-Tantrism” was the infamous “Sex Guru” known in his early years as Bhagwan Shree Rajneesh and in his later life as “Osho.” Redefining Tantra as a kind of “religionless religion” based on the rejection of all fixed institutions and the celebration of sexuality and material nature, Rajneesh offered a new ideal for human existence – the ideal of “Zorba the Buddha,” who combines the sensuality of Zorba the Greek with the spiritual insight of the Buddha.

By the 1980s and 1990s, Tantrism had become a basic part of the amorphous movement known as the “New Age,” and increasingly identified with a wide variety of religious traditions believed to honor the forces of nature, sexuality and femininity. Thus, as Tantra: The Magazine defines it, Tantrism is no longer a tradition confined to certain forms of Hinduisms and Buddhism in Asia, but is in fact a universal tradition of nature-, goddess-, and sex-worship followed by peoples of all cultures, from pre-historic shamans to modern neo-pagans:

Tantra is life in balance . . . Tantra is practiced by Native Peoples the world over, through profound respect for All that Is. It is also practiced through the respect of the divine feminine worshipped in her physical form through attending the needs of Mother Earth as our own body (1991: 3).

Now reconceived as an ancient global tradition centering on the reverence of nature and sexuality, Tantrism has been increasingly embraced by many of the various “green” movements and other environmentalist groups that have emerged in the last three decades. As we see in a wide array of movements such as GreenSpirit, Creation Spirituality, and various Wiccan and Pagan groups, Tantrism is welcomed as a unifying vision that brings together spirituality and physical nature. In contrast to the life-denying, other-worldly and male-dominated Abrahamic traditions, Tantrism represents for many a positive expression of human sexuality and spirituality, with the power to unite people to the sacred energies of the Earth, even empowering them for her defense. According to one popular Australian website,

TANTRA is part of a broad evolutionary process in consciousness, which is moving toward an integration with the Natural World, the physical body and the many sexual expressions of human behavior. All of Nature is then perceived as a sacred manifestation of the Divine, where there is no separation between Spirit and Nature (www.tantra.co.nz).

For many neo-pagans, this discovery of Tantra by the West is really only a rediscovery of the long-forgotten divinity of nature that lies at the core of Western traditions, as well. In the words of one of the most prominent figures in the early Wiccan revival, Doreen Valiente, it is only fitting that modern Western witches should rediscover Eastern Tantric techniques; this is simply the great spiral dance of Shakti, the Great Goddess Earth herself, coming round full circle. It follows naturally,

in accordance with the evolving trends of the Aquarian Age, that modern witches should adapt the Tantric sexual magic for use in their own magic circles . . . Everything in this world is flowing. Nothing stands still, nor does time go back upon itself; but it proceeds in a spiral . . . The spiral has come round again, to its ancient place (Valiente 1988: 151).

In the course of its transmission to the modern West, Tantrism has undergone a profound transformation and reinterpretation. Once a highly esoteric tradition focused on secret ritual and acquisition of power, Tantrism has today become a popular form of spirituality focused on the celebration of nature and the liberation of sensual pleasure. There are various conflicting opinions as to how we ought to judge this transformation. More skeptical critics tend to view it as a tragic misinterpretation of an ancient religious tradition, which has been mistakenly appropriated for modern Western interests and hopelessly confused with Western sexual obsessions. More sympathetic observers, conversely, see this as just one more example of the changing nature of religious traditions in new historical contexts, as a much-needed corrective to the destructive attitudes of modern Western society, and as a powerful affirmation of the inherent sacredness of the natural environment.

Target Earth

Target Earth is an international Christian Environmental organization founded in 1986 by Roy and D’Aun Goble, who were inspired to begin a retreat center after taking a course together at Westmont College, a small Christian College located in Santa Barbara, California. Target Earth started simply as the Hidden Lakes Retreat Center in the Sierra Nevada Mountains of California and it remained the Goble’s sole project for many years. In 1992 the Gobles encountered a writer from Christianity Today magazine and the result of that meeting and collaboration was Target Earth International, and the beginning of a global outreach program.

Target Earth is a response to the biblical mandate found in Genesis, which states that humans have dominion over the Earth. Target Earth sees this not as encouragement to plunder the Earth, but as a call to be caring stewards of God’s creation. It is a partner of the Evangelical Environmental Network and offers a Campus Programs Division, including 45 campus chapters across the United States, which assists students with lobby training, student conferences and alternative spring breaks. It also publishes a Magazine entitled Target Earth.

In addition to maintaining the Hidden Lakes Retreat Center, Target Earth offers numerous international educational opportunities. Students can participate in short seven- to fourteen-day missions or eight-week internships in Belize, Honduras, Mexico, Russia, and South Africa. Target Earth offers a Global Stewardship Study Program at its Environmental Research and Education Center at Jaguar Creek in Belize. It also works with conservation groups to select areas of the rainforest for preservation. One such property is the 8000-acre area of Jaguar Creek in Belize. Target Earth also maintains the Lasting Impressions Wilderness in Zimbabwe, Africa; and in North America, it has focused on preserving land in the Soda Mountain Wilderness in Oregon.

The Target Earth website expresses the mission of “Serving the Earth, Serving the Poor.” In this sense, Target Earth is like many other Christian environmental organizations with a presence on the internet, which indicate that they are involved in human rights advocacy, spreading of the gospel, and preservation the environment. Such a multiple mission avoids elevating the Earth to a position of importance above humanity. The Earth is not preserved for the Earth’s sake alone, but because it is God’s creation.

While sharing these views and attributes, Target Earth International is noteworthy in part because, unlike some other Christian environmental organizations, it is attractive to students and others who may not otherwise join a Christian group. Target Earth maintains a liberal and educational approach, offering a resources page outlining environmental justice, recycling, simple lifestyles and biblical references supporting each activity. This combination
of practical projects and faith-based environmentalism makes Target Earth appealing to a wide variety of people.

Tattoos

Tattooing (from the Tahitian word tatau) is an art form of body modification that has been practiced throughout history in many regions of the world. Modifying the body, according to some anthropologists, is one of the simplest ways that human beings become social beings. The human body is the place where the natural world, social worlds, and personal experiences join. The practice of tattooing and body modification, which often has strict, gender-dependent rules, thus situates the human body within a particular visible context for community members.

Tattoos have often been used to construct identity: by marking criminals, denoting social status and rank, symbolizing fighting ability, showing community membership, and as symbols of successful initiation. Initiation tattoos symbolize the wearer's willingness and ability to accept social responsibility and established socio-cultural values. Other, more voluntary, tattooing practices mark the body for aesthetic or erotic purposes, in rebellion against societal norms, or as medical therapy. Tattoos have also been used as symbols of religious affiliation and community membership. Many Coptic, Syrian, and Russian Christians returning from the Holy Land often acquired “cross” tattoos on their hands, and even though proscribed in the Qur'an, many Turkish Muslims returning from the hajj to Mecca have received tattoos to commemorate their completed pilgrimage.

In societies where spiritual forces are understood to be present in the natural world, objects, and living creatures, the human body becomes an avenue for relations between the spiritual and physical realms; the blood of the tattooing process symbolizes manipulation of the life-force. For example, tattooing was performed to bring prosperity and fertility to the wearer among many traditional African communities. Thus the physical body, having more than functional meaning, can become a unique magical talisman that integrates the spiritual, physical, and social aspects of life. For example, the North American Cree not only had tattoos for luck, beauty, and protection of health, but men also received tattoos, derived from dream-images, to help them communicate with nature spirits. Also, the complex designs found among Polynesian tattoos represented aspects of their lives within the natural world (e.g., centipedes and water symbols), tribal status, strength of character, and esoteric religious teachings.

In Middle Kingdom Egypt the tattoo functioned as a bridge between the physical body and the afterworld. In order to activate their procreative powers after death and assure their immortal salvation and resurrection into the realm of Osiris, some women were incised with special lines and dots related to the Goddess Hathor. Also, Native American Eskimo women traditionally tattooed their faces and breasts in order to assure a happy afterlife.

Tattoos as marks of protection from evil forces and chaos were believed to make the wearer invisible or unrecognizable to malignant spirits or forces (e.g., among the African Nuba and Butwa). Nineteenth-century Alaskans utilized tattoos as protection from the spirits of animals and people that they had killed. Additionally, Thai Buddhist monks inscribe Buddhist sayings and symbols onto the bodies of male lay practitioners for protection purposes and to create embodied mantras.

The Edo period in Japan saw a rise in the practice of tattooing (called horimono – dug things) among urban lower-class social groups such as firemen and theater workers. Japanese tattooing utilizes figures from Buddhism, mythology, and literature (such as the Suikoden, a translation of the fourteenth-century Chinese classic about tattooed bandits that fought against injustice). Additionally, many of the most important Japanese tattoo motifs are based on folk beliefs about the powers of flora and fauna of the Earth and sea. These motifs are important because of the belief that tattoos are able to transfer to the wearer the power inherent in the meaning of the symbol. Personality traits such as loyalty and fierceness are embodied in the symbol of the lion-dog, strength and restraint (the dragon); religious elements such as devotion (Buddha, Kannon, and Fudo the Guardian), a Buddhist-inspired understanding of impermanence (cherry blossoms); as well as material aims such as longevity (the tortoise) are common themes among Japanese tattoos.

Almost all societies have seen traditional forms of body modification disappear. Only the West, especially in America where tattoos often function as markers for ideals of individualism, is witnessing a growth in tattooing practices at the beginning of the twenty-first century. Tattoos in America have begun to symbolize the ideals of self-actualization, spiritual growth, social and personal transformation, and ecological awareness. The New Age Movement, Women’s and Men’s movements, the ecology movement, and the Paganism and Goddess movements of the late twentieth century have promoted an understanding of the body as sacred. Individuals within these movements often understand tattooing as a means of decorating the sacred temple of their body.

For some wearers, tattoos symbolize spiritual ideals, for others the process itself is considered a spiritual transformation. For example, common tattoo narratives of women relate themes of self-healing, empowerment, and reclaiming control of their lives and bodies. Additionally,
an emergent sub-set of Americans practice tattooing and body modification as a means of reconnecting their minds with their physical bodies and the natural world while aligning themselves with non-Western religious ideals thought to be more spiritually and ecologically aware than those provided by the consumer-driven Western society (e.g., idealized visions of Irish Celtic Pagan and Native American relationships with the spirits of nature, or Buddhist and Daoist notions of the interconnectedness of all life). Valorizing non-Western ideals, these “modern primitives” not only work to provide ecologically oriented ethics but they also promote awareness of the spiritual aspects of traditional forms of body modification and their potential value in modern contexts.

Tawhid (Oneness of God)

Tawhid literally means “making one” or “unifying,” and generally refers to the Islamic doctrine of the oneness of God. In the Qur’an, Tawhid implies both belief in God’s unity as well as the corresponding conduct demanded by such belief. Tawhid therefore has a doctrinal as well as an ethical dimension.

As the most basic premise of Islam, Tawhid finds its expression in the first half of the testimony of faith: “There is no god but God.” The meanings and implications of this deceptively simple statement are far-reaching and manifold. Tawhid can be seen as the very life-force of Islam, for all aspects of Islamic belief, thought, and practice are rooted in its unifying and integrating vision. In any epistemology based on Tawhid, for instance, knowledge of nature cannot be divorced from knowledge of God’s oneness.

Lynn White’s critique of Christianity has been taken as an indictment of the entire Abrahamic tradition, including monotheism’s Islamic manifestation in Tawhid. A single transcendent God is necessarily outside of nature, making the latter appear as a profane object, fit for human manipulation and domination. The description of God in the Qur’an and its reception and development in the subsequent Islamic tradition present a more complex picture. To begin with, the God of the Qur’an is both transcendent and immanent. In the Islamic tradition, the proponents of classical theology and jurisprudence typically emphasized the former aspects of the divine due to their reliance on discursive reason and concern with the maintenance of social order. The proponents of the sapiential and mystical traditions, on the other hand, often emphasized the latter aspects of the divine because of their interest in inculcating a close personal relationship between God and the human individual.

In short, Tawhid embraces divine transcendence from and incomparability with creation (tanzih), as well as divine immanence in and similarity to creation (tashbih). Consequently, the God of the Qur’an, while not identical with nature in any simplistic or pantheistic way, is not far removed or separate from it either. While the former perspective opens up the possibility of legitimately making use of nature, the latter perspective sets ethical limits on such use. In the vision of Tawhid, nature is anything but a profane object.

The key Qur’anic term that must be emphasized in order to apprehend the relationship between God and nature is ayah, or sign. The word appears in the Qur’an as referring to miracles of prophets, to the beings and phenomena of nature, to the realities found in the human soul, to major historical events, and to the verses of the Qur’an itself – all of these are signs of God. The Qur’anic position seems to be that even though there may not be any adequate rational proof for the existence of God, there are more than enough signs that point or allude to the Ultimate Reality. According to the vision of Tawhid, everything other than God is a portent or pointer that signifies God. In this context, the Qur’an puts particular emphasis on directing the reader’s attention to the innumerable and easily accessible beings and phenomena of nature as so many signs through which God may be known.

By positing all existing things as signs of God, the Qur’an brings sacredness back into nature. By using the same word for the verses of the scripture and the beings and phenomena of nature, the Qur’an indicates that the book of nature is as sacred as the scripture itself, each representing a modality of divine speech. For those who forget God, both the Qur’an and nature can serve as reminders. The supernatural revelation of the Qur’an and the natural phenomena of the universe disclose and unveil the same truth, indicating the unity of Ultimate Reality. The ordinary distinction between natural and supernatural becomes irrelevant in this context.

How is the relationship between the signs and the Sig-
nified understood? From one perspective, the beings and phenomena of nature point toward God just as a work of music or painting indicates the qualities of the artist who created it. From another perspective, God’s being forms the very essence or reality of everything that exists. According to Indian philosopher-poet Muhammad Iqbal (1877–1938), the universe does not confront God as its other; time, space, and matter are not independent realities but only interpretations or intellectual modes for apprehending the creative energy or life of God. What mind perceives as a plurality of things in nature is actually one continuous and dynamic divine act. Nature, in Qur’anic parlance, is the habit of God. By observing nature in the Tawhidic frame of mind, human beings come into close contact with the behavior of Ultimate Reality, thereby sharpening their inner perception for its more direct and deeper vision.

The ethical attitude demanded by Tawhid may be understood in terms of cibadah and khilafah, two central Qur’anic terms that define the consequences of accepting the oneness of God. The first can be translated as servant-hood, or the attitude of loving obedience and humility that human beings ought to display toward God. The second may be translated as vicegerency, or the privileged capacity for exercising God-like authority with respect to the world. In the Tawhidic framework, vicegerency presupposes servanthood; human beings cannot become partners in God’s creative work without first humbling themselves before their Creator-Lord. While the ethic of dominion is inherent in the notion of vicegerency, the Qur’an views the exercise of human powers without genuine servanthood toward God as illegitimate. The Qur’anic notion of vicegerency includes the understanding that human powers are not their own but have been delegated to them from a higher authority, for a limited time and for a specific purpose. Human beings must exercise these powers within the limits set by the Real Sovereign, or they will be seen as criminals and rebels (taghut), no longer acting in accordance with the demands of Tawhid.

Tawhid implies that everything in the universe belongs to God – a frequently repeated Qur’anic theme. Consequently, the idea of material possessions and natural resources as constituting a sacred trust (amanah) from God is also built into the notion of vicegerency. Human beings have been temporarily bestowed with certain “possessions” through which they are being tested; this is true of individuals as well as communities and humankind as a whole. Ultimately, there is no such thing as human property. This understanding calls for an attitude of careful and vigilant restraint (taqwa) on the part of human beings vis-à-vis nature, which is divine property under temporary, partial, and conditional human stewardship.

These ethical implications of Tawhid are not limited to individual morality but extend to the dynamics of the collective order as well. In addition to religious beliefs and ethical norms, the Qur’an provides the outlines of a social order through which these beliefs and norms can be actualized in concrete human reality; the social order established by the Prophet Muhammad in seventh-century Arabia constitutes a paradigmatic model for Muslims in this regard. The Qur’an recognizes that human beings are rarely able to act in accordance with their professed beliefs and norms if these are not simultaneously supported by social structures and institutions. Consequently, the actualization of Tawhid in a given community remains incomplete and precarious if it is confined to the individual’s consciousness as a doctrine but does not shape the collective order.

The present-day ecological situation in the Muslim world is a forceful reminder that the chasm between ideal and reality will exist whenever professed beliefs and norms are not embodied in the collective order. Tawhid is no longer the central principle in the various social orders prevailing in the Muslim world, where the role of Islam in shaping public policy is itself a fiercely contested area. Moreover, any secularizing trend in the Muslim world further weakens Islam’s ability to be ecologically relevant at a collective level. It is hardly surprising that the ecologically beneficial imperatives of Tawhid have only a limited impact in everyday reality. Tawhid’s great potential in this regard, however, may be tapped through Islam-based environmental movements at the grassroots level.

Technological Immortality
Suffering death is the price that humans pay for their intelligence, yet through intelligence humans have long sought to overcome death, by means either of religion or technology. A single-celled animal such as the amoeba is in a
sense immortal. While it can die, every living amoeba is many millions of years old, because it reproduces by splitting, whereas multi-celled creatures such as ourselves die of old age after a short life. Many animals suffer when they die, but probably only humans are fully aware of the meaning of death and know from early childhood that they are mortal. From the time of the ancient Egyptians, some cultures and individuals have sought partially technological solutions, but only in recent decades have fully non-supernatural alternatives become plausible.

Cryonics
Probably inspired by science-fiction stories and the success of the frozen food industry, in the 1960s, Robert C.W. Ettinger launched the cryonics movement to freeze dying human beings. The original idea was that cryopreservation could halt death for years until medical science had developed a remedy for the individual’s fatal illness, at which point he or she would be thawed out, cured, and restored to a normal life.

A number of organizations set up laboratories to develop methods of cryopreservation, and a few dozen bodies were actually frozen. Ettinger and some other members of his movement began to think that future technologies could not only restore life but also improve it, giving people saved by cryonics a chance to become superhuman and even possibly god-like. A number of technical problems would need to be overcome, however, especially the extensive chemical and mechanical damage caused to large, slow-cooling human bodies by the freezing process itself.

More recently, rapid progress in gene analysis and genetic engineering has led to the idea that much of an individual’s character might be preserved in a sample of DNA. For example, the Center for Reproduction of Endangered Species at the San Diego Zoo has established a collection of cryopreserved animal cells. The Coriell Institute for Medical Research has established a research repository of cells from human beings with inherited diseases, and a sufficient sample is four teaspoons of blood.

Frozen DNA samples can be stored indefinitely without deterioration, and in future centuries they might be used to create a clone of the deceased individual, or the individual’s genetic code could be employed in some other method of technological resurrection. However, DNA does not contain information about anything the person experienced or learned, so this approach would have to be combined with some method to preserve the individual’s personality and memories.

Cybersurvival
In his 1953 novel, *The City and the Stars*, Arthur C. Clarke imagined that people could be archived inside an advanced computer, for technological resurrection thousands of years after their deaths. Many recent developments in computation, information storage, and cognitive science have provided both hope that this dream actually could be realized and some hint of how this could be done.

In his influential book, *The Age of Spiritual Machines*, computer entrepreneur Ray Kurzweil predicted that human beings and their computers will gradually merge over the next century, and that we will thereby become god-like spirits inhabiting cyberspace as well as the material universe. Specifically, Kurzweil suggests that magnetic resonance imaging (MRI) or some even more advanced technique could be used to read out the neural structure of a person’s brain, which then could be simulated inside a computer.

A second approach is to videotape extensive interviews, then use computer graphics and artificial intelligence technology to create a virtual human. A virtual copy of a person is called an avatar. This term traditionally refers to a manifestation of a Hindu deity, including incarnation in human form. But it is used currently in computer engineering to refer to a software embodiment of a human personality.

The most impressive project to preserve interviews digitally is Steven Spielberg’s Survivors of the Shoah Visual History Foundation which has recorded interviews with over 52,000 survivors of the European Holocaust at a cost of $175,000,000. The same effort devoted to a single individual could preserve enough to make a convincing avatar, and the needed digital library and graphics technology is progressing rapidly.

A third approach is to employ the full range of psychological tests and sociological questionnaires to archive opinions, attitudes, beliefs, and other aspects of a personality. Even a relatively simple computerized database permits a kind of conversation with such a corpus of personal data, querying it for information in the form of questions and answers. Existing scientific measures of personality are designed to compare individuals along a few standard dimensions. Researchers working on personality preservation have recognized the need to develop new approaches designed to capture an individual’s unique characteristics.

Thus, several rapidly developing technologies are making it possible to record aspects of a person, and it seems likely that the technology will permit recordings of increasingly higher fidelity over the coming decades. The problem then becomes how to integrate the different kinds of data (genetic, neuro-structural, audio-visual, linguistic, and social-psychological), and there is much room for debate whether even a highly advanced computer system could accomplish this.

Conclusion
Death is a natural phase of human existence, but it is also part of our nature to seek solutions to problems, even the most challenging ones. For thousands of years, the preferred responses to mortality depended upon belief in a
supernatural realm that transcended the limitations of material existence. Science, the systematic quest for the secrets of nature, now offers the possibility of technical solutions that conceivably could obviate the need for religion.

It may prove difficult to develop the technology, either requiring many decades or ultimately succeeding only partially. If science can preserve and reanimate only portions of the human personality, then future centuries may develop a hybrid approach to death that blends the technical with the sacramental, thereby building a bridge between the natural and the supernatural.

Tehri Dam

Tehri Dam, a hydro-electric power project on the principal upper tributary of the Ganges River, will, if completed, be the fifth highest in the world, and the highest in Asia. Located just below the confluence of the Bhagirathi and the Bhilangana Rivers in the Indian state of Uttar Pradesh, the Earth and rockfill dam of 260.5 meters will flood 45 kilometers of the Bhagirathi Valley and 35 kilometers of the Bhilangana Valley, impounding 3.22 million cubic kilometers of water spread over 42.5 square kilometers. The reservoir will submerge the town of Tehri, and 5200 hectares of land. It will displace an estimated 70,000 to 100,000 people. Promising 2400 megawatts of electric power to such cities as Allahabad and Kanpur, it is expected to irrigate 270,000 hectares in the western districts of Uttar Pradesh, providing 500 cubic feet per second of drinking water to Delhi.

Since its inauguration, public protest against the project has centered upon the interrelated issues of ecology, economic and environmental justice, and religion. At a meeting in Brazil in 1997, J.P. Raturi, the representative of the Tehri Dam Resistance Struggle Committee (Tehri Bandh Virodhi Sangharsh Samiti), stated Indian culture sees divinity in nature. He observes that to the rulers, the Ganges is megawatts of power and hectares of irrigated land. To the local people, she is a life-giving goddess. Sunder Pal Bahuguna, one of the most visible leaders of the movement against the dam, recalls that the goddess Ganga (the Ganges river) answered the prayers of King Bagiratha to descend to the Earth only after Lord Shiva permitted her to descend into his matted locks, preventing her from becoming a destructive torrent. Bahuguna states that the locks of Shiva are the natural forests of the Himalayas which protect the land from floods. But the catchment area of the Bhagirathi River is the victim of massive deforestation by commercial forestry, and has turned the Ganges into the destructive force of which the ancient story told. For him, the dam is a further desecration of a sacred environment.

The religious significance of the Bhagirathi and Ganges rivers pertains to objections raised on grounds of ecology and environmental justice. The Himalayan region is seismically active, and the dam site is located only 15 kilometers from the boundary of two plates of the Earth’s crust. Local people, however, have worked this land productively for many generations. Upstream from the dam site is a scenic valley, the heart of an ancient village culture. The proposed reservoir will fill this valley, with its 23 villages, and their terraced fields, sculpted over centuries of painstaking work. In 1978, when officers of the Uttar Pradesh government arrived to inaugurate construction on the first diversion tunnel for the dam, thousands of men, women, and children blocked their way and shouted: “You love electricity, we love our soil.” J.P. Raturi has argued that while the project will provide electric power and irrigation to the affluent, to the local people it will bring displacement and disaster. Bahuguna states that when the Ganges flows in her natural course she benefits all, irrespective of caste, creed, color, poverty or wealth. When she is dammed, she becomes the possession of the privileged and powerful who can dispense her blessings on a partisan basis.

Bahuguna argues that religion traditionally played a vital role in the regulation of natural resource use. As the industrial revolution began to see nature as a commodity, this crucial feature of religion came to be covered over with rituals. When development was identified with economic growth, a new religion was born: the temple of this religion is the market, technocrats and experts are its priests, and the dollar is the new god. Our political leaders, he says, are prepared to make the highest sacrifices to this god to bring it home. With his frail body, his white beard, and his simple Kadi apparel, Bahuguna appears as a prophet standing against an idolatrous faith. The dam, he argues, is a project to realize a false hope. It is based on a view of reality that equates progress with the affluence of...
the few. We should not kill our sacred river, he says, on the promises of a false vision of reality.

Bahuguna's idiom of resistance supports his credibility. Personifying the traditional ideals of nonviolence (ahimsa), renunciation of possessions (aparigraha), and devotion to God (Ishvar-pranidhana), Bahuguna states that the method of satyagraha, or standing courageously for the truth, is the only form of protest that can be effective. In the course of this struggle, Bahuguna has undertaken several fasts that have received much media attention. Ranging from 11 to 74 days, they have repeatedly brought him close to death. Early in 1996 the Tehri Hydroelectric Development Corporation ordered the people and businesses to vacate the town of Tehri and move to the New Tehri town located on a hillside above the dam site. The town was to be submerged by the end of June 1996. Local activists argued that the call was intended to convince the people that a review of the project was no longer possible. Again in June of 1999 all government offices, educational institutions and businesses were asked to vacate the town by the end of the month, but the plan was again postponed. In December 2001 with the rising waters behind the dam, the Ganga Kutir or hut on the bank of the river in which Sunderlal Bahuguna had been residing in satyagraha for the past fifteen years was the first dwelling to be submerged.

Teilhard de Chardin, Pierre (1881–1955)

Pierre Teilhard de Chardin was born on 1 May 1881 to Emmanuel and Berthe-Adele Teilhard de Chardin. His birthplace in Auvergne in southern France had a lasting effect on his experiences of love for the natural world. In 1899 he entered the Jesuit order where he launched into his lifelong effort to unify science and religion through the study of evolution and the role of the human as part of evolutionary processes. Three years later the novitiate was moved to the island of Jersey in England due to anticlericalism in France. It was also at this time that his eldest brother died, his younger sister became seriously ill and two years later another sister passed away. These experiences had a profound effect on Teilhard who considered engaging only in theological studies and turning away from science.

Instead he was sent to teach at the Jesuit College in Cairo from 1905–1908. It was here that he developed his naturalist's inclinations by studying Egypt’s flora and fauna as well as the fossil record. Teilhard spent from 1908–1912 in Hastings, England, where he continued his theological studies but also pursued his interest in evolution. He encountered Henri Bergson's newly published Creative Evolution. This had a profound effect on his ideas regarding the spirit and direction of the evolving universe. It was also during this period that the attack on modernism and evolution arose under the papacy of Pius X. From 1912–1915 Teilhard studied geology and paleontology in Paris eventually earning his doctorate in 1922 from the Sorbonne.

The war years interrupted his studies as Europe was plunged into bloody trench warfare. Teilhard served as a stretcher bearer and was awarded the Legion of Honor for his heroic service. The experience of war had a profound effect on him as he wrote of his growing sense that even in the midst of such turmoil there emerges a feeling for a purpose and direction to life more hidden and mysterious than history generally reveals. It was shortly after the war when he was recuperating in Jersey that he wrote his essay on "The Spiritual Power of Matter." For Teilhard all of matter has a psychic/spiritual component and it is this interiority of matter that helps to move evolution toward greater complexity and consciousness.

In 1923, at the invitation of the Jesuit Emile Licent, Teilhard sailed for China to undertake paleontological research. Together they traveled numerous times to the Ordos desert on the border with Inner Mongolia to study Paleolithic remains as well as the natural terrain. Teilhard returned to France a year later to resume teaching at the Institute Catholique, but the conservative climate perpetuated by the Vatican created a difficult atmosphere for him to develop his thinking on evolution. This conservative climate was due in part to the anti-modernist movement spearheaded by the Vatican before World War I. Rome sought to thwart the efforts of Catholic intellectuals who were interested in introducing broader elements of biblical criticism as well as reconciling aspects of religion and science, especially around the theory of evolution. In response, Rome tried to preserve orthodox Catholic teaching by requiring all clerics to take an anti-modernist oath.
Teilhard returned to China and settled in Beijing where he continued his scientific studies, interacted with a broad circle of intellectuals, and wrote *The Divine Milieu*. This work eventually caused his Jesuit Superior General to insist that Teilhard confine himself to his scientific work and not publish any of his theological writings. This was in large part because his vision of an immanent evolving cosmos appeared to more conservative minds to have pantheistic elements not in line with strict interpretations of the doctrine of creation. There were some who were concerned about Teilhard’s profound immanent sensibilities regarding the infusion of the divine in nature. This was seen to be in contrast to the more orthodox position that God was transcendent or beyond nature. Teilhard was thus encouraged to stay in China where he remained until after World War II except for brief visits to France.

Teilhard engaged in several key research projects including the discovery of Peking Man in 1929–1930, the Mongolian Expedition sponsored by the American Museum of Natural History, the Yellow Expedition sponsored by Citroen, as well as expeditions to India, Burma, and Java. In 1931 he traveled across the United States, which inspired him to write *The Spirit of the Earth*. This work situates the human within evolutionary emergence and suggests that recognizing our deep embeddedness in nature is crucial to the future of all life. Teilhard voices his concern that humans embrace their common destiny as members of the Earth community and help to create a viable future by activating, not stifling, the larger spirit of the Earth within each human.

It was in 1940 that he completed his most important work, *The Human Phenomenon* (originally translated as *The Phenomenon of Man*). After the war when he was able to return to France his Jesuit superior would still not allow this work to be published. He spent the last years of his life in New York City with a research position at the Wenner-Gren Foundation. *The Human Phenomenon* was not published until after his death in 1955. It was first translated into English in 1960 and a new, more accurate translation by Sarah Weber was published in 1999.

In *The Human Phenomenon* Teilhard outlined the four-fold sequence of the evolution of galaxies, Earth, life, and consciousness. Teilhard presented his vision of the emergence of the human as the unifying dimension of the evolutionary process. For Teilhard the awakening of humans to the idea of evolution since Darwin is unique in history and he likens this to the moment when a child becomes aware of perspective. He felt that for humans to realize that they participate in cosmogenesis, namely that they are part of evolutionary developmental time, results in a major change in knowledge and beliefs. Absorbing this perspective, he felt, was a critical juncture for the growth of human awareness.

Teilhard sees consciousness as intrinsic to the process of evolution, not as an extrinsic addition to matter. For him all reality consists of simultaneously a within and a without. Matter and spirit are thus joined in this vast evolutionary unfolding toward a final Omega Point. The universe in this context is a *divine milieu*, a center that has the possibilities of uniting and drawing all things to itself. For Teilhard the evolutionary process is characterized by increasing complexity and consciousness and the divine is seen as part of the process, not simply transcendent to it.

Humans are the self-conscious mode of the universe in whom complexity and consciousness has come to its fullest expression. One of Teilhard’s greatest hopes was that this large perspective of a purposeful universe would help to inspire human action for building the human community. In contrast to a resigned or fatalistic perspective, he spoke of the need to reignite in the human community a joy for action and a zest for life. Human suffering he saw not as due to original sin but as a form of potential energy which if transformed could change the face of the Earth in positive ways.

Teilhard’s optimistic perspective has led to critiques from theologians who grapple with the problem of evil and feel that Teilhard may gloss over this pervasive reality in the human community. It has also resulted in criticisms from deep ecologists who view him as highly anthropocentric and his vision of “building the Earth” as lacking in awareness of the need for environmental restraints. Many are thus wary of Teilhard’s apparent faith in technology and in progress. Moreover, Teilhard was a product of his times in having a rather limited understanding of religions outside of Christianity. His strong Christocentric approach and language infuse his writings.

Nonetheless, conscious of these critiques and aware of Teilhard’s limitations, Thomas Berry and Brian Swimme have drawn on Teilhard’s evolutionary perspective in developing their idea of *The Universe Story* as a comprehensive context for an expanded ecological sensibility. Like Teilhard, they see cosmogenesis as critical to understanding the role of humans as intrinsic to evolution and as responsible for its continuity. Teilhard’s ideas continue to inspire appreciation and critique in the search for sustaining human–Earth relations.

Thai Buddhist Monks

In 1986, the ecclesiastical council of the Thai Sangha, the order of Buddhist monks, recommended to the Thai government that the Departments of Forestry and Religious Affairs work together on conservation and rural development projects. This recommendation foreshadowed the currently popular environmental movement in Thailand and the growing number of projects throughout the nation involving monks and the use of Buddhism in development and conservation. In the face of severe problems of deforestation and damaged watersheds across Thailand, several monks are advocating forest conservation, along with rural development schemes, based on their interpretations of Buddhist notions of respect for and balance with nature.

The work of these self-proclaimed “environmentalist monks” (Thai, phra nak anuraksa thammachaat) raises controversial issues concerning the relationship between Buddhism and environmentalism. The debate goes beyond equating the religion with nature, a simplistic interpretation often made by both these activist monks and environmentalists throughout the Buddhist world. (For example, the Buddha’s birth, enlightenment, teaching and death all occurred in forests, providing evidence in this line of thinking for the importance of the forest for spiritual development and environmental conservation.) The Buddhist environmental movement, amorphous as it is in Thailand, raises questions about both the appropriateness of monks’ involvement in such “this-worldly” affairs as environmentalism and the philosophical grounding of their interpretations of Theravada scriptures and ritual practices.

Although making up only a small percentage of the total Sangha in Thailand, environmentalist monks became prominent in the 1990s. Controversies involving some well-known monks, such as the arrest of Phra Prak Khut-tajitto for allegedly trespassing in a national park while documenting illegal logging, and a sex scandal surrounding the environmental activist Phra Yantra (in which he was accused of fathering a child with one of his followers), heightened the debate and put all activist monks under increased public scrutiny. The controversies and public image of environmentalist monks also tend to keep most “forest monks” — meditation masters who remove themselves from society to emphasize religious practice and asceticism — away from involvement in environmental activities.

Nevertheless, environmentalist monks maintain that their actions follow the Buddhist invocation to end suffering (Pali, dukkha). They are critical of changes wrought in Thai society as a result of the capitalist economic development promoted by the government since the 1950s. The consumerism that has swept across the nation and the accompanying debt and environmental degradation, these monks argue, are based on greed, one of the three root causes of suffering in Buddhist thought. They see it as their responsibility as monks, therefore, to engage in changing people’s attitudes and behavior toward the natural environment and the economy. By promoting environmental conservation and sustainable development (by which they primarily mean growing one’s own food through organic agriculture), they aim to help people recognize their responsibilities toward nature and avoid the desire that underlies capitalist development. Environmental degradation, economic development, and the abandonment of religious principles and practice are all intertwined in environmentalist monks’ assessments of the major problems Thailand faces today.

In their efforts to deal with these problems, environmentalist monks focus on three main types of activities: reinterpreting traditional rituals, education, and activism. The interplay between these approaches highlights the cultural creativity of these monks as they draw on local, national and Theravada Buddhist beliefs and practices in response to the environmental crisis in Thailand. Their more activist approach is supported by teachings of prominent scholar monks such as Buddhadasa Bhikkhu and Phra Prayudh Payutto (current monastic title, Dhammapitaka).

Environmentalist monks reinterpret a range of traditional rituals to promote conservation and engender laypeople’s participation in conservation projects. These rites include symbolically ordaining trees in endangered forests, drawing people’s attention to their mutual dependence on the forest. They also incorporate tree seedlings for reforestation with the traditional lay donations of robes to monks. Some monks perform “long-life” ceremonies for bodies of water, such as rivers and reservoirs, to highlight the urgency of protecting water supplies from drought (often caused by deforestation) and pollution. One monk even modified the monks’ daily practice of alms-rounds to ask people in his village to donate land to the temple, thereby gaining religious merit, to use in a model integrated agriculture farm. Through reinterpreting a familiar practice, the monk aimed to get villagers to rethink how they lived from the land.

Education is a major component of environmentalist monks’ activities. They teach both laity and the larger Sangha about ecology, appropriate technology and organic agriculture to provide tools to live in an ecologically sensitive manner. The monks emphasize meditation and Buddhist teachings, seeing the religion as the basis for

Thai Buddhist Monks 1629
positive change in society. They use principles such as dependent origination or the interdependence of all things (Pali, paticca-samuppada) to teach people responsibility toward the natural environment.

The most controversial activity of some environmentalist monks is their activism. Many of these monks have initiated local conservation projects or protested ecologically harmful policies and actions by the government, military and big business. Together with local people and non-governmental organizations, monks have protested both the construction of a dam in northeast Thailand and a natural gas pipeline coming from Burma through a Thai national park for both their negative ecological effects and their impact on the livelihoods of local people. Monks have established sanctified, protected community forests and fish, bird and wildlife sanctuaries, and organized Dhamma walks in which monks, environmentalists and other lay people walk and meditate mindfully for several days or weeks, engaging with local people to draw attention to endangered areas such as lakes and forests (see Bhikkhu 2000). In northern Thailand, one young monk runs a model organic farm and provides seeds, seedlings and knowledge to farmers as they shift from cash cropping to integrated, organic agricultural techniques.

The actions and religious interpretations by environmentalist monks are diverse and controversial. They are also genuine efforts to make Buddhism relevant in a changing society. Despite – or perhaps because of – the debates surrounding these monks, they are contributing to rethinking the religion and religious practice in light of the urgency of the environmental crisis. The result is a form of cultural creativity that, while grounded in an ancient tradition, has the potential radically to change the way Thai Buddhists think about their religion and their natural environment.

Theme Parks

The term “Theme Park” has been used to describe everything from small amusement attractions, such as family entertainment centers with a few rides, to the massive Walt Disney World entertainment complex outside Orlando, Florida. Theme parks are not to be confused with fairs, carnivals, or amusement parks. The relationship between theme parks and their predecessors – both medieval carnivals, festivals and fairs, and nineteenth-century amusement parks and World’s Fairs – is well documented. What is of interest here is the way the more than 225 major theme parks in the United States (as at the turn of the 21st century), and unknown numbers of others around the world, have evolved to present a new cultural intersection of religion and nature. We can identify several prominent religious possibilities for presentations of nature in contemporary theme parks.

In the 1950s, theme parks began to embody what has been called “civil religion” (Bellah 1967), central tenets of which were: capitalism, nuclear family and domesticity, scientific and technological progress (leading to utopian community living), wealth and leisure provided through national supremacy, and triumph over nature.

Themes of progress and domination of all things natural have also been prominent in a “frontier religion” common in theme parks, including such places as Disneyland and Disney World, Southern California’s Knott’s Berry Farm, and Silver Dollar City in the Missouri Ozarks. A prominent narrative in such locales as Disney’s Frontierland, Knott’s Berry’s Ghost Town, and Silver Dollar City in its entirety is the rejuvenating value of an anti-modern experience with a romanticized, simpler period of American exploration, conquest, and new settlement.

Finally, what can be called a religion of “nature celebration” has been made possible by the more recent, steady increase in the use of natural themes in park design. What Disneyland started with exotic recreations of flora and
fauna has increasingly developed into a more overt role at such parks as Busch Gardens: Africa: The Dark Continent, the Sea World parks, and Disney’s Animal Kingdom. Now nature is no longer presented as mere backdrop for entertainment and practical landscape manipulation. It is the point (and source) of the experience.

Critics have called these parks to task in recent years for encouraging visitors to feel that their attendance amounts to environmental action since their messages are often intensely scientific and environmentally sound, focusing upon the veterinary and conservationist activities that may go on there. The parks are often built on fragile habitats and clearly encourage unsustainable consumption. Some critical scholars portray the success of nature-focused theme parks as especially problematic for their influence on American tourist culture in general. There is concern that zoos, museums, and even national parks will be remodeled to mimic theme parks (Davis 1997; Wilson 1991).

It is one thing to say that theme parks present visitors with a particular view of nature, to worry, for instance, that Sea World’s oceans, Busch Garden’s African landscape, and Disney’s multiple geographies narrate a particular version of nature as exhibited by each corporate interest. It is quite another thing to consider what people are doing with those presentations of nature. Scholars need to ask why Sea World attendees have been known to strip off their clothes and jump into the dolphin tank (an unsanctioned activity). Do they seek only to cool off? Do they simply find swimming with dolphins entertaining? Or is there a more fundamental desire for an authentic experience that has a religious dimension?

Some have argued that theme park visitors desire a particular set of experiences that in many ways can be considered sacred. Margaret J. King (1981) joined a growing scholarly focus on Disney parks, calling them the “popular culture capitals” of the country, noting that more so than Washington, D.C., families are motivated to go on a double pilgrimage to Disneyland and Walt Disney World – first as children and later with children. For King, this notion evokes community, communal experience, shared values, ritual motion, and perhaps additional traditionally religious language and imagery. This is not to say that theme parks have become traditionally religious for their visitors. Instead, visitors value community and the feeling of shared, ritual experience on a broad cultural level – rituals of a civil religion (King 1981).

Anthropologist Alexander Moore (1980) compared theme parks with traditional baroque pilgrimage centers. Though he argues that Walt Disney World’s form replicates that of a pilgrimage center, behavior in the Magic Kingdom, he says, is not traditionally religious. Instead, ritualized play seems to be gaining importance over both organized religion and obligatory rituals. Theme parks are isolated and enclosed. There are ritualized barriers separating them from the outside world (e.g., private highways, toll booths, parking lots, and ticket counters). Like traditional pilgrimage centers, theme parks evoke the supernatural (with its emphasis on magic, fantasy and make-believe), or at least a mytho-heroic past. Moore discusses the cultic and symbolic dimensions of the park, arguing that going to theme parks is not only about playing but bearing witness to the metaphors they evoke and pay homage to. Increasingly, those metaphors highlight nature and its religious significance. He concludes that the social and spatial order of a place like Disney World is the genuflection – ritual motion – of mass industrial society.

Much more research is needed to explore the roles of religious experience of nature presentations in theme parks, but that audiences have transcendent experiences in theme parks is unquestioned. For example, a 33-year-old father in New Hampshire wrote to The Unofficial Guide to Walt Disney World,” It was on this trip that I experienced what can only be described as . . . an epiphany. I was on the ferry boat that runs between the Magic Kingdom and the TTC, waiting for it to fill up and cast off. The rain had cooled things off comfortably, and a rainbow had formed behind the Contemporary Resort, disappearing over the rooftops of the Wilderness Lodge that poked from behind the treeline. It was beautiful, and I just felt so relaxed, peaceful and happy. I also felt a little silly – here I am, a 33-year-old guy, alone in Walt Disney World, and I’m feeling like there’s not a problem in the world. But that’s the effect this place can have on you. Sure it can be hot, crowded, muggy, and it’ll suck your wallet dry . . . but that’s a small price to pay for those moments when the “Disney Magic” takes over and all seems right with the world.

In the passage we see references to human creation: the ferry boat, the Magic Kingdom, the crowds, etc. But we see references to nature: the rain, a rainbow, the treeline. As Van Maanen (1992) pointed out, there are important cultural contrasts that intensify the meaning potential of theme park nature. Mugginess, crowds, waiting, and spending money are offset by beauty, relaxation, peace, happiness, and contentment. Religion sociologist Wade Clark Roof (1993) has argued that, increasingly, late modern Americans engage in similar quests to seek new symbols and meanings – incorporating such experiences with prior beliefs to cobble together their own belief systems. Is it possible that such popular cultural (and for profit!) corporate creations as theme parks provide at least some of the meaningful material? Are the creators and operators of these parks able successfully to present a crafted “nature” that transforms their commercial endeavors into profoundly moving, even religious, experiences for paying
customers? And is it worth the cost? By positioning theme park nature as entertainment, information, and even transcendent inspiration, are we denying our own threat to its authenticity?

We can only be certain that theme parks will continue to draw visitors, providing an experience that will undoubtedly carry on a contribution to the ongoing evolution of the story of transcendent nature.

**Theosophy**

The modern Theosophical movement, which commenced in 1875 with the founding of the Theosophical Society by Helena P. Blavatsky, Henry Steel Olcott, and others, has had a role in the emergence of recent spiritualities of nature and ecology. The new movement was viewed by its founders as a middle way between what they perceived as the twin dogmatisms of the nineteenth century, science and theology. Theosophy represented, they believed, a path based on the profounder perspective of the “ancient wisdom,” the vision of nature and humanity held by pre-moderns who, to judge from those most often cited in the literature, tended broadly to be in the tradition of Vedantins, Mahayana Buddhists, and Platonists together with their neo-Platonic, Gnostic and Cabalistic progeny.

In respect to nature, nineteenth- and twentieth-century Theosophy has contributed to nature spirituality insofar as it: a) presented quasi-religious images and concepts to embody the romantic view of nature as vibrant with life and meaning, both visible and invisible; b) popularized in the West monistic and pantheistic Eastern experiences of nature, humanity, and the divine; and c) expanded evolution (known best in its controversial Darwinian form at the time of the Society’s founding) to embrace all of nature, together with humanity, in immense cosmic evolutionary schemes. Such ideas are certainly not unique to Theosophy, but in the late nineteenth and early twentieth centuries Theosophists were pioneers in presenting them in popular as well as academic and literary venues. In lodge meetings, publications, and such centers as the Pt. Loma community in San Diego, started by Katherine Tingley in 1897, or Krotona, established in Hollywood in 1912 and moved to Ojai, California, in 1924, the idea of evolutionary kinship with nature deeply felt by many Theosophists took such concrete forms as vegetarianism, humanitarianism toward animals, progressive farming, and appreciation of the salutary spiritual effect of an inspiring natural environment.

The core Theosophical idea is usually said to be oneness: that the unity of all being is more fundamental than any apparent separateness and diversity. Oneness therefore overrides all dualism, whether of the One and the many, the human and the divine, consciousness and matter, or humanity and nature. A corollary of this perspective is the assumption that consciousness, though perhaps in rudimentary or radically nonhuman form, is found consistently throughout all levels of the universe. Some modern Theosophists (as well as some scientists) have seen evidence of universal consciousness underlying matter in the phenomena described in quantum theory.

Recent Theosophical writers and teachers like Joy Mills, Shirley Nicholson, Amit Goswami, and Ravi Ravindra have emphasized the congruity of the Theosophical worldview with what seems to be emerging on the frontiers of physics and cosmology, especially as interpreted by such sympathetic writers as David Bohm, Rupert Sheldrake, Ken Wilber, and Gary Zukov. The Theosophical stress on oneness, the consistent interaction of consciousness and matter, and the coexistence of many planes or dimensions are particularly mentioned. Out of such conceptions has come a recent Theosophical environmental ethic like that of Shirley Nicholson in *Ancient Wisdom, Modern Insight*, particularly Chapter 3, “Holism and
Hierarchy." Nicholson here views nature as a series of increasingly large "interlocking wholes," in which a prime imperative in any ethical choice involving nature – as do nearly all choices, ultimately – is taking into account its "reverberations" up and down the interlinked system.

Theosophy regards nature as alive, conscious on various levels, continuous with humanity both immanently and in evolutionary process, and so legitimately entitled to personification. Theosophical writers like Blavatsky, Annie Besant, C.W. Leadbeater, and Geoffrey Hodson, have not hesitated to personify powers of nature with names generally derived from venerable mythologies regarded as vehicles of the Ancient Wisdom. Out of theosophy's classic texts emerge creative Dhyan Chohans (cosmic buddhas or, in Western parlance, archangels), Sanat Kumara the world-spirit and Kwan Yin or Mary as world-mother, devas who serve as guardians of particular places or phenomena of nature, on down to "elementals" and the elves or dryads of garden and field. Some of these identifications have become more and more commonplace as part of the New Age attempt at reenchantment of the world through recovery of enlivening perceptions of nature recalled from childhood or folklore. As Leadbeater put it, "It is one of the most beautiful characteristics of Theosophy that it gives back to people in a more rational form everything which was really useful and helpful to them in the religions which they have outgrown" (Leadbeater 1928: 1).

In both the personification of natural entities and its efforts toward reconciling science and spirituality, Theosophy's distinctive attitude toward nature has had an impact on recent nature spirituality generally.

Theosophy and Ecofeminism

The international Theosophical movement founded by Helena Petrovna Blavatsky in the 1870s has kept alive in the West the ancient belief that meaningful relationships can occur between human beings and other animals and plants. Some ecofeminisms posit a special bond between women and nature other than that based on shared or interdependent patriarchal oppression; while many ecofeminists celebrate the special connections between women and nonhuman nature. Ecofeminism and feminist spirituality have, however, lacked compelling cosmologies, whereas the core Theosophical idea is of a cosmos permeated by energetic relations that manifest themselves as different forms of consciousness. Theosophy, on the other hand, has not been interested in the question of under what conditions one gender is better able than another to have special relationships with animals or plants or places. Ecofeminism and feminist spirituality, however, have had this concern.

Connecting Theosophy and ecofeminism is the pioneering work done by women Theosophical leaders to restore ecological health to the movement's various communities. Madame Blavatsky's famous garden in England; what historian Emmett Greenwalt has called Katherine Tingley's "agricultural Eden" at Point Loma, California; and the grounds at the Theosophical Society's international headquarters at Adyar, India in which Annie Besant took considerable interest, were all early twentieth-century efforts to infuse ecology with concepts from Theosophy's cosmology. Findhorn, Scotland, and Perelandra, Virginia, are related recent examples of communities sustained largely, although not exclusively, by communication between women and nonhuman nature (by Eileen Caddy and Dorothy Maclean and by Machaelle Small Wright, respectively).

Thoreau, Henry David (1817–1862)

Henry David Thoreau was an author, naturalist and leading member of the nineteenth-century literary, social and religious movement that came to be known as Transcendentalism. Thoreau is best remembered for his two-year venture in “living deliberately” on the shores of Walden Pond in his hometown of Concord, Massachusetts from 4 July 1845 to 6 September 1847, an experiment which led to the publication of Walden in 1854. Though few of his writings were widely known at mid-century, his work became increasingly sought after in the late nineteenth and twentieth centuries. His other well-known published writings include: A Week on the Concord and Merrimack Rivers (1849), Cape Cod (1865) and The Maine Woods (1864).

Even in his own time, local responses to Thoreau’s experiment at Walden helped to shape two competing portraits of Thoreau that have persisted into the present: Thoreau as “wilderness man” par excellence, living self-sufficiently in the wild woods and, to a lesser extent, Thoreau as hypocritical crank, grinding his literary ax to chop at society and its conventions, while regularly going into town and dipping into the maternal cookie jar. While both of these portraits contain some truths, they are caricatures of a man and his work that often miss the complexity of his vision and the multifaceted dimensions of his legacy.

Thoreau’s sojourn at Walden was never intended to be an attempt at perfect self-sufficiency or wilderness living. In terms of setting alone, Thoreau’s retreat to Walden cannot be considered a wilderness venture, as Concord in the mid-nineteenth century had been a settled village for two centuries. Thoreau’s purpose in going to Walden should be understood as practical, spiritual and symbolic, none of which demanded a lifelong retreat to the woods or absolute purity in his practice of self-reliance.

Practically, Thoreau sought a means of making a living which would preserve the time he desired in order to cultivate his craft as a writer, while maintaining a mode of life that permitted generous swaths of time for outdoor walks, leisure and meticulous nature study. The retreat to Walden was, at a fundamental level, a first step in solving the practical problem of livelihood that all writers face.

The spiritual dimensions of Thoreau’s decision were tied to the practical impetus behind his choice, but also went beyond them. While Thoreau sought to reduce his needs (of food, clothing, shelter and leisure) to a minimum in order to maximize time to write, this pursuit of simplicity was itself a form of spiritual practice. With Emerson and other New England Transcendentalists, Thoreau subscribed to principles of plain living: a simple, often vegetarian diet; avoidance of tea, coffee and alcohol; regular excursions in the fresh air, frequent intellectual interchange and a complementary pursuit of solitary contemplation. All of these practices were understood to be means of cultivating the self and, more particularly, “Reason” (knowledge through intuition) and imagination. In addition, Thoreau (like other Transcendentalists) assumed that nature had particular lessons to teach and that simple, “natural” ways of living would help to cultivate his moral sense. The spiritual practice of “self-culture” (which began when the young Thoreau changed his name from David Henry to Henry David) was an essential aspect of the retreat to Walden.

The experiment at Walden was also intended to resonate symbolically, both in Concord and beyond. While living at Walden enabled Thoreau to develop inwardly (to learn about himself in a natural context, to practice his craft as a writer, and also to grieve the early death of his brother), his life at Walden was also intended to be an outwardly directed comment about (and against) prevailing social norms. While he farmed beans for part of his livelihood, he denigrated the commercial aspects of farming and praised instead the educational and spiritual benefits of tilling the soil. While he made trips to the village almost daily, Thoreau constantly criticized village life, particularly the idle conversation and status-seeking mores he felt dominated the town.

Although he cultivated a sometimes biting and misanthropic persona in his texts, Thoreau’s reputation as a misanthrope is inaccurate. Thoreau was no hermit. He enjoyed frequent visitors from among family, friends and laborers near the pond and went into town frequently, especially in the winter months when he supported himself with odd jobs as a handyman and surveyor. During his time at Walden, he maintained an active correspondence, regularly attended lectures and often appeared at gatherings at the homes of Ralph Waldo Emerson, Bronson Alcott and other Concord friends. Through the symbolic act of withdrawing to the woods, Thoreau intended not to recommend such a withdrawal for everyone, but rather to symbolize through deed (and then word) the virtues of independent thought and action, rather than behaving in line with social convention.

Walden (1854) is Thoreau’s most celebrated text, a carefully crafted manuscript that went through eight drafts before publication. Thoreau’s ambitious reworking of the material from his journals included the adoption of a seasonal structure (summer to spring) and the collapsing of two actual years into a single narrative one, a model nature writers have followed to this day. The text stands as the most complex fusion of his post-Christian, Transcendentalist religious orientation with his detailed and scientifically informed observation of a particular natural surround. A Week on the Concord and Merrimack Rivers (1849), which preceded Walden (and was a publishing failure) is more obviously metaphorical. While a travel narrative in some respects, it is interspersed with philosophical departures, essays, poems and fragments from
Thoreau’s reading, while also intending to serve as an elegy to his brother, John. Throughout the text, attention to natural detail appears and recedes, but ultimately takes a back seat to Transcendentalist philosophy and the workings of Thoreau’s young literary and religious imagination. Thoreau’s late writings lean in the other direction, his unpublished manuscripts on seed dispersion and the development of flora in Concord (recently collected and published posthumously as *Faith in a Seed* [1993] and *Wild Fruits* [1999]) contain still accurate and scientific useful documentation of the growth, development and distribution of plants in New England.

When traced through the corpus of his writing, Thoreau’s view of nature is clearly a dynamic one, shifting and changing in response to Thoreau’s own growth as a writer and his synthesis of naturalistic observations accumulated over the years. In general terms, Thoreau’s interpretive stance toward nature is a view shaped by his European and New England, Protestant heritage, yet defying easy categorization. It is neither Christian, nor secular; neither wholly scientific, nor traditionally religious. With the European Romantics, and older Transcendentalists, Thoreau saw nature as something other than simply God’s creation (the traditional Christian view and one that was itself comparatively neglected by Christians of his day, who placed more emphasis on personal salvation).

Thoreau was a lifelong critic of the Church, even the liberal Unitarian church attended by the majority of his family. His vision of nature was pursued outside the boundaries of both Christian orthodoxy and liberalism and his contemporaries therefore often criticized his writing (or expurgated it) because of its “paganistic” tendencies. Even Thoreau’s Aunt Maria worried that portions of *A Week* sounded like “blasphemy” both because of Thoreau’s approving nods toward Buddhism and Hinduism, as well as his claims that the divine could be found within both nature and humanity. While *Walden* was a comparative success, the same kinds of criticisms came from more religiously conservative circles, who praised the examples of detailed “nature study” in the text, but not the more radical philosophical and religious themes.

Thoreau’s approach to the natural world was particularly informed by his reading of the Romantics, who saw nature as the ultimate source of insight and a means of return to childhood innocence untainted by “civilization’s” expectations and failings. Thoreau’s sense of ethics and aesthetics emerged from the Romantic (and later, Transcendentalist) presumption that nature is the ideal teacher. His purpose was to cultivate himself, in return, as an ideal pupil. Yet such an embrace of nature was not wholly positive, nor was his construction of nature exclusively beneficent, though it was prevailingly so. The “Higher Laws” section of *Walden* show a Thoreau who is sometimes ill at ease with the unseemly, violent, or lowly aspects of nature (including his own body) and reveal a typical Transcendentalist and post-Christian preoccupation with purity: nature in her ideal, good and “higher” aspect. His writings of travels in the Maine woods also display an unexpected fear of the wilderness in its most rugged form. Overall, however, nature is a source of goodness and a model for humanity in Thoreau’s view.

Nature occupied a space in Thoreau’s imagination that his Christian neighbors reserved for God. Thoreau enjoyed needling others with this unorthodox, but increasingly popular, approach, commenting toward the end of his life that “a snowstorm was more to him than Christ” (Harding 1965: 464). Thoreau was also influenced by the newly (and sometimes inaccurately) translated Eastern religious and philosophical texts becoming available in America, which gave testimony to the sacredness of particular aspects of the physical world (mountains, rivers, etc.) Thoreau welcomed the Vedas, *The Laws of Manu* and purported sayings of the Buddha into his literary repertoire (using them often to support his own Transcendentalist assertions) and argued for the equal legitimacy of the religions of the world. In addition, he drew deeply – though perhaps less consciously – on a broader legacy of Christian and especially Protestant, New England interpretations of nature as a book to be read, the so-called “Book of Nature.” While leaving Christian theology behind, Thoreau retained the Christian – and particularly, American – legacy of findings in nature lessons and morals for leading an ethical life. While rejecting traditional Christian typology, Thoreau maintained a “typological stance” toward nature, seeing lessons for humanity in battles between ants, the lure of the woodchuck and the play of the loon.

Thoreau’s daily practice of attentiveness toward nature, however, enabled him to go beyond a “reading” of nature only for moral and spiritual guidance. His daily walks became a means for gathering precise naturalistic data within the limited boundaries of a particular watershed over several decades, an invaluable contribution – before its time – that leaves us with a thick ecological portrait of a particular bioregion. His “amateur” conclusions regarding the succession of trees, his identification of rare plants and his innovations in everything from pencil-making to predicting ways to lengthen the cranberry harvest were all discoveries that were independently supported or produced by professionals in later years.

While Thoreau’s Transcendentalism always led him to see “more” in nature than a scientist would discern, his unflagging curiosity and rigorous record-keeping also helped him to become a self-taught naturalist and to establish literary naturalism as an American genre. More than any other Transcendentalist, Thoreau wove together contemporary scientific knowledge and liberal, post-Christian interpretations of nature’s symbolic capacity. On the other hand, Thoreau’s criticism of Christian institutions, his insistence on seeing the divine in nature (and in the self) and his respect for other religious traditions of the world
opened his writing up to charges of paganism and pantheism that persist in conservative, evangelical circles. Yet a close reading of Thoreau’s work clearly reveals its intellectual and spiritual debt to New England Protestantism. His thinking and writing is “post-Christian” more than it is anti-Christian, pantheistic or pagan. Like Emerson, but going beyond him, Thoreau knitted together a Protestant heritage, a philosophical interest in idealism and a passion for observation and study of natural phenomena in the field.

Today, Thoreau’s legacy is less felt in religious circles than it is in environmental ones. Hand in hand with the growth of the environmental movement from the 1960s forward has been an ever-increasing enthusiasm for Thoreau’s work, though few read more than portions of Walden. Thoreau’s relative self-sufficiency, his concerns about the marketplace and emerging capitalism, and his view of nature as a beneficent source of spiritual transformation all contributed to the dominant themes of contemporary environmentalism: a growing interest in simple, sustainable living, a critique of consumer culture and a view of nature as the source for personal (often spiritual) renewal.

Though prone to misrepresentation, Thoreau’s writing and his example continue to speak to both religious and non-religious audiences, to scientists and to humanists, to those who read nature symbolically and to those who simply admire the vast records of this “self-appointed inspector” of snowstorms.

change in every moment as a result of causes and conditions. The world is conceived as an infinitely complex causal network in which each individual part acts on all other parts while simultaneously being influenced by its surrounding environment. These notions are connected with the Buddhist doctrine of no-self (anatman), which holds that there is no enduring “self” or “soul” and that living beings are instead individual continuums composed of various constituent elements that are changing with every moment. This process operates in intimate connection with the surrounding environment, and there is said to be no real dividing line between oneself and the world. Thus, concern for oneself naturally extends to concern for the environment. The fourteenth Dalai Lama has become one of the leading proponents of this idea, and he claims that prior to the Chinese invasion Tibetans did in fact live in harmony with the environment.

Some contemporary commentators dismiss this idea, claiming that prior to the mid-twentieth century Tibet was an agrarian society in which most people subsisted on low-technology agriculture and animal husbandry. Prior to the Chinese invasion, the utilization of biomass was closely related to the physical conditions of Tibet, which had a stable population and little change in agricultural or animal husbandry techniques for centuries. Furthermore, in vast areas of the Tibetan plateau the poor soil and sparse vegetation required that people avoid overgrazing and overfarming. Most of what people consumed came directly from the Earth, and their waste products were mainly biodegradable and were returned to the environment. Thus the fact that they maintained a sustainable approach to the environment was non-reflective and merely a direct result of their technological backwardness and the physical limitations of their environment.

There is some merit to this idea, and it is doubtful that most Tibetans had (or have) a consciously articulated environmental ethic that guided their approach to the environment, but there were also significant conceptual factors influencing the Tibetan approach to the natural world. In addition to Buddhist doctrines of nonviolence and interdependence, there were also pre-Buddhist animistic ideas about the Tibetan plateau, which was seen as the abode of innumerable forces that owned the land. Among these were the sadak (“lords of the Earth”), and lu (water spirits), which respectively guarded the soil and water. Ethnographic studies of contemporary Tibetans have demonstrated that belief in these natural forces is widespread and that Tibetans commonly assert that people who cause harm to the environment draw the wrath of these beings, who can cause great harm to humans. Any building or construction is commonly preceded by a ceremony that asks their permission, and great care is taken to avoid angering them by causing unnecessary damage to the Earth. In addition, mining was almost unknown in Tibet, because it was thought that digging up the Earth to extract resources was effectively robbing the “lords of the Earth,” who would inflict punishment on the offenders.

Similarly, polluting water causes the lu to harm offenders, and prior to the Chinese takeover, Tibet’s rivers and lakes had some of the most unpolluted water in the world. In addition, exile Tibetans often point with pride to the fact that hunting was outlawed by the fifth Dalai Lama in 1642. According to his official decree, all birds, fish, and non-predatory animals were protected by law. Since at least that time, Tibetans have generally avoided killing wild animals and fishing for sport, and travelers in Tibet prior to the Chinese invasion often remarked at the large herds of grazing antelopes, wild ass, and deer that were found throughout the region. Moreover, because Tibetans generally avoided cutting down trees there were extensive old-growth forests in the lower regions of the Tibetan plateau.

Although environmental concern has become an important theme in publications by the Tibetan government-in-exile, there is little evidence of this concern prior to the mid-1980s, when the Dalai Lama first began articulating the notion that Tibetans have for centuries consciously protected the environment. The first exile government statements on the environment followed the publication of reports of widespread environmental damage to the Tibetan plateau by the Chinese, and the exiles’ environmental awakening was at least partly reflexive and political. Particularly during the chaotic period of the Cultural Revolution (1966–1976), when marginal land was taken over for agriculture and forests were clear-cut, many animal species were hunted to extinction, and significant – and in many cases probably irreversible – damage was done to Tibet’s fragile ecosystem. Thus the exile government’s newly pro-environment stance was part of a larger polemical attack on China’s annexation of their country and its subsequent record in administering it.

Several commentators have also noted that even the language used in Tibetan publications on the environment indicates that conscious concern with environmental issues is part of the discourse of modernism, in which Tibetans and other indigenous people have been constructed as “naturally green” by Westerners seeking to construct an idealized primitive “other” whose practices implicitly critique those of technologically advanced societies. It should also be noted that much of the vocabulary used in Tibetan exile publications on the environment is derived not from Buddhist doctrine but instead employs contemporary Western notions and language. The “greening” of Tibet and Tibetan Buddhism is also connected with the discourse of Buddhist modernism, which portrays Buddhism as essentially “rational” and “scientific” and represents Buddhism as the conceptual basis of social movements like environmentalism, human rights activism, social reform, and feminism.

There is no reason to believe that the widespread
influence of Buddhism contributed significantly to the general practice of sustainable agriculture and animal husbandry in Tibet, nor that the exile government’s pronouncements and publications on the environment have significantly affected either attitudes or practices toward the environment. These publications are the work of a small, educated elite, and the massive accumulation of garbage along the roadways of Dharamsala – along with the common practices of spitting, urinating, and defecating into public water supplies – is ample demonstration of this. It should be noted, however, that although Tibetans have only recently begun to articulate environmental concerns, and the leading figures are a small elite group, there is some evidence that their message is gaining ground at least among the Tibetan exile community, and there have been several grassroots campaigns to clean up their environment in recent years.

solely to consider how we can stop being such a wasteful society.

We should make tikkon olam a major focus of our synagogues, Jewish schools, and other Jewish groups and institutions in order to help move our precious planet to a path that is more just, humane, and sustainable. Changing will not be easy, since our society and economy are based on consumption and convenience, using and discarding. But it is essential that we make supreme efforts, for the survival of humanity may be at stake.

Toland, John (1670–1722)

Historians describe John Toland as a multifaceted man – a philosopher, a writer, a linguist, a polemicist, a diplomat, a biblical scholar, a deist, and ultimately a proponent of pantheism. Lexicographers credit Toland with the first English-language usage of the term pantheist.

Born near Londonderry, Ireland on 30 November 1670, and christened in the Catholic Church, Toland converted to Protestantism around age 15. Subsequent higher education and an inquiring mind led him to extensive questioning of accepted religious doctrines. Toland acquired a degree from the University of Edinburgh in 1690, and studied further in England, Germany, and Holland.

A friend described Toland as “a free-spirited, ingenious man” (in Berman 1997: 223). But his unorthodox views forced him to move from place to place to avoid prosecu-

A book Toland wrote in 1705 entitled Socinianism truly stated . . . recommended by a Pantheist to an orthodox friend contains the first known use of the term “pantheist” in an English-language publication. (Earlier, in 1697, Cambridge mathematician Joseph Raphson coined the words “pantheist” and “pantheism” in a theological work written in Latin; Toland had read and commented upon Raphson’s book). In 1709, a Toland critic named J. Fay used the term “pantheism” in English, and both terms quickly became common. Toland’s use of the term appears to derive from the pantheization of his religious outlook, as reflected in his later works, although some scholars question his commitment to any particular religion.

Toland had previously expressed pantheistic theory in Clito (1700) and in Letters to Serena (1704), but had not employed the term. He thought “All things were full of God,” and pronounced that “The sun is my father, the Earth my mother, the world is my brother and all men are my family” (members.aol.com/pantheism0/toland.htm).

The Roman materialist Lucrictius and especially the Italian philosopher Giordano Bruno (martyred for his pantheistic beliefs in 1600) greatly influenced Toland’s perspective.

Toland detailed his own pantheism in Pantheisticon: sive Formula celebrandae Sodalitatis Socraticae/ Pantheisticon: or, the Form of Celebrating the Socratic Society (1720, anonymous English translation, 1751). He believed in a boundless universe. He visualized the unity of all matter and the ceaseless motion of atoms. He spurned personal immortality yet averred that “Nothing dies totally, the death of one thing brings the birth of
another, by a universally reciprocal exchange, and everything contributes necessarily to the preservation and welfare of the Whole” (members.aol.com/pantheism0/toland.htm).

John Toland had a significant impact on his generation during the Age of Enlightenment. And he brought the concept of pantheism as well as the word “pantheist” into wider circulation, a term now commonly used by philosophers, theologians, and nature religionists throughout the world.

Tolstoy Farm

Huw “Piper” Williams was a peace activist who founded an open-land community on some of his family’s farm property in eastern Washington State in 1963, seeking to promote a Christian lifestyle of simplicity, self-reliance, and cooperation. His inspiration came from some of the religious essays of Tolstoy and from the nonviolent philosophy and activism of Gandhi. Friends from the peace movement and the Catholic Worker movement soon joined him. The sole rule at Tolstoy Farm was that no one could be asked to leave, which meant that all differences would have to be worked out directly and peacefully.

The poverty at Tolstoy in its early years was striking, with dozens of residents trying to eke out survival with antiquated farm equipment and a cash income of only a few dollars per person per month. Over time, however, the community managed to acquire 240 acres of land in two tracts and, as the counterculture became more popular and Tolstoy’s reputation spread, it attracted large numbers of visitors, some of whom stayed and built their own houses.

The farm’s lack of rules meant that social life tended to consist of a rather freewheeling anarchy. Williams, who eventually married and had children, finally left and later founded another organic, self-sufficient farming community, Earth Cycle Farm, 25 miles away. Tolstoy endured, however, becoming more stable as the permanent residents improved their homes (some have installed off-the-grid power systems) and continued to strive for rural self-sufficiency. In recent years, many members have embraced Earth-centered religions, holding an annual all-night Corn Dance, full moon rituals, and community sweats. In 2000, Tolstoy reported about fifty members.

Torres Strait Islanders (Australia)

Torres Strait Islanders, who are, with Aborigines, one of two peoples indigenous to Australia, are grounded in continuous exchanges between people, kin groups, and the natural and numinous worlds. Of the 100 or so islands strewn over the 150km-wide, 10–15-meter-deep seas that lie between the Western Province of Papua New Guinea and the Cape York tip of the Australian mainland, 16 support communities. The current geography of Torres Strait has been in existence since approximately 6500 BP. Islander society is generally regarded as Melanesian, particularly on the northern islands, although those living in the southwest of the Strait share cultural characteristics with Cape York Aborigines. While Torres Strait Islanders originate in the Strait, over 80 percent of people who identify as Islanders in Australia (around 29,000), are resident on the Australian mainland where they cherish their island of origin, family history, totemic, wind and star affiliations. The enduring attachment of Islanders to their land was made evident in the historical Murray Island Land Case of 1992, the most significant legal acknowledgement
of indigenous rights and interests in Australia. The High Court of Australia recognized the Meriam peoples ownership, occupation and possession of their Mer (Murray Court of Australia recognized the Meriam peoples owner-ship, occupation and possession of their Mer (Murray Island) land, overturning the concept of terra nullius (land belonging to no one) that had guided Australian courts and governments on questions of indigenous rights to their lands since settlement in 1788.

Torres Strait Islanders were traditionally a maritime people who combined small-scale agriculture (growing yams, taro, cassava, sweet potato, bananas and coconuts) with marine and land foraging to meet their subsistence needs. By the turn of the twentieth century colonization had impacted on the elaborate horticultural and marine rituals that ensured the continuation of the seasonal calendar and increased the produce of the sea and land. Despite colonization a great deal of the worldview that encompassed these rituals continues to inform the experience of Islanders today. Religious rituals were transitional points that substantiated relations of responsibility and care between Islanders, the natural and the numinous. Thus, the ceremonial display and feasting of harvested yams publicly expressed appropriate uses of land through an exchange of energies between gardeners and soil resulting in the yield and the recognition of various social relationships by sharing the produce through a feast. The numinous dimension resided in a complex interaction between moral behavior, environmental care, and environmental behavior. In a worldview that understands the environment to express the actions of the people to which it is related, including Ancestors, uses of land through gardening and the sea through fishing or marine hunting (turtle and dugong [sea cow]) are relationships of nurturance and responsibility.

On the island of Mabuiag, it is said that a person is constantly connected to key sites in their family and clan lands through an imperceptible umbilical link. The smell of a person who has tended a food garden is recognized by plants in that garden and quickens their growth. Prosperous gardeners, healthy bodies and the plentiful provision of foodstuffs reflect a mutually constituting exchange and resource ceremonies gave regular public expression to these relationships. In contrast a person who does not care for the places they attain responsibility for, which can simultaneously include reefs, foreshores, cays, rivers, waterholes, stars, winds and lands, either through lack of visitation and resource use or morally objectionable behavior, can have an adverse effect on these locations and social relationships that are integral to relationships of place.

While colonialism has had great impact on Islander society, the rich cultural meanings and beliefs that inspired lapsed horticultural and marine ceremonies continued or transformed to emerge in new forms. The display of garden produce found a place in the church calendar of the Anglican (Episcopalian) church for roughly the first half of the twentieth century as Torres Strait Islanders gathered harvests and piled them for show on important days of yearly church commemoration. Harvests are no longer publicly displayed through the religious calendar, but prestige is still accorded to men who provide turtle, dugong and ceremonial yams of long length and succulence, and to women who provide crabs and fish for church-based feasts. Also, the migration of many Islanders away from their traditional places of residence in the last half-century has led to the development of new relationships of care that transcend the inability to be present and active at particular places. Islanders maintain these connections by reciting memories, creating songs and dances that evoke significant associations to land and sea, and writing genealogies, seasonal and cosmological information, and agricultural and marine practices in family-owned manuscripts. These compositions sustain relationships to place by recording and making available the intricate connections between people, place and the numinous to family members physically separated from their terrestrial and marine territories.

The sea and landscapes of Torres Strait are permeated with individual, collective and cosmological histories in which personal experience and movement has constant reference to Ancestral activities and totemic affiliations. The mythical narratives in which Ancestral Beings construct the sacred geography of the region (adhiad) provide an important schema for relating individual identity, relationships to place and relationships between peoples and groups. Alongside mythical narratives of Ancestors who rarely participate in daily affairs exist active family-oriented Ancestral Beings that share responsibility for the nurturance of territories particular to their family or clan group. On the island of Saibai the identification of people with their territorial territories is given fullest expression through relationships with family Ancestral Beings called Muruyg, who take the shape of snakes. Muruyg are recognized as being high-status Ancestors who have gardened at a particular area as humans and have over a long period of time transformed into snakes with special powers. Their presence around garden beds that they were associated with in human life is propitious for cultivated crops and if a fire has devastated a garden they help bring it back to good health. They also act in a protective manner for their descendants’ lands and sometimes extend the range of their activities to include monitoring other lands within a clan estate.

At present, Islanders in the Strait face significant issues of environmental care. High levels of trace metals in marine biota, some of which may originate in the Ok Tedi outflow (located in the headwaters of the Ok Tedi, a tributary of the Fly River) may render some marine foods inedible for Islanders. Also, Islanders are unable to support the high cost of licenses and infrastructure needed to take advantage of lucrative local commercial fisheries.
Accessing the wealth from this industry would help establish independent economic security, resource management and sustainability and continue long-established affinities to the marine environment.

Totemic Practices in Borgu (West Africa)

Borgu straddles present-day Republic of Benin and Nigeria in West Africa. Before its partition by the British and the French in 1898, Borgu covered a vast expanse of land, stretching from the Atakora mountains in the west to the River Niger in the east, with three main kingdoms (Bussa, Illo, and Nikki) and several chieftdoms. The major towns included Bussa, Illo, Kaima, and Nikki. The Borgu people spoke several languages, but the major ones were Batonu and Boko. In spite of the partition and linguistic differences, the people practiced similar religious belief systems. Before the penetration of Islam and Christianity, the Borgu people associated religion with nature by worshipping the sun, moon, rocks, and rivers. They demonstrated the intersection of nature and religion by venerating animal, reptile, bird, and plant totems. Thus, the forces of nature brought spiritual attraction.

A British colonial officer described Borgu religion as “a fumble of superstitions, with strong indications of totemism,” but this religious belief system was not unique to the Borgu society because the veneration of natural phenomena was a common concept in West Africa. A mystic relationship existed between an individual or clan and an animal, bird, or plant totem whereby the totem could not be killed or eaten. This practice was common among individuals of both sexes and clans. The people believed in the existence of spirits who were invoked or appeased by particular rites. In the Batonu language, totems are referred to as shesheru.

The most prominent animal totems were the leopard and the red antelope but others included the weaverbird, monitor lizard, rabbit, and crab. Reptiles, such as the python and cobra were also revered. Mostly, the sacred animals and birds were from non-domestic species because as hunters the people related more to animals in the bush than domestic ones.

The leopard, known as musuku or musu, was a royal animal totem of Mora and Kenu clans. Members of the Mako, Sawe, Yari-Ateuwa, and Yo clans, who were mostly farmers and hunters, adopted the leopard as a totem. The spiritual relationship has been explained in the tradition, which claims that the leopard embodied the soul of their ancestors. A live leopard was accorded respect in human fashion, but if found dead, members of the clans would bury it with two cowries and mourn it seven days. Sacrifices of appeasement were often offered and the adherents of the totem believed that the leopard usually ate up the food that was put at a shrine located within the courtyard of the palaces.

As hunters, the people believed that if they were lost in the bush, the leopard would lead them back to the town safely. If somebody accidentally killed a leopard, a propitiatory sacrifice would be offered. Failure to perform the sacrifice would evoke the leopard’s wrath in form of widespread sickness among the clan members. The Mako clan referred to the leopard as “father,” which accentuates the close relationship between the animal and the people. A surviving oral tradition indicated that a leopard protected the clan ancestors by attacking and killing their enemies during a battle. Hence, in appreciation of the animal, the ancestors gave great respect to the leopard and preserved the act of revering it in their clan tradition and history.

The veneration of the leopard in Borgu was closely related to that of the Jukun (Kwararafa) and the Nupe in central Nigeria. The Kisra legend, which was popular among many West African societies, referred to Kisra as the founder of the dynasties of the Borgu, Hausa, Jukun, Nupe, and Yoruba polities. The familial relationship has been supported by the similarity in the treatment of dead leopards among the Jukun and Borgu peoples. If a Wukari Jukun killed a leopard, he would parade the dead animal around the town mounted on a mat. The people would salute the animal with uplifted arms as they would a chief. However, the slayer was required to perform propitiatory rites and three days’ solitude in the bush. To kill a leopard among the Igara of Nupe was tantamount to committing an offence against the living and dead chiefs. A dead leopard was often brought to the chief, dressed up in white, and carried around the town with singing and beating of drums. The royal mausoleum of the Ata (the king) of Nupe was known as “The Grave of the Leopard.”

The gbero (red antelope) was the animal totem of several clans, such as the Bare, Kabo, Kpai, Kpasi, Mako, Mora, Mori, Sawe, Yari-Ateuwa, and Yo clans. These clans...
may have had a common ancestry or they migrated from the same place. While on a hunting expedition, an ancestor of the Mora clan entered the warren of an animal to rest, but he could not find his way out. Fortuitously, a gbero made a hole through which the ancestor came out. As an expression of gratitude, the ancestor declared the gbero a totem for members of his clan.

Reptiles constituted another form of totem in the Borgu society. The Tosu royal clan of Okuta revered the python, which inhabited the Kuroboko hill. Pythons (mìlèda in the Boko language) lived in two shrines located at Kabami rocky hill in Gurai town. Bare, Kabo, Wanro, and Yari Wanro clans also revered shurokorù (cobra). The reverence of pythons and cobras might have developed from snake worship, which was commonplace in pre-colonial West Africa. People kept serpents in their homes and allowed them to wander about the village without being attacked by members of the community. Among the Mako, Kenu, Sawe, and Yo clans, both gunasemù (rabbit) and shekuro (weaverbird) were accorded human burial. One cowry would be buried with it and mourning would last only a day.

Animal totems were more common than plant totems but spirits lived in sacred trees. The Lesaworu clan at Illeasha revered the Besigonde tree but Baatoko tree was the plant totem of the Yari at Okuta. The Laru-speaking people of Lashiye in Wawa District regarded Kanya tree as the abode of Zarami, an important spirit who provided security for members of the community in times of sickness or epidemics. The chief priest of Lashi, an important Earth spirit represented by a stone in a hut, could not be circumcised, and was not allowed to farm. The chief of Sabon Gari could not eat new yam until he made a sacrifice of a sheep and corn to Lashi. The Kani spirit lived in Kauwo tree and often accepted a sacrifice of a white cock, a libation of honey, milk, and flour for appeasement. Ants, represented by a small piece of iron, could be invoked in case of sterility. The spirit of Fu lived in a Rimi tree. In addition, the spirit of Dauda at Kagogi near Bussa lived in Duki tree. Furthermore, the spirit of Dogwu Farù in Illo lived in the sacred tamarind tree.

Unlike the others, the Dandawa (Muslim) clans, such as the Taruwere, Ture, Mane, and the Wangara merchants, did not adopt any animal totem. But like other clans, the Muslims observed food taboos, which do not fall within the category of totemism. For a long time, the Borgu people refused to be Islamized and the veneration of animals, birds, rocks, and rivers have been employed as instruments of religion to consolidate socio-cultural cohesion and cross-clan relations. They served as symbols of unity within the society. The breaking of a totemic practice could imperil the unity of the clan. Determined to remain traditionalists and nature worshippers, the Borgu people did not adopt Islam or Christianity until the colonial period. Traditional religion still exists, an example of which is Bionkuro, whose shrine is represented by a collection of fine stones in Kenu and the priest attends to patrons who come to ask for improved health, wealth, or childbirth. Although Islam and Christianity are gaining ground in contemporary times, they have not completely obliterated the practice of totemism and nature worship.

Totemism

The word totem comes from the Algonquin language of the Chippewa (or Ojibwe) people of the American mid-West. It first came to prominence in the late eighteenth century, when trader James Long wrote:

The religious superstition of the Savages consists in each of them having his totem, or favourite spirit, which he believes watches over him. This totem they conceive assumes the shape of some beast or other, and therefore they never kill, hunt or eat the animal whose form they think this totem bears (Long 1791: 86).

Long also told the story of a Chippewa man whose “totam” was bear. The man one day killed a bear, thereby angering the Master of Life. So he was punished by a second bear, who admonished him and struck his face. As it turned out, Long had confused the Chippewa’s idea of a personal guardian spirit (or manitoo) with their idea of a collective clan spirit (or totem), but the words “totem,” “totemic,” and “totemism” developed and gelled in the English language from that time on.

Totems are usually defined as objects or beings that are emblematic of individual or group identities. Typically, the totem is an animal; less typically a plant or some other natural feature (like fire, rain, the sun, or the moon). In Long’s time, and for more than a hundred years afterwards, anthropologists usually interpreted totemism as the classical type of “primitive” religion – religion that belonged to such a low level of human social development that it was inextricably tied to nature, whose forces were seen to dominate primitive worlds. Some even argued that it was a kind of “pre-religion” or magic found among people who had yet to take any significant steps toward civilization and the rational control of natural forces. Spiritual beliefs from throughout the Americas, Australia, the Pacific Islands, and Africa, as well as large parts of Asia, all came to be lumped together under the category “totemism.”

These speculations more or less came to a definitive end when Claude Lévi-Strauss published *Le Totémisme Aujourd’hui* in 1962. Lévi-Strauss drew attention to the incredible variation that existed in the ethnographic record, suggesting that no single form of totemism could be identified as characteristic of the phenomenon as a whole. Totems could symbolize individual, lineage, or sexual identities, to name only a few, and have been found in all kinds of combinations in a single society. However, Lévi-Strauss did make one positive observation about this variety, saying that each type of totemism had to be understood as an example of a universal human propensity to utilize metaphor in the negotiation of identity. From that moment on, Aboriginal and other tribal people’s use of totemic emblems became no more remarkable than Americans identifying with the bald eagle, an army regiment identifying with its mascot, or the American prisoner Robert Stroud becoming “the Birdman of Alcatraz.” Recent attempts to enlist ostensibly tribal forms of totemism to environmentalist or New Age agendas, so that pandas, dolphins, salmon, or wolves, for example, come to symbolize particular human identities, such as conservation organizations or neo-tribal shamans, build on firm traditions long embedded in modern as well as pre-modern thought.

The extensibility of totemism is a key question in its ethnographic definition. For example, W.E.H. Stanner once described the local selection of Australian Aboriginal totems as “irreducibly arbitrary” (1979: 130). His account is worth quoting more fully.

A totem is in the first place a thing; an entity, an event, or a condition – what I have called an existent. Virtually anything perceivable can serve: plants and animals of all kinds – anything in the entire floral and faunal realms; wind, rain, storms, thunder, lightning, stars, sun, moon and clouds – anything of the heaven; tools and weapons, food and cosmetics, fire and smoke, mist and spume, fresh water and salt – anything of the Earth; the human exuviae and genitals – almost anything of the body . . . Sexual desire, cold weather, sweethearts, vomiting, runaway wives, mother’s milk and innumerable pests have all been recorded as totems. A part of an object can serve – the handle of a spear-thrower, or the bowels of an animal; so can a disease – diarrhoea or colds; so can flood-wrack swirling down a river, or tide marks on a beach. Living persons evidently cannot be totems, but a mythical person can be – for example, the Warramunga “laughing boy” (1979: 129–30).

The totemic impulse is similarly protean in Western societies, where, for example, sports teams have totems that include not only animals, but also colors, peoples, professions, mythical beings and abstract energies, to name but a few. Such versatility is found in totemic systems worldwide, both modern and pre-modern.

Yet totemic systems do tend to be dominated by animals, probably because humans are also animals – hence a strongly perceived similarity between “us” and “them.” But at the same time humans are more diverse within the species, so that differences between nonhuman animals are readily employed to symbolize differences between people. Paradoxically, totemic species then appear closer to their equivalent groups of people than other humans and, in common parlance, the totemic species often comes...
to be referred to as a friend or relative. Indeed, “totem” is actually taken from the Algonquin expression *ototeman*, which translates as “he is a relative of mine.” In societies similar to that of the Chippewa, it is common to call totemic species “brother,” “mother,” “grandfather,” and so on, so that totems, or any of the objects or spirit beings which instance them, are fully regarded as kin or extensions of the self. Totemic relationships, be they religious or secular, are invariably marked by familiarity and special intimacy.

In recent centuries the contrast between humans and other animals has been heavily compromised by the idea that humans are somehow beyond animality, or cultural rather than natural. Hence totemism has come to be perceived as “kinship with nature,” “nature worship” or “analogy between nature and culture” – this even though the Chippewa and other classically totemic societies did not originally possess a concept of nature in opposition to a concept of human society. Neo-totemic characterizations are usually strongly wedded to the romantic critique of civilization, which tends to claim that the West has lost touch with nature and needs to reinstate a reciprocal relationship with it. In this mindset, totemism tends to take on a distinctly New Age feel in terms of the ability of people to communicate with nature and comes to be strongly connected with the wisdom of “primitive peoples,” particularly insofar as they are exponents of shamanism and spiritual journeys to commune with other species. The extent to which this romantic vision accurately reflects past ethnographic reality remains problematic, but it is certainly now part of the contemporary ethnographic landscape.

Take, for example, the contemporary image of the wolf. This creature has a long history in the totemic folklore of a large part of the Northern Hemisphere. In Europe, the wolf is most famously associated with the stories of Little Red Riding Hood and the Three Little Pigs, where he is the personification of the forest and a symbol of the potential destruction and transformation of childhood. He also appears in a related unkindly guise as the werewolf. But the wolf also figures in the totemic mythology of Native North America, where the associated symbolism, often more benign, is rapidly hybridizing with the ongoing romantic backlash against the modern world. For example, Jungian works like Clarissa Pinkola Estes’ *Women Who Run with the Wolves* invert classical European imagery to make a statement about modernity.

Within every woman there lives a powerful force, filled with good instincts, passionate creativity, and ageless knowing. She is the Wild Woman, who represents the instinctual nature of women. But she is an endangered species. For though the gifts of wildish nature belong to us at birth, society’s attempt to “civilize” us into rigid roles has muffled the deep, life-giving messages of our own souls (1992: 1).

Hence, loss of kinship with the wolf, which is lack of contact with nature, is also detachment from one’s own nature – one’s true self. Neo-totemism preaching this kind of “back-to-nature” scenario inevitably establishes links with tribal regimes.

The reference to the Wild Woman/wolf as “endangered species” is telling, for in recent years the “originators” of totemism, the Chippewa people, have organized with other Native American groups (Nez Perce and Dakota Sioux) to protect wolves in their local areas. Chippewa spokespeople have stated in relation to their campaign that they are “concerned citizens that are worried for the protection of the wolf” and they have claimed the right to participate in “decisions that will affect our brother the wolf.” They back their claims with mythological precedent, saying that, at the beginning of time, Ashishinabe (the first Chippewa man) walked the Earth alone “naming all creation, lands and waters.” Because he was alone, the wolf was created to walk with him and share his fate. What would happen to one would also happen to the other. And this is how the Chippewa see their dispossession in the modern world. Just as they have had their lands taken, and been hunted and pushed to near extinction, so too has the wolf become endangered. If, as the Chippewa and others intend, the wolf returns in numbers to the land and gains in strength, then this will show how Chippewa life, culture and spirituality will also return and gain strength in those places where they were once destroyed. And perhaps, they say, “the wolf will lead the way to a more natural living” and teach the new Americans to respect “Mother Earth” (Bob Shimek and Jean Brave Heart. “Native Americans Enter Wolf Controversy.” http://nnic.com/mnwolves/nap.html, visited 3 July 2001).

These ideas are at once old and new, a recasting of totemic traditions in hypermodern circumstances. They also mark a tense conjunction of interests expressed by indigenous peoples, environmentalist groups and New Age spiritualists. These interests often help to form strong alliances, but they also often lead to accusations of neo-colonialism and the wrongful appropriation of indigenous knowledge. Some ethnographers have argued that classical totemic systems, in effecting ritual control of human movement and foraging, have long played a part in environmental resource management in pre-modern societies. In turn, successful environmental management is reflected in spiritual beliefs about maintaining harmony and balance in the cosmos. Yet violent hunting practices and other pragmatic issues in indigenous communities do not always sit easily with contemporary environmentalist or New Age sensibilities. Consequently, neo-totemic solidarity across the indigenous/non-indigenous divide cannot be taken for granted, but is rather a matter for
Traditional Ecological Knowledge

The theme of traditional ecological knowledge is important for the consideration of a broad range of questions related to nature–human relations. Different groups of people in various parts of the world perceive and interact with nature differently, and have different traditions of environmental knowledge. Their perceptions and knowledge are in part shaped by their values, worldviews, and environmental ethics – religion in the broader sense. In the exploration of environmental ethics and religion toward an ecologically sustainable society, indigenous peoples and traditional ecological knowledge have attracted considerable attention from both scholars and popular movements. Traditional ecological knowledge may be defined as “a cumulative body of knowledge, practice and belief, evolving by adaptive processes and handed down through generations by cultural transmission, about the relationship of living beings (including humans) with one another and with their environment.” As a knowledge–practice–belief complex, traditional ecological knowledge includes the worldview or religious traditions of a society. It is both cumulative and dynamic, building on experience and adapting to change, as societies constantly redefine what is considered “traditional.” It is an attribute of societies with historical continuity in making a living in a particular place.

Many discussions of traditional ecological knowledge and indigenous knowledge focus on North American Indian peoples. However, there are traditions of ecological knowledge in various indigenous societies in South America, Australia, and parts of Africa and Asia. Culturally transmitted, cumulative, multigenerational knowledge is held also by some groups that have European backgrounds, such as Newfoundland fishers and Swiss Alpine people.

TEK in Our Common Future

Tribal and indigenous peoples’ . . . lifestyles can offer modern societies many lessons in the management of resources in complex forest, mountain and dryland ecosystems . . . These communities are the repositories of vast accumulations of traditional knowledge and experience that link humanity with its ancient origins. Their disappearance is a loss for the larger society, which could learn a great deal from their traditional skills in sustainably managing very complex ecological systems [Our Common Future 1987: 12, 114–15].

Traditional ecological knowledge may be considered as a sub-set of indigenous knowledge, defined as local knowledge held by indigenous peoples or local knowledge unique to a given culture or society. There is controversy over the term, traditional. Some scholars consider that the term implies backwardness, and instead favor “indigenous” or “local.” Others point out that many indigenous peoples themselves see “tradition” in a positive light. They do not take it to mean inflexible adherence to the past but rather to mean time-tested and wise.

These considerations make it difficult to generalize about traditional ecological knowledge. But in any case, one cannot generalize about “the Amerindian (or African) view of nature.” Every cultural group has within it a range of environmental values and ethics, and a range of practices. Environmental relations of a group are not uniform; they are shaped by the day-to-day contingencies, as well as their worldview and ethics. Environmental ethics do not describe how people actually behave, but indicate how they ought to behave. Human–nature relations tend to be ambivalent; there often is a discrepancy between belief and practice.

Origins of Traditional Ecological Knowledge and its Development as a Field

The intellectual roots of traditional ecological knowledge are in ethnoscience (mainly ethnobotany) and human ecology. The field started with the documentation of lists of species used by different indigenous groups, and elaborated a science of folk taxonomies of plants and animals, and later, of other environmental features such as soils. Early ethnobotany goes back at least to Barrows’ 1900 work on Coahuila Indians of southern California who made a living in a seemingly barren desert environment by harvesting no less than 60 kinds of edible plants and 28 kinds of medicinal plants. The science of folk taxonomies is often associated with the name of Harold Conklin who documented in the 1950s the extensive plant knowledge and classification systems of traditional groups such as the Hanunoo of the Philippines.

There is a technical literature on various kinds of indigenous environmental knowledge. For example, traditional agricultural practice is a major field of indigenous knowledge; others include traditional medicine and architecture. Much of the indigenous knowledge literature is not about ecological relationships but about other kinds of ethnoscience, including agriculture, ethnobiology, ethnopharmacology, ethnovenery medicine, and ethnopedology (soils). Some of these areas, for example, traditional practices of water conservation and erosion control, are directly related to ecological knowledge, but others (e.g., ethnoastronomy) are less so.

The shift of emphasis from the documentation of species used by indigenous groups and their taxonomy, to a consideration of functional relationships and mechan-isms, gave rise to the field of traditional ecological knowledge. The field borrows from the cultural ecology tradition of the anthropologist Julian Steward who emphasized the study of adaptive processes, and argued that social organization itself may be considered an ecological adaptation of a group to its local environment. This emphasis on adaptive processes in human–nature relations may be seen in some of the key volumes on traditional ecological knowledge. As defined in this literature, traditional ecological literature overlaps with cultural ecology, ecological anthropology or anthropological ecology but is not a sub-set of these fields because it often goes beyond the discipline of anthropology.

The rapid development of traditional ecological knowledge as a field in its own right started with the documentation of a tremendously rich body of environmental knowledge, not just of species but also their ecological relations, among a diversity of groups outside the mainstream Western world. These included studies of shifting cultivation and biodiversity conservation in tropical ecosystems, and traditional knowledge and management systems in coastal fisheries and lagoons, semi-arid areas, and the Arctic. These studies showed that a variety of traditional peoples, in diverse geographical areas from the Arctic to the Amazon, had their own understandings of ecological relationships and distinct traditions of resource management.

By the mid-1980s, the rapidly growing literature on traditional ecological knowledge led to a recognition in the international arena of its potential applications to contemporary resource and environmental problems. This recognition is reflected in Our Common Future, the 1987 report of the World Commission on Environment and Development. The report pointed out that indigenous peoples hold a wealth of knowledge based on thousands of years of experience, and that their practices can offer modern societies lessons in the management of resources in complex forest, mountain and arid land ecosystems.

Traditional Ecological Knowledge and Science

Even though the importance of traditional ecological knowledge is recognized in the international arena and the number of publications has grown rapidly since the 1980s, the relationship between Western science and traditional knowledge has remained controversial. There are both similarities and differences between traditional science and Western science. Both kinds of knowledge are ultimately based on observations of the environment, and both result from the same intellectual process of creating order out of disorder. But they are different in a number of substantive ways. Traditional ecological knowledge is often an integral part of a culture, and tends to have a large social context. Different kinds of traditional knowledge have their own rules, but they are different from science regarding rules of evidence and repeatability.
Some of the conflict between science and traditional knowledge is related to claims of authority over knowledge. In the modernist tradition, Western science is seen as having a monopoly on truth. Hence, knowledge and insights that originate outside institutionalized Western science are not easily accepted. Scientists tend to dismiss understandings that do not fit their own (and this often includes understandings of other scientists using different paradigms). Scientists tend to be skeptical, demanding evidence when confronted with traditional knowledge that may not easily lend itself to scientific verification.

Some traditional knowledge may include elements, such as the religious dimensions of the environment, which do not make sense to science. For example, many of the Dene (Athapascan) peoples of the North American subarctic consider that some non-living parts of the environment (including rivers and mountains), as well as all living beings, have spirit. Science has no tools for the study of the spiritual dimensions of the environment, but nevertheless such beliefs are important for understanding Dene traditional ecological knowledge.

For their own part, traditional knowledge holders are skeptical of book learning, and tend to dismiss scientists who do not have extensive first-hand knowledge of a specific land area. As well, they are often baffled by the preoccupation of scientists to measure and quantify everything. Power relations become an issue when Western experts and Aboriginal experts have different political agendas. Traditional ecological knowledge has frequently been used to assert indigenous land and resource rights and to fight government-imposed development projects on native land. In turn, science may be used to justify the very same projects.

Hence the issue is complex, even if one agrees with postmodern philosophers of science that Western scientific methodology is merely one way, and not the only way, to acquire knowledge. However, it is the one that happens to be the dominant knowledge system by far, and the one used as the basis of environmental decision-making by centralized bureaucracies throughout the world.

**Significance of Traditional Ecological Knowledge**

Traditional knowledge and Western science need not be thought of as opposites. Rather, it may be useful to emphasize the potential complementarities of the two, and to look for points of agreement rather than disagreement. The use of traditional knowledge contributes to conceptual pluralism, and expands the range of approaches and information needed to solve environmental problems.

The explosion of interest in traditional ecological knowledge since the 1980s is in part related to its practical significance. However, the interests of different parties are quite different. For many indigenous groups, the broader social and cultural aspects of traditional knowledge are very significant, and this is one of the reasons why dealing with traditional ecological knowledge has become politically volatile. In many indigenous areas, researchers no longer have a free hand to conduct their work independently from the people themselves.

Politically organized groups of indigenous peoples are beginning to assert control over their knowledge systems for at least two reasons. First, some indigenous groups have seen their knowledge and biological resources (for example, medicinal plants) turned by others into profit-making commodities. Thus, they have started to ask the question of who benefits from the recording of their knowledge, and to investigate how they themselves can control their knowledge and products.

Second, indigenous knowledge has become a symbol for many groups to regain control over their cultural information. Reclaiming their indigenous knowledge has become a major strategy in many parts of the world for movements of cultural revitalization. For example, many of the Aboriginal groups in Alaska and Northern Canada have been carrying out their own traditional knowledge studies as part of an effort to strengthen their culture, educate their young people, prepare land and resource claims, and assert their rights. Such revitalization is not merely a cultural exercise; it is about empowerment and political control.

The need for indigenous groups to control their knowledge has to be balanced against the importance of traditional ecological knowledge as the common heritage of humankind. There are tangible and practical reasons why traditional ecological knowledge is important for the rest of the world’s people. I have identified seven areas in which traditional ecological knowledge is significant.

First, it is a source of biological knowledge and ecological insights. Second, indigenous knowledge is important for the sustainability of difficult-to-manage ecosystems such as tropical forests. Third, it is important for community-based conservation by connecting human values with conservation values. Fourth, some traditional systems are of special interest for biodiversity conservation because they are based on multiple-use principles that distribute resource-use pressures in space and time. Fifth, in-depth local environmental knowledge and trends over time for a given site are important for environmental assessment. Sixth, traditional knowledge is essential for development, especially for “bottom-up” (as opposed to top-down) development planning with people.

Finally, traditional ecological wisdom is a source of inspiration for environmental ethics. Belief systems of many indigenous groups incorporate the idea that humans are part of the natural environment, and their relationship with nature may be characterized as peaceful coexistence. Callicott points out that some traditional ecology sees humans and nature in a symbiotic relationship, with mutual obligations leading to “respect,” a central idea in the relations of many Amerindian groups with nature.
These observations are significant. The explosion of interest in traditional ecological knowledge in recent years reflects in part the need to derive ecological insights from indigenous practice, and the need to develop a new ecological ethic based in part on indigenous wisdom.

(“Skip”); Religious Environmentalist Paradigm; A Religio-Ecological Perspective on Religion and Nature; Traditional Ecological Knowledge among Aboriginal Peoples in Canada; Water Spirits and Indigenous Ecological Management (South Africa); Yunnan Region (Southwest China and Montane Mainland Southeast Asia).

For generations, indigenous peoples in what is now known as Canada have been using their own knowledge systems to live sustainably with the land. Indigenous knowledge systems are unique systems of generating, storing and transmitting knowledge completely separate and independent from Western science and Western epistemologies. Rooted in relations with the spirit-world, indigenous knowledge continues to provide Aboriginal peoples with unique worldviews, languages that are constructed to reflect those worldviews, systems of governance, values, and processes and ways of knowing and interacting with the land. Aboriginal philosophies and values reflect worldviews that are based on inter-relationships and interdependency with the natural world and all other elements of the cosmos. Traditional teachings, stories, songs, dances and ceremonies reinforce the importance of relationships and process in the lives of individuals, communities and nations. Indigenous knowledge is dynamic and creative and, although it varies from nation to nation, has certain common elements and themes. Indigenous knowledge is at once ancient and contemporary knowledge, recording through the oral tradition the collective knowledge of a people in addition to documenting the impacts of colonization, colonialism and environmental destruction. Experts in indigenous knowledge are not academics or researchers who study TEK, but they are the Elders and knowledge-holders who not only hold the knowledge, but who have lived the knowledge and the teachings over the course of their lives. It is these experts who are best equipped to provide leadership around this topic, and it is these experts that need to be included in an effective way in discussions regarding the many potential applications of Traditional Ecological Knowledge (TEK).

During the initial stages of colonization, Europeans were dependent upon indigenous peoples and their knowledge for their survival. The colonizers relied upon technology in the areas of transportation, hunting, fishing, food gathering, nutrition, healthcare and navigation. They relied upon Aboriginal peoples for their most basic needs and in turn had great respect for indigenous knowledge. However, as the settler economy developed and the infrastructure needed to support the colonizers way of life was realized, they no longer relied on Aboriginal peoples and

Traditional Ecological Knowledge among Aboriginal Peoples in Canada

Each contracting Party shall, as far as possible and as appropriate: Subject to national legislation, respect, preserve and maintain knowledge, innovations and practices of indigenous and local communities embodying traditional lifestyles relevant for the conservation and sustainable use of biological diversity and promote their wider application with the approval and involvement of the holders of such knowledge, innovations and practices and encourage the equitable sharing of the benefits arising from the utilization of such knowledge innovations and practices (from www.biodiv.org – the Convention on Biological Diversity’s website).
Aboriginal knowledge for their continuance and survival. Subsequently, over the next five centuries, indigenous knowledge was disrespected, undermined and assimilated into Canadian society with no recognition or acknowledgement for Aboriginal peoples. Many of the modern symbols of Canadian culture, such as maple syrup, canoes, kayaks, snow shoes, wild rice and wild meat, represent appropriated Aboriginal knowledge. The systemic dispossession of Aboriginal nations from their territories along with the assimilative policies of the Canadian government through the Indian Act would have come close to destroying indigenous knowledge if it were not for the resistance and commitment of past generations of Aboriginal peoples.

In recent times, non-Aboriginal researchers, academics, environmentalists, industry and government personnel have once again become interested in what has become known as Traditional Ecological Knowledge. Many environmentalists believe that TEK holds answers to the pending ecological crises and provides Euro-Canadian society with a blueprint toward sustainable living. The pharmaceutical and natural health products industries are interested in the Aboriginal knowledge and use of traditional medicines and medicinal plants so that these might be commercially exploited for profit. Natural resource managers at the federal and provincial levels are interested in TEK in hopes that it can contribute to the management of renewable and non-renewable resources in a positive way. These interests in the knowledge of Aboriginal peoples have unfortunately caused researchers to separate out “ecological” or “environmental” knowledge from other kinds of knowledge, because it is the component of the knowledge system that outside researchers are currently most interested in learning. Existing academic literature regarding TEK continues along this line of thinking, privileging the components of indigenous knowledge that conform well to Western ideals over the spiritual basis of indigenous knowledge. Aboriginal spiritual traditions, beliefs and values form the foundation of traditional knowledge, and are completely integrated into every aspect of TEK and indigenous thought. Much of the TEK literature published in applied scientific journals and publications is written by non-Aboriginal scientists and academics and has focused on introducing TEK to scientists. Works written by Fikret Berkes, for instance, attempt to gain acceptance for TEK and Aboriginal peoples in disciplines that have traditionally ignored the contribution and knowledge of indigenous peoples. Publications in scientific journals generally ignore contemporary impacts of colonization and colonialism on indigenous peoples, the land, and their knowledge, marginalize indigenous elders and knowledge-holders, and undermine the oral tradition, thereby constructing “TEK” in a manner that is often not meaningful to the very people who hold the knowledge.

These criticisms, long observed by indigenous elders and knowledge-holders are making their way into the academic literature articulated by indigenous scholars such as Marie Battiste, James Sa’kej Youngblood Henderson, Leanne Simpson and Deborah McGregor.

Aboriginal peoples have approached these outside interests with caution, concerned that their knowledge could be taken out of context, misused and appropriated. Indeed, there have been several examples of this kind of exploitation increasingly occurring, and indigenous peoples continue to take special precautions when sharing knowledge with people from outside their communities and nations. Many communities have developed information-sharing policies and guidelines for researchers entering their territories in addition to their traditional protocols for sharing and transmitting knowledge.

Internationally, TEK has most recently been recognized in the United Nations Convention on Biological Diversity. Article 8j (see the epigraph) of the Convention outlines the importance of indigenous knowledge and indigenous peoples in the protection of biodiversity. Canada, as a signatory to the Convention, is slowly working toward implementing Article 8j in its domestic legislation. As a result, environmental impact assessments, co-management agreements, and certain pieces of legislation such as the proposed Species at Risk Act are beginning to include certain aspects of indigenous knowledge within them. Despite these initiatives, there are many barriers to including TEK in environmental management in ways that respect Aboriginal peoples and bring about meaningful change to these processes. Scientists and resource managers have little opportunity to learn about Aboriginal peoples and their TEK first-hand. This can create misunderstandings regarding the nature of TEK. Governments often require their bureaucrats to include TEK in policy and legislation without proper consultation with Aboriginal peoples, in unrealistic timeframes, and without appropriate financial support. Governments also regularly require TEK to be written down or documented before it is considered useful. Documented TEK is then integrated into processes and frameworks that remain strongly rooted in Western science, and much of the transformative potential of indigenous knowledge is assimilated in the process. Many Elders are concerned that once their knowledge is removed from the oral tradition and the knowledge-holders, translated into English and textualized, it is removed from its context and all of the relationships that give the knowledge its meaning.

Aboriginal advocates have challenged this approach and Aboriginal peoples are monitoring these initiatives with concern. It is critical that Aboriginal people, not just isolated components of their
Youngblood Henderson, James.

LaDuke, Winona. "Traditional Ecological Knowledge and ultimately means that different decisions will be made.

Contemporary Aboriginal peoples in Canada are concerned about protecting their territories from environmental destruction not only as a way of protecting their relations with the natural world, the health of their communities and their cultures, but also as a way of protecting their knowledge systems. Indigenous knowledge comes from the land. Without these relationships, it is difficult to strengthen, promote and preserve the knowledge of Aboriginal peoples for the coming generations and it is difficult to envision healthy, sustainable Aboriginal nations in the future. TEK has much to offer Aboriginal and non-Aboriginal societies if it is accessed and used in a way that is respectful and fair from the perspective of the people who hold the knowledge. As interest in TEK grows, and Aboriginal voices are listened to, so does the potential for using both indigenous and Western forms of knowledge together to address some of the many local, national and global environmental issues facing the world.

Transcendental Meditation

Transcendental Meditation is a spiritual movement organized by Maharishi Mahesh Yogi, an Indian who came to the U.S. in 1959 to utilize modern media and communications to spread his teachings. These teachings are based on monistic Advaita-Vedanta, a Hindu tradition that describes the universe as diverse manifestations of a single, underlying Absolute, called Brahman. The goal of meditation is personally to experience direct knowledge of Brahman, and realize that the essence of one’s own self is this same Brahman. In the 1970s, Maharishi rephrased his teachings to use Western scientific terminology and described his meditation program as the Science of Creative Intelligence (SCI) with Creative Intelligence being the all-pervasive, organizing principle of the universe. Nature appears in two areas of SCI, first as Brahman and second in the context of environmentalism.

In writings from the 1980s, Maharishi often used “Nature” instead of “Brahman” when describing the underlying foundation of the cosmos. In this context, nature is described as the basis of all order and the goal of meditation is to become aware of it. TM uses the language of physics, mathematics, and chemistry to explain the order of the universe and show that modern science is describing a unified cosmos that coincides with the ancient Indian scriptures, the Vedas. Maharishi makes effective use of the Grand Unification Theories of physics to communicate the idea of the basic unity of all material existence to a Western audience. This emphasis on science also allows TM to define itself as a practical technique for improving modern life rather than a religion with a creed. Referring to the Absolute as “nature” rather than God or Brahman facilitates the movement’s non-religious identity.

Nature is not, however, completely passive. It is the Creative Intelligence that organizes the cosmos and is said to have “moved Maharishi” to begin his life of teaching. This teaching is necessary for “nature to work out its divine plan for the spiritual regeneration of mankind” (Maharishi 1986: 2). From such statements, it is clear that nature is an active, conscious force in Maharishi’s philosophy. And the divine plan requires that people learn to
meditate so that they can realize their inherent oneness with the cosmos and be brought into harmony with the natural order of the universe. This, in turn, transforms one’s life and leads to the full realization of “human potential.” A person who is attuned to nature will be confident and content, able to handle the pace of modern life without succumbing to stress. Such a person is in harmony with the cosmic order. Maharishi attributes his success and his movement's growth to “the natural expression of the force of evolution, silently reshaping the destiny of the world through the thought and action of one moving in perfect attunement with the infinite intelligence of nature” (Maharishi 1986: 1). If his followers meditate, they too will be successful at life because they are in accord with the natural order.

TM’s description of nature concerns the cosmic whole, not specific phenomena such as the sun or mountains. The same is true of the movement’s approach to the earthly environment. One of TM’s stated goals is “to maximize the intelligent use of the environment” (Forem 1974: 10). However, TM writings do not have specific aims such as stopping global warming or requiring that all members be vegetarian. Rather, there is a general belief that those who practice TM will find themselves naturally living a more harmonious life. This will include better human relationships, reduced stress, greater clarity of thought, and better choices about how to live. Among these will be environmental awareness, because polluting the world is selfish and places short-sighted gratification before long-term well-being.

Although TM does not champion specific causes, Maharishi describes two ways in which it can have an effect on the world beyond its membership. First, he suggests that the “custodians of this knowledge” should serve in governments where they will create “problem-free” nations and raise life to the level of a “Heaven on Earth.” Second is the “Maharishi Effect,” the theory that the mental states of a few people can influence the behavior of others at a distance. According to TM, if the square root of one percent of a population meditates regularly, the higher consciousness of the meditators will affect the whole area and social problems will be alleviated. Thus, their efforts will bring the society into harmony with nature.

Transcendentalism

Transcendentalism refers to the intellectual and social movement that emerged primarily in Boston and surrounding areas during the mid-nineteenth century and included such familiar figures as Henry David Thoreau, Ralph Waldo Emerson and Margaret Fuller, as well as Frederick Henry Hedge, George Ripley, James Clark, Orestes Brownson, Bronson Alcott, Elizabeth Peabody, and Theodore Parker, among others. Already known to each other through intellectual and social circles, the Transcendentalists formalized their relationship (to the extent that they ever did so) through a regular symposium – sometimes dubbed “the Transcendental Club” – that gathered at participants’ homes from 1836 to 1840. The group analyzed such topics as “the essence of religion as distinct from morality,” “American Genius,” “Pantheism” and “the nature of Poetry.” As these titles indicate, the preoccupations of this group were flexible and wide-ranging (as was its informal membership).

Participants in the club were interested in expanding the latest trends in German philosophy, developing original – recognizably American – literary contributions and experimenting with new forms of religious life and thought. Often, they were referred to as the “New School” by their critics and even the term “Transcendentalist” was more often a term of criticism leveled by opponents than a term used by its participants. While regular meetings of the club waned after 1840, the Transcendentalists continued to communicate and exert their influence through their publication, *The Dial* (1840–1844), which was edited first by Fuller and then by Emerson.

The Transcendentalists were highly individualistic in both character and philosophical outlook, resisting any common doctrinal or intellectual stance. They shared, however, a highly optimistic vision of humanity and a confidence in the future of American intellectual life and thought, freed from the bonds of intellectual precedent or religious superstition. These young writers also shared an intellectual affection for various forms of idealism, from neo-Platonic thought to the increasingly influential work of Immanuel Kant, whose use of the term “transcendental” – mediated through the writings of Samuel Taylor Coleridge – these thinkers both borrowed and transformed for their own purposes. What was “transcendental” for the Transcendentalists was a preference for spiritual (or “intuitive”) over material (sense-based) forms of knowledge. Similarly, they expressed a commitment to shaping life according to individually discerned aesthetic and spiritual priorities, rather than those of social convention or the

See also: Hundredth Monkey; Natural Law Party; New Age.
marketplace. Their intellectual stance was the starting place from which they developed their ideas of nature, as well as their moral and religious views.

The intellectual agenda of the Transcendentalists was broad, eclectic and not always consistent, consistency itself not being an ideal toward which the Transcendentalists strove. In the most general sense, however, the Transcendentalists embraced a new theory of knowledge. This theory refuted the, then prevailing, Lockean view of the process of human knowing. At the same time, the Transcendentalists put forward new theories of morality that countered more conservative religious approaches, while also opposing the skepticism of David Hume and other Enlightenment figures. In a general sense, the Transcendentalists can be said to have welcomed the Enlightenment critique of religion, while resisting recourse to forms of rationalism that overlooked human emotions and disenchant the natural world.

In terms of epistemology, the Transcendentalists resisted Locke’s empiricist approach, which proposed that knowledge comes from sense experiences which are impressed on the waiting mind just as words are written on a blank slate. While Locke’s own view was more complex than that of his followers, Lockean psychology was generally accepted by the intellectuals of the eighteenth and early nineteenth century, particularly the New England Unitarians. Taking cues from the writings of Kant and Coleridge, the Transcendentalists responded against Locke by articulating a distinction between “understanding” (rational reflection on sense experience) and Reason (the use of intuition and one’s innate, divinely created capacities to discern the good, the true and the beautiful). While accepting Locke’s confidence in the rational capacities of humanity, the Transcendentalists argued that Reason was also an innate human gift which each individual should cultivate.

The Transcendentalist’s view of the moral life followed from this epistemological premise. While rejecting orthodox religion and even the comparatively liberal Christian Unitarianism that was culturally dominant in nineteenth-century Boston, the Transcendentalists also rejected Hume’s skepticism with respect to religion and morality. Most Transcendentalists affirmed their belief in a divine Creator, while rejecting the notion of divine revelation of miracles. Many also became increasingly interested in the religions of China and India as these became available to them through newly available European translations of Eastern texts. Moreover, Transcendentalists’ vision of human nature was indefatigably optimistic, resting on the assumption that all individuals carry the divine within them and must dedicate their lives to nurturing this divine potential, particularly through education and artistic expression.

The Transcendentalists’ view of nature rests on the important epistemological and moral assumptions described above. As with particular philosophical, literary and political preferences, the Transcendentalists’ reading of nature also varied among individuals. In general, however, the Transcendentalists borrowed from the European Romantics the notion that a regular contact with nature (by which was generally meant: living in or visiting rural and pastoral settings) was essential for regaining human innocence and originality that was corrupted by civilization. Intimacy with nature could return the individual (especially the writer) to a state of childlike openness and wonder. Such a state was crucial to developing what Emerson famously termed an “original response to the universe.”

The quest for originality and authenticity both in spiritual experience and in literary expression was a central preoccupation of the Transcendentalists. While the foundations of their ideas were, belatedly, shaped in response to European Romanticism, the Transcendentalists worked to create literature, educational theory and, more broadly, “culture” that was distinctly American. Because such work was dependent on the experience of and response to a particular natural landscape (primarily, pastoral New England), it is no surprise that much Transcendentalist literature concerns itself with “nature” both as an abstract concept and as a particular physical context for spiritual experience.

When considering the Transcendentalists’ views of nature, it is important to recognize the complexity of what the term “nature” could signify. In its broadest sense, it represented what was not the self. “Nature” then was equivalent to the Kantian “not-Me.” More particularly, nature might refer to a particular biophysical context for the experiences of insight and intuition that were sought after by the Transcendentalists: the “bare common” upon which Emerson experienced himself as a “Transparent Eyeball,” Thoreau’s Walden or the communal Brook Farm in West Roxbury. Even in these instances, however, the reading of nature offered by the Transcendentalists was not one of appreciating nature for what today we might call its “intrinsic value.” While theologically departing firmly from their Puritan heritage, the Transcendentalists continued, while altering, the Puritan view of nature as a “book” to be read for spiritual lessons. They also carried forward Unitarian interests in natural theology, particularly the study of nature to comprehend the character of the divine. The Transcendentalists reworked and reimagined these Puritan and Unitarian legacies, ultimately asserting the presence of the divine in nature (as well as in humanity), while also not limiting their understanding of the divine to the Christian tradition. They incorporated spiritualism, Emmanuel Swedenborg’s theory of correspondences and Eastern concepts of sacred geography into their cultural repertoire.

Nevertheless, nature remained in what we might call a “spiritually utilitarian” position. Nature was most often
Transpersonal Psychology

Transpersonal psychology is the branch of psychology which integrates psychological concepts, theories, and methods with the subject matter and practices of the spiritual disciplines. Its interests include spiritual and mystical experiences, meditative practices, ritual, shamanism, and the connections between spiritual experiences with disturbed states such as psychosis, mania, and depression. Transpersonal psychologists apply their work in clinical and counseling psychology, spiritual guidance and pastoral counseling, organizational and community development, healthcare and healing, the transpersonal dimensions of interpersonal relationships, cultural diversity, gender studies, business, ecopsychology, and other areas.

The root of the term transpersonal, or literally “beyond the mask,” refers to self-transcendence, the development of the self from a sense of identity which is exclusively individual to one that is deeper, broader, more inclusive, and more unified with the whole. The core concept in transpersonal psychology is nonduality, the recognition that each part or person is fundamentally and ultimately a part of a larger, more comprehensive whole. From this insight come two other central insights: the intrinsic health and basic goodness of the whole and each of its parts, and the validity of self-transcendence.

Transpersonal psychology is phenomenological, inclusive, and optimistic. It values and integrates the personal with the transpersonal, the psychological with the spiritual, exceptional mental health with psychological disturbance, and analytical intellect with contemplative ways of knowing. It finds wisdom in Western psychology and philosophy, Eastern spirituality, postmodern insights, and worldviews of indigenous traditions. Such overlaps between psychology and spirituality have been present in both psychology (e.g., the work of William James, Carl Jung, and Abraham Maslow) and in the spiritual traditions (which have their own rich views of development, cognition, social interactions, emotional and behavioral suffering, and methods of healing). The work of Ken Wilber (Integral Psychology) and Stanislav Grof are at the forefront of transpersonal psychology today. Among its important projects are describing the stages and processes of transpersonal development, researching the psychological effects of meditation, exploring spiritual emergences (those mystical or spiritual experiences which also create acute debilitating psychological suffering), and identifying the transpersonal dimensions of nature experiences.

Transpersonal psychology is a field of inquiry which includes theory, research, and practice, offering insights and applications based on research and experience and methods for evaluating and confirming or disconfirming its findings. It is scientific in the broad sense of the
phenomenological or “human” sciences. Research in transpersonal psychology uses both qualitative-phenomenological methods and quantitative methods such as experimental designs. In recent years, the *Journal of Transpersonal Psychology* has published reviews of research on psychospiritual problems, mystical experiences, meditation, and measures of transpersonal development. Still, most of the work and practice of transpersonal psychology concerns psychotherapy and self-development.

Meditation, contemplative prayer, and similar forms of open-ended phenomenological inquiry are core practices for transpersonal psychology. These practices lead to an expanded awareness, a greater sense of presence, and a greater degree of self-integration or self-transcendence. While such practices have been successfully used for self-regulation, relaxation, and pain control and for self-exploration and psychotherapy, they have traditionally been used for self-transcendence and self-liberation. Despite their many surface forms, meditation and contemplative practices can be a means of disidentifying from our “masks” or personalities and realizing our fundamental nonduality.

Ritual is another core practice for transpersonal psychology. For many individuals and in many cultures and spiritual systems, ritual is the central means of discovering connections with each other, with communities, with the Earth, and with the cosmos. Other practices that are associated with transpersonal psychology include shamanism, lucid dreaming, visualization, chanting, transpersonal uses of music and art, and religious uses of psychedelic drugs.

Transpersonal psychology arose in the 1960s out of work by Abraham Maslow, Stanislav Grof, Anthony Sutich, and others in humanistic psychology. The work of William James on mysticism, Carl Jung on the collective unconscious, and Roberto Assagioli on psychosynthesis anticipated the development of transpersonal psychology. Interest in the psychological implications of Buddhism, Yoga, shamanism, psychedelic states, and holistic medicine fueled its development. At the present time, transpersonal psychology is gaining acceptance by many psychologists, and a number of professional organizations have been established worldwide. The Association for Transpersonal Psychology has published the *Journal of Transpersonal Psychology* since 1969. Its influences are found in a number of other psychological and psychiatric journals and books, both scientific and popular. Conferences and training programs sponsored by professional organizations such as the Association for Transpersonal Psychology and the International Transpersonal Association also provide training in transpersonal psychology and contribute to developments in the field.

Most transpersonal psychologists are involved in counseling and psychotherapy. Transpersonal psychotherapists may deal with spiritual crises or other explicitly transpersonal content, or they may bring a transpersonal context and processes to a broader range of psychological issues such as addictions, emotional distress, relationships, and life transitions. Art therapists, music therapists, dance therapists, and body-centered psychotherapists often use transpersonal principles in their work as well.

Transpersonal studies are arising in a number of fields, including medicine, education, anthropology, and organizational development. There are also strong connections between transpersonal psychology, ecopsychology, and deep ecology. Many people find transpersonal experiences in contact with nature, and many nature-based personal growth practices such as wilderness retreats, rites of passage, and other Earth-centered rituals have transpersonal dimensions. Similarly, some environmental activists bring a transpersonal perspective into their work. Deep ecologists such as Arne Naess, Warwick Fox, and John Seed and ecopsychologists such as Theodore Roszak and Ralph Metzner have promoted a kind of self-transcendence or transpersonal identity as a basis for environmental action. They argue that when one’s identity expands or deepens beyond the individual self to include the Earth (i.e., a kind of self-transcendence), environmental action is more likely to be based on love, joy, and caring than on fear, shame, or sacrifice and that such a transpersonal attitude leads to action which is more effective and more sustainable.

Transpersonal psychology proponents believe that the practices they are developing benefit both psychology and the spiritual disciplines. Psychology can expand toward a fuller and richer accounting of the full range of human experience and potential and incorporate practices that develop this potential. The spiritual disciplines can incorporate insights and skills related to human development and healing to deal more skillfully with the psychological issues that arise with spiritual development. They can more effectively use these issues as gateways, rather than obstacles, to self-realization and authentic service.

Tree Music

When I was 26, needing to rest after injuring my back while landscaping, I realized that I would much rather relax in the forest of Washington’s Olympic Peninsula than in Seattle. So I drove out to Graves Creek Campground on the Quinalt River, and spent four days reading and playing my guitar next to a giant Douglas Fir tree. At the end of the four days, right before I left to return home, the song “The Tree” came flowing out. I looked up at the big Douglas Fir and said “I bet this is your song.”

For years after that I’d sing “The Tree” and mention that I thought it was the big Douglas Fir’s song. It seemed like a nice thought, and as the concept of a tree having “a song” had never come up in my scientifically oriented Western education, I only light-heartedly believed it.

A few years later I was invited to a celebration on Orcas Island, where the Lummi Indians and their allies had succeeded in saving a place called Madrona Point, where a developer had hoped to build condominiums on top of a Lummi Indian burial ground. After a 10-year battle, the United States Congress appropriated money to buy the land and give it back to the Lummi people.

The celebration was held at the Oddfellows hall on Madrona Point near Eastsound. Several hundred people gathered from the Lummi Reservation and Orcas Island. There was a huge potluck feast with salmon and berry pies and salads and fried bread. Spirits were high and children ran around everywhere.

The man who invited me to the celebration then told me that the chief wanted me to sing “The Tree.” I expressed reluctance, however, unsure whether this quiet song could be heard over the clanking dishes and spirited children. My friend simply restated, “The chief would like to hear ‘The Tree.’”

After I was introduced, the place quieted down and I began to sing, noticing immediately something that had never happened before at one of my concerts. While everyone seemed to be enjoying the tune, the elder Lummi

was riveted, holding on to every note, every word. I felt honored that they would care so much about this song.

Afterwards I spoke with the chief and several elders. I told them the story of spending four days with the old Douglas Fir tree by the Quinalt River and how I had always thought it was the Tree’s song.

“It is,” said the chief, “I recognize the tune. It is a song from a tree in our region. In Lummi tradition, and for many of the peoples of this region, we get our music from trees. Each tree has its own song. We go out and spend three or four days next to a tree where we fast and pray and listen for that tree’s song. We take the song and sing it or play it on the flute. In this era when so many of our ancient trees are being cut down, we go out and learn their songs before they die, as a way of honoring the great trees. We are working to save the last remaining ancient groves on our territory.”

I have never looked at a tree in the same way since then. I have never looked at any creature in the same way since then.

Trees – as Religious Architecture

It goes without saying that trees are essential to many architectural creations. Not only do they serve structural functions, but they are often also imbued with symbolic meaning as well. This is seen quite clearly in religious contexts. Examples are found around the world from ancient to present times. Shinto shrines, Egyptian and Greek temples, Celtic groves, the Lakota Sun Dance, Pacific Northwest coast totem poles, Buddhist stupas, and Christian churches – along with associated “Green Man” imagery – are briefly examined here as a sample of the great variety of places that exist.

We begin with Japan and Shinto beliefs. Some of the oldest Shinto shrines sites are groves or forested hillsides where rituals were performed in relation to kami. The idea, and thus the definition, of kami has changed over the millennia as influences from China, Korea, and India, among other places, participated in the shaping of Japanese thought on the subject. In general, however, kami can perhaps be best understood within a polytheistic context, where powerful spiritual forces are conceived as embodied through human, animal, tree, river, rock, wind, sun, or...
other natural forms. In early Shintoism trees themselves were shrines to kami. Later, human-built shrines were erected. The natural and the built overlapped in meaning. The same characters that today are interpreted as jinga, or shrine, were understood in ancient texts as kama-tsu-yahshiro, or mori, two terms meaning “kami grove.” Close relationships between trees and architecture are visible in the torii gates and in the cylindrical wooden columns supporting shrine floors and ridge poles. At Ise Shrine, unique in that it is rebuilt every twenty years, rituals pertaining to the protection, burial, re-use, and adornment of the heart-pillar (shin no mihashira) hearken back to early Shintoism.

Similarly, trees played functional and symbolic roles in Egyptian temples. Columns were shaped to reflect lotus, papyrus, and palms. These were intentionally suggestive of the connections between religious beliefs, the fertility of the land, and the well-being of people. Other columns were shaped to represent Osiris. In addition to vegetative abundance, the myths and rituals associated with him revolve around themes of death and resurrection. A link between religious belief and trees is also indicated by the story of how he was murdered, set adrift down the Nile in a sarcophagus, incorporated into a growing tree along the river’s banks, and installed within a temple as a pillar.

Greek temples also manifest relationships between trees, architecture, and belief. Doric columns are reminiscent of organic forms. Their girth, taper, and overall appearance is quite tree-like. Architectural historians point out that logs could have been easily sculpted into a series of planar surfaces amenable to fluting. Peg features, triglyphs at the end of what would have been beams, and mutules imitative of rafters all support claims of the column’s wooden derivation. A number of Doric traits were replicated in Ionic and Corinthian forms. Greek temple architecture also suggests the physical appearance of sacred groves. The manner in which temple space was divided into spaces was intended to mimic the sense of multiple spaces within groves.

Sacred groves were also central to Celtic traditions, found across a vast area spreading from Asia Minor through continental Western Europe and into Britain and Ireland. While beech and various conifers figured prominently in the rituals and beliefs of some groups, oak appears to have the most widespread symbolic significance. The word “Druid,” in fact, is closely associated with a Celtic term for oak. In some cases altars were constructed for use in these groves. Tree motifs are commonly carved upon them. Additionally, trees themselves served as religious architecture. Miranda Green, author of Symbol & Image in Celtic Religious Art, speaks of archeological finds in Germany at places like the Golerding and the Goldberg where a large tree-like pillar was set in the center of an enclosure. There are many instances in the archeological record where Celtic groups dug pits and left offerings in association with living trees and pillars.

Trees are important in Native American beliefs, and there are many circumstances where trees serve as architecture. It is not romantic to say that participation in traditional ceremonies helps root contemporary native peoples in their heritage. Trees can play very important roles. Lakota Sun Dance ceremonies, for instance, revolve around a central pole that is understood to be a sacred tree. It is ceremonially harvested from the forest and erected in the center of a Sun Dance site. Dancers attach themselves to the pole with long cords as they pray and engage in acts of self-sacrifice. As symbol, the sacred tree links the elements of the larger universe with the dancers, and through them to the entire community gathered for the ritual.

Totem poles are associated with native peoples of the Pacific Northwest, and are especially common in the coastal regions of British Columbia and southeastern Alaska. Coast Salish, Nuu-chah-nulth, Kwakiutl, Nuxalk, Tsimshian, Haida, and Tlingit are representative groups. Great diversity of language and religious practices exists among them. Diversity is found in the poles as well. Some serve memorial purposes, while others have mortuary uses. There are also frontal poles and house posts; both are incorporated into the structure of traditional homes. All poles are made of red cedar. Preferences for one or another type vary among groups. Carvings are not actually totems. Rather, they symbolize crests and signs of a given family or clan. Pole-raisings were, and today typically are, attended by the narration of stories, prayer, singing, drumming, dancing, feasting, and the gift exchange known as potlatching. In contemporary times a fifth type of pole – the commercial pole – is often carved for non-natives and erected in non-traditional settings. More important than merely generating revenue, these intentionally communicate the vitality of indigenous groups and indicate that their ties to the land remain.

Buddhist architecture, such as that found in stupas, also features a central pole with strong tree associations. Originally a type of pre-Buddhist Indian burial mound, stupas were tumuli with a wooden post in their center. The pole may have symbolized Aryan traditions where community leaders met under a tree for discussions, and it may have symbolized their beliefs about sacred or cosmic trees. In Hindu contexts, the tree and umbrellas under which royalty were shaded, and ideas of Mt. Meru, were all combined in stupa architecture. Buddhists adopted and embedded these notions into places like Sanchi, where a central axle-pole at the top of the stupa symbolizes the process of enlightenment. The vertically arranged series of disks on the pole represent levels of enlightenment; they are in essence stylized branches of the cosmic tree.

Tree motifs, some of which refer to a cosmic tree, are integral to the architecture of churches and cathedrals. Not only are representations of the Tree of Knowledge and the Fall highly significant, but in many places carved foliage and even the Green Man is seen. The Green Man appears in
church architecture as a male face encompassed by leaves. Sometimes leaves are shown sprouting from his mouth. Common across much of Western Europe, the Green Man evidently predates the spread of Christianity, and very well may have Celtic associations with fertility. The Church incorporated the Green Man as an expression of death and resurrection. In a similar way the cross, symbolizing resurrection and the promise of salvation, is often understood to be a tree or tree-like. One example is found in the architecture of St. Andrews in Ellensburg, Washington. On the interior wall behind the altar hangs a large wooden cross. Behind it a series of tightly clustered beams stretch toward the ceiling, spreading ever-further apart as they go. The overall effect is that of a tree emerging from the cross.

In the sites described here, as in many more from all around the world – Africa, Oceania, Australia, Europe, Asia, and the Americas – trees are a significant element of religious architecture. While the particular symbolic meaning of a tree or trees may differ from one culture to another, they are all reminders of the organic connection between humans and the world they inhabit.

Trees in Haitian Vodou

Vodou crystallized as a religion among African and African-descended slaves in the French colony of Saint-Domingue (1697–1804), whose massive sugar production made it Europe’s most lucrative colonial enterprise. With the most dynamic early Vodou communities springing up in settlements of escaped slaves from diverse African ethnic groups in the colony (which became the independent Republic of Haiti in 1804), since its inception the religion has demonstrated significant variety. Certain traditions are primarily ancestor cults, while others focus on particular spirits brought from West Africa or others revealed in the New World. Because of the clandestine and variegated nature of colonial-era Vodou, moreover, the religion has no founder, no unifying doctrine, and no formal organizational network. Neither any of these, nor a Vodou scripture, has ever developed.

Slaves brought to the colony were baptized Catholic upon arrival and given minimal religious instruction by Dominicans, Capuchins, and Jesuits. Syncretism thus immediately resulted, as slaves identified Catholic saints as new manifestations of African spirits, and adopted crosses, holy water, and incense as powerful religious trinkets to be used in conjunction with the amulets that they reconstructed from African religious memory. The Catholic “pantheon” – with its single high creator God, Virgin Mary, and host of dead individuals (the saints) who intervene in the world of the living – lent itself quite fluently to assimilation with the traditional African community of spiritual beings, which likewise has a single distant creator God (called Bondyè in Vodou) and numerous spirits and ancestors, who, much like the Catholic saints, are perceived of as accessible and with whom the greatest amount of human/divine commerce transpires.

Spirit possession and divination are the main forms of communication with the dead (*lemò*) and the spirits (*luaw yo*) in Vodou, and together form its ritual focus. Put simply, when our relationship with *lemò* and/or *luaw yo* is in harmony, life is full and pleasurable, whereas when this relationship is discordant, sickness, some other hardship, or even death may result. Upon the occurrence of such misfortune, ritual specialists (female: *manbo*; male: *oun- gang*) are consulted. Either through divination or the orchestration of ceremonies aiming to provoke spirit possession (which most often take place either in temples [ounfô], family burial compounds, or public cemeteries), the *manbo* or *oun- gang* effect communication with the *lemò* or *luaw yo* in order to discover the cause of the illness or discord and to determine a means of reestablishing harmony or effecting healing. Both the maintenance and the reconstitution of this harmony rely primarily on sacrifice in various forms, while healing often involves herbalism and ritual baths.

Haitian Vodou thus combines a variety of traditional African (e.g., Fon, Yoruba, and Kongo) and Catholic elements. While decidedly more akin in ritual and belief to African traditional religion than to Catholicism, Vodou is not an African religion but a product of the Haitian experience of and response to the social and natural worlds. Its understanding of nature is thus more rooted in
West African spirit and ancestor cults than in Catholic theology, which is especially reflected in the religion’s great reverence for trees and forests. In Vodou, spirits and the ancestors abide in nature. Together they are spoken of with great reverence for trees and forests. In Vodou, spirits and theology, which is especially reflected in the religion’s West African spirit and ancestor cults than in Catholic

preferred avenue of divine approach,” in Maya Deren’s terms, of the mysteries (myste yo), and, as in Africa, trees (called in Haitian Creole pyè bwa; lit.: “wood foot”) are among their most cherished homes.

Vodou is deeply rooted in and sensitive to nature, with many lwas being associated with natural phenomena. The serpent-rainbow Iwa Dambalah Wedo, for example, lives in waterfalls, while other spirits are embodied by natural forces, such as Ogun, the lwa of the iron. The dead are likewise deeply enmeshed in nature and conceived of as residing either under the ground, across the water, or in the forest. Trees and the forest, though increasingly scarce in the impoverished nation, have thus always featured prominently in Haitian Vodou’s rich symbolism and mythology.

Trees gain their great religious significance in Vodou for a number of reasons, such as being the source of sacred drums and the gourd out of which is made the Vodou priest’s sacred rattle (asson). The most important reason is that trees are believed to be the residence and the “preferred avenue of divine approach,” in Maya Deren’s terms, of the lwas. Because of this, certain species of trees considered especially sacred are planted around Vodou temples, or temple sites are determined by the presence of such trees. These trees, called in French arbres-reposoirs (lit.: resting-place trees; altar trees), are recognizable by the straw sacks and strips of cloth that often hang on their branches. Since the lwas are thus considered to live in these trees, the arbres-reposoirs are themselves rendered cult in Vodou, and thus the straw sacks sometimes contain offerings for these trees and/or the spirits who reside in them, candles are lighted at their trunks, and pottery is broken against them. As the home of the lwas, these sacred trees are also addressed by candidates during initiation ceremonies: 95 percent of the country’s forest has been lost, and each year 15,000 acres of fertile topsoil is washed away as a result. With an annual per capita income of roughly $250, Haitian peasants cut trees for charcoal as a means of income, while electricity-deprived urban Haitians also rely on charcoal for cooking. The result is desertification and a litany of related ecological problems. Thanks to Vodou, at least, in some of the countries most desertified regions there are at least a few mapou trees and arbres-reposoirs that remain standing.

Apart from the arctic prairies and deserts on the northern fringes, Europe is a continent of trees. The dark, evergreen conifers of spruce and fir characterize the northernmost part, the light conifers with its larches and pines are to be found where the sunlight is more generous the year around. The forests reign in Middle Europe where the seasons are even and the rainfall bountiful. The deciduous forests, with their oaks and beeches, show much more diversity of trees than the boreal conifers.

The Teutonic, Celtic, Baltic and Slavic tribes who inhabited Northern and Middle Europe from at least 900 B.C.E. were of Indo-European origin, akin to tribes in Southern Europe. Their languages were and are related, and many of the surviving myths and legends are similar. The Finnish-Ugrians who inhabited the northeast of Europe form a special group within the family of European cultures. The religious history of the continent is multilayered and complex, because the settlements of the ancient tribes were scattered or they were nomadic, and their ideas diverse. Moreover, the extant sources of information are often colored by the worldviews of the commentators.

Julius Caesar described the religious, sacrificial practices of the Druids, the religious class of the Celts, in his Gallic Wars (VI.13, composed ca. 50 B.C.E.). Caesar pictured the Druids weaving immense figures out of twigs, which were filled with living people and set on fire. The funeral rites, according to Caesar, were also connected with great bonfires. A century later, Pliny the Elder spoke in his Natural History about the Druids as the “people of the oak,” a name derived from the Greek “drouios” which means “oaken” or “from the oak,” and stated that their magic potions consisted primarily of oak-bark (XVI). Pliny also described the sacredness of the mistletoe for the Druids. According to Pliny, mistletoe grows rarely on a hard oak, and when it occurs, it is collected with a great ceremony, which takes place around the oak tree.

According to Edda (a collection of poetry from ca. 300–800 and preserved in fourteenth-century Icelandic manuscripts), the mythical tree of Nordic mythology is the Ash of Yggdrasill, the largest tree in the world, stretching its branches over the skies. Yggdrasill has three roots and each is stretched over a well. The first root is in heaven, over a well where the gods have their sanctuary. Three Fates who represent past, present, and future guard the well and decide the fate of humans. Human ancestry is thought to have come from the twigs of Ash and Elm that floated to shore and were given spirit, breath, and life. The second root reaches over a well filled with water of wisdom, where the primal, yawning void of the Nordic creation story used to be. In exchange for the water in the well, Odin had to be hanged on the tree for nine nights. The name of the tree means “the stallion of Odin” (one of Odin’s names is Ygg) and is derived from this ordeal. The third root ranges over hot-spring Hvergelmir, filled with snakes. Yggdrasill constantly suffers a great hardship, as four stags bite the trunk from above, and below the snakes gnaw its root. The Fates wash the tree every day with white clay, which keeps Yggdrasill green, in this balance of destruction and preservation, until the day of doom.

The hanging of Odin may bear shamanistic traits of connections with and travel to the underworld and point to an influence from the Finnish-Ugrians on the Teutonics. Kalevala (the epic poem of the Finns, collected in 1835–1849), tells the story of Väinämöinen, who goes to the underworld in search of a magic formula which he needs to finish his oak-boat. He walks for three weeks, through a stand of saplings, bird-cherry and, at last, through junipers (Poem 16). In the end he meets the giant Vipunen (Poem 17), who is fast asleep under the ground. An aspen grows on his shoulders, birch from the brows, alders spread from the jaws, willows from the beard, firs from the forehead, and the pines from the teeth. Väinämöinen is swallowed by Vipunen, but the former tortures the tree-monster from within the belly until Vipunen sings the magic rhyme of the creation of the world.

Bonaventure (1217–1274) was a Franciscan teacher at the University of Paris. His book, The Tree of Life, is an important Christian source on trees and spirituality in medieval Europe. The Tree of Life is based on tree metaphors in the Bible, framed by the trees of the first and the last books of the Bible, the trees of knowledge and life in Eden and Revelation 22. The tree of Revelation bears twelve kinds of fruits and the leaves of the trees are for the healing of the nations. For Bonaventure the twelve fruits are symbols of twelve virtues, which all show aspects of the life and ministry of Jesus as described in the gospels. According to Bonaventure, one can avoid the fallacy of Adam, who chose the tree of knowledge instead of the tree of life, by meditating on the fruits of the tree of life in Revelation, each of which symbolizes the life of Jesus from his conception in eternity to resurrection. The goal of meditating on the tree and its fruit is to be one with the body of Christ in ecstatic unity.

The popularity of The Tree of Life, miracle plays, and old Roman traditions of using evergreens as decorations, may have inspired the Christmas tree. This tradition became popular in Germany after the Reformation, especially at the end of the eighteenth century. It was expanded to Britain, America, and throughout the world in the nineteenth century, under the strong influence of Victorian family values, where the tree became the center of family and home rituals during Christmas. The tradition of celebrating spring with a dance around the maypole in Northern Europe is another example of a European tree ritual.

Trees – Sacred

A tree is a tall, single-stemmed, woody plant which bears branches some distance from the ground. Trees are the oldest and largest living organisms on planet Earth. The bristle cone pine (*Pinus longaeva*) in the White Mountains of California can live to be over 4000 years old. The species with the largest individual trees is the giant sequoia (*Sequoiadendron giganteum*), averaging at maturity 300 feet tall and 15 feet in diameter.

In many ways trees are a primary source for life on our apparently unique planet Earth. A leaf is a miniature food-making factory – sunlight, air, and water interact with chlorophyll cells in the leaf through photosynthesis and with nutrients from the soil to produce food which allows the tree to grow. In turn, the tree produces food and shelter for other plants (epiphytes), animals, fungi, and microorganisms that visit or reside somewhere on it. Trees influence other life far more than any other kind of plant by their wood, leaves, and fruit, as well as by the special kinds of environments they create (shelter, shade, microclimatic zones).

For humans, trees provide oxygen, food, fuel, building and craft materials, paper products, shade, and soil erosion and flood control. The monetary value of the environmental services provided by a single tree that lives for fifty years has been calculated at nearly $200,000.

There are also whole cultures, sub-cultures, industries, and occupations focused on trees of a particular kind such as logging redwoods (*Sequoia sempervirens* and *Sequoia-dendron giganteum*) in the Pacific coast forests of the northwest United States; maple sugar (*Acer spp.*) in New England; rubber trees (*Hevea brasiliensis*) in the Amazon and rubber tree plantations in South and Southeast Asia; mulberry (*Morus alba*) for the cultivation of silk worms in China; olive (*Olea europaea*) in the Mediterranean and Middle East; and coconut (*Cocos nucifera*) in the Pacific islands and other tropical areas. In addition, special arts have developed around trees like topiary, tree sculpturing in eighteenth-century England, and bonsai, the cultivation of miniature or dwarf trees in Japan. Trees can have physiological and psychological impacts on individual humans as well, such as relaxing heart rate, blood pressure, and brain waves. Research has shown that hospital patients recover faster than otherwise if they can see a tree outside their window.

From observations such as the above it is little wonder that trees may also be considered sacred. The common characteristics of sacred trees are described by Nathaniel Altman:

A tree becomes sacred through recognition of the power that it expresses. This power may be manifested as the food, shelter, fuel, materials used to build boats, or medicine that the tree provides. How a tree is used will vary according to geography, species of tree, and the particular needs (and ingenuity) of the human culture involved. Sacred trees have also provided beauty, hope, comfort, and inspiration, nurturing and healing the mental, emotional, and spiritual levels of our being. They are symbols of life, abundance, creativity, generosity, permanence, energy, and strength (1994: 9).

I first discovered the existence of sacred trees while conducting field research in Thailand. From Bangkok to the remotest rural villages, one often sees colorful cloth wrapped around the lower trunk of a tree. A small spirit house with offerings such as candles, incense, food, and water may be placed near the base of the tree. Local people believe that the tree is the residence of a spirit. Anyone who harms such a tree might experience misfortune, sickness, or even death as the spirit takes revenge. Consequently, because of their special status sacred trees are usually protected in effect.

Sacred trees are usually extraordinary in age, size, shape, or some other attribute. For example, in one village in Thailand that I visited, a giant ironwood tree or Malacca teak (*Afzelia bakeri*) is considered sacred. Its secretions resemble blood. Also residents in the area mentioned that twice lightning struck and burned other trees nearby, but did not touch this tree because of its extraordinary power. In addition, some residents have seen an unusual light near the tree in the early evening.

Certain species of trees are sacred because of their
relation to a religion. The banyan (Ficus bengalensis) and bodhi (F. religiosa) have been associated with Buddhism since its inception. The Buddha is believed to have been previously incarnated as a tree spirit and later during his reincarnation in human form he reached enlightenment under a bodhi. Also in Hinduism the bodhi is supposed to be the home of the gods Krishna, Brahma, Vishnu, and Shiva. Thus, the bodhi is the most sacred of trees for both Hindus and Buddhists, and this is reflected in its species name. The banyan tree is also considered sacred by Hindus. Moreover, in the Buddhist country of Bhutan, it is actually illegal to cut down any living tree.

In many Asian countries, some monks wander in forests where they shelter and meditate under trees, emulating the life and teachings of the Buddha. Furthermore, in Thailand, a number of monks have symbolically ordained trees by ceremonially wrapping the saffron robes around giants in the forest to protect them from loggers. By mere association, the surrounding trees may also be protected. Tree ordination as a conservation technique has usually proven successful in Thailand.

Throughout the world, diverse cultures recognize sacred trees. For instance, the Celts, Druids and many other tribes in ancient Europe venerated single trees, groves, and forests, especially of oak (Quercus spp.). Oaks seem more prone to being struck by lightning than other tree species, and this may have contributed to their sacred status. Oak and spruce (Picea spp.) were of special significance in ancient Germanic rituals, and this is the origin of the modern tradition of the Christmas tree. Yew trees (Taxus spp.) were especially important in ancient Britain, and churchyards were built around or close to them. To this day there are several hundred shrines throughout Europe associated with individual trees.

In the United States, the Mormon religious faith was born near the town of Palmyra in New York. There today it is still possible to visit the Sacred Grove where the Mormon prophet Joseph Smith first had divine visions. Also in the United States and elsewhere, some families plant trees as a living memorial when a relative or friend dies. A tree that survived the bombing of the federal building in Oklahoma City became a symbol of renewal and a sacred tree of sorts.

At first glance a single sacred tree may not appear to have much if any significance for environmental and biodiversity conservation. However, a single tree is part of a hierarchy of progressively larger ecological systems. A large tree can host dozens or more of other species such as lianas (vines), epiphytes, mosses, and fungi. In turn there may be dozens to hundreds of species of resident and transient animals. Millions of microorganisms may also inhabit a single tree. Interacting with these species are others as predators, parasites, competitors, and so on. In addition, birds, bats, insects, and other animals pollinate flowers of the tree and those of other members of its species in the surrounding environment. Such animals may eat fruit from the tree and disperse the seeds elsewhere, thereby stimulating growth of other individuals of that species. In such ways, diverse animals link individual trees of the same species into wider networks of reproduction and production.

A large tree also creates microclimates and microenvironments for plants, mosses, fungi, and other organisms which grow on its leaves, branches, trunk, and roots as well as on the adjacent ground. The leaf-fall and other litter from the tree yields nutrients for plants and animals below on the ground through decomposition by decomposer species. A large tree may also act like a water pump, its deeper tap roots pulling water toward the surface. Some of this water may become available for surrounding plants as well. The roots of the tree may pump nutrients to the surface too. Acting something like a sponge, the tree captures and slowly releases some rainwater which might otherwise contribute to more soil erosion. Thus, trees are a very important component of the composition, structure, and function of many ecosystems.

From this systems perspective a single tree can contribute to environmental and biodiversity conservation. When a large tree is considered sacred, and thus afforded special protection from harm, it may help conserve a multitude of other species and their symbiotic relationships as well as specific microclimates, microenvironments, soil, and water resources. Of course, these manifold ecological functions of a single tree are multiplied many times over in groves and forests which are even more important for conservation.

If more people appreciated the numerous diverse meanings and significances of trees, then they might appreciate even more the groves and forests, and consequently be more concerned about their wise use and conservation.

The Trickster

The trickster is a virtually universal figure in world mythology, especially that of hunter-gatherers, on whose mythological landscape he holds center stage. Trickery and deceit, frequently exercised in the form of coarse and hurtful practical jokes on a duped party, and excessive biological drives, are the trickster's characteristic traits. He is usually a solitary figure who roams the landscape, playing pranks and getting into scrapes, as his deceit and cunning (due to the stupidity with which they are usually performed) may backfire on him. In the context of his prankish and foolish antics, he may, more or less inadvertently and haphazardly, find himself in the role of culture hero and transformer, bringing such things as fire, cooking, curing, weapons, carnal knowledge, conception by sex and painful childbirth, death to humans, setting the cycles, that provide entertainment to an audience both of misadventures and the follies of humans and – as is the trickster's wont – “laughing at their harm.” He delighted in watching the maidens of the villagery.

As is evident from this brief and quite incomplete survey of the world’s rogues’ gallery of tricksters, we have here a figure of great diversity and complexity. In his role and being, the trickster is an ambiguous blend of things: prankster-protagonist, culture hero and transformer and, in some instances, also god. Ambiguity is evident also in his ontological make-up, which is that either of an animal – usually one sly, agile and elusive – or of a human. However, neither guise is unequivocally “animalian” or humanoid. As animal – Coyote, Spider, Mantis, Hare, Raven – trickster, the storytellers insist, is also “a person.” As for the humanoid tricksters, these figures may be of missshapen bizarre appearance, such as the Nharo Bushmen’s Pate, a one-legged manikin who was covered with cocoon fibers and had big toes sticking out from all over his body, or the Canadian Micmac’s Kuloscap, who was a giant. Humanoid tricksters may have trouble with their limbs and body parts, which may work at cross-purposes.
The Trickster

with each other or may become unfastened from their owner's body, running off on their own. The body parts that are especially active in the trickster are those that contain orifices, especially those of the alimentary canal and nether regions; they – anus, penis, along with buttocks, testicles, and entrails – may sever themselves, to fly off on some mischievous pranks that blend scatology with lasciviousness (two examples of tricksters with such errant body parts are Wakdjunkaga and Kauha, of Winnebago and !Kung folklore). In refastening themselves to his body, the trickster's parts may be haphazardly reordered, such that his head may be fastened to his bottom or his penis to his back. His anatomy is thus quite fluid and unstable; its inconstancy is heightened whenever he undergoes one of his shape-shifting transformations to animal, tree, rock, or water body. The trickster delights in transformation, both of himself and of beings and states around him; as a result, he and the world around him are a-quiver with inchoate, liminal ambiguity.

Ambiguity also marks the trickster's sexual and social disposition. While usually male – with often voracious heterosexual appetites – he may also assume a female guise, usually in the context of some sexual escapade. While generally solitary, the trickster may wander with a companion, who may be the butt of his pranks, or who may turn tables on the trickster and outwit him; the classic example is Coyote and Wolf (or, in the southern African variant, Jackal and Hyena). In Amazonia, the trickster may be one of a pair of mythical twins, while the Chippewa Wenebojo's sibling companion was Nekajiweizik – one of his two younger brothers (after he had killed the second brother). Some tricksters – such as the /Xam and !Kung Bushmen /Kaggen and Kaoxa (or Kauha) – have wives and live in extended families, permanently or for a while. The family members provide a foil to the trickster's moral and social failings, of food greed, failure to share or provide properly, sexual lusts and jealousies (frequently incestuous in bent), which all conspire against the trickster's ever being a solid family man.

While the moral qualities of this vindictive and destructive prankster and boaster, vulgarian and libertine, may seem to be unequivocal, once again we note ambiguity. The trickster may also be seen in the role of Heilbringer, extending help, generosity, compassion and protection to those he deals with, especially weak or oppressed beings who are threatened by danger or monsters. An example is the Athapaskan-speaking Tagish people's “Smart Beaver” who, in a cycle of myths that chronicle his heroic voyage down what is probably the Yukon river, “cleaned out” all the giants and animals (and scaled down the latter to their current size, as well as changing their diet to foods that excluded human flesh).

The ambiguity that surrounds the trickster also has a temporal dimension. While his world is usually the inchoate, mythic age back in the mythological past, he may also enter the historic and recent past; thus, we find the Khoisan tricksters Heiseb or Jackal roaming the farms of the pioneer trek Boers and working for, and duping the baas, or the Zande Tore, who was arrested by the British colonists who, among other things, taught him to drive an automobile. Life and death are poles that the trickster conforms as well. Many a tale tells of his death or murder, sometimes in a gruesome manner, through burning, drowning, dismembering, being devoured and swallowed up, only to be revivified anew (or revivifying himself). He may do so by healing himself, as did the !Kung trickster Kauha (introducing thereby the trance curing dance to humankind).

The fact that this being, of deceit, moral turpitude and stupidity, may also be a being that is god-like in his power and acts, and the reverential attitudes he may invoke in the people, who, at other times, would laugh at his antics and express outrage at his moral perversities, is perhaps the most striking manifestation of the ambiguity that envelop the trickster figure. Among the Navaho, Coyote was both a holy being and a buffoon, and to the Bushmen, the tricksters /Kaggen or /Gäwa were, in addition to pranksters and vulgarian, both also gods, who protected game animals and were a numinous presence at initiation and curing rites. Among some of the Bushman groups, the curing shaman had to seek out the help of trickster god, who was a bit of a curer himself, when he went on his trance-induced outer-body, spirit journeys. As among the North American Indians, there is a similarity between some of a trickster's exploits and adventures and shamans' journeys to the spirit world.

Combining in his being the traits of animal, human and god, the trickster points out the unity of such universally separated realms as culture and nature, sacred and profane, natural and supernatural. Among hunter-gatherers, whose trickster figure is especially prominent, well delineated and universal, and whose guise is usually animalian – yet, at the same time also human – the inseparableness of nature and culture is perhaps the main symbolic message of the trickster. That humans and animals are kindred beings, that the ontological and conceptual boundaries that separate them are fluid or even illusory, is a message that resonates with the lifeways and worldviews of hunter-gatherers, which are embedded within nature. Among other societies, with states and food production and complex pantheons and charter myths, the trickster is more likely to be a god – such as Loki, Hermes, Legba, or Maui, respectively of the Scandinavians, Greeks, West Africans and Polynesian – with his own divine profile and purpose, as creator or destroyer, demiurge, messenger, translator, diviner, protector or fertility god. Through the constraints of his human and animal side, such a trickster-god displays a sacred quality that is different from that of other gods. It is a sacrality that is both more and less accessible than that of the other divine mortals. Through
his foolishness and carnality, his lies and moral failings, he is akin to mortals and their own follies and failings. Yet the trickster-god is capable also of dumbfounding the gods, of stealing from them, outsmarting and out-talking them, through witty double-talk that contains depth of wisdom that may surpass their own divine understanding.

As a wanderer, an outsider, a “marginal man,” the trickster, in each of the places and domains he enters, causes both havoc and consternation. The reason is that he shocks its inhabitants – humans, animals, gods – into recognizing the relativity and fragility of the world of order and structure they have created for themselves and live by unself-consciously. Puck’s exclamation – “Lord, what fools these mortals be” – is the message of the trickster everywhere, presented by the outsider looking in on the insiders’ ways of doing things, living their lives, thinking their thoughts, which to him, the outsider, seem antic and contestable. In upsetting and challenging them, he reminds humans – or gods, or animal-humans of the mythic age – of the arbitrariness and limitations of a set and seemingly given cultural, sacral and biological order. As such, the trickster becomes an agent of creativity who challenges a culture’s monocultural ways and univocal thoughts; he brings a “more than this” dimensionality to existence, alerting humans to the “unquenchable fecundity of all that truly is and can be” (Hynes 1993: 212, 216).

Tukanoan Indians (Northwest Amazonia)
The Tukanoan Indians form a linguistic macro-unit divided into two geographically separated populations in Northwest Amazonia, the Western and Eastern Tukanoans. Straddling the borders between Colombia, Ecuador and Peru, the Western Tukanoans (including principally the Secoya, May Huna, Siona and the Koreguaje ethnic groups) comprise some 1500 individuals living on the upper Putumayo and Caquetá rivers and the lower Napo river. The considerably larger population of Eastern Tukanoans, amounting to some 20,000 people, inhabit the Vaupés and Apaporis drainages in the Colombian Amazon and the upper Rio Negro region of Eastern Brazil. Though related closely linguistically, the two populations are socially and culturally distinct.

The habitat of the Eastern Tukanoan Indians (henceforth Tukanoans) is interfluvial (terra firme) tropical lowland forest. The Vaupés region is ecologically described as a blackwater ecosystem with nutrient poor soils and rivers (Moran 1993). Biological diversity is high while the productivity of terrestrial and riverine fauna is low, even by Amazonian standards. In these harsh surroundings the native populations make a satisfying living by means of shifting cultivation (bitter manioc being the staple), fishing, hunting and gathering. Population density is low, and settlements widely dispersed along rivers and streams. The traditional settlement is the multifamily longhouse or maloca comprising a patrilineally extended family. Today settlements are increasingly concentrated around schools, shops and other facilities, and the traditional maloca is largely replaced by smaller, single-family houses grouped into villages. Though the traditional livelihood system still provides the basis for sustenance, petty trade, mining and contract labor are increasingly important in the local economy.

The Tukanoan social universe is composed of some twenty named exogamous groups (including the Tukanop proper, the Desana, Cubeo, Wananao, Bara, Barasana and Makuna), each identified with a distinct language and a proper river territory. Each group reckons descent in the male line from a putative, mythical ancestor, conceived of as an Anaconda. The exogamous group also holds what may be described as corporate sacred property, including tangible ritual goods (musical instruments and dance ornaments), sacred substances (blessed coca, tobacco, red
Tukanoan Indians

paint and beeswax), and intangible, spiritual wealth, such as chants, songs and a specific set of personal names which circulate among its members in alternate generations. The most important material symbol of the group is the set of sacred palm-wood flutes, the Yurupary instruments, which are said to embody the ancestors. This sacred property is described as the “weapons” and “defenses” of the group.

Different exogamous groups relate to each other as putative kin (between which marriage is avoided) or affines (between which marriage is prescribed). Tukanoan society is economically undifferentiated, and there is little evidence of political cohesion beyond the local group of adjacent settlements. Leadership is confined to settlement headmen and occasional charismatic local leaders. However, this equality in the economic and political field goes with a conspicuous differentiation in the religious and ritual domain. Shamans and other ritual specialists (dancers and chanters) of varying and complementary skills play an important role in society. Large-scale public rituals are frequent and considered essential for survival and prosperity.

Tukanoan religion is conveniently described under three general headings: the Yurupary cult, animism and shamanism. Of these, the Yurupary cult does not (and probably never did) form part of the Western Tukanoan religious universe, while the essential features of animism and shamanism appear to apply to both the Eastern and Western groups.

Environmental understanding is constitutive of Tukanoan religion. Social and religious imagery draws on, and is fundamentally inspired by, indigenous knowledge of biological and ecological processes. The Tukanoan environmental understanding is encoded in an animistic ontology-cosmology. Animism, as understood here, implies a fundamentally monistic, participatory orientation to the world, transcending the Western ontological divide between nature and culture, the animate and the inanimate. The human–environment relationship is one of relatedness, inter-subjectivity and inter-agentivity; it is fundamentally social and dialogical in nature. This is the ontological basis for Tukanoan shamanism.

It can be argued that such a participatory stance is conducive to environmental sustainability and the conservation of biological diversity. The traditional Tukanoan notion of reciprocity, which guides their interaction with the environment, and the mythologically grounded ritual regulation of resource use, provide strong behavioral sanctions against the overexploitation of forest and river resources. In the Tukanoan view, human life is ultimately geared toward the overall goal of sustaining the cosmos. This life-sustaining responsibility is epitomized in the role of the shaman. Fundamentally concerned with human survival and the continuous fertility of nature, shamanism is the dominant mode of religious practice among the Tukanoan Indians.

The Yurupary Cult

The Yurupary cult is the fullest expression of (Eastern) Tukanoan religious life. Misunderstood as a “devil’s cult” by early missionaries, the Yurupary complex involves the ritual use and display of sacred palm-wood flutes and trumpets (the Yurupary instruments) representing the defied ancestors of the clan and exogamous group. The cult, which is common to the Tukanoan and Arrawakan groups of the Vaupes-Icana region of Northwest Amazonia, has therefore been described as an ancestor cult with features of a male secret cult. The Yurupary instruments are handled by adult men only, and the ritual display of the most sacred instruments is the key event in the process of male initiation. The Yurupary complex is thus intimately connected to the patrilineal descent system – the establishment of gender difference and the formation of male personhood and collective identity. However, beyond their patrilineal connotations, the sacred instruments are associated with the fertility of nature and the regeneration of life at large. The ancestors, embodied in the Yurupary instruments, are the generative source of all life.

There are two types of Yurupary rituals: the principal ritual, involving the display of the most ancient and sacred instruments, and the Tree Fruit ritual. The latter is a weaker version of the main ritual, involving less sacred instruments and the ritual redistribution of forest fruits. The main ritual, which does not feature any ritual redistribution of fruits, is held at the beginning of the rainy season, which is also the season of the ripening of the wild forest fruits. In Tukanoan thinking, this is the beginning of the annual cycle. The Yurupary ritual heralds the new year, and is seen as instrumental in bringing about the renewal of nature and the spiritual revitalization of the community.

Just as it inaugurates the annual cycle, the Yurupary ritual initiates male adulthood and conveys full membership in the descent group. As the key event in the male initiation process, it marks a new stage in the life cycle of men. Indeed, the annual ritual cycle, beginning with the Yurupary ritual and ending with the Peach Palm festival, a food feast celebrating the peach palm harvest and the final departure of the recently dead, symbolically reproduces the male life cycle from initiation to death. Also pubescent women are ritually initiated. However, in contrast to the male ritual, which is a collective and public affair, female initiation is a private and discrete event following upon first menstruation.

At male initiation, a group of pubescent boys are made to see the Yurupary instruments. Under the effect of hallucinogenic yané (Banisteriopsis sp.), and supervised by elders and the officiating shaman, the initiates are brought
into direct contact with the ancestors (in the form of the sacred instruments). Women and children are excluded from the central events of the ritual. The ritual sequence follows the familiar pattern of a passage ritual: the initiates are symbolically killed (immersed in a cold forest stream) at the eve of the ritual, and brought back to life as new-born beings at the end (as they are again made to immerse themselves in the river, now together with the instruments, and subsequently led back into the house). At the height of the ritual, the initiates sit in fetal position inside the house, as the instruments are played over their heads and motionless bodies. Thus, they are impregnated with the vital force of the living ancestors. The boys are then whipped to become hard and strong. The Yurupary instruments are imaged as fierce predators (jaguars and anacondas), swallowing and regurgitating the initiates and thereby reconstituting them as full social and spiritual beings. Infused with regenerative, patrilineal essence, the pubescent boys are reborn as fertile, adult men.

**Animism**

Tukanoans inhabit an animated landscape where everything created has the capacity to become alive and to actively intervene in the course of events. Hills, mountains, rocks and rivers are infused with the forces of creation; they are seen as consubstantial with the creators and incorporate their powers. Every place and feature of the landscape has a name and tells a story about the deeds of the ancestors. These mythical events, encoded in names and places, confer particular powers to the local landscape. The beings – plants, fishes, land animals and humans – inhabiting this empowered landscape share in its potency; they are charged with creative as well as destructive powers which must be ritually handled to ensure human survival and well-being. Everything made and crafted from natural materials is also believed to contain this ancestral potency; baskets, tools and weapons, houses and canoes situationally obtain agency and become alive. Objects are fundamentally subjects; subjectivity is their natural condition. Crafted things are thus doubly potent; they contain not only the powers of the materials from which they were made but also the agency and creative intentionality of their makers.

In Tukanoan metaphysical discourse, nonhuman animals and plants are generally described as “people” or “humans.” The term, which in ordinary discourse is used to denote an (unspecified) exogamous group and to distinguish human beings from other living kinds, is thus contextually expanded to include all living kinds. In the religious ontology of Tukanoan peoples there is no absolute distinction between human and nonhuman beings. Social groups and natural species are categorically fused; exogamous groups are natural kinds, and different species are “distinct peoples.” Nonhuman animals and plants are attributed with human agency, will and intention. Animals and plants have houses, are organized into communities, have headmen and ritual specialists. Game animals, in particular, are said to live like human beings: they cultivate the land, harvest their crop and prepare their food, make their proper ritual dances and drink their beer. They have their own ritual attire and, most significantly, their proper Yurupary instruments. Like all people, they have “culture.” Humanity, the human life form, is the model for all living kinds. Culture is what all mortal beings, human and non-human, have in common.

What distinguish different species or “peoples” from one another are their distinctive “bodies,” their shape, coloring, sound and corporeal habits which are all associated with their different mythical origins and the specific metaphysical roles assigned to them in the cosmic scheme of things. In the case of animal species, difference is conceived of in “cultural” terms – as distinctive “clothing,” body paint, language, food habits and ritual property (“weapons” and “defenses”). Natural differences are, as it were, culturalized. Conversely, in the case of humans, cultural difference is essentialized and naturalized: differences in language, food habits and ritual goods are perceived as natural – innate and corporeal, constitutive of group identity. To Tukanoans, culture is nature – timeless and unchanging, created along with the rest of nature and handed down to present generations from the first ancestors.

A wholly socialized or humanized cosmos such as that of the Tukanoans, in which the Western nature–culture divide is abolished and where all beings and things are construed as actual or potential subjects-persons, is conveniently called animistic. Animism, in this precise (and revised) sense, refers to a participatory (monistic) type of ontology which is extremely widespread among indigenous peoples around the world, and one which is fundamentally distinct from, or opposed to, the naturalistic (dualistic) ontology characteristic of Western modernity.

**Shamanism**

Tukanoan social and religious practice is situated in this ontological-cosmological space. Survival, reproduction and the pursuit of well-being take place in a perceived reality where every life form (species) is seen as a “people,” and every being a person – a sentient, intelligent subject. Natural objects, artifacts and features of the landscape have a subjective side and, thus, a potential for intentionality and agency. What is generally referred to as shamanism should be understood against this animistic background. Tukanoan shamans, invariably male, are part-time ritual specialists possessing expert knowledge of the ultimate powers. Their function is to mediate between humanity and the nonhuman agencies that surround them in order to make human life possible and to oversee the proper working of the cosmos.

Shamanic knowledge is essential for making a living in
Tukanoan Indians

1668

this animated world, made possible by the creative and destructive powers of the ancestral beings. By shamanic means – incantations, spells and blessings – the world is made safe, food is blessed and human beings protected from spiritual dangers. Shamans are, quite literally, gods on Earth; they cure and prevent disease, but may also send sickness and death; they supervise and metaphysically control the events at birth, initiation and death, literally constructing, deconstructing and reconstructing human persons; they ensure, by ritual means, the continuing fertility of nature and, thus, the availability of game and fish for human consumption; and they transform beings of nature (game, fish and forest fruits) from potentially perilous subjects and vehicles of death and disease to life-giving and strengthening food (Arhem 1996).

Tukanoans distinguish between two kinds of shamans, one intimately associated with curing but also with causing death and disease, the other associated with protective, preventive and life-sustaining shamanism in connection with life-cycle rituals and public rituals more generally (Hugh-Jones 1996). The former, usually referred to as payé in the literature, is feared and perceived as a morally ambiguous figure of comparatively low social status. The source of his power is highly inspirational and idiosyncratic. As curer and sorcerer, he operates as an individual, often at the margins of society. In many respects he is the prototypical shaman.

The other, life-sustaining and protective shaman, by contrast, has attributes usually associated with priesthood: his role is entirely benevolent and thoroughly social. Directed toward the good of the community, the life-sustaining shaman is morally unambiguous. Consequently, his social standing is high, usually merging secular and ritual authority. The source of his authority is his knowledge of the mythical canon of the group. The officiant is usually interpreted as a senior patrilineal relative and invariably involves many years of apprenticeship, from initiation to mature age. Recognition as a true life-sustaining shaman comes only with advanced age and demonstrated expertise.

All initiated, mature men are attributed with some amount of shamanic knowledge. All men know how to bless food and, thus, to render it safe for consumption, and all men are capable of sustaining themselves in the local environment: they know the spiritual dangers and assets of their territory and the ritual acts that necessarily accompany the everyday chores in the forest and on the river. However, only the curing shaman is capable of treating the seriously ill, and only the life-sustaining shaman possesses the expertise to direct the major life-cycle rituals and the public ritual events aimed at ensuring the fecundity in nature.

Yet, even among the shamans, knowledge and skills are differentiated and graded. Thus, only the most reputed and knowledgeable of life-sustaining shamans are entrusted with the supervision of the annual Yurupary ritual, when the ancestors come alive and enter into direct contact with the living community members. At this ritual, the officiating shaman turn into a primordial being himself; he embodies the Yurupary, the omnipotent Ancestor-Creator. Among the Makuna, one of the Tukanoan groups in the Pirá-Paraná region of the Colombian Amazon, the principal Yurupary is identified as the Ancestral Bumble-Bee, the Primordial Pollinator. The imagery is revealing: feeding on flowery plants, the Pollinator enables the plants to reproduce and multiply. Impersonating the Primordial Pollinator, the shaman fecundates nature and renews the world.

In the 1970s and 1980s, the indigenous population in the Vaupés region was heavily affected, in close succession, by the booming Colombian coca trade and the Amazonian gold rush. Both events implied dramatic upheavals in the regional economy. For many indigenous communities they provided much needed cash income but also caused social disruptions and local environmental depletion. Nevertheless, the Eastern Tukanoan homeland has, on the whole, been spared large-scale forest destruction and settler penetration. In 1982, the main part of the Colombian Vaupés (some 3.5 million hectares) was declared Protected Indigenous Land (resguardo). Within this legal framework, Tukanoan Indians have largely been successful in defending their heritage and homeland against external intrusion. Indigenous interests have been effectively promoted by the Regional Indigenous Organization (CRIVA), founded in 1973, and by its several local offshoots.

Missionary influence is strong along major waterways and in the vicinity of frontier towns and trading settlements. In more remote areas, however, indigenous beliefs and practices remain strong. Partly in response to the threats posed by the cocaine boom and the subsequent gold rush, partly as a result of the activities of the regional indigenous movement, there are today signs of indigenous cultural revival in the region (Arhem 1998b). Traditional rituals are performed with renewed vigor, and shamans and other local authorities are assuming a new role in the emerging Tukanoan leadership, now efficiently interacting with state institutions, the church, and pro-indigenous international organizations.

U'wa Indians (Colombia)

The U’wa Indians live on the slopes of the Andes in northeastern Colombia, along the eastern side of the range called Sierra Nevada del Cocuy. Brutally reduced in numbers and in territory by the Spanish conquest, the U’wa remained somewhat isolated in the Andes until the 1940s and 1950s when a road was constructed by the government opening their lands to white peasants and to Catholic mission settlements. At the turn of the twenty-first century the U’wa numbered about 5000, and the Colombian government acknowledged only a small portion of their original territory. Much of this land has been affected by ongoing civil war, by illegal drug trafficking, and by the government’s policy of promoting oil exploitation. A large number of U’wa, and the governing authority of the tribe itself, adhere to their traditional ways while they struggle to keep these outside forces from invading their culture. Their struggle is carried on by political and legal means, but at bottom it is a religious one, for the U’wa world is essentially constructed of spiritual beliefs.

The U’wa believe that they are descended from deities of an upper world and a lower world. They occupy a middle world that is delicately balanced between the upper and lower worlds, and believe it is their duty to maintain this balance through chants and by living in harmony with the processes of the universe. If the balance is upset, the universe will come to an end. Thus, for example, in certain ceremonies the U’wa chant myths all night to assure that the sun and other natural processes continue along their proper courses, and they chant at different times of the year to keep the cycle of seasons moving. There are pathways connecting the three worlds, along which the deities travel. The paths of the upper world are those of certain stars, sun and moon, while the paths of the lower world are rivers, and all paths meet in lakes. By these paths, various good and bad qualities enter the middle world, and the master shaman chanters, under hallucinogens, travel the paths in order to shut out bad qualities or allow good ones to enter the middle world. Nature serves as a central symbol in this cosmology, as it does in the simpler metaphor that the U’wa sometimes use, namely, that the world is a body with its head in the highlands, caves are mouths, mountain ranges the spinal cord, and the forest the pubic hair of lower world deities.

This religious view of nature guides the way the U’wa live in their environment. As agriculturalists, hunters, gatherers and fishers, they change their place of residence several times a year, from tropical lowlands, to foothills, to high mountain rainforest. The moves, at set times, appear not to be related to agricultural or climatic advantage, but rather to maintaining the balance of upper and lower worlds. Maize is not sown in optimal planting conditions, but rather at the times and locations that assure its harvest will be available for scheduled religious ceremonies in which maize plays an important role. The U’wa do not enter certain high mountain areas, and do not fish, bathe or drink from certain lakes and rivers. In clearing fields for cultivation, they do not touch trees that provide fruits or nuts for animals or humans, and they leave a great deal of vegetational cover and mulch. Fields are left fallow for a period of years before replanting. Animals are to be caught only by trapping and the spilling of their blood is to be avoided. Many of the U’wa’s chanted myths (they have no written language) are about forest foods, cultivated foods, and animals. They believe these things will disappear if they stop chanting about them. Indeed, they are disappearing as white settlers and others encroach on the U’wa traditional territory. One U’wa response is to increase the chants in order to re-create them.

The U’wa have no known tradition of violence to settle conflicts among themselves or with outsiders. Animosities do arise within the tribe and with outsiders, but the U’wa eschew use of knives or firearms in disputes, and say their weapons consist of thoughts and words. Today, they strive to be left alone, aligning themselves with neither side in the civil war and resisting foreign encroachments that affect their land or environment. Through political stances and legal actions, they accuse white colonization and the Colombian government in general of taking their territory, introducing diseases, exhausting natural resources, causing hunger, preventing them from living materially on their land in the traditional way, and refusing to acknowledge their beliefs that all the natural world is sacred and the U’wa are its keepers. They view the government’s current opening of their territory to international oil companies in apocalyptic terms. In actions from lawsuits to civil disobedience to an international media campaign, the U’wa insist upon recognition of their belief that oil was distributed throughout this world and the lower world by the deities when they created the universe, that it is a living resource as if it were the blood of Mother Earth doing its sacred work just where it is, and that to exploit it would be a sacrilege destroying the balance of the universe and provoking the collapse of U’wa culture. A network of international activists has formed to aid the U’wa in their
struggle against oil companies and the government. Struck by the poignancy of this small, spiritual tribe resisting oil exploitation because it believes oil is the blood of Mother Earth, human rights and environmental activists from Colombia, the United States and Europe have publicized the natives’ plight, helped them in litigation, brought U’wa tribal leaders on foreign tours, and pressured their own governments to protect the U’wa. Colombian anthropologists and lawyers, the Italian Green Party, a coalition of several groups operating as The U’wa Defense Project, Earth Justice Legal Defense Fund, and Harvard University’s Program on Nonviolent Sanctions and Cultural Survival, among others, have all played key roles. Amazon Watch several times brought tribal leaders to address the annual shareholders’ meeting of a California oil company threatening U’wa land. A young American environmentalist, impressed by the naturalistic religion of the U’wa, was in U’wa territory in the late 1990s together with two native American Indian women leaders to build international solidarity when the three were sequestered and assassinated by gunmen of the Fuerzas Armadas Revolucionarias de Colombia (FARC), demonstrating further that the U’wa world has turned chaotic.

If the oil drilling goes ahead, the council of elders—the most respected tribal authority—has recommended that the U’wa follow a precedent said to be known in their oral history from the sixteenth century: with the Spanish in pursuit, the U’wa men, women and children jumped from a high cliff in a mass suicide.

**UFOs and Extraterrestrials**

Flying saucer cults and the broader UFO movement work in general within a galactian theological framework that ranges between gnostic and astral worldviews. From the transcendental orientation of gnosticism in which the material is either denied reality or significant value, nature is dismissed as a foil to spiritual meaning. The astral view is of course closer to the pagan inasmuch as both ground themselves in the tangible. Where it differs, however, is in crossing the “death of God” threshold to deny any ontological validity to the supernatural. Astral galactianism replaces the supernatural with the extraterrestrial and technological in order to demystify and demythologize primarily the Abrahamic religions, simultaneously (if unconsciously) mythologizing and ideologizing science and technology. Inasmuch as galactic spirituality centers on the cosmos as its all-encompassing structural reference and tends often to employ an Enochian narrative concerning “fallen angels” and their revolt against the divine hierarchy, nature religion becomes largely incidental. Nevertheless, UFO groups are highly individualistic, and must be examined on an ad hoc basis to discern whatever nature-spiritual dynamic may inform their particular outlooks. These range from James Jacob Hurtak’s writings (The Keys of Enoch), those of Elizabeth Clare Prophet (Church Universal and Triumphant) and the Urantia Foundation to such groups as George King’s Aetherius Society and Claude Vorilhon’s Raelians.

The galactian inspiration of New Age UFO thought derives from Theosophy and the concomitant notion of the Great White Brotherhood of Ascended Masters who have become reinterpreted as extraterrestrial space beings. In a language reminiscent of science-fiction and scientific conceptualization, the galactian matrix includes an emphasis on cosmic law, engineering codes, electromagnetism, wave-form harmonization and/or “faulty genetic circuits” as well as such notions as pyramid power, Atlantis, Lemuria, extraterrestrials or space brethren, and the Pleiades as a command center of higher forms of consciousness. Such groups as Guy and Edna Ballard’s I AM Religious Activity or Mark and Elizabeth Clare Prophet’s Summit Lighthouse/Church Universal and Triumphant (CUT) concentrate on the principle of cosmic law alone, whereas Hurtak, the Raelian Movement, Urania, Ron Hubbard’s Church of Scientology, and Marshall Applewhite’s Heaven’s Gate all express a typical and fully galactian cosmology of absolute and material immanence in which life is not the result of a process of natural evolution, but one of extraterrestrial biotechnological fabrication. At the same time, while spiritual seeking through galactian frameworks often intersects with ufology, not all flying saucer cults are necessarily galactian or can even be considered as New Age. Closer to the gnostic galactianism position that considers supersensuous possibilities that transcend the natural might be King’s Aetherius Society and Ernest and Ruth Norman’s Unarius. But like New Age’s lack of clearly articulated differentiation between its gnostic and pagan elements, the same fluid confusion exists between galactianism’s gnostic and astral
formulations. Elements of both appear throughout the various UFO or flying saucer groups as well as in José Argüelles’ Surfers of the Zuvuya or Benjamin Creme’s teachings on Maitreya.

At the center of the galactian theological world is a single ultimate God. In other words, the galactian worldview extends the gnostic and medieval chain of being into an infinite plenum of multiple dimensions. This divine source of all being is usually presented in masculine terms (e.g., Urantia’s Fatherhood of God and Brotherhood of Man). Nevertheless, although the heavenly bureaucracy is also portrayed as male, Urantia does speak of a Mother Spirit. A different galactian understanding is encountered with the Universal Faithists of Kosmon (headquartered in Salt Lake City). For the Faithists, the godhead is both masculine and feminine, and half the heavenly host is female.

In galactian spiritual history, the central rupture is the Luciferian rebellion considered as the free will breaking on higher dimensions with the even higher law of cosmic harmonics and its plan for intergalactic evolution. The story of the segment of heavenly hosts who broke away under the leadership of Lucifer and came to Earth is recorded in the Genesis 6:2 tale of the “sons of God.” The fuller version is found in the apocryphic Book of Enoch’s narrative of the Watcher Angels who, in violation of their assigned role, had intercourse on Earth with female humans. Their giant offspring, consisting of “genetic aberrations,” are accordingly the corruptive elements within the human race. In CUT’s understanding, these descendants of the Watcher Angels are now those who head the world’s governments, financial institutions, multinational corporations and the underworld drug cartels.

In galactian expectation, the rebels are eventually to be defeated by the archangel Michael. They will be imprisoned and secluded in permanent torment. This notion of eternal damnation is a prominent feature of most galactian theology. There are, however, exceptions. For both the Aetherius Society and the Faithists, as recorded in their central work Oahspe, there is no ultimate annihilation and all souls are finally cleansed. There is no hell of everlasting punishment. But what is common to all forms of galactian mystic theology is the belief that the purpose of existence is the continual progression of the human soul toward perfection. The idea of nirvana or the attainment of supreme oblivion is considered a delusion and replaced with the notion of eternal evolution.

Consequently, there are different understandings of space brethren and the role of the flying saucer or space ship. Following a more Theosophical gnostic orientation, former CUT leader, Elizabeth Clare Prophet considered the visiting extraterrestrial as a dangerous Luciferian agent. On the other hand, in the non-Theosophical astral framework such as we find in Raëlianism, Heaven’s Gate and possibly Urantia, it is the advanced knowledge of the “more advanced” races from other spheres or dimensions who, through their superior technical skills concerning genetic manipulation, are responsible for life on Earth in the first place. The Raëlian Movement International began in December 1973 when French race-car driver, Claude Vorilhon, while walking in the Clermont-Ferrand region of France, encountered and boarded a flying saucer. Over a six-day period, the extraterrestrials taught to Vorilhon the “true” purport of the Bible concerning the biotechnological origins of humanity. Henceforth known as Raël (“messenger of the Elohim”), Vorilhon is accepted by his followers as the last of forty prophets. In Raël’s reinterpretation of the Old Testament, the alternate designation of Yahweh, namely, Elohim, becomes a reference to the extraterrestrials ("our fathers from space") who, through their perfect mastery of DNA, created humanity in their own image. While in the past, the Elohim have subsequently spoken to their creations through Moses, Buddha, Jesus, Mohammed and others, their mission is now to convey through Vorilhon/Raël the imminent danger to the human race through self-annihilation. So while CUT considers that we are entering the New Age of Aquarius in which the central spiritual master is the Comte de Saint Germain rather than the Piscean Jesus Christ, Raëlians consider instead that the foremost prophet for the present “Age of the Apocalypse” that began with the nuclear detonation of 1945 is Raël.

Typical of galactian thinking is the concern with “interdimensional reality.” Its spiritual hierarchy often exists on multiple levels or dimensions of cosmic reality. However, in the Urantian understanding of the cosmos, allegedly channeled and recorded during 1934 and 1935 to assist humanity in our local galaxy’s evolution toward perfection, the elaborate polytheism presented in its Urantia Book is not outside our space-time, but one in which its higher beings live on various spheres found within our universe. This more corporeal notion of the heavenly hosts may reflect Mormon theology in which God has a material body. Usually, however, galactian theology comprehends its enormous hierarchical bureaucracy of spiritual beings (angels, deities, evolved souls and ascended masters) in a plenitude of realms that extend not only throughout our own three-dimensional world but beyond it as well – a perspective closer to contemporary cosmological theory that envisions there to be an eleven-dimensional multiverse containing an infinite number of parallel universes. For the Raëlians, our galaxy is simply a tiny particle of an atom of a living being on a planet revolving around a sun in some super-galaxy. Likewise, the sub-atomic particles of atoms in our own world are seen by Raëlians as galaxies in themselves. The Raëlian mystical union between the sub-universes and super-universes within and beyond the individual is accomplished through the practice of Sensual Meditation, a set of contemplation techniques that aim for individual communication with the Elohim in order to regain control over and happiness in all areas of life.
(body discovery, sexuality, enjoyment through the senses, cosmic organism, etc.)

When the multiple cosmos is conceived along Theosophical gnostic lines, it will entertain an understanding of the supernatural as an operative factor. But if galactian thought formulates itself along a strictly astral horizon, there is no spiritual, and the universe has no beginning. For the Raëlians, for example, matter is purely mechanical. There is no anima mundi to the world or the cosmos. Consequently, while the “astral” realm is a Theosophical concept developed to describe a supersensible substance supposed to pervade all space and bodies and one that provides a bridge between the spiritual and physical planes, in the astral school of galactian interpretation, there is no spiritual dimension, and the astral is essentially an extension of matter. The final contrast between the two forms of galactian theology is in the gnostic understanding of the spiritual as a priori, while the astral recognizes instead the centrality and permanence of matter. This last is similar to Paganism and the general emphasis of nature religions which also centralize matter, but it differs from these by not regarding the mental, spiritual and supernatural as emerging from the tangible and at best achieving an ultimate co-validity with it. With astral galactianism, in place of evolution, there is simply achieving an ultimate co-validity with it. With astral galactianism, in place of evolution, there is simply achieving an ultimate co-validity with it.

Unlike the more atheistic astralism of the Raëlian movement, the Aetherius Society founded in 1955 by George King (1919–1997), is both gnostic and astral. This “saucer cult” reveres a Cosmic Hierarchy, engages in a battle with evil forces, and expects that everyone will eventually become a Master and continue to evolve. As a regular practitioner of yoga, King claims to have attained samadhi in which he has gained access to many cosmic secrets. In 1954, the Venusesian Cosmic Master who had assumed the name “Aetherius” reputedly told King that he was to become the voice of the Interplanetary Parliament that is headquartered on the planet Saturn. The following year the Aetherius Society was established in London, and King allegedly receives “Cosmic transmissions” from Aetherius and other Cosmic Masters while in his yogic trance state.

The Aetherius Society holds belief in both reincarnation and the Great White Brotherhood of Ascended or Cosmic Masters that includes Jesus, Krishna, Buddha and others. Inasmuch as everyone will eventually become a Master, the Brotherhood consists of members from both genders. Like CUT, the Society’s belief system is essentially both Christian and Buddhist (both Jesus and Buddha are said to come from Venus), but unlike CUT’s distrust of flying saucers as containing negative entities, King teaches that saucers have played an important role for humanity and have saved the planet on several occasions from atmospheric damage caused by human civilization – specifically from experimental nuclear fallout. His movement considers that the Earth is regularly orbited by space ships, and, in particular, Satellite Three distributes special Prayer Hours of spiritual energies or prana that members of the Society can then channel toward specific concerns through King’s invention of Spiritual Energy Radiators. The periods during which this distribution occurs, usually lasting three to four weeks, are called “spiritual pushes.” One, designated Operation Bluewater, ended in 1976 and involved charging a specific Spiritual Energy Battery, a “radionic” storing device that can be used in times of crisis to alleviate the Earth’s magnetic field warp caused by both atomic experimentation and negative human thought. Another “spiritual push,” Operation Starlight, lasted for just over three years (1958–1961) during which King and others climbed eighteen mountains around the world that had been selected through a vision of the Master Jesus. The purpose of this push was to charge these mountains permanently with spiritual power. Regular pilgrimages to these sites now allow members to use the holy energies through prayer for terrestrial benefit such as the relief of physical suffering, diminishment of belligerent tensions, the aversion or reduction of such catastrophes as earthquakes or famine, and individual and environmental healing.

While the Aetherius Society’s Interplanetary Parliament (or Cosmic Hierarchy) is responsible to the Lords of the Sun, it argues that each planet functions as a learning stage that must be completed before one progresses to the next. Many reincarnations are necessary on each planet before one learns to live according to God’s Laws. Some Masters already live on the Earth, but the coming Master, whose magic powers exceed all terrestrial military might, will appear in a flying saucer and launch a millennium of planetary peace. Before this, however, the Great White Brotherhood is engaged in a cosmic battle with an organization of black magicians who seek to enslave humanity. The Society assists in this warfare by training its members in what is known as Operation Prayer Power: redirecting or channeling prana (energy) through mantras and prayers in order to heal disease. Apart from spiritual healing and the use of yoga, the Aetherius Society is also concerned with alternative medicine, dowsing and most of the practices characteristic of New Age and Human Potential. It has remained at the forefront of ecological anxieties relating to nuclear radiation pollution and industrial contamination.

Similar concerns with planetary well-being are shared by the Raëlian movement. While Raël communicates with the Elohim and Yahweh, his personal teacher and Elohim president, primarily through telepathy, he has been instructed that a major enterprise for the Raëlians is to construct an international embassy to which the Elohim can return once more to Earth to welcome the planet into a technological world of choice, infinity and pleasure. Following instructions from the Elohim, the movement would hope to establish this embassy near Jerusalem.
World government is then to be established as a form of "geniocracy" or rule by geniuses. Along with this, a universal humanitarian economy will eliminate the need for inheritance. The movement's mission as well as difficulties involved in establishing its Elohim embassy, however, is similar to the delays and opposition to the construction of the Pyramid Temple of the Unity of God's Faces by the Religion of Aumism at its monastery of Mandarom Shambhasalem in Castellane, France. The followers of Hamsah Manarah likewise believe that such an "anchoring bridge" is required for the inauguration of a Golden Age of Unity but, following a more Theosophical and Hindu framework, the Aumists understand their Temple as a "Spiritual Pole" that will link God to the material realm, whereas for Raëlians, the embassy will serve as a landing station for the spaceships of the Elohim. Nevertheless, the Aumist temple is expected to facilitate the rapprochement of science and spirituality and allow nature to recover its proper position by returning to ecological equilibrium.

Unlike the more typical gnostic-idealist aversion to the joys of the physical universe, with the Raëlians there is no rejection but rather an endorsement of worldly pleasure. Some of the methods of its central practice of Sensual Meditation are to be used by two people of the opposite sex, and this involves nudity, sensory awareness exercises and sexual experimentation with the aim of achieving a mystical experience of oneness. Nevertheless, the movement stresses complete choice in the selection of sexual partners as well as in all other aspects of life. As long as no one else is harmed, Raëlians are encouraged to be free of social mores and inhibitions. With its astral rejection of the supernatural and/or spiritual, the immortality of reincarnation is instead to be achieved through the process of serial cloning. Consequently, and in view of the Raëlian belief that all earthly life originated artificially, Raëlians support biotechnological developments – whether concerning genetically altered foods, increased mechanization, robotized automation, space exploration, use of computers or reproduction of animal and human life through cellular cloning. The Raëlian belief that all life is synthetic "grounds an empathy for all organisms, vegetable and animal" in appreciation of the biotechnological artist's abilities: "This approach to nature and the advocacy of the use of reproductive technology are the religion's primary points of engagement with ecological concerns" (Sentes and Palmer 2000: 101). It is through the steady advances of science as well as the assistance of the Elohim that the Raëlians expect the world will enter its golden age.

Whether pursued by organized groups and movements, or whether individual UFO sightings made by pilots of aircraft or by people of all occupations, the UFO myth remains "one of the world's most powerful religious or semi-religious narratives" (Rothstein 2001: 134). It relates to the "crop circles" of Britain, and while many of both flying saucer sightings and crop circle constructions are clearly hoaxes, some are not as readily established as such but persist as unexplained paranormal paradoxes. Psychologically, the UFO would appear to be a product of counter-intuitive beliefs that include what we normally relate to the supernatural but are not necessarily restricted to this. But as a phenomenon in and of itself, contact with spaceships and extraterrestrials tends to interlink with the ideas of evolution that derive from Theosophy and have entered the general New Age vocabulary. For Rothstein, the UFO is "elusive, flexible and versatile and therefore an obvious candidate to become a global cultural representation distributed along the ever-expanding means for easy international communication" (2001: 147). As twenty-first-century Earth continues to face ever-increasing environmental threats, and while the possible perception of extraterrestrial technology is nothing new (e.g., the experiences of the biblical prophets Elijah and Ezekiel), the UFO encounter and corpus of belief are now more focused on both spiritual and ecological progress.

In this light, the studies conducted by Harvard psychiatrist John Mack on UFO abductees have shown that while little is reliably gained concerning knowledge of extraterrestrial life, abduction reports tell us much about our own culture and psychology and an emerging ecological sensitivity. Mack finds that the chief reasons given for UFO abduction are either to develop offspring between humans and aliens or to increase human consciousness toward preventing the destruction of the planet's ecosystems. By linking ufology and ecology, Mack is possibly founding a new religion based on the "green politics" of star people. He has at least uncovered within the U.S. alien-abduction mythology that has developed since the 1960s the link between an alleged encounter with extraterrestrial beings and both spiritual transformation and environmental awareness.

Umbanda

Umbanda is a syncretic religion par excellence, creatively blending African religions, particularly from Yorubaland and Congo, with Native American traditions, folk healing, Iberian Catholicism, spiritism, “Oriental” esoterism, and popular culture. This complex and often contradictory mixture emerged in Brazil in the early 1900s, as the country was making the transition from empire to republic. This period also marked Brazil’s entry to modernity, with incipient processes of industrialization and urbanization. Umbanda reflects these social dynamics, originating in the increasingly cosmopolitan cities of Rio de Janeiro and Sao Paulo. Today, Umbanda is present throughout Brazil and sustains relations of competition, accommodation, and cross-fertilization with other Afro-Brazilian religions such as Candomble, Xangô, Batuque, and Tambor de Minas. Umbanda has also spread in South America, with thriving centers in Uruguay, Argentina, Peru, and Venezuela. Not surprisingly, it has also traveled to the United States, to New York, Boston, and Miami, with the waves of immigrants who have come from Brazil since the late 1970s.

Umbanda holds ambivalent attitudes toward nature. As a “cult of affliction,” to draw from anthropologist Victor Turner, this religion takes an instrumental view of the environment, seeing it as a set of forces that can be carefully manipulated to produce physical and spiritual healing and well-being. Nevertheless, Umbanda has at its core a relational ethos that tightly links humans, spirits, and the natural world. This ethos challenges notions of a sovereign, detached, and purely calculating self, standing over against nature.

As an African-based religion, Umbanda shares many elements with Candomble. Like Candomble, Umbanda adheres to a monistic and panentheistic worldview. All entities – animate and inanimate, mineral, vegetable, animal, human, and spiritual – are informed by and are ultimately expressions of a sacred vital force called aré. Because this elán vital flows unevenly across the Umbanda cosmos, a central concern in the religion is to provide practitioners with the right knowledge and proper ritual practices to place themselves strategically in the changing grid of energy generated by aré. Umbanda’s aim is thus unabashedly practical: to help the practitioner negotiate a favorable position vis-à-vis other entities, particularly humans and spirits, through strategic exchanges of energy (for example, special foods offered to one’s head spirit in exchange for health, good fortune, or happiness in love). The aim is to establish a reciprocal balance of forces that will allow the practitioner’s own aré to fulfill its destiny.

As in Candomble, Umbanda locates high concentrations of aré in the orixás, the ancestral spirits that are part of the African pantheon of gods. Orixás, which are associated with specific natural forces or domains like thunder (Xangô), the sea (Iemanjá), and sweet water (Orun), and their iconic representations serve as powerful openings to and conduits for aré. This explains why the religion is organized around terreiros, territorially based extended spiritual families headed by specialists (pai şi mán de santos) who train initiates in the correct ritual etiquette to relate to terreiro’s and the practitioner’s head spirits. An essential component of this relation is the incorporation of orixás by practitioners in trances that are often accompanied and supported by drumming and the use of liquor and tobacco. In these trances, the orixá descends on the head of the medium, “riding” him or her, that is, controlling his or her body movements and speech. In this way, orixás become publicly present and can receive the respect and loyalty of their devotees.

In contrast to more Africanized Candomblés, however, Umbanda tends to privilege interaction with what we may call intermediate or lower spirits. It is not that orixás disappear altogether; they continue to be displayed prominently in terreiro altars albeit through their Catholic correlates (the saints). However, Umbanda mediums prefer to work with spirits native to Brazil, rather than with the African royalties represented by the orixás. This is where Umbanda demonstrates a high degree of syncretism and adaptability to the local environment, for the central spiritual characters in Umbanda are indigenous Brazilians and backwoodsmen (caboclos), old African slaves of colonial Brazil (pretos velhos), and rogues and prostitutes (ezus). These are characters that are salient in the way in which Brazilians, particularly at the grassroots, imagine their nation.

Caboclos play a key role in Umbanda’s attitudes and relations toward nature. In the Umbandista imagination, caboclos are associated with Brazil as it existed prior to the conquest, an exuberant mythical land without manmade social hierarchies. Caboclos represent the untamed spirit of the wilderness, the undifferentiated jungle prior to domestication by the Portuguese. This idealized wilderness is often connected with the land of Aruanda, the mythical home of caboclo spirits said to be located in the Congo-Angola region of Africa. Caboclos belong to a wild, pristine place where all species are closely interconnected and where distinctions between animals and humans are tenuous. Thus, caboclos are seen as rugged, proud, and
rebellious characters, always capable of transgression. As part of this transgressive personality, they are quick to smoke cigars and drink jurema, a drink with mild hallucinogenic properties made out of a mixture of the sacred plant *Pithecolobium diversifolium* Bent, herbs, honey, and alcohol.

*Pretos velhos* contrast sharply with *caboclos*. They represent post-conquest Brazil, a Brazil marked by violence and deep social inequalities. Whereas the initiate who incorporates a *caboclo* becomes brash and struts around whooping and beating his/her chest, the medium who receives a *preto velho* will behave meekly, speaking softly and haltingly and walking with his/her back bent to represent the fact that s/he is carrying the whole weight of slavery. Their humble condition allows *pretos velhos* to have great empathy for those in trouble and to be great healers. Like the *caboclos*, they also carry a wealth of ethnobotanical knowledge (from the forest in *caboclo’s* case and from the ancestors in the case of *preto velho*), which they can use to cure ailments ranging from persistent headaches to nervous breakdowns.

Besides contributing to the therapeutic dimension of Umbanda, the *caboclo-preto velho* dyad serves a commentary on what the religion sees as the contradictions in Brazil’s entry to modernity – tensions such as servitude versus autonomy, hierarchy versus equality, and domination versus resistance. The dyad is a way to narrativize, and thus legitimize, the civilizing process in Brazil. Yet this civilizing process is incomplete, subject to the destabilizing power of nature as represented in the transgressive, almost carnivalesque figure of the *caboclo*. The *caboclo-preto velho* dialectic, thus, offers a view of nature as “savage and primitive” forces periodically interrupting in the midst of a precarious and contradictory humanmade world.

Transgression is also preeminent for *exus*, spirits commonly associated with the underworld. In West African traditions the *exu* is a single trickster figure linked to sexuality and fertility. In Brazilian Umbanda, the *exu* assumes multiple identities, coming to stand for marginal social groups like thugs, thieves, prostitutes, and other “devils,” figures which local lore and the national mass media alternately vilify and celebrate for their resourcefulness. The centrality of *exus* in Umbanda reflects its adaptation to the modern urban environment, where the tough streets of the city become the stage for sacred dramas. The *exus* are, in fact, a vehicle to sacralize the profane, to cosmicize the everyday life of poor Brazilians, who are the country’s vast majority. Extending Karen Brown’s argument about Vodou in Brooklyn, it can be argued that Umbanda’s emphasis on protean *exus* is a way to solve the “cosmological problem”: the ecological dissonance produced by the need to practice a religion that is tied to natural places and entities in the heavily humanmade context of the city. If *caboclos* are the transgressor of the originitative jungle, harking back to pristine origins, *exus* are the border-crossers of the new concrete and asphalt jungles, subverting bourgeois morality. *Exus* help Brazilians negotiate the tension between the city’s built environment and the “natural” environment. It is common to find food offerings to the *exus* at street corners near Umbanda centers. After all, because they are lower spirits, very close to matter, *exus* are considered masters of the crossroads. They literally have one foot in the spiritual world and another in the all-too-human world, which is the reason why they limp when they walk. Because of their hard life and street smarts, *exus* are considered excellent problem solvers. They can be very loyal and effective when accorded the proper recognition and properly fed, but they can rapidly turn vengeful and destructive if disrespected or ignored.

Umbanda also distinguishes itself from Candomblé by its closer relation with Spiritism. Spiritism originated in France in the mid-1800s, with the prolific writings of Hyppolyte Léon Denizard Rivail (1804–1869), a Parisian educator and translator of scientific books, who took the name of Allan Kardec from his previous incarnations. Spiritism is itself a highly syncretic philosophy, blending “Eastern” notions such as karma and reincarnation with parapsychology (construed as the science of the soul), Enlightenment ideas of progress and education, and a secularized version of Christianity stripped of supernatural content and stressing heavily a humanist ethic of charity. Borrowing piecemeal from Hinduism and Buddhism, Kardec held the existence of disembodied spirits closely connected with the material world. Sensitive to the effects of good and bad actions (the karmic law), these spirits seek to purify themselves through multiple reincarnations. As part of their education and progress toward becoming pure light (gaining release from the constraints of material world), the spirits may communicate with us through mediums to guide us in our own spiritual development or to request our help.

Spiritism’s belief in the close interaction between the spiritual and material world dovetails with Umbanda’s monistic panentheism. Spiritism’s therapeutic system is partly based on the notion that all animate beings contain a spiritual fluid, a kind of electro-magnetic energy, that can be transferred. Spirit centers train *passistas*, literally “hand passers or hand layers,” who hold periodic cleansing clinics where they help discharge negative energies, often produced by *espiritos obesidiados* (obsessing or perturbing spirits), by passing their hands over the bodies of those afflicted by physical or psychological problems. Positive spiritual fluids can also be concentrated in water that has been prayed over by the religious specialists. This “sacred water” (*água fluidificada*) is imbied by the practitioners. Along with fluidified water, clients may also receive homeopathic prescriptions. Umbanda also recognizes Spiritism’s concern with disincarnate spirits seeking perfection by giving place to *eguns* (the wandering souls of dead people) and more evolved spirits in its pantheon.
The latter are considered spirits of light or guide spirits (babas/espiritos guias ou de luz), who like Socrates, Buddha, and Francisco Cândido Xavier (a.k.a. Chico Xavier, a famous Brazilian Spiritist and interpreter of Kardec), stand in sharp contrast to the “baser” spirits, the exus. Whereas exus are summoned through drumming and relish the pleasures of the flesh, the wild dancing, drinking, and smoking involved in many Umbanda public celebrations, spirits of light prefer to engage in quiet learned conversation. This tension has led scholars such as Roger Bastide to argue that Spiritism “whitens” or “europeanizes” Umbanda, distorting its African roots. Umbandistas, for their part, see the confluence of European, Eastern, African, and Brazilians strands as proof of the universal nature of their religion and as a reflection of the hybrid culture that is Brazil.

In terms of attitudes toward nature, Spiritism’s influence on Umbanda is ambivalent. On the one hand, Spiritism’s religious humanism reinforces Umbanda’s anthropocentric tendencies – the stress on the instrumental manipulation of natural forces to produce personal well-being and success. Moreover, Kardec affirms that, from the moral point of view, there is a clear hierarchy in the universe, with human beings being able to rise above their instincts and have full consciousness of their spiritual nature. On the other hand, this anthropocentrism is counterbalanced by Spiritism’s recognition that there is an underlying order in the universe in which all entities are interconnected in a progressive evolutionary scale. Thus, it is essential to overcome egotism and behave charitably toward the whole of creation. For instance, in his popular psychographed book Nosso Lar (Our Home), Chico Xavier offers a utopian vision of a celestial colony in which spirits hold basic goods in common and are governed by benevolent philosopher kings, the most evolved spirits. Leaving aside Diana Brown’s and David Hess’ discussion as to whether Umbanda and Spiritism reproduce the clientelism that has typified Brazilian politics, in Xavier’s spiritual home there is not only peace and moral happiness – since everybody knows his/her place – but also harmony with nature. The spirits are presented as carrying their intellectual discussions in a tropical paradise of inexhaustible resources which the inhabitants exploit with rational moderation. This tropical paradise is suspiciously similar to an idealized version of Rio de Janeiro. This perfect society is said to exist directly above the city.

Spiritism’s contradictory impact on Umbanda highlights the latter’s complex character. Umbanda reflects Brazilians’ ambivalent relations with their local environments, both natural and humanly constructed. On the one hand, Umbanda offers a pragmatic ethics of individual self-improvement adjusted to the demands of Western, urban modernity. On the other, it holds a relational ethos more in tune with traditional, “rural” lifeways which stress interdependence and reciprocity. Umbanda’s hybridity, its power to syncretize, adapt, and even present itself as an all-encompassing religion, is in large part the result of this capacity to bridge between individuality and collectivity, and between matter and spirit.

**Umehara, Takeshi (1925–)***

Takeshi Umehara, a Japanese philosopher, has published many works on philosophy, religion and literature. His unique approach to the deep strata of Japanese culture and religions through archeological and mythological studies is known as “Umehara’s Japanology.” His numerous lectures and writings, which have drawn people from various academic fields and sections of society, are given considerable credit for the recent rise of interest in rediscovering Buddhism, Shintoism and earlier Japanese spiritual traits, as well as so-called “Joomon (Japanese neolithic) period studies” in general. His insight has also proved to be a particular inspiration for environmental educators and conservationists calling for the revitalization of forests, rivers, wetlands and indigenous lifestyles harmonious with the natural environment of each region.

Umehara was born in Sendai, Miyagi Prefecture in 1925. He grew up in Aichi Prefecture and graduated from Kyoto University, where he majored in European philosophy. Immediately after World War II, haunted by the specter of the nuclear holocaust in Hiroshima and Nagasaki, he became absorbed in the writings of Frederich Nietzsche and Martin Heidegger. Umehara was acutely conscious of the void left by a collapse of values following the introduction of European modernism. Influenced also
by such thinkers as Kitaroo Nishida (author of *Zen no kenkyuu* Studies on Goodness, 1911) and Tetsuroo Watsuji (author of *Fuudo*, Climate and Culture, 1935), he began studying Japanese Buddhism and then Shintoism, the indigenous religion of Japan. He assumes religious imagination to be the key to the rise and fall of civilizations. Thus, from the outset, Umehara’s thought attempted to bridge the gap between East and West in order to lift Japan and the world itself from the ruins of modernity.

Umehara’s studies of Japanese culture, developed in such works as *Jigoku no shisoo* (The Concept of Hell, 1967), *Kamigami no ruzan* (The Exiling of the Gods, 1985) and *Nihonjin no anoyo kan* (The Japanese View of the Other World, 1989), culminated in *Mori no shisoo ga jinrui o sukuu* (The Worldview of Forest-dwellers Will Save Human Beings, 1991), which addresses the relationship of religion to nature. In this book he rejects the traditional assumption that the Japanese come from a homogeneous race of rice-growing farmers – first by noting that 67 percent of the land in Japan has been preserved as forest, thereby reflecting widespread worship of trees, and then by proposing an alternative view that the original culture of the Japanese is retained in the minority Ainu and Okinawan cultures. He points out various elements common to Ainu and Okinawan religious rites and mythologies, and to Japanese Shintoism and Buddhism. He interprets the well-known Japanese Mahayana Buddhist phrase “Mountains, rivers, grass, and trees, all can become Buddha” as advocating the equality of all living beings. All can go to the other world (anoyo) where there is neither distinction of heaven and hell, nor final judgment, and eventually all will return to this world. Today, after many stages of transformation and syncretism, Buddhist temples take care of the rites for the dead, while Shinto shrines celebrate the birth and growth of all beings in nature. Belief in reincarnation can be found in the Ainu rites of sending bears and other animals back to the world of the gods above and in the Okinawan rites of communing with the eternal other-world of ancestors beyond the sea.

Umehara reinforces his assumption by referring to the findings of archeologists and physical anthropologists, which suggest that an early type of Mongoloid people, of whom Ainu and Okinawans are the remnants, had lived throughout the archipelago as hunters or fishers and gatherers during the Joomon period (ca. 12,000–300 B.C.E.) with a highly developed pre-agricultural forest culture, exemplified by their sophisticated earthenware. Then, around the third century B.C.E., a newer type of Mongoloid people arrived on the Japanese islands with a rice-growing culture. They expelled some of the indigenous people, and mixed with others to build the Yayoi culture (ca. 300 B.C.E.–300 C.E.). Umehara asserts that the natural religion born in the ancient forests survived the transition of cultures and even the introduction of such a powerful world religion as Buddhism in the sixth century. He believes that human beings today should reevaluate the polytheistic natural religions of the forest and view the cyclic movements of life as a whole beyond individuals, races and species. It is an ecological and practical necessity for human beings to stop conquering nature and to live harmoniously with others in order to survive in the postmodern world.

Umehara has headed archeological expeditions to the sites of ancient civilizations in China and the Middle East as well as within Japan. He served as president of Kyoto Municipal University of Arts, was the first Director General of the International Research Center for Japanese Studies in Kyoto, and has been president of the Japan Pen Club since 1997. He is also a Kabuki playwright. He has won major literary awards and was honored with the Order of Culture in 1999.

### Unitarianism

The Unitarian movement can be defined as a radical tradition that emerged into self-consciousness during the European Reformation in the sixteenth century as an alternative to the authoritarian traditions of Luther and Calvin. Like their Anabaptist cousins, the Unitarians were suspicious of the misuse of ecclesial power to enforce such non-biblical teachings as the eternal Trinity, infant baptism, the exclusivity of revelation, and the doctrinal method of establishing worthiness for salvation. On the positive side, Unitarians affirmed a more immanent deity closely bound to nature, universal salvation, and the necessity of religious tolerance and freedom of the pulpit. Because of these beliefs, many Unitarians lived under religious persecution from both the Protestant and the Roman Catholic authorities until well into the eighteenth century. The most infamous case of this occurred when the Spanish Unitarian theologian Michael Servetus was burned at the stake by Calvinist forces in 1553. Servetus’ crime was to have published a treatise, *Christianismi Restitutio* in 1552 in which he attacked the Trinity, orthodox Christology as it was determined by the Council of Nicaea in 325 – which affirmed the co-equality of Christ and God while rejecting the proto-Unitarian view of Bishop Arius who denied this equality – and the doctrine of infant baptism. Implicit in his views was a pantheism that found God
to be co-extensive with nature. This early Unitarian laid the groundwork for a universalist pantheism, which rejected a transcendent, sovereign, deterministic and punitive God.

Unitarianism’s most readily identifiable form emerged in 1805, when radical professors at Harvard won the Hollis Chair of Divinity for their Unitarian candidate Henry Ware, thus marking the end of Congregational power at that institution. Soon Unitarianism was rocked by the even more radical religious movement of Transcendentalism initiated by the former Unitarian minister Ralph Waldo Emerson when he threw down the gauntlet to the church establishment in his 1838 Divinity School Address, in which he went so far as to divinize the self, deny the centrality of Jesus, make nature holy, and posit a form of purely personal revelation that was self-validating outside of any form of ecclesial community. Three years later the Unitarian minister Theodore Parker delivered an equally controversial ordination address, The Transient and Permanent in Christianity. While more Christian in tone than Emerson’s address, it rejected the importance of dogma, liturgy, and anything other than ethics and a gospel of love.

Theologically, contemporary Unitarianism is diverse in expression and often even questions the need for theological reflection insofar as there is no agreement as to the real or alleged object of such reflection. However, there are identifiable philosophical commitments that mark Unitarianism as a decidedly nature-oriented perspective. Historically the distinction between liberal and conservative Protestant traditions was expressed by the difference between positive and natural religion. In the context of the post-Kantian milieu in which this distinction came to the fore, positive religion stressed a unique historical revelation, a unique textual record of that revelation, the centrality of a founder whose eternal word was embodied in a spirit-guided church, and the superiority of Christianity to any other religion. Natural religion denied any special revelation while placing a great deal of value on universalizable reason. It rejected the importance of texts in favor of a renewed understanding of the book of nature. The power of autonomous natural and atemporal reason replaced the role of the historical founder. Reason operated within the framework of a radically open experience of the whole or the infinite. Further, Christianity was often seen as a religion that had begun to exhaust its resources, thus paving the way for an honest exploration of other religions. Unitarianism has long embraced the basic commitments of natural religion, but has moved them more directly into a post-mechanistic view of a growing, infinitely complex, and fecund nature.

Insofar as Unitarianism would affirm a metaphysics it would deny the doctrine of creatio ex nihilo, while asserting that nature has neither beginning nor end, with the stipulation that the world of astrophysics, which affirms the Big Bang creation, is but one world within the infinity of nature which has its own subaltern conception of creation, perhaps out of imaginary time. Transforming the eighteenth- and nineteenth-century distinction between positive and natural religions, it is perhaps preferable to speak of anti-naturalist and naturalist religions. The anti-naturalist forms embrace supernaturalism, miracles, a sovereign and external Creator, and a devaluation of creation over its Creator. Naturalist religions, which can be either panentheistic or pantheist, but not theistic or personalistic, are not only immanentist, but also affirm that nature is the genus of which the object of religion is the species. Nature is the all-encompassing category, and actually transcends the genera (classes) of all orders that occur within and as nature. Hence the term “nature” functions as both the highest category and a pre-category, that is, there is no opposition term to nature precisely because nature is all that there is, both actual and potential. For many Unitarians all-encompassing nature is itself holy while for others nature is neither holy nor unholy per se; it simply obtains in its infinite unfolding.

Panentheist naturalism retains some remnants of the Christian traditions insofar as it affirms that a dimension of the divine is discontinuous with the orders of nature (the dimension of nature natured), even though fully relevant to them. Pantheist naturalism is more radical in that it decisively moves beyond the Christian traditions by asserting that the dimension of the divine in nature can in no way be discontinuous from any or all orders of nature natured. This deeper dimension of the one nature is often denoted by the term “nature naturing,” a term used by Emerson in this sense.

Within the Unitarian movement this tension is expressed as the difference between a more optimistic somewhat Christian progressivism tied to the evolutionary advance of the divine (panentheism) and a more quietist post-Christian meliorism correlated to a less optimistic view of human prospects within infinite nature (pantheism). In either case, Unitarianism affirms that supernaturalist religion remains a destructive force in culture insofar as it masks our deeper relationship to the eternal self-creating nature.

This underlying, and not always self-conscious, naturalism is manifest in both the liturgy and practice of the contemporary Unitarian Universalist Church. In 1961 the-then separate but theological similar movements of Unitarianism and Universalism joined to form a common Fellowship that is now called the Unitarian Universalist Association. Since 1961 the liturgy of the Fellowship has been shaped in ways that mark the transition to a more nature-centered worldview. Services are now dedicated to solar and lunar events as well as to the inner rhythm of the seasons. Generally the liturgy celebrates cyclical rather than historically unique events, although traditional world religious holidays are often celebrated as well, and the
services use texts from all of the major religious and secular traditions.

Native American and pagan traditions are often used to transform religious consciousness by returning to the pre-monotheistic world, a world held to be friendlier to nature than that of the supernatural monotheisms. Among the more important yearly events is the Flower Communion in which each member of the congregation is asked to bring a flower that is placed in a common vase at the front of the meeting room or sanctuary. At the end of the service, each member takes a different flower home. The Czech Unitarian minister Norbert Capek created this service before the Second World War. Capek also created the symbol of the flaming chalice, which combines the naturalistic symbols of enlightening fire and the wisdom-holding cup, which is now the central liturgical object in the Unitarian Universalist movement. Capek was executed in a Nazi concentration camp in 1942 for his resistance work in which the symbol of the flaming chalice was used as a code to help escaping Jews.

Along with a strong social gospel tradition, Unitarian Universalists today fully participate in the worldwide movement of the greening of the Church. There is a direct involvement in local issues of justice and the use of resources in a way that distributes them equitably and does minimal harm to the environment. Each member of the congregation is asked to use ecologically friendly practices in all dimensions of personal and social life. In the national realm, the Association works to create laws that will bring these practices into being. On the international level, the Association has long fought for forms of just trade and reduced First World consumption. One particular focus of this concern is with critiquing the growing power of international corporations as they control the yearly sale and distribution of hybrid seeds for which they have the patents. Given that Unitarian Universalism denies the reality of a potentially salvific deity who could create an apocalypse that would rescue a few of us from our abuse of nature, congregation members feel compelled by conscience to work toward the reversal of the natural degradation partially caused by the monotheisms.

United Nations’ “Earth Summits”

The first international United Nations’ “Earth Summit,” formally known as the United Nations Conference on Environment and Development, was held in Rio de Janeiro, Brazil from the 3rd to the 14th June, 1992. It included 172 national representatives (of which 108 were heads of state) and over 2400 representatives of nongovernmental organizations (NGOs), and addressed the threat of global environmental degradation as nations seek economic development. The gathered national leaders signed the Convention on Climate Change and the Convention on Biological Diversity and the conference itself adopted The Rio Declaration on Environment and Development, The Forest Principles, and Agenda 21, a plan for coordinating environmental and national development by the next century. The Commission on Sustainable Development was formed to monitor and report on the implementation of these declarations and principles.

The 1992 Earth Summit emerged from an earlier United Nations Conference on the Human Environment, held at Stockholm in 1972, which for the first time placed environmental issues before the international community, and led to the formation of the United Nations Environment Program. By 1983 the relationship between environmental degradation and economic and social development had led to the formation of the United Nations World Commission on Environment and Development, known as the Brundtland Commission. This issued the 1989 report entitled Our Common Future, which defined sustainable development as “that which meets the needs of the present without compromising the ability of future generations to meet their needs” and called for international strategies combining both environmental protection and development. Significantly, the envisioned programs include action not only at the international, but also at regional, national and local levels, and involving state and non-state actors. The United Nations General Assembly voted in 1989 to hold the first United Nations Conference on Environment and Development (UNCED) in 1992.

UNCED was a watershed, but not only for the obvious environmental reasons. The United Nations moved toward
the Rio meeting by hosting several preparation committee meetings in New York. Those who attended these meetings included not only government officials but also representatives of non-governmental organizations who could apply for official NGO status with the UN and provide input into the process. Each country could solicit contributions from numerous organizations and individuals, including that of both organized religious bodies and other groups motivated by nature-related spirituality whose main identity was not religious. These official conversations involved intense debates and disagreements about what was to be included and excluded from the agenda. Many compromises were made prior to and at UNCED.

Running parallel to the UNCED was an “Earth Summit” – a people’s conference – an exclusively NGO event that coexisted with UNCED also in Rio. Although sponsored by the UN, this event drew environmental and political activists from all over the world. Seventeen thousand or more people (or their organizations) paid their own way (or their organizations did) to discuss the social and environmental situation around the world. Here a radical environmental and social agenda emerged and alternative treaties were written. The Earth Summit represented the critical social politics that had been emerging over decades, such as international feminism, indigenous peoples’ rights, post-Marxist and post-colonial analyses, peace, human rights, and environmental agendas. The crucial presence of these groups pressured the UNCED’s official governmental representatives to strengthen their environmental commitments, with particular attention to marginalized peoples. One result of UNCED and the Earth Summit was that it was now evident that citizens groups had developed their own analyses and viewpoints, were no longer going to accept their government’s positions, and would be very active in planning and presenting alternatives. One of the most dynamic conversations took place at the Women’s Tent – Planeta Femea – with speakers such as Wangari Matthai, Peggy Antrobus, Bella Abzug, Vandana Shiva, and over a hundred other engaging radical feminists, all of whom asserted strongly that the environmental crisis is connected to the oppression of women. The women’s caucus worked hard to make the negotiators respond to the world’s most disadvantaged peoples, especially women, who make up the majority of the world’s poor in every country and are critical to sustainable agriculture and poverty eradication.

Others, such as the Canadian Scientist and television documentarian David Suzuki, North American Indian Faithkeeper Chief Oren Lyon of the Onondaga, economist Hazel Henderson, and world-famous television oceanographer-documentarian Jacques Cousteau, and many more, brought a sharp and multidisciplinary focus on the complexity and urgency of the environmental crises around the world. Religious voices were woven through-out these presentations. Oftentimes there was an open speaker forum, such that the conversation was participatory, democratic and lively. Music from indigenous drummers, the Earth musician Paul Winter, and the North American popular singer John Denver, brought home the need to connected together spirituality, music and politics.

Thousands of journalists reported on Rio 1992. This event showed clearly the signs of a global citizens movement, which continued on to Rio+10 and is manifested in the World Social Forum.

A strong religious voice promoting environmental sustainability and social justice emerged at Rio and continued to develop through subsequent United Nations environmental events. The World Council of Churches, the Vatican, and representatives of other world religions, notably Judaism, Islam, Buddhism, Bahá’í for example were represented at the 1992 Earth Summit. The Dalai Lama played a significant role as a spokesperson for religious sensitivities. He spoke at UNCED and especially the Earth Summit, offering a sunrise ceremony for participants at the latter venue. Given his respect for diversity and reputation for moral and spiritual integrity the Dalai Lama was able to call to awareness the many religious traditions that teach the sacredness of the Earth. Reverence for the Earth was a dimension added to intense environmental and social analysis, which strengthened both. His presence also brought a certain spiritual authority to the NGO community at the Earth Summit, as it pressured the UNCED delegates to take action. In addition, hundred of indigenous peoples gathered nearby at Altimura and brought both indigenous teachings and a powerful political presence to the events. They focused attention on the importance of protecting “Mother Earth” and helped contribute to the growing appreciation among some United Nations officials and delegates of the value of their cultures and “traditional ecological knowledge.”

Although many religious traditions were present in Rio, the overall effect was an interreligious cooperation on social and environmental issues. The fact that religious leaders from around the world, representing many faiths, symbols and customs, could join as one voice in claiming the religion is an integral aspect of any viable solution. Rituals occurred at many times, and most often in a combining of rituals, teachings and wisdom. This multi-religious presence registered the need for religions to work together, and initiated a host of public and political collaboration on environmental issues. As well, religious leaders were often on panels where economics, human rights, gender equity and biodiversity were discussed, which led to an understanding that religion is an integrated voice in the conversation and solutions.

A proposal for an “Earth Charter” may prove to be the most significant religion-related development at the UNCED. This initiative mimics the strategy that guided the
United Nations Declaration on Human Rights, in which ratification by member-states is sought as a means to leverage better environmental behavior among individuals, institutions, and nation-states. Although not officially embraced at the UNCED the idea was soon championed and developed by influential actors in the non-governmental community.

The Earth Charter was initially brought forward by Maurice Strong, the Canadian who was the main organizer of the Earth Summit. In subsequent years Strong laced his speeches promoting the Charter with Gaian spirituality. The Charter’s most famous early proponent was Mikhail Gorbechev, the former leader of the Soviet Union, who promoted Glasnost and presided over the Soviet Union’s rejection of communism, before going on to serve as the President of Green Cross International, which is devoted to turning international institutions green. Less well known is that Gorbechev’s environmentalism was grounded in a biocentric axiology in which “life has value in itself” (Gorbechev 1997:14), and a pantheistic, earthen spirituality, as he put it, “I believe in the cosmos . . . nature is my god. To me, nature is sacred. Trees are my temples and forests are my cathedrals” (1997: 15). It is not uncommon for actors engaged with the United Nations’ sustainability efforts to express such spirituality.

After the UNCED at Rio, the next United Nations Conference on environment and development was labeled the World Summit on Sustainable Development (WSSD) and held in Johannesburg, South Africa from 26 August to 4 September 2002. This summit was the largest UN conference ever held, with 65,000 participants, including 104 heads of state, and with representatives from over 8000 NGOs and voluntary associations. There were, however, fewer heads of state than at Rio; in contrast, there were many more NGO representatives and other citizens. The conference was contentious as it spotlighted the growing imbalance in living standards between developed and less developed nations. According to most observers, the progress that was made on a number of issues was insignificant when compared to the scale of the problems, and overall the conference failed to gain a comprehensive implementation plan for Agenda 21, a chief conference objective.

There was, however, significant evolution in the religious, ethical challenge to business as usual by the nation-states. A “Sacred Space” was designated at Ubuntu Village, for example, the main exhibition venue, where interfaith ritualizing and prayer for the well-being of the Earth’s community of life was a regular occurrence. The primatologist Jane Goodall, for example, spoke widely from the official venue as well as at the venue devoted to non-governmental organizations representing “civil society” and at a conference organized by the International Union for the Conservation of Nature. She brought her own biocentric ethics and animistic spirituality to a wide audience, including during one session devoted to promoting the Earth Charter, which by 2002 had been through many drafts and had been officially brought before the United Nations. At this Earth Charter celebration, an “Arc of Hope” was present, which was on its own pilgrimage around the world, taken by those promoting this initiative. Its outside was adorned with Earth-related symbols from the world’s major religious traditions, and inside of it, in addition to messages of hope from children around the world, was the Earth Charter itself, as a new sacred text, painstakingly scribed on papyrus. The Charter was mentioned favorably by a number of heads of states, or their representatives, during the WSSD, and in the conference’s political declaration, a phrase from it urging respect for the wider “community of life” remained in the final text, which was the first such reference in a United Nations International Law document, according to Stephen Rockefeller, one of the Charter’s most influential proponents (email correspondence after the conference).

Jane Goodall and some other important figures who had promoted Earth-focused spirituality at the official WSSD venues also appeared at the so-called “People’s Earth Summit,” held nearby at an Anglican school, which became during the WSSD the epicenter of anti-globalization resistance. At that venue, spiritualities of connection and belonging to an Earth considered sacred were often expressed, even being included in declarations protesting the failure of the WSSD itself to take decisive action to protect the environment and promote social justice. African traditional religions and religious leaders (Sangomas) were given a special place of honor. Among the well-known activists and scholars speaking at that venue, in addition to Goodall, were the ecofeminist Vandana Shiva and the anti-globalization leader Helena Norberg-Hodge. For them and others at the venue, “disconnection” with nature was viewed as a fundamental cause of environmental decline and “reconnecting with nature” as the antidote. African Sangomas led rituals to connect people to the ancestors and solicit their guidance and power for the present environmental struggle, explaining that in African traditional religion the ancestors live in a corporeal world connected to this one, and that the well-being of the Earth and the worlds inhabited by the ancestors are connected, and that environmental protection is necessary for our well-being not only in this world, but also in the one to come.

But it was not only at the WSSD’s margins that Earth-related spirituality appeared, and was evolving. In addition, the Japanese power industry ran expensive advertising in the International Herald Tribune under the headline “Let’s Be Grateful to Mother Earth”, then defending nuclear power as an energy source. Less commercially, the major institutional religious actors who had been present at the Rio Summit were represented again, issuing
position papers, and endeavoring to influence delegates toward strong positions in defense of ecosystems and for greater equity in the distribution of the world's natural resources. Perhaps even more significant were developments in Earth-related spiritualities beyond the sphere of institutional religions, some of which may presage the emergence of a kind of non-sectarian global civic Earth religion.

Jane Goodall, South African President Thabo Mbeki, and the Secretary-General of the UN, Kofi Annan, for example, along with many other dignitaries, led a pilgrimage on 1 September to Sterkfontein, which was located near the WSSD site, and had been inaugurated in 2001 by the United Nations Educational, Scientific and Cultural Organization as a World Heritage Site. There the Austra-lothecus, an extinct form of pre-humans dating to 4 million years ago, had been found in the 1930s, leading the place to be called the "Cradle of Humanity." Mbeki himself gave a speech there (and during his comments during the WSSD's opening ceremony) and although not overtly religious, his words were in many ways reminiscent of the Epic of Evolution, expressing a reverence for the natural world as the habitat of humanity. He asserted that this site in particular, and evolution in general, shows the kinship of all humanity, and the interconnectedness of all life forms. The pilgrimage to and celebration of this site was remarkable, as was the way in which it was repeatedly mentioned at the WSSD and viewed as relevant to the conference's mission, given that so many, on religious grounds, reject a Darwinian understanding of human origins, and because politicians generally avoid making pronouncements that might give offense. Even the pageantry of the conference's opening ceremony assumed an evolutionary understanding, implied a reverence for life, and envisioned an (at least) quasi-religious utopian hope for the reharmonization of all life on Earth. Such events suggest that the consecration of evolutionary narratives is making progress beyond the figures and religious enclaves that have birthed and nurtured such religious production.

The United Nations has thus become a venue where the world's religions and newer forms of religiosity increasingly press an environmental agenda upon nation-states and international institutions. Increasingly these diverse voices express the conviction that all is interconnected and that the Earth and its living systems are inherently valuable and sacred in some way, understood either as divine themselves, or as divinely imparted gifts from a beneficent Creator.

P Universal Pantheist Society

Founded in 1975, the Universal Pantheist Society (UPS) is the world's oldest membership organization dedicated to the advancement of modern pantheism. The Society's stated purposes are to unite Pantheists everywhere into a common fellowship, to undertake the conveyance of information about Pantheism to the interested public, to encourage discussion and communication among Pantheists, to provide mutual aid and defense of Pantheists everywhere, to stimulate a revision of social attitudes away from anthropocentrism and toward reverence for the Earth and a vision of Nature as the ultimate context for human existence, and to take appropriate action toward the protection and restoration of the Earth.

The Society's name underscores its "universal" outlook, not tied to any single view of pantheism, but rather recognizing a diversity of viewpoints within it. UPS accepts and
explores various interpretations of pantheism, stressing the importance of each member’s personal pantheistic beliefs. Recognizing that freedom of belief is inherent in the Pantheist tradition, the UPS’s bylaws prohibit any particular interpretation of Pantheism or imposition of any particular dogma.

Comments by members on what Pantheism means to them reveals the insights that are our collective faith. One member stated simply: “Being one with all life and nature.” Another said, “All are one – I am a part of nature not above nature.” Similarly, another wrote, “I am somewhat surprised, but delighted to learn that there are other Pantheists . . . I find a grand Unity; a wonderful Oneness with the Universe.”

This last statement shows Pantheism is not usually something that someone hears from others and then decides to become. Instead, our members typically say they already know how they feel and what they believe about religion and nature, and rejoice when they find the name “Pantheism,” which they find an apt term for what they already believe. One new member wrote: “I feel a strange feeling of relief – because for many years I felt the forces of nature were ‘God’ – without ever hearing about Pantheists.”

Such statements testify that despite the diversity of viewpoints, members share one consistent direction in looking toward the natural world for our source of spiritual enrichment. Pantheism is an ancient faith experiencing a modern renaissance. Out of this understanding the UPS was born.

Accordingly the overall vision of the Society is more attuned to promoting reverence for nature and an ethical pantheism of responsible action and life-affirming practices than philosophical debate regarding the nuances of religion or philosophy. Persons joining the UPS may engage in seeking freedom and nourishment of religious experience from fellow pantheists and through the practice of the spiritual path of Pantheism in ways meaningful to themselves.

UPS publishes a quarterly journal Pantheist Vision and maintains a website offering an array of material on pantheism, including articles, reading lists, and members’ reflections on their beliefs. An online forum addresses questions about pantheism, lifeways, and other issues. UPS hosts an Ecological Community Preservation Fund that encourages donations from members to protect natural habitats.

How do we treat the ground beneath our feet? What is the attitude of Western civilization to the ground on which we walk and live? This ground is always, of course, part of land, and the approach of Western civilization to land has been to treat it as a *fabula rasa* on which individuals and societies are free to impose their own designs. This is true in every society which has been subjected to regimes of Westernization/modernization: land, in all its ecological, topographical and geological particularity, has been reduced to a neutral substrate to be divided up in accordance with abstract geometrical principles.

This approach has been described as a Euclidean one: it imposes a conceptual grid of straight lines on land, and land is then parcelled up into the discrete, usually rectangular “blocks” of the surveyor’s plan. The blocks are treated as separate entities, generally leveled or otherwise physically modified to constitute the “blank sheet” that can then accommodate the designs of its subsequent “owners.” In this process little if any account is taken of the contents even of adjoining blocks, let alone of the character of the region at large. The bumps and curves of actual things, the particularity of the actual ground on which we stand, is regarded as incidental, contingent; the world as it is given to us is mere “scenery,” a manifold of “appearances” which can be replaced and rearranged, like theatrical backdrops, to suit our purposes. All the world is indeed, from this point of view, a stage.

Why has the West opted for this approach and why is it wrong to do so? Suffice it to say here in answer to this very large question that the Euclidean approach follows from a worldview according to which the fundamental metaphysical datum is not land, in all its particularity, but matter, conceived as neutral substrate. From this point of view, the objects that we see around us and the ground beneath our feet are just the forms that this neutral substrate, this essentially undifferentiated matter, happens to take at a particular point in space and time. Neither objects nor ground possess integrity of their own or intrinsic significance. There is thus no reason why we should not rearrange this matter to suit our convenience. The Euclidean grid is a correlate of this view and serves as a conceptual tool for optimizing our use of matter.
If we are to respect the world as it is given to us however, if we are to adapt our thinking and our practice to the “lie of the land,” following the original contours of the environment rather than imposing our Euclidean grid, then we need a metaphysics which affirms that the world as it is given to us does indeed possess a certain integrity. Such metaphysics will involve an ascription of life to the world: the things around us and the ground beneath our feet will harbor ends and meanings of their own, ends and meanings which they can moreover share with us. Such a view of the world, as alive with a life of its own and potentially communicatively open and responsive to us, of course suggests the possibility of new forms of praxis and a new poetics to match.

Does environmentalism hold the key to such a praxis and such a poetics? In its traditional forms, hardly. As Aboriginal philosopher, Mary Graham, says, environmentalism is just another Western “ism.” It is just another grid that we impose on the world, failing to notice the contours of the given. In this sense it is as decontextualized as the rest of Western praxis. Consider, for instance, how environmental organizations are typically housed in ordinary offices – neutralized, decontextualized spaces – which environmentalists themselves treat in as instrumental a fashion as real-estate agents treat other “property.” More generally, environmentalists tend to ignore the world as currently given, urbanized and industrialized and ecologically “fallen,” in favor of a dream, a “mise-en-scene,” of restored forests and eco-villages.

We can begin truly to respect the world as it is given to us, to regard it as a thing with ends and meanings of its own which it can in principle communicate to us and in which we can participate, by simply honoring and cherishing the place in which we find ourselves, whether that place happens to fall in the degraded heartlands of the inner city or the pristine expanses of the outback. To affirm the life and integrity of the world is to reinhabit it just as it is, via the local modality of place. To reinhabit the places in which we live is not to raze the smokestacks and freeways that we might find there but to fit them back into larger unfoldings of land and planet and cosmos. It is to embrace our own role in those unfoldings, both at the level of sustainable practices and at the level of communicative exchange: by engaging with place communicatively, by singing it up, as indigenous people say, we encourage it in its unfolding and become implicated in its ends. In this way a dialogical poetics begins to evolve out of a praxis which turns around engagement with the given. Indeed, praxis and poetics become inseparable, because all the praxes of everyday life constitute interactions with world, and hence in a reawakened world all these interactions will have a dialogical, and hence a poetic, potential.

One example of such an integrated praxis-and-poetics of reinhabitation in an urban context is CERES (Centre for Education and Research in Environmental Strategies), an environment park in the inner city of Melbourne. CERES differs from most environmental organizations in that it is first and foremost a site. That is to say, it is not merely housed on a site; its identity is inextricable from the site itself.

CERES started out twenty years ago on a degraded ten-acre lot on the banks of the Merri Creek. In its early days it was used by a number of community groups for small environmental projects. As these groups had few resources, they had no alternative but to work with the site as it was, adapting their plans to the contours of the land and to the materials at hand. No “master” plan prevailed. In consequence, the site developed organically, taking shape by a kind of natural selection of appropriate initiatives rather than by any premeditated design. Since the site was “in charge” of its own regeneration in this way, it soon assumed a life of its own, emanating a palpable presence. Attuning to this presence, people developed a sense of loyalty to the site, a loyalty which also generally translated into loyalty to CERES’ organizational aims. By inducing this custodial sentiment in people, the site enabled CERES, as an organization, largely to transcend ideologies of the political left or right, and to attract a true community to itself on its own account.

CERES then represents an instance of environmentalism in a custodial and dialogical mode. The role that naming has played in the “singing up” or “en-chanting” of place in this instance is notable. “Ceres” is, of course, the Roman name for the Greek grain goddess, or goddess of fertility, Demeter. The original choice of this name – on the one hand an allusion to an ancient fertility goddess of the settler peoples and on the other an acronym for a thoroughly technical exercise in scientific intervention – accurately portended the unique blend of technoenvironmentalism and reenchantment that would in time give rise to this now blossoming locus of reinhabitation. But the name functioned not only descriptively and predictively in this way, but also as an invocation, a call to the sacred forces of renewal in the land. In this sense CERES’ intent was dialogical from the start. Though the call was drawn from the mythic memory of a colonizing culture, it was nevertheless addressed to this land, as it now is; it was thus less a homage to a foreign past than an attempt, in an only dimly remembered idiom, at dedication to an indigenous presence. The resacralization of this degraded site via its dedication to Demeter has in any case been uncannily successful: Demeter’s myth is being played out with extraordinary appositeness in its present antipodean setting.

What is this myth? It is, of course, a myth of descent and return. Demeter loses her beloved daughter, Persephone, to the god of the underworld. In her desolation she withdraws the life-force from the land; plants wither, animals cease to thrive or give birth. The goddess retreats, in her grief, to Eleusis. Eventually Persephone, who has
become Queen of the Underworld, is restored to Demeter, but only for part of each year. Reunited with her daughter, Demeter renders the land fruitful again, and thereafter Persephone’s descent marks the onset of winter, her return the arrival of spring.

The CERES site itself started out as a quarry, a hole in the ground, a gateway to the underworld. Subsequently, it was a tip – the very image of waste, desolation, blight. Then, twenty years ago, when the goddess Demeter was invoked, the process of renewal began. The soil, originally compacted and barren, gradually became fertile again. The ground sprouted with gardens and groves; animals (particularly pigs, the creatures sacred to Demeter) made their home there; and people – especially schoolchildren – came from far and wide to visit the site and learn about the ways of renewal, exemplified in windmills and solar generators, methane digesters and grey water systems, worm farms and native permaculture. There was music and dancing and art, as the devotees of Demeter understood the need for celebration as much as for work. There were many festivals, notably the annual Kingfisher Festival.

In classical times, the cult of Demeter and Persephone gave rise to the most revered and hallowed event in the religious calendar of the ancient world: the initiation rites at Eleusis. There, where Demeter was believed to have grieved for her daughter, a large-scale enactment of the descent of the goddess was conducted each spring, for the purpose of revealing to initiates the promise of regeneration hidden within the mystery of death.

In an almost eerie resurrection of the Eleusinian Mysteries, adapted to the present place and time, the Return of the Sacred Kingfisher Festival is held at CERES each spring. The recent return of this little azure bird, the sacred kingfisher, to its homelands along the Merri creek, after the long “winter” of colonization/development/modernization, affords an appropriate indigenous Australian expression of the sacred daughter’s return.

The festival brings hundreds of local performers of different ethnicity and cultural provenance – schoolchildren, dancers and artists – together with thousands of local residents, environmentalists and activists, in a cathartic, high-energy celebration of place. Its dramatic reenactment of the retreat of the kingfisher in the face of ecological holocaust and its return in response to the efforts of local people to regenerate their “country” through revegetation and restoration, symbolizes the beginning of a new “season” of peaceful coexistence between people and land in this locality. Mythic elements from Aboriginal culture are woven into the proceedings, and the Aboriginal custodians who lead the entire performance “initiate” non-indigenous Australians into ancient local rituals of place, thereby inducing a more custodial consciousness in the new peoples, and inviting all, indigenous and non-indigenous alike, to become “reconciled” as one people through their common commitment to homeplace. With a blend of forms faithful to the land and its first and later peoples then, but also to the archetypal meaning of its eponymous goddess, CERES both celebrates and powerfully invokes, via this festival, the return of life, of fertility, to our blighted planet.

The Kingfisher festival is an instance of a participatory poetics, an event conceived and presented wholly in place. It is an event which could not be “staged” anywhere but at CERES. Each year, moreover, the “festival” comes closer to being a ceremonial event, with “audience” being invited to process along the creek, light tapers and perform other ritual actions in the context of the kingfisher story. Each year too the site joins in, adding cicada choirs and rainbows, for instance, with dazzling appositeness, at strategic junctures.

In so greatly expanding the meaning of its original environmental brief, so that it encompasses the mythopoetic in addition to the technological, and takes as its starting point the actual ground beneath our feet, CERES is perhaps pointing the way, not only for environmentalism but also for something larger than environmentalism. As churches are being closed down and sold off throughout the Western world, perhaps it is time to see “centers” like CERES, which answer to the increasingly ecological tenor of contemporary spiritual sensibilities, taking their place. In such centers people could come together to experiment collectively, both practically and poetically, with new, locally specific ways of being in the world, negotiating a new covenant with reality that would not only sustain “the environment” but would also reconnect us to the sources of meaning in life.

Utopian Communities

Many religions around the world have an ancient myth that people once lived in harmony with nature, but sin expelled humanity from this Edenic environment. Simi-
larly, inhabitants of industrial societies have often longed to recapture the lost bliss they imagine that people enjoyed in traditional agricultural society, marked by brotherhood and communal sharing. On the basis of such myths, utopian experiments have sought to revive harmony between humans and between humanity and nature. These are worldwide phenomena, but the utopian communities of the United States have been especially well documented.

Sects and Cults
Some of the most successful communes have been Protestant sects in the German Anabaptist tradition that migrated to North America: notably Amana, Harmony, Zoar and the Hutterites. A sect is a religious movement that broke away via schism from a larger and less intense denomination, and that seeks to create a more perfect version of the religious tradition in which it arose. The members of such sects tend to have long-standing social bonds with each other, and their internal group cohesion is so strong they often lose bonds to the surrounding society and thus are well prepared to establish their community in a new land.

Because utopian sects try to return to ancient forms of agricultural community, they live close to the land. This means that in many respects they live in harmony with nature, but they also dominate and exploit nature, so their relation to the natural world is fundamentally ambivalent. This can be seen, for example, in the great variation in birth rates across these groups, Harmony producing no children and the Hutterites having among the highest fertility rates of any group in the world. Similarly, they tend to be ambivalent toward technology, often accepting innovations that improve agricultural productivity while resisting innovations that would increase their contacts with secular society.

Other communal groups are sometimes called cults, although this term has such negative connotations that many scholars call them “new religious movements” instead. Technically, a cult is a religious movement that departs significantly from the dominant religious tradition, and cults tend to be founded by individuals, couples, and very small groups of friends. Two extremely well documented examples are the Shakers and Oneida. Both of these have some affinities with conventional Protestantism, but they innovated significantly in both beliefs and practices. Oneida was born in America, whereas the Shakers developed their distinctive way of life in America from a loosely knit group of less than a dozen people that came from England. Because they tend to begin very small, cults must recruit rapidly if they are to survive, and most of them die out very quickly.

Because of their innovativeness, cults are culturally diverse and thus have many different relationships with nature. Some of them, including both the Shakers and Oneida, are very articulate about their philosophies and contradictions. In an 1823 Shaker treatise, A Summary View of the Millennial Church, Calvin Green and Seth Wells argued that communal life was “contrary to the partial, aspiring and selfish nature of man.” Thus, they believed, only actual divine intervention could overcome this sinful nature. John Humphrey Noyes, founder of Oneida, developed techniques for controlling natural erotic urges that would allow men to have sexual intercourse without ejaculating. While ambivalence about human nature runs throughout all major religious traditions, these communal cults take it to an extreme.

Principles of Religious Communes
Scholarly research on utopian societies, both modern and historical, has provided evidence to support a number of scientific hypotheses about these phenomena. First of all, Green and Wells seem to have been right, in a sense, because religious communes tend to last far longer than secular communes, although communes of all kinds tend to die within a generation or two after formation. Second, erotic relations between individual members challenge the social integrity of communes, so successful groups tend to regulate them strictly, sometimes going to the extremes either of celibacy or of organized multipartner sexuality. Sexual tensions among members, and the tension of separation from the surrounding society, may be among the strongest factors causing ambivalence toward nature in general.

During the twentieth century, the proportion of the general population involved in agriculture declined rapidly, and society became heavily urban. This profound shift may have reduced the opportunities for new communal sects that try to re-create essentially medieval agrarian communities, without necessarily reducing the opportunities for more radical communal cults. This suggests that utopian ambivalence toward nature is increasing, with some groups embracing the Earth while others try to escape it. The sect–cult distinction is only a matter of degree, however, and either kind of group can evolve back toward conventional society. For example, the Amana sect became a household appliance corporation, and the Oneida cult became a silverware corporation.

Acknowledging the instability that comes from their experimental character, we can learn much from utopian religious communes about building sustainable society in harmony with the environment. Their transcendent ideals and social cohesion allow them to work cooperatively for shared goals. The material lifestyle of successful communes tends to emphasize efficiency rather than luxury, and their need for social harmony causes many of them to develop effective means for controlling the birth rate. Humanity needs brotherhood and harmony with nature, so utopian religious communes can
provide valuable myths for the twenty-first century and beyond.

Valuing Nature

In a provocative 1997 article for the journal *Nature*, Robert Costanza and 12 colleagues calculated that the Earth's ecological systems and natural resources contributed “ecological services” valued at an average of U.S. $33 trillion per year. The calculations included all renewable ecosystem services but excluded non-renewable resources, such as fuels and minerals. In their valuing of nature, Costanza et al. attempted to be comprehensive, estimating and including values for ecological services that are excluded by market processes but nonetheless provide important benefits. Their estimations of value even included “esthetic” and “spiritual” services provided by nature. In their article, the Costanza group admitted “there are many conceptual and empirical problems inherent in producing such an estimate” (253). However, they also noted that whenever humans make decisions about ecosystems, we are inevitably making decisions about the value of nature, even if only implicitly. Thus, for Costanza et al., it is important to determine explicitly the monetary value of nature for public policy making, despite the difficulties with such financial calculations.

Most contemporary religions also affirm the importance of valuing nature. Such perspectives from religions could also validate the work of Costanza et al. to ascertain financial values for public policy making. Yet, from the perspective of contemporary religions, the assignment of financial worth cannot adequately capture the full value of nature. For example, how is it possible to assign a financial value for spiritual ecoservices provided by nature? Rather, financial valuing of nature would be subsumed under a broader, overarching valuation.

In the creation story of Genesis 1 – which is shared as sacred scripture by the three Abrahamic traditions of Judaism, Christianity, and Islam – God follows a pattern of creating, then seeing and judging that what has been created is good. The chapter concludes with God’s final evaluation: “God saw everything that he had made, and indeed, it was very good. And there was evening and there was morning, the sixth day” (Gen. 1:31, NRSV) Thus, from the perspective of the Abrahamic traditions, creation is valued because God has judged it good.

Then God said, “Let us make humankind in our image, according to our likeness; and let them have dominion over the fish of the sea, and over the birds of the air, and over the cattle, and over all the wild animals of the Earth, and over every creeping thing that creeps upon the Earth” (Gen. 1:26, NRSV).

White claims that this elevation of humanity serves to devalue the rest of creation, thus giving humans an implicit permission to degrade the environment as they please. As White observes, “Christianity . . . not only established a dualism of man and nature but also insisted that it is God’s will that man exploit nature for his proper ends” (18).

There are some obvious flaws in the harsh critique of Christianity represented by White. For instance, if Western Christianity is the principal factor creating attitudes that devalue nature and lead to its degradation, then logically we would not expect ecological crises to occur in areas informed by other cultural paradigms. Unfortunately, this is not the case and other areas that are not predominantly Christian have also had ecological crises. Despite such flaws in the position represented by White, many Christian thinkers have taken the broad criticism seriously.

van der Post, Laurens (1906–1996)

Sir Laurens Jan van der Post was born in the Orange Free State of South Africa on 13 December 1906 and he died shortly after his 90th birthday in London. His was a life of travel to the far reaches of the Earth, an Earth he loved and fought hard to preserve: his long and creative life as a soldier, journalist, author, explorer and conservationist earned him a knighthood and the honor of Commander of the British Empire.

Sir Laurens spent the 1930s writing and farming in England and his first book, In a Province, was pioneering in its dealing with the tragedy of apartheid. After the outbreak of World War II, he enlisted in the British Army and served until 1942 in Abyssinia, Syria and Southeast Asia, where he was then captured by the Japanese Army on the island of Java. During the ensuing three and a half years in a prisoner-of-war camp, he was instrumental in organizing extensive educational efforts among his fellow prisoners. The experiences of this camp were described in his two books, The Seed and the Sower (later made into the film, “Merry Christmas, Mr. Lawrence”) and The Night of the New Moon.

All told, Sir Laurens wrote more than two dozen novels, along with countless short stories, memoirs and essays dealing with psychology, the nature of prejudice and good and evil, the environment and the importance of story in our lives. One of his many talents was the ability to weave these themes together into one and the same character or work, for example in his telling of the Bushmen stories in ways that illustrate basic human psychology and inspire a love for nature. The best known of his books are The Lost World of the Kalahari and The Heart of the Hunter. He also made numerous films for the BBC, including All Africa Within Us and Jung and the Story of our Time.

His encounter and ensuing friendship with the Swiss psychiatrist Carl Gustav Jung shortly after his return from the war was decisive and marked the beginning of his striving to understand outer and inner nature, macrocosm and microcosm. He combined Jung’s philosophy with his own that had been formed from his African and Asian jungle experiences, and shared it widely with readers, viewers and friends for the rest of his life.

As a result of talking to Jung about the Africa I had within myself, I was re-confirmed into a new area of the human spirit which had been singularly mine intuitively ever since I was born. Nothing seemed to me more wonderful than the prophetic observation by Sir Thomas Browne, the intuitive alchemist figure of Norwich in the Elizabethan age: “We seek the wonders without that we carry within – we have all Africa and its wonders within us” (van der Post 1998: 311).

Sir Laurens lived his life with passion, and one of his greatest passions was the preservation of the Earth, our environment. Gifted storyteller that he was, he spent much of his time and energy in the last years of his life telling stories about the creatures of the Earth and pleading that more attention be given to our environment. He freely shared his views with gatherings of people large and small, in interviews and in his books and other writings. In an
interview conducted for Earth Day in 1990, he responded to a question about why it is more important today than ever for people to experience nature and wildlife first-hand, a primary goal of an organization he championed, The Wilderness Foundation:

We are trying to conserve the spirit of the conservationist in people . . . If you keep the Earth as close to the initial blueprint of creation as you can, and you bring a person into contact with it, a person who is not whole, from a lopsided society, poor, that person changes. I’ve never known it to fail. Problem children, all sorts of people who have lost their way in life, once they’ve had this experience, they’re different (van der Post 1998: 311).

In his 1985 essay entitled, “Wilderness – A Way of Truth,” he wrote:

Some of our scientists talk about “managing wilderness” and this worries me a bit. It is like saying they want to control revelation. But the moment you try to control it, there is no revelation . . . We try to give it elaborate definitions, but we all know what wilderness really is, because we have it inside ourselves. We know it is a world in which every bit of nature counts and is important to us, and we know when it is not there (van der Post 1985: 47).

Sir Laurens spent the final decades of his life not only continuing to write both fiction and historical pieces, but also speaking widely throughout the world promoting the importance of nature and our environment.

Vegetarianism and Buddhism

Buddhist outlooks toward the eating of meat vary by historical periods and traditions, and they often reflect the influence of local cultural practices and social ethos. Generally speaking, Buddhist attitudes toward animals are shaped by the ethical principle of non-injury to others (ahimsa), and by the virtues of compassion, respect, and love that extend toward all beings. The principle of non-injury was shared by Buddhism and other religious traditions in ancient India, and is a core ethical virtue of Indian religions. Its importance in Buddhism can be seen from the fact that the first of the Five Precepts – which define the ethical foundation of Buddhist life and serve as the basis for other forms of spiritual cultivation – is the injunction not to kill any living creatures. While Buddhist texts and leaders often try to discourage the killing of animals, in actual practice there is a wide range of attitudes toward the practice of vegetarianism among different Buddhist groups and traditions, ranging from strict adherence to vegetarian diets to conspicuous consumption of meat by the clergy.

The texts of the monastic code of discipline, the Vinaya, indicate that the early monastic order did not adopt a strictly vegetarian diet. According to these sources Buddhist monks were allowed to eat meat provided it was “pure” by fulfilling three requirements: that a monk who is given a meat dish has not heard, seen, or become suspicious that the animal was specifically killed for him. Monks were of course prohibited from killing animals, or even small creatures that might reside in water used by them. Because for their food they relied on alms received from the faithful, monks were supposed to eat whatever they were offered while practicing detachment from the sensual pleasures associated with eating. In the Vinaya there is also the story of the Buddha’s refusal to make vegetarianism compulsory for all monks, when that was proposed by his evil cousin Devadatta as part of a request to institute a range of new rules initiated by him in order to create schism within the monastic community.

While monks were absolved from any transgression if they consumed meat that fulfilled the three requirements, in early Buddhism, killing of animals was regarded as an unwholesome act and was proscribed by Buddhist moral values. It was believed that for lay people the killing of animals brought about negative karmic consequences, while the sparing of animal lives became a cherished Buddhist ideal. The positive regard of animals was reinforced by Jataka stories, which depict previous lives of the Buddha. In a number of these stories the Buddha is depicted as being reborn in a previous lifetime as an animal, and noble feelings and actions are attributed to wild animals such as elephants. A similar point of view was adopted by the famous Buddhist monarch Asoka (r. ca. 265–238 B.C.E.), who recognized the sanctity of animal lives and instituted official days when animals were not to be killed. In one of his inscriptions the Emperor states that he has conferred many boons to animals, birds, and fish, including the saving of their lives. Asoka himself abandoned hunting and eventually prohibited the killing of animals in order to supply food for the court and the imperial household.

Asoka’s example was followed by a number of Buddhist
monarchs, such as Sri Lankan kings who prohibited the slaughter of animals, and Emperor Wu of the Liang dynasty (r. 502–549) in China, who practiced vegetarianism and issued decrees that restricted the killing of animals.

Adoption of vegetarianism became more prevalent with the emergence of the Mahayana tradition. That was largely motivated by an increased emphasis on compassion as a prime Buddhist virtue, although external criticisms of Buddhist meat eating might have also played some part. Mahayana promoted universalistic ethics that was predicated on the notion that the pursuit of the bodhisattva path is to be undertaken for the sake of benefiting all beings. Since animals, like all other creatures, were objects of the bodhisattvas’ compassionate regard and selfless salvific acts, it was deemed improper for Mahayana practitioners to consume their flesh. Explicit critiques of meat eating appear in a number of Mahayana scriptures and other texts composed by leading figures of the movement. Arguably the most trenchant critiques can be found in the Lankavatara Scripture, which presents a series of arguments that highlight the evils of meat eating and includes a call to disallow the practice. According to the scripture, eating of animal flesh is disgusting, creates hindrances to spiritual progress, contributes to bad health, and leads to unpleasant rebirth. Conversely, in addition to being healthy, the adoption of a vegetarian diet accords with Buddhist values and ideals, aids spiritual cultivation, and helps one to avoid the negative karmic consequences of meat eating. The scripture also takes to task the permissive attitudes of earlier Buddhist texts and traditions, proclaiming that arguments made in support of meat eating, including the notion that meat is pure if it fulfills the three requirements, are spurious. The text also states that the Buddha never permitted the eating of meat, and for good measure it also explicitly prohibits the eating of meat by all disciples of the Buddha under all circumstances.

With the transmission of Mahayana forms of Buddhism to China, vegetarianism became a characteristic feature of Chinese Buddhism. From the medieval period onward meat eating was prohibited in Buddhist monasteries, and Chinese monks and nuns adopted a strict vegetarian diet that also precluded the consumption of eggs, diary products, and certain types of leeks (which more or less amounted to veganism). Vegetarianism was given additional canonical legitimacy by the Brahma Net Scripture, an apocryphal text composed in China, which contains a series of bodhisattva precepts that became accepted as normative by Chinese Buddhists. Since this text prohibits the eating of meat, abstinence became binding for all monks and nuns who received bodhisattva ordinations as part of their entry into the monastic order. Vegetarianism was, and still is, practiced by lay Buddhists as well. Vegetarian feasts are a common feature of Chinese Buddhist festivals, and lay devotees who have not adopted a vegetarian diet often abstain from meat eating on certain observance days, such as festivals dedicated to popular bodhisattvas. Vegetarianism also had a broad effect on traditional Chinese society. Under Buddhist influence, during the medieval period the imperial government issued decrees that restricted or prohibited the slaughter of animals on certain dates, and vegetarianism was also adopted by Daoist monastic orders. Vegetarianism continues to be a basic feature of Chinese Buddhism, which remains distinct among the Buddhist traditions by its stress on the injunction against the eating of meat.

The practice of vegetarianism was also transmitted to other areas of Asia that adopted Chinese forms of Buddhism, viz. Korea, Japan, and Vietnam. In Japan that influence extended until the onset of the modern period, as by and large in traditional Japanese society most people lived on a largely vegetarian diet (although they consumed fish). Meat eating became more prevalent from the late nineteenth century onward with the greater emphasis on modernization and the acceptance of Western mores. With the increased secularization of the Buddhist clergy, the various Buddhist sects abandoned the age-old prohibitions against meat eating, although training monasteries, especially ones belonging to the Zen sects, formally retain vegetarian diets for priests undergoing formal training. Among other Mahayana traditions, vegetarianism is not widely practiced in Tibetan Buddhism. Although compassion and love for all beings are regarded as cardinal virtues by the Tibetans, the widespread meat eating by the clergy is largely explained by the difficulty of practicing a vegetarian diet in Tibet’s harsh climate.

Although the prohibition against killing and the call to adopt attitudes of kindness toward animals are accepted as normative by the contemporary Theravada traditions, the practice of vegetarianism is a rare occurrence in all Theravadin countries. In Sri Lanka most Buddhists avoid killing animals (which often does not extend to fish), and most butchers are Muslims. The Buddhist concern with killing is also reflected in the relatively low consumption of meat and the rarity of making offerings of red meat to the monks, although few Buddhists identify themselves as vegetarians. Meat eating is much more prevalent in other Theravada countries such as Thailand, where the vast majority of monks engage in conspicuous consumption of large quantities of meat. There vegetarianism is often frowned upon, although there are a few monks who are trying to promote the idea of vegetarianism. Vegetarianism is much more widespread among Western Buddhists. That seems to be influenced by a number of disparate factors, including increased interest in vegetarianism by the general society, adoption of specific views about Buddhist values and lifestyles, and adherence of ethical principles informed by ecological concerns.

**Vegetarianism and Judaism**

In traditional Jewish thinking, not only are normative laws regarded as binding solely upon the authority of divine revelation, but ethical principles as well are regarded as endowed with validity and commended as goals of moral conduct and eschew the flesh of animals. Permission to eat the flesh of animals was granted only to Noah because, subsequent to Adam’s sin, mankind could no longer be held to such lofty moral standards. Nevertheless, they argue, people ought to aspire to the highest levels of moral conduct and eschew the flesh of animals.

In point of fact, this talmudic dictum is simply a terse statement of the relevant law prior to the time of Noah, but is silent with regard to any validating rationale. The classic biblical commentators found entirely divergent explanations for the change that occurred with regard to dietary regulations.

An examination of the writings of rabbinic scholars reveals three distinct attitudes with regard to vegetarianism:

1) The Gemara (BT *Sanhedrin* 59b) declares that an ignoramus ought not to partake of meat:

   “This is the law of the animal . . . and the fowl” (Lev. 11:46): whoever engages in [the study of] the Law is permitted to eat the flesh of animals and fowl, but whoever does not engage in [the study of] the Law may not eat the flesh of animals and fowl.

This text should certainly not be construed as declaring that meat is permitted only to the scholar as a reward for his erudition or diligence. *Maharsha* (Rav Shmuel Eliyzer Halevi Eidels, fifteenth century) indicates that this text simply reflects a concern for scrupulous observance of the minutiae of the dietary code. The ignoramus is not proficient in the myriad rules and regulations governing the eating of meat, including the differentiation between kosher and non-kosher species, the purging of forbidden fat and veins, the soaking and salting of meat, etc.

2) A number of medieval scholars, including R. Isaac Abravanel (also spelled “Abarbanel,” 1437–1508) in his commentary to Genesis 9:3 and Isaiah 11:7, and R. Joseph Albo (c.1380–1444) in *Sefer ha’Ikarim*, Book III, chapter 15, regard vegetarianism as a moral ideal, not because of a concern for the welfare of animals, but because of the fact that slaughter of animals might cause the individual who performs such acts to develop negative character traits, viz., meanness and cruelty. Their concern was with regard to possible untoward effect upon human character rather than with animal welfare.

Indeed, R. Joseph Albo maintains that renunciation of the consumption of meat for reasons of concern for animal welfare is not only morally erroneous but even repugnant. Albo asserts that this was the intellectual error committed by Cain and that it was this error that was the root cause of Cain’s act of fratricide. Albo opines that Cain did not offer an animal sacrifice because he regarded humans and animals as equals and, accordingly, felt that he had no right to take the life of an animal, even as an act of divine worship. Abel maintained that humans were superior to animals in that they possessed reason as demonstrated by his ability to use intellect in cultivating fields and in shepherding flocks. This, Abel believed, gave human beings limited rights over animals, including the right to use animals in the service of God, but it did not confer upon him the right to kill animals for his own needs. Abel’s error was not as profound as that of Cain, but it was an error nonetheless. And, declares Albo, because Abel shared the error of his brother, he was punished by being permitted to die at the hands of Cain. Cain’s error was egregious in the extreme. Hence he was so lacking in favor in the eyes of God that his sacrifice was rejected. Although he was also guilty of error, Abel’s sacrifice was accepted by God because his error was not as serious as that of his brother.

According to Albo, Cain failed to understand the reason for the rejection of his sacrifice and assumed that, in the eyes of God, animal sacrifice was intrinsically superior to the offering of produce. Since Cain remained confirmed in his opinion that humans and animals are inherently equal, he was led to the even more grievous conclusion that just
Vegetarianism and Kabbalah

Abstinence from the flesh of animals is also the subject of scattered comments in kabbalistic writings. R. Moses Cordovero, *Shi’ur Komah* (Warsaw 1883: 84b), advises that a person seeking spiritual perfection should “distance” himself from eating meat. Accepting the principle of transmigration of souls, R. Moses Cordovero expresses the concern that the soul of a wicked human being may be present in a slaughtered animal and exert a deleterious influence over the person who consumes its flesh. In a footnote appended to that text, the editor remarks that, according to this thesis, one who is imbued with the Divine Spirit, and hence capable of determining that no such soul is incarnated in the animal he is about to eat, has no reason to refrain from eating meat.

A similar position is attributed to R. Eliyahu de Vidas’ *Reishit Chokhmah* (sixteenth century) in *Sdei Chemed* (an encyclopedia of Jewish Law by R. Chayyim Chizkiyahu Medini, nineteenth century), “Ma’rekeh Achipha” sec. 1. *Reishit Chokhmah* is cited as stating that one should not eat the flesh of any living creature. The reference appears to be to the Amsterdam, 1908 edition of *Reishit Chokhmah*. However, an examination of pp. 129b–30a of that edition reveals that, rather than advising total abstinence from the flesh of living creatures, *Reishit Chokhmah* offers counsel with regard to the time of day most suitable for the partaking of meat.

Opposition to the consumption of meat appears to be a narrowly held view even within the kabbalistic tradition. A number of kabbalistic sources indicate that, quite to the contrary, the doctrine of transmigration yields a positive view regarding the eating of meat. According to these sources, transmigrated souls present in the flesh of animals may secure their release only when the meat of the animal has been consumed by a man. The *mitzvot* performed in preparation and partaking of the meat and the blessings pronounced upon its consumption serve to “perfect” the transmigrated soul so that it may be released to enjoy eternal reward. See, for example, *Shevet Musar* (by R. Eliyahu Hakohen of Izmir, d. 1729), ch. 36 and R. Tzvi Elimelekh of Dinov (1783–1841, also spelled “Elimelech”), *Bnei Yissakhar, Ma’amarei haShabbatot, Ma’amor* 10 sec. 4, and *Sivan, Ma’amor* 5, sec. 18. Scripture speaks of fish as “gathered” rather than as slaughtered and similarly speaks of the righteous as being “gathered” to their forebears rather than experiencing the throes of death. Righteous individuals who must undergo transmigration in expiation of minor infractions are incarnated in fish in order to spare them the pain of slaughter. See also R. Moshe Teitelbaum (1759–1841), *Yismach Mosheh, Parshat Vayeira*, s.v. vayikach chem’ah v’chalav [Gen. 18:8]. R. Yechiel Mikhel Halevi Epstein (1829–1908), *Kitzur Sh’lah* (Jerusalem, 1960: 161) advises that particular effort be made to eat fish on *Shabbat* so that the souls of the righteous which may be incarnated in the fish be “perfected” through consumption of the fish by a righteous and observant Jew.

R. Menachem Mendel Schneerson (the Lubavitcher rebece, 1902–1994) is quoted as having expressed opposition to vegetarianism, at least tentatively, on kabbalistic grounds. He is reported by R. Shear-Yashuv Cohen (chief rabbi of Haifa and lifelong vegetarian) to have voiced the concern that refraining from consumption of meat will prevent the “elevation of sparks,” a goal that is central to the kabbalists’ view of the human purpose in life (Slae, Min hattai, Jerusalem, 1988).

J. David Bleich
be regarded as proof positive of the superiority of human beings over members of the animal kingdom. Animals could be destroyed by a righteous God only because the sole purpose of those creatures was to serve humanity. Hence, if humankind is to be destroyed, the continued existence of animal species is purposeless. Thus the basic principle (i.e., the superiority of humans over members of the animal kingdom) was amply demonstrated by the destruction of animals during the course of the flood.

3) One modern-day scholar who is often cited as looking upon vegetarianism with extreme favor is the late Rabbi Abraham Isaac Kook. It is indeed the case that in his writings Rabbi Kook speaks of vegetarianism as an ideal and points out that Adam did not partake of the flesh of animals. In context, however, Rabbi Kook makes those comments in his portrayal of the eschatological era. He regards man’s moral state in that period as being akin to that of Adam before his sin and does indeed view renunciation of enjoyment of animal flesh as part of the heightened moral awareness which will be manifest at that time. But Rabbi Kook is emphatic, nay, vehement, in admonishing that vegetarianism dare not be adopted as a norm of human conduct prior to the advent of the eschatological era. Rabbi Kook advances what are, in effect, four distinct arguments in renunciation of vegetarianism as a goal toward which contemporary man ought to aspire:

i) Rabbi Kook remarks almost facetiously that one might surmise that all problems of human welfare have been resolved and the sole remaining area of concern is animal welfare. In effect, his argument is that there ought to be a proper order of priorities. Rabbi Kook is quite explicit in stating that enmity between nations and racial discrimination should be of greater moral concern to humankind than the well-being of animals and that only when such matters have been rectified should attention be turned to questions of animal welfare.

ii) Given the present nature of the human condition, maintains Rabbi Kook, it is impossible for humans to sublimate their desire for meat. The inevitable result of promoting vegetarianism as a normative standard of human conduct, argues Rabbi Kook, will be that humans will violate this norm in seeking self-gratification. Once taking the life of animals is regarded as being equal in abhorrence to taking the life of human beings, it will transpire, contends Rabbi Kook, that in pursuit of meat, people will regard cannibalism as no more heinous that the consumption of the flesh of animals. The result will be, not enhanced respect for the life of animals, but rather debasement of human life.

iii) Human beings were granted dominion over animals, including the right to take animal lives for their own benefit, in order to impress upon human beings their superhuman nature and spiritually superior status. Hence, according to Rabbi Kook, it is impossible for them to enter into the same relationships with animals that they entered into with human beings.

iv) In an insightful psychological observation, Rabbi Kook remarks that even individuals who are morally degenerate seek to channel their natural moral instincts in some direction. Frequently, they seek to give expression to moral drives by becoming particularly scrupulous with regard to some specific aspect of moral behavior. With almost prescient knowledge of future events, Rabbi Kook argues that, were vegetarianism to become the norm, people might become quite callous with regard to human welfare and human life and express their instinctive moral feelings in an exaggerated concern for animal welfare. These comments summon to mind the spectacle of Germans watching with equanimity while their Jewish neighbors were dispatched to crematoria and immediately thereafter turning their attention to the welfare of the household pets that had been left behind.

Despite the foregoing, vegetarianism is not rejected by Judaism as a valid lifestyle for at least some individuals. There are, to be sure, individuals who are repulsed by the prospect of consuming the flesh of a living creature. It is not the case that an individual who declines to partake of meat is ipso facto guilty of violation of the moral code. On the contrary, Scripture states, “and you will say: ‘I will eat meat,’ because your soul desires to eat meat; with all the desire of your soul may you eat meat” (Deut. 12:20). The implication is that meat may be consumed when there is desire and appetite for it as food, but may be eschewed when there is no desire and, a fortiori, when it is found to be repugnant. The question is one of perspective. Concern arises only when such conduct is elevated to the level of a moral norm.

Vegetarianism and Rabbi Abraham Isaac Kook (1865–1935)

Rabbi Abraham Isaac Kook, often referred to by the Hebrew title Rav Kook, was the leading Orthodox Jewish thinker of the Zionist movement. Born in Griva, Latvia, Kook was a leading Talmudic scholar and expert in Jewish law, while also deeply influenced by Jewish mysticism and Hasidism. After serving as rabbi to two Eastern European towns, in 1904 Kook immigrated to Palestine to serve as rabbi of Jaffa. While attending a convention in Europe in 1914, Kook found his return route to Palestine cut off by the outbreak of World War I. He spent the duration of the war in a temporary rabbinical position in London, and afterwards returned to Palestine to serve as Chief Rabbi of Jerusalem. In 1921 he was elected first Ashkenazi (European) Chief Rabbi of Palestine.

Kook’s prolific writings meld traditional Jewish philosophical and mystical ideas with elements of modern European philosophy to create a comprehensive Jewish worldview. He viewed history as the dialectical unfolding of a cosmic drama of redemption, encompassing processes ranging from biological evolution to the spiritual advancement of humanity. At the center of this drama stands the Jewish people, whose own historical development serves as a catalyst for, and harbinger of, the perfection of humanity as a whole, bringing about, ultimately, the perfection of the entire universe both in its material and spiritual aspects.

In this context, the return of the Jewish People to Palestine may be seen as aimed at achieving its rapprochement with physical nature. Kook taught that an unbalanced attachment to nature invites the dangers of idolatry and pantheism. The Jewish people had been exiled from their land in order to distance Judaism from nature and purify Jewish monotheism of idolatrous and pantheistic tendencies. Now that those dangers had been dealt with, the time had come for the Jewish People to return to its land. Immunized against idolatry and reestablished in its home soil, Judaism can safely engage with the physical world in order to perfect and bring to light the holiness implicit in all of reality, including inorganic matter. Building upon earlier traditions, Kook claimed that the Land of Israel (Palestine) is peculiarly endowed with a unique spiritual quality whose influence is necessary for the Jewish People to fulfill their spiritual quest.

Reflecting his belief that every part of the Jewish people plays an essential role in the redemptive process, Kook sought ties with people from all sections of the Jewish population, from the radically anti-religious socialist-Zionists, to the Ultra-orthodox anti-Zionist pietists of Jerusalem. He was something of a controversial figure, antagonizing modernists with his insistence on the absolute centrality of religion in Jewish life, and scandalizing traditionalists by embracing Zionism. True to his belief in the inherent goodness within all phenomena, he viewed secular atheism as a spiritually profound and ultimately beneficial challenge to traditional religiosity. Modernist atheism would catalyze monotheism’s final purification. Similarly, Kook found in the theory of evolution an expression of the cosmic drive toward perfection that informs all created beings.

Kook’s writings on vegetarianism, collected in a pamphlet entitled HaZon HaTzimchonut v’haShalom miV’khinah Toranit (The Vision of Vegetarianism and Peace from a Torah Perspective), have been the subject of great interest and misunderstanding. On the one hand, Kook addressed the morality of human/animal relations in remarkably radical terms. Judaism has traditionally objected to unnecessary animal suffering and to the wanton destruction of nonhuman life. However, these are often regarded within Judaism as spiritually damaging to the human perpetrator, rather than genuinely evil in themselves. Kook went beyond such considerations to speak of human injustice toward animals. Not only is the slaughter of animals for food wrong, but also even the nonviolent exploitation of animal products such as wool and milk constitutes a form of theft!

Kook was careful to explain that full moral consideration for animals should only be implemented when humanity achieves its highest spiritual development in the messianic era. His view is rooted in the ancient Jewish notion that while God originally forbade humans to eat meat (“Behold I have given you every seed-bearing plant upon all the Earth, and every tree that has seed-bearing fruit; they shall be yours for food” [Gen. 1:29]), after the Deluge God permitted it as a concession to human weakness (“Every creature that lives shall be yours to eat; as with the green grasses, I give you all these” [Gen. 9:3]). Kook claimed that while the earlier ban on meat would be reinstated in messianic times, a premature demand for vegetarianism and full justice toward animals would be spiritually destructive. In their present fallen state, people would understand such a demand as implying the essential equality of humans and animals. They would forget humanity’s unique spiritual vocation and lapse into a brutish and purely corporeal existence. Tyrannical governments would use radical campaigns for animal protection as tools for the oppression of humans, and as a propagandistic distraction from the injustices they perpetrate against people. Kook argued that absolute justice for animals should be demanded only after inter-human relations are free of violence, oppression and injustice.

For the time being, Kook taught, many biblical commandments serve to remind us of the present imperfect state of human attitudes toward animals. Jewish laws including careful ritual guidelines for humane slaughter, and the prohibition against eating blood (Deut. 13:23) serve to prepare us for the day when vegetarianism will be required of humans. The law stating, “You shall not boil a
Vegetarianism, Judaism, and God’s Intention

And God said: “Behold, I have given you every herb yielding seed which is upon the face of all the Earth, and every tree that has seed-yielding fruit – to you it shall be for food” (Gen. 1:29).

God’s initial intention was that people be vegetarians. The foremost Jewish Torah commentator Rashi states the following about God’s first dietary regime: “God did not permit Adam and his wife to kill a creature to eat its flesh. Only every green herb were they to all eat together” (Rashi’s commentary on Gen. 1:29). Most Torah commentators, including Rabbi Abraham Ibn Ezra, Maimonides, Nachmanides, and Rabbi Joseph Albo, agree with Rashi.

The Talmud also asserts that people were initially vegetarians: “Adam was not permitted meat for purposes of eating” (BT Sanhedrin 59b).

The great thirteenth-century Jewish commentator Nachmanides indicates that one reason behind this initial human diet is the kinship between all sentient beings:

Living creatures possess a soul and a certain spiritual superiority [to non-human creation] which in this respect make them similar to the possessors of intellect [human beings] and they have the power of affecting their own welfare and their food, and they flee from pain and death (commentary on Gen. 1:29).

God’s original dietary plan represents a unique statement in humanity’s spiritual history. It is a divine blueprint for a vegetarian world order. Yet millions of people have read this Torah verse and passed it by without considering its meaning.

After indicating that people should consume only plant-based foods, God saw everything that he had made and “beheld, it was very good” (Gen. 1:31). Everything in the universe was as God wanted it, in complete harmony, with nothing superfluous or lacking. The vegetarian diet was a central part of God’s initial plan.

The strongest support for vegetarianism as a positive ideal in Torah literature is in the writing of Rabbi Abraham Isaac HaCohen Kook (1865–1935). Rav Kook was the first Ashkenazic Chief Rabbi (Rav) of pre-state Israel and a highly respected and beloved Jewish spiritual leader and thinker. He was a writer on Jewish mysticism and an outstanding scholar of Jewish law. In the early twentieth century he spoke powerfully for vegetarianism, as eventually recorded in A Vision of Vegetarianism and Peace (1961).

Rav Kook believed that the permission to eat meat was only a temporary concession to the practices of the times, because a God who is merciful to his creatures would not institute an everlasting law permitting the killing of animals for food.

People are not always ready to live up to God’s will. By the time of Noah, humanity had morally degenerated. “And God saw the Earth, and behold it was corrupt, for all flesh had corrupted their way upon the Earth” (Gen. 6:12). People had degenerated to such an extent that they would eat a limb torn from a living animal. So, as a concession to people’s weakness, God granted permission for people to eat meat: “Every moving thing that lives shall be food for you; as the green herb have I given you all” (Gen. 9:3).

According to Rav Kook, because people had descended to such an extremely low spiritual level, it was necessary that they be taught to value human life above that of animals, and that they concentrate their efforts on first working to improve relations between people. He writes that if people had been denied the right to eat meat some might
eat the flesh of human beings instead, due to their inability to control their lust for flesh. Rav Kook regards the permission to slaughter animals for food as a “transitional tax,” or temporary dispensation, until a “brighter era” can be reached, when people will return to vegetarian diets. Just prior to granting Noah and his family permission to eat meat, God states:

And the fear of you and the dread of you shall be upon every beast of the Earth, and upon every fowl of the air, and upon all wherewith the ground teems, and upon all the fish of the sea; into your hands are they delivered (Gen. 9:2).

Now that there is permission to eat animals, the previous harmony between people and animals no longer exists. Rabbi Samson Raphael Hirsch argues that the attachment between people and animals was broken after the flood, which led to a change in the relationship of people to the world.

The permission given to Noah to eat meat is not unconditional. There is an immediate prohibition against eating blood: “Only flesh with the life thereof, which is the blood thereof, shall you not eat” (Gen. 9:4). Similar commands are given in Leviticus 19:26, 17:10 and 12, and Deuteronomy 12:16, 23 and 25, and 15:23. The Torah identifies blood with life: “for the blood is the life” (Deut. 12:23). Life must be removed from the animal before it can be eaten, and the Talmud details an elaborate process for doing so.

When the Israelites were in the wilderness, animals could only be slaughtered and eaten as part of the sacrificial service in the sanctuary (Lev. 17:3–5). The eating of “unconsecrated meat,” meat from animals slaughtered for private consumption, was not permitted. All meat which was permitted to be eaten had to be an integral part of a sacrificial rite. Maimonides states that the biblical sacrifices were a concession to the primitive practices of the nations at that time: people (including the Israelites) were not then ready for forms of divine service which did not include sacrifice and death (as did those of all the heathens); at least the Torah, as a major advance, prohibited human sacrifice. God later permitted people to eat meat even if it was not part of a sacrificial offering:

When the Lord your God shall enlarge your border as He has promised you, and you shall say: “I will eat flesh,” because your soul desires to eat flesh; you may eat flesh, after all the desire of your soul (Deut. 12:20).

This newly permitted meat was called basar ta’avah, “meat of lust,” so named because rabbinic teachings indicate that meat is not considered a necessity for life.

The above verse does not command people to eat meat. Rabbinic tradition understands the Torah as acknowledging people’s desire to eat flesh and permitting it under proper circumstances, but not as requiring the consumption of meat. Even while arguing against vegetarianism as a moral cause, Rabbi Elijah Judah Schochet, author of Animal Life in Jewish Tradition, concedes that “Scripture does not command the Israelite to eat meat, but rather permits this diet as a concession to lust” (1984: 300). Similarly, another critic of vegetarian activism, Rabbi J. David Bleich, a noted contemporary Torah scholar and professor at Yeshiva University, states, “The implication is that meat may be consumed when there is desire and appetite for it as food, but it may be eschewed when there is not desire and, a fortiori, when it is found to be repugnant” (1987: 245). According to Bleich, “Jewish tradition does not command carnivorous behavior . . .” (1987: 245).

The Talmud expresses this negative connotation associated with the consumption of meat:

The Torah teaches a lesson in moral conduct, that man shall not eat meat unless he has a special craving for it . . . and shall eat it only occasionally and sparingly. The sages also felt that eating meat was not for everyone: Only a scholar of Torah may eat meat, but one who is ignorant of Torah is forbidden to eat meat (BT Pesachim 49b).

Some authorities explain this restriction in practical terms: only a Torah scholar can properly observe all the laws of animal slaughter and meat preparation. While there are few conditions on the consumption of vegetarian foods, only a diligent Torah scholar can fully comprehend the many regulations governing the preparation and consumption of meat. However, master kabbalist Rabbi Isaac Luria explains it in spiritual terms: only a Torah scholar can elevate the “holy sparks” trapped in the animal.

How many Jews today can consider themselves so scholarly and spiritually advanced to be able to eat meat? Those who do diligently study the Torah and are aware of conditions related to the production and slaughter of meat would, I believe, reject meat eating.

Rav Kook writes that the permission to eat meat “after all the desire of your soul” contains a concealed reproof and an implied reprimand. He states that a day will come (the Messianic Period) when people will detest the eating of the flesh of animals because of a moral loathing, and then people will not eat meat because their soul will not have the urge to eat it.

In contrast to the lust associated with flesh foods, the Torah looks favorably on plant foods. In the Song of Songs, the divine bounty is poetically described in references to fruits, vegetables, nuts, and vines. There is no special b’rakhah (blessing) recited before eating meat or fish, as there is for other foods such as bread, cake, wine, fruits, and vegetables. The blessing for meat is a general
one, the same as that over water or any other undifferentiated food.

Typical of the Torah’s positive depiction of many non-flesh foods is the following evocation of the produce of the Land of Israel:

For the Lord your God brings you into a good land, a land of brooks of water, of fountains and depths, springing forth in valleys and hills; a land of wheat and barley, of fig trees and pomegranates; a land of olive oil and date honey; a land wherein you shall eat bread without scarceness, you shall not lack anything in it. . . . And you shall eat and be satisfied, and bless the Lord your God for the good land that He has given you (Deut. 8: 7–10).

Rav Kook believes that there is a reprimand implicit in the many laws and restrictions over the preparing, combining, and eating of animal products (the laws of kashrut), because they are meant to provide an elaborate apparatus designed to keep alive a sense of reverence for life, with the aim of eventually leading people away from meat eating. He also believes that the high moral level involved in the vegetarianism of the generations before Noah was a virtue of such great value that it cannot be lost forever. In the future ideal time (the Messianic age), people and animals will again not eat each other’s flesh. People’s lives will not be supported at the expense of animals’ lives. Rav Kook based these views on the prophecy of Isaiah:

And the wolf shall dwell with the lamb, And the leopard shall lie down with the kid; And the calf and the young lion and the fatling together; And a little child shall lead them And the cow and the bear shall feed; Their young ones shall lie down together, And the lion shall eat straw like the ox . . . They shall not hurt nor destroy in all My holy mountain . . . (Isaiah 11:6–9).

In a booklet which summarizes many of Rav Kook’s teachings, Joseph Green, a twentieth-century South African Jewish vegetarian writer, concluded that Jewish religious ethical vegetarians are pioneers of the Messianic era; they are leading lives that prepare for and potentially hasten the coming of the Messiah:

Although most Jews eat meat today, God’s high ideal – the initial vegetarian dietary law – stands supreme in the Torah for Jews and the whole world to see.

Based on the above Torah teachings, and because animal-centered diets violate and contradict important Jewish mandates to preserve human health, attend to the welfare of animals, protect the environment, conserve resources, help feed hungry people, and pursue peace, Jewish vegetarians believe that Jews (and others) should sharply reduce or eliminate their consumption of animal products.

Venda Religion and the Land (Southern Africa)

By the combined use of oral traditions and archeology, the oldest Venda clans (mitupo) of the Soutpansberg Mountains area between South Africa and Zimbabwe can be traced back roughly 600 years. More recent clans from Zimbabwe settled in the Soutpansberg area roughly 500 years ago and again some 250 years ago. As settled agriculturists and specialized long-distance traders ruled by
powerful chiefs, the various Venda clans were intimately tied to the land and its features. Chiefs enjoyed both political control over decision making and access to high status ancestral spirits. These dual powers of a chief were metaphorically expressed by reference to prominent features on the landscape. The Venda likened a chief’s political power to a mountain, whereas they likened his spiritual abilities, such as being responsible for soil fertility and rain, as a pool.

The organization of royal Venda living space also expressed this dichotomy between politics and religion. Stone-walled royal settlements were divided between a low-lying assembly area, or “pool,” and a higher royal living area, or “mountain.” The assembly area was the venue for various fertility rituals, including rainmaking, renewal of the Earth, and pre-marital rites. Various Venda clans recall that they originally came from a fertile pool in a mountain, so the rituals within the assembly area actually reenact the creation stories.

The royal living area inhabited by the chief, his councilors, and wives, was the arena of political decision making and maneuvering. Reference to this area as a mountain is metaphorically expressed in oral traditions as a conquering chief stepping from mountain to mountain. In the same vein, when a chief dies, it is said, “The Mountain has fallen.”

Medicines buried at the entrance to the assembly area, or “pool,” were intended to protect the royal settlement from invaders. Venda people believed that if invaders crossed this protective threshold, then the assembly area turned into an actual pool. This pool returns to normal once the enemy has been frightened away or drowned. However, if the invaders’ medicines proved too strong, then the assembly area permanently turned into a pool, inundating the royal mountain portion of the settlement. As mentioned above, this is a metaphorical expression of the demise of the chief’s political power.

It is abundantly clear from various oral traditions, however, that a new chief respected or even feared a subjugated chief’s intricate spiritual link to the land and its associated ancestors. Accordingly, the new chief almost invariably recognized the spiritual potency, or pool status, of his predecessor. Even though the subjugated chief lost his political power, or mountain status, he normally retained his spiritual potency to make rain and influence soil fertility, or pool status. In some instances the subjugated chief actually became a ritual specialist to the incoming chief and so increased his prestige as ritual rainmaker. But shifting political fortunes did not end here as subsequent chiefs in turn established their hegemony. A new chief became the mountain, his immediate predecessor became the pool, and the original chief became a so-called “dry-one” (i.e., his pool status has “dried up”). The “dry-one” label applies to those chiefs who came from a line that formerly had great powers, but due to repeated political misfortunes were eventually ostracized from the recognized political system. Those in power viewed the formerly influential chiefs on the periphery of the status quo as a threat and conveniently branded them as witches.

Yet, since the most current chiefs and their ritual functionaries respected the intimate and long-lasting spiritual connection of the first chiefly dynasty to the land, they did not kill their descendants. It was believed that elimination of these ancient people might upset the original spirits of the land. Instead of elimination, the most recent ruling dynasty normally avoided contact with descendants of the original rulers. This process explains the historic distinction between the Singo rulers with their mountain status, the Mbedzi with their pool status, and the Dzhivhani “dry-ones.”

According to oral traditions and radiocarbon dates from associated settlements, we know that the Dzhivhani lived in the Soutpansberg at least 600 years ago when they enjoyed mountain status, but possibly also enjoyed prestige as being responsible for fertility and rain. Mbedzi immigrants from southern Zimbabwe subjugated the Dzhivhani chiefs some 500 years ago. The Mbedzi immigrants stripped the Dzhivhani of their political powers, but respected their abilities as pool people, particularly as rainmakers. Approximately 250 years ago the Singo from central Zimbabwe in turn conquered the Soutpansberg. Since that time, the Mbedzi became the official rainmakers, while the Dzhivhani lost their pool status.

The different status categories are expressed by the distinctive burial practices of the various clans. Typically, Singo chiefs are buried in mountains, Mbedzi chiefs in pools, whereas Dzhivhani chiefs have no particular burial mode any more. But the importance of the original rulers, such as the Dzhivhani, still resonates in the Soutpansberg Mountains. Various noticeable locations on the landscape, in particular old stone-walled ruins of royal settlements, pools, mountains, caves, and boulders, are either avoided or treated with respect. These are the locations believed to be portals to the underworld where ancestral spirits reside. Venda people believe that ancestors send messengers, in the form of dangerous animals and/or distorted mountain and water creatures, to scare disrespectful trespassers. At certain unusual locations, including San rock-art sites, Venda still leave trinkets to appease the original spirits of the land. Another reason for leaving gifts at sacred spots is to obtain fertility from the very old spirits.

Although the political clout of the ancient Venda dynasties is long gone, their religious legacy lives on in unusual landscape features and in the old ruins. This Legacy prohibits Venda people from altering the landscape too much. Very old rock art, for instance, is not to be tampered with. Unlike their Sotho-speaking neighbors to the south, Venda people tend not to repaint or scratch the
Venda Witch Beliefs (Southern Africa)

The Venda people inhabit the far northern area of the Republic of South Africa as well as the extreme south of Zimbabwe, bordering on either side of the Limpopo River. In South Africa, they occupy the fertile Soutpansberg mountain range where they were traditionally horticulturalists and pastoral cattle-keepers, until the discovery of diamonds and gold in the nineteenth century introduced migrant labor as a way of life for the menfolk.

The Soutpansberg mountain range is a richly forested area whose trees provide wood for ritual, ceremonial, and utilitarian purposes, as well as fruits that are an important source of food. The rivers of Vendaland and especially the sacred lake Fundudzi have religious and mystical significance for the Venda people. Rivers flowing through forested areas, such as the famous Phophihi falls, are associated with the spirits of the VhaNgona, the original inhabitants of Venda at the time of the early Iron Age, ca. 200. To propitiate these spirits, everyone crossing the falls must contribute an offering: a bracelet or piece of broken pot for a woman, a tuft of hair for a man. Cattle are not excluded and some cow hairs must be offered if the animal is not to incur misfortune.

The Venda people are made up of various tribal clusters who migrated to the area at different times; some came from Zimbabwe to the north and others from the Sotho-speaking areas to the south and east. The Venda language is unique among South African languages in having links to the early Iron Age (200–800) inhabitants of Southern Africa. Among the important migrations from the Karanga area of southern Zimbabwe were the Vhathavhatsinde people, so called because many families in this group were great medicine men (diviners) who supplied a powerful antidote to evil from the mutavhatsinde tree. The name is said to derive from the word muta, referring to the small enclosure surrounding women’s huts and tsinde, meaning the stem or trunk of a tree. Medicine men or diviners from the Vhathavatsinde still erect poles in the yards of their homesteads to indicate their avocation. I was able to photograph the pole erected by well-known diviner and herbalist, Mr. Nelson Shonisani, at his home in Kubvhi, central Venda in 1988.

Much of the work of herbalists (nanga) and diviners (maine, pl. mingoma) among the Venda has to do with protecting people from the machinations of witches (sg. muloi, pl. vhaloi) who seek to kill or harm their fellows, as well as providing charms to protect people against misfortune. A simple charm might be a piece of wood taken from a branch of a tree overhanging a well-used pathway. The charm is believed to contain strength given to it by travelers who trod that path without coming to any harm.

Most medicine people among the Venda are herbalists who specialize in curing diseases and who are consulted often about ordinary ailments. The mingoma or diviner is not a supernatural sanction against killing animals residing in old ruins or in sacred pools can also be linked to respect for the original occupants of the land. In this sense then, the Venda-speaking people from the Soutpansberg can be considered to be conserving the land, irrespective of the fact that their intensive farming and overgrazing practices have resulted in damaging soil erosion. Even those Venda clans that were specialist copper miners or elephant hunters did not exploit the available copper ore deposits or elephant herds to their fullest. Whereas technological inability to exhaust such resources no doubt was a contributing factor, supernatural sanction against overexploitation might have been another. For example, abandoned copper mine shafts in the Limpopo River valley were supposedly haunted by spirits of the Musina clan and considered off-limits to trespassers. Whereas conservation among the Venda was almost certainly not an end in itself, their worldview contributed to the preservation of unusual cultural and natural features of the Soutpansberg.

believed to have occult powers and is always consulted after someone has died so that the family of the deceased can discover who the evil person was who caused the death. Like many other African peoples, the Venda believe that death (except in the case of the very old) is not a natural occurrence. Most diviners are madambikharhali, diviners who discover the identity of witches who are responsible for most misfortunes and deaths, which are often believed due to the use of sorcery in the form of poisons obtained from plants and added to the victim’s food.

Among the Venda, a diviner or herbalist may be male or female. A man inherits his knowledge from his father and a woman from her mother. Witches (vhaloii) are believed to be of either gender but are more generally women. They operate at night, sometimes traveling long distances on the back of a hyena or other animal, and they may send snakes, owls, or, particularly, a turi (stoat) into the victim’s home to bite him or her and cause disease or death. Wild animals such as snakes, owls, hyenas, and stoats are creatures of dark places or the night, like witches, and are known to cause harm either by biting humans and animals as snakes do, or by attacking small stock, like hyenas, or sucking the udders of cows, as stoats are believed to do. Stayt comments that the turi is especially feared, as it is believed the animal can become invisible and in that way enter the body of its human victim and cause a mortal illness (Stayt 1931: 278).

There are two distinct types of witch in Venda that correspond to the famous distinction made by E.E. Evans-Pritchard for the Azande of Central Africa. The first type are witches who act unconsciously. They are unaware of their evil-doing. The second type corresponds to the sorcerer among the Azande. This witch uses material means such as spells made from powdered roots and bark or magic, to cause harm. The first type of witch is believed to act during sleep. It is at this time that the witch spirit leaves the body of its innocent human victim and goes out on its evil mission. Other persons sleeping with the muloi are believed to be put into a deep sleep so the witch is never seen, except by the herbalist or diviner. Apart from killing people, the witch also is believed to be very fond of milk and may force a cattle owner, while asleep, to go into his cattle enclosure, milk his animals, and give the milk to the witch. Alternatively, the muloi may send a turi (stoat), well known as a witch familiar, a creature that carries out the bidding of a witch and operates usually at night, to suck the milk from the cows. Protection against witches comes from the mother’s ancestors, and if these spirits are angry with the victim, they may withdraw their protection and allow the witches evil work to proceed.

Remedies against the work of witches consist of charms, made, for instance, from the powdered root of the mukundulela tree (Niebuhria triphylla) which translates as “the way of force,” mixed with the powdered bones of a snake, owl, bat’s wing, and stoat. As this mixture is made up of parts of all the witch’s familiars, it is considered especially powerful in making the wearer invulnerable to attack by witches.

The second type of witch, the sorcerer, uses black magic to kill her or his enemies. This magic is known as madambi. Herbalists (nanga) are sometimes suspected of assisting a muloi to work harm in this way. Madambi usually works by the witch getting hold of an object belonging to her/his enemy and using it to destroy the person. Thus, nail and hair clippings are carefully hidden. Stayt notes that the most popular madambi is made of sand from an enemy’s footprint, which is mixed with poisonous herbs and through sympathetic magic the owner of the footprint dies from poisoning. Sometimes the evil powder will be blown on, or toward, a hare. The animal will run to the intended victim and look him or her in the eyes and then vanish. The victim is believed to die soon after while the hare vanishes.

The herbalist can provide a protective charm against this sorcery, a magic powder mixed with fat, which, when rubbed over the body, envelopes the wearer in a kind of magic coat. Herbalists provide many other charms made from powdered roots or bark that act as antidotes to evil, as spells, or as protective amulets. For instance, the powdered roots of the mpeta (Royena pallens) protect against ordinary diseases and keep the ancestral spirits from worrying the wearer.

Witch beliefs in Venda are similar to those in other Bantu-speaking societies in Africa, especially those of their neighbors, the Lovedu, who live in a deeply forested area to the southeast of the Venda, and who are famous for their rain-queen, Modjadji. These witch beliefs tend to reflect social strains in predominantly kin-based cultures. That is, those most likely to be accused of being witches are often neighbors or co-wives, in polygamous homesteads.

Nowadays, a successful business entrepreneur may find himself the target of malicious accusations, as happened to Isaac Ramakulukusha, a Zionist bishop who owned numerous business enterprises, including butcheries and filling stations in Venda. In 1975, he sued the Commander of the Venda National Force for wrongful arrest and defamation. He was accused of being a ritual murderer (mavia vhatu – slaughterer of human beings) after the body of a four-year-old girl was found in the Nzehele River in Venda. Forensic science came to the aid of the bishop when the child was found to have drowned and crabs had eaten part of her body.

Accusations of witchcraft also have increased in recent years with the change to a democratic majority rule in South Africa. With the power of chiefs and headmen waning, some have resorted to devices like the murder of young children (so-called “muti” [medicine] murders) to prop up their waning influence.

Virgin of Guadalupe

On 8 December 1531, the legend goes, the apparition of the Virgin of Guadalupe appeared to Juan Diego on the hill of Tepeyac north of Mexico City. In 1999, Pope John Paul II proclaimed Our Lady of Guadalupe the Patron Saint of the Americas. Devotion to the tradition of Guadalupe has been sustained for nearly 500 years and has played a significant role in Mexican history, whether as a symbol for independence, the Church’s resistance to political intervention, the rights of native populations, or for social conservatism and control. Although contentious debates over the historical credibility of the apparition-narrative mark the Guadalupan tradition, the image and legend of the Virgin of Guadalupe has provided a powerful symbol for Mexican nationalism, and by the twentieth century, a symbol of freedom for oppressed native peoples and agrarian reform. As a symbol fusing religion and politics, native and Christian images, the Virgin of Guadalupe, patron saint of the Americas, remains a complicated symbol embodying conquest, pre-Colombian Earth goddesses, nature, the modern nation, and various, complicated social relations.

The first account of the appearance of the Virgin of Guadalupe was not published until the mid-seventeenth century. This account tells the story of Guadalupe’s appearance in December 1531 to Juan Diego, a poor Christianized native. Speaking to him in the Aztec language of Nahuatl, she asks Juan Diego to tell the bishop of Mexico, Juan de Zumárraga, to build a chapel in her honor at Tepeyac. After two unsuccessful visits, Zumárraga instructs Juan Diego to return with signs from the apparition. Disconsolate, Juan Diego meets the apparition of the Virgin of Guadalupe for the third time. Guadalupe tells Juan Diego to climb the hill of Tepeyac and gather roses and flowers as signs for the bishop. When Juan Diego opens his cloak in front of the bishop, the roses tumble out, revealing a life-size image of Guadalupe found miraculously imprinted on the cactus-fiber cloth of his cloak. Realizing that a miracle had taken place, the bishop places the image in the cathedral for public devotion and later brings it to Tepeyac. The painted icon on what is alleged to be Juan Diego’s cloak remains the heart of the cult and tradition of the Virgin of Guadalupe, on display today in the twentieth-century basilica in Mexico City that serves as the central locus for Guadalupan devotion.

Scholars find it significant that the Guadalupan tradition was introduced 35 years after the conquest. Native peoples understandably resisted domination, sometimes overtly through resistance, but more commonly through ongoing practice of traditional religious beliefs and life-ways. Syncretic practices that merged Christian images and ideas with local beliefs and rituals were employed as methods of proselytizing native peoples. In the case of Guadalupe, cults of Mary imported by the Spaniards merged with pre-Colombian Earth deities. Tepeyac had long served as a pilgrimage site for various Earth goddesses referred to collectively as Tonantzin, our “revered mother.” Early veneration of Guadalupe and pilgrimages to Tepeyac, some sixteenth-century priests complained, only continued pre-Christian practices since native worshipers still associated her with sacred space and power coming from the Earth.

Although Guadalupe may have had an early following among native peoples and been used as a means of evangelization by the Catholic Church, by the seventeenth century Guadalupe became associated with the interests of Mexican-born Spaniards or Creoles. Guadalupe became championed as the American Mary, thus serving Mexican patriotism and nationalism, but also justifying the conquest. After Mexico City and Puebla were devastated by the plague in 1737, Mexico City claimed the Virgin of Guadalupe as its patron saint, and by 1754 the Pope named her patroness of Mexico. In 1895 the Virgin of Guadalupe was crowned Queen of the Americas. During these centuries of merging religion and patriotism, it should be noted that the image of Guadalupe was not explicitly employed to champion native peoples. The Virgin of Guadalupe was important for the Catholic Church and its position in Mexican society, as well as for patriots who employed it to champion Mexican identity. In relation to policies and practices concerning native peoples and their lands however, the cult of Guadalupe was used primarily as a conservative, paternalistic, and exclusionary mechanism.

It was not until the twentieth century that the image and tradition of the Virgin of Guadalupe became explicitly associated with the rights of native peoples, disenfranchised populations, and the land. Pancho Villa and Emiliano Zapata both used the symbol of Guadalupe during their revolutionary struggles, thus associating Guadalupan tradition with social and agrarian reform. Peasant followers of Emiliano Zapata carried banners of Guadalupe through Mexico City following the defeat of General Victoriano Huerta in 1914. These indigenous peasants also visited Tepeyac to venerate Guadalupe who, as both Earth goddess and patron saint, came to symbolize the protector of damaged land and oppressed peoples. Banners of Guadalupe regularly appeared in marches organized by Cesar
Chavez and the United Farm Workers beginning in the 1960s. Numerous contemporary Chicana artists now depict Guadalupe in ways that link her to pre-Colombian Earth goddesses, thus championing both native peoples and the land. Contemporary Latina/o theologians claim that both images and fiestas demonstrate Guadalupe’s clear connection to nature. In popular religious images, the sun, stars, moon, and nature surround Guadalupe. Daybreak on December 12, “the time of new beginnings and the rebirth of the sun” is the time of Guadalupe’s feast and celebration and a dawn song, Las Mañanitas is sung to her (Rodriguez 1994: 147).

Our Lady of Guadalupe remains a contested symbol – standing at different points in history for conquest as well as indigenous rights; for Earth goddesses and nature as well as the power of the nation-state.

Virtues and Ecology in World Religions

Virtues (commonly understood as excellences of character acquired through self-cultivation) play a role in all major world religions – even as ideals of personal cultivation differ significantly from tradition to tradition. Recent adaptations in religious attitudes toward nature to a large degree involve changes in the perception and cultivation of virtues as well. Across the board, religious environmentalists highlight the ecological import of traditional traits of character, such as moderation, humility, and compassion. However, to speak of a uniform “green” religious virtue ethic would be to deny the varied contexts of religious belief and practice that continue to give these virtues their full meaning. By examining relationships between the virtues and ecological awareness in Christianity, Judaism, Islam, Hinduism, Buddhism, and Confucianism we can see the various types of green virtue ethics.

Frugality

Under a number of names, frugality has been a prominent moral norm and practice in all the great religious traditions, including Buddhism, Christianity, Confucianism, Hinduism, Islam, Judaism, and Daoism. These traditions often have interpreted frugality as an expression of love or its equivalent – that is, seeking the good of others in response to their needs.

Frugality is the virtue of economic constraint – a standard of excellence for both character formation and social transformation in necessary interaction. It connotes moderation, thrift, sufficiency, and temperance. It demands careful conservation, comprehensive recycling, minimal harm, material efficiency, and product durability. Frugality is a middle way that struggles against both overconsumption by the affluent and underconsumption by the poor.

Frugality, according to its advocates, is an antidote to a cardinal vice of the age, prodigality – or excess in the goods humans take from the Earth, and excess in the wastes and contaminants we return to it. These excesses are unfair and unsustainable. The prodigal take more than their due, and thereby deprive others – poor people, other species, and future generations – of their due. In this setting, frugality is a necessary condition of justice and sustainability, seeking a greater thriving of all life together by sparing and sharing global goods.

Contrary to some stereotypes, frugality is not generally a world-denying asceticism. On the contrary, the word’s Latin root, frug-, defines its essential character: fruitfulness and joyfulness. Frugality is an Earth-affirming and enriching norm that delights in the less-consumptive joys of the mind and flesh, especially the enhanced lives for human communities and other creatures that only constrained production and consumption can make possible on a finite planet.

Frugality is regularly defended as a universal norm, not bound to particular religious confessions. Interpreters argue that it can be ethically justified, apart from appeals to privileged revelations, as a rational response to economic maldistribution and ecological degradation. For its fans, frugality is the subversive virtue, in rebellion against the ethos of excess.

Virtue and Ecology in Christianity

In 1976, historian Lynn White charged that the environmental crisis will only beverted if Christians exchange their arrogant attitudes toward nature for St. Francis’ model of humility. Since then, virtues have played a major role in the greening of Christianity. From qualities of character marking a person’s journey to an other-worldly salvation, they changed into qualities of character fitting the flourishing of persons-within-ecocommunities in which the immanent Spirit of God is made manifest. As a result, a thoroughly reinterpreted and reshuffled catalogue of desirable traits is emerging.

Changes range from simple extensions to radical innovations of meaning. Rather than hope for the salvation of human souls only, Christians may now hope (even against all odds) for the liberation of all creation. Rather than humbly consider themselves at the bottom of an ontological ladder, they may humbly accept their place in the web of earthly relations. Rather than practice vigilant control of emotions, they may try to relearn spontaneity.

And rather than divert their attention away from the physical details of this world (contemptus mundi), they may practice sensuousness in order to attend properly to this world – following a recast model of Jesus as a teacher with an eye for illustrations drawn from animal and plant life.

Some observers doubt whether such attitude changes go far enough in addressing ecological problems. They stress the need for complementary social analysis and organized efforts to transform institutions (e.g., Dieter Hessel). Others question whether personal transformation can be thorough enough as long as Christians continue to see themselves as managers of creation (e.g., Elizabeth Dodson Gray). The most radical critics suggest that Christians look outside their tradition toward Eastern and indigenous religions for alternative models of ecological self-cultivation (e.g., Joanna Macy). Christian scholars typically respond to this last charge with a warning against the vice of romanticism.

Virtue and Ecology in Judaism

From the rich array of Jewish scripture, legal traditions, stories, rituals, and cultural practices, virtues emerge as those personal character traits that renew and sustain the chosen people’s covenant relationship with God. The Jewish community has received many blessings from the transcendent Creator of the universe; in return, it must look after creation, following the commandments of the Torah. This covenant bond is especially served by gratitude, responsibility, and repentance for failure. Today, those who interpret the environmental crisis as a sign of covenantal breakdown find new significance in these traditional virtues (e.g., Eric Katz).

Ancient blessings for food, natural beauty, and seasonal renewal continue to express appropriate gratitude for the gifts of creation. Entrusted with those gifts, responsible stewards will be caring and compassionate, keeping in mind the suffering of all living beings (tz’ar ba’alei chayim). They will also be in the habit of exercising personal restraint, demonstrated every Sabbath by refraining from nature-altering activities. Following the commandment not to destroy (bal tashchit), they will be averse to vandalism (including specifically the wanton destruction of fruit trees), cruelty (including animal abuse), and wastefulness. Conflicts of interest they will approach with prudence, new environmental challenges with love of learning. Even responsible stewards may fail, however. They must be able to admit mistakes and repent for their shortcomings.

Like Christianity, Judaism has been charged with promoting arrogance by putting humans in charge of the Earth. Critics also say that Jewish anti-paganism prevents appropriate reverence for nature. Jewish scholars typically respond that a covenantal life actually inspires humility and awe before God’s marvelous works. Some go further and draw on Jewish mystical traditions (Kabbalah) that do allow full-blown reverence for the Divine Presence in creation (e.g., Arthur Green).

Virtue and Ecology in Islam

Although Islamic ethics is especially known for its tradition of law (Shari ‘ah), the life of a Muslim should in all aspects be marked by the cultivation of one main virtue: surrender (Islam) to God (Allah). Each other virtue (fudhlah), either leads up to, belongs to, follows from, or is perfected by the Muslim’s singular commitment to the transcendent Creator and Sustainer of the universe. While largely remaining within this traditional framework, which is based on scripture (Qur’ an), the example and teachings of the Prophet Mohammed (Hadith), and the work of great thinkers such as Al-Ghazali (1058–1111), modern scholars of Islam have begun to identify ecologically relevant virtues.

Muslims look upon creation as the extended family of God, in which each species forms a community designed to live harmoniously with all other communities. Thus, beneficence toward any creature takes on meaning as an act of devotion by which the believer treats God’s family well. Planting and sowing, insofar as they benefit human and nonhuman communities, are concrete instances of such charity. Respect for the basic needs of others requires vigilant control (jihad) over destructive “lower” desires, especially greed, aggression, and jealousy. The willingness to make such personal sacrifices for the common good, strengthened annually during the fasting month of Ramadan, again ultimately underscores the believer’s respect for God.

Ecofeminists and those who follow Lynn White’s line of reasoning have leveled the same criticism against Islam as against Christianity and Judaism: its belief in a transcendent God and its elevation of humans as the viceregents of
creation are likely to engender exploitative attitudes toward nature. Two types of Islamic responses are emerging. Most scholars stress that a viceregent (khalifa) should be responsible. They also qualify the implications of divine transcendence (e.g., Al-Hafiz Masri). For example, they highlight scriptural texts that depict creation as a mosque, or as bearing many signs (ayat) of divine grace, and argue that such a sacramental world demands human respect. Some scholars, however, contend that an other-worldly focus on a transcendent and all-powerful God should in fact benefit the environment, inssofar as it encourages frugality and deep humility (e.g., Seyyed Nasr).

Virtue and Ecology in Hinduism

Within the multifaceted spectrum of Hindu traditions, the ideal of living in mental and bodily harmony with all beings, seen as a divine unity (Vasudeva/Brahman), stands in creative tension with the ideal of self-transcendence. Both ideals require self-cultivation through various forms of meditation and discipline (yoga). However, Hindus seeking self-transcendence must ultimately renounce all aspects of the natural world as illusory (maya) to attain an entirely other-worldly liberation (moksha) from the cycle of life and death. Because of these distinct (though complexly intertwined) foci, Hindu traditions offer both rich resources and significant challenges for a this-worldly, ecological virtue ethic.

Ancient Hindu texts, such as the Gautama Dharma-utra, already stress the importance of compassion for all creatures. Today, against the backdrop of India’s serious environmental problems, other traditional virtues are reinterpreted within an expanded doctrine of dharma as the duty to act for the entire ecological community (e.g., Christopher Chapple). Those who practice universal veneration (mindful of the interconnectedness and divinity of all things, as well as the transmigration of souls) will tend to cultivate an attitude of non-injury (ahimsa) toward other living beings, indeed toward all species, ecosystems, and elements that adorn the divine Mother Earth (Devi Vasundhara). Living a life of nonviolence in turn requires simplicity (restraint of greed), tranquility (restraint of anger and envy), and truthfulness (satyagraha). Through such personal sacrifice (yajna) the environment can be purified – just as, conversely, the vices of selfishness and willful ignorance cause (karma) environmental ravage (e.g., Seshagiri Rao).

Despite Lynn White’s doubt whether Eastern traditions could change Western attitudes toward nature, Hindu teachings have helped to shape ecological consciousness in the first industrialized nations. Virtues such as universal respect and ahimsa, as well as the ideal of self-realization (atman moksha) within the context of the oneness of all beings, now also guide many Western people of non-Indian descent.

Virtue and Ecology in Buddhism

Buddhist virtue ethics takes its shape from the earliest teachings of the Buddhist monastic community: the universality and inevitability of suffering (dukkha), the impermanence of everything (anitya), the dependence of everything on other elements (pratitya-samutpada), and the absence of an enduring self or soul (anatman). Insofar as Buddhists deny the existence of a self, their efforts at being virtuous cannot be understood in any strict sense as self-cultivation. Yet Buddhist practitioners do cultivate their minds and seek emotional equanimity. Theravada Buddhists tend to do so primarily in expectation of personal release from the suffering inherent in the cycle of life and death (nirvana). Mahayana Buddhists may also focus on relieving the suffering of others, an aim perfected in the life of the bodhisattva. In either case, however, mind and emotions are channeled to enable adaptability to change (impermanence) and awareness of mutual dependence (dependent arising). Many observers have noted the remarkable fit between these basic Buddhist attitudes and an ecological worldview (e.g., Stephanie Kaza).

Buddhists have long held that those who are mindful of the suffering around them will see the appropriateness of showing compassion to human and nonhuman alike. The Indian emperor Asoka (270–232 B.C.E.), for example, is famous for constructing hospitals for both people and animals. In addition to seeking relief of suffering, Buddhists also teach the need for prevention through an attitude of non-injury (pranatipata-virmana). The effects (karma) of a nonviolent lifestyle again extend beyond the human community. For example, one will as far as possible avoid slaughtering animals and cutting trees. Moreover, by overcoming one’s greed, anger, and delusions through understanding their source in self-clinging, one can avoid the ecologically harmful effects of these vices.

Both external and internal critics find a relative neglect of social ethics in some or all Buddhist traditions. However, Buddhism does offer an explicit and scientifically compatible theory of how the personal practice of virtues affects social and indeed ecological systems. According to the doctrine of dependent arising, each person’s way of being and acting in the world affects every other aspect of the world. Thus, the cumulative effects of human virtuous agency should be understood not as a matter of simple addition, but rather as following the mathematics of complexity (cf. Stuart Kauffman). Beyond a certain threshold of virtuous people, a web of new social and ecological connections will emerge.

Virtue and Ecology in Confucianism

Virtue (de), understood as self-cultivation following the dao (the Way), is the main pillar of Confucian ethics. From the days of classical Confucianism, character formation has been understood in relation to the natural world as an attempt to live in harmony with the ever-changing
dynamism (qi) of Heaven and Earth. Mountains, plants and animals provide helpful analogies for self-cultivation, and the four main human virtues of humaneness (ren), righteousness (yi), propriety (li), and wisdom (zhi) all have cosmological components. Accordingly, various modern scholars (e.g., Tu Weiming, Mary Evelyn Tucker) have identified Confucian tradition as a rich resource for environmental ethics.

While the four main virtues and their derivatives are first and foremost understood to guide five spheres of human relationships (parent–child, husband–wife, older–younger siblings, friend–friend, ruler–minister), their implications reach into the nonhuman world as well. Neo-Confucian thinkers of the Song and Ming dynasties already suggested that humaneness (ren) includes consideration (shu) for animals, plants and even stones, as all are one body sharing the vitality of qi. And insofar as people are children of Heaven and Earth, it is fitting for them to show filiality and self-restraint toward nature. All in all, the exercise of proper reciprocal relations with “the myriad things” is central to the Confucian conception of the exemplary person (junzi), who seeks to live in accordance with the Mandate of Heaven (tian-ming).

Critical observers have wondered whether Confucian virtue ethics (like any other religious virtue ethics) may be greener on paper than in practice – a question complicated by the current absence of recognizable institutions to facilitate and represent such practice. Some note the many uneasy compromises within Confucianism between general teachings and specific (often pre-Confucian ritual) cultural practices (e.g., Donald Blakeley). Confucian hierarchalism may also conflict with ecologically attuned self-cultivation. However, many observers agree that, considering the tradition’s deep-seated holism, the dynamism of yin-yang cosmology, and the appreciation for spontaneity, deference, and adeptness in living, it contains significant potential for guiding people toward more ecological ways of being.

Concluding Observations
The following general patterns characterize the relationship between the cultivation of virtue and ecological awareness in Judaism, Christianity, Islam, Hinduism, Buddhism, and Confucianism.

1. Across the spectrum, the ecological import of traditional virtues is assessed and highlighted. 2. Adjustments often involve extending the reach of virtuous acts to nonhuman entities. 3. Radical changes (e.g., a traditional vice, such as sensuousness, being reassessed as a virtue, and vice versa) are rare and most likely to occur in Christian circles. 4. Certain virtues emerge so frequently and universally that they may be considered part of a crosscultural catalogue of ecological virtues, namely: gratitude, respect, humility, caring, compassion, generosity, gentleness, frugality, and wisdom. 5. Across the world religions, these virtues are more similar in their outward effects on the environment than in their broader significance, which depends heavily on specific contexts of belief.

Volcanoes
One aspect of the cultural appropriation of nature is the religious appropriation of volcanoes. As part of nature, volcanoes provide various metaphors for religion. The colossal threats and blessings emerging from volcanic activities are made meaningful through cognition and active processes of practical engagement, often by ritual means and sacrifices. Ideas that attribute sacred qualities to mountains, and especially to the peaks of volcanoes, are familiar to many cultures worldwide. This is illustrated in textual and visual imagery; it can be traced in myths and oral traditions and can be observed in ritual practices. Frequently the (cosmic, mythological) mountain is the chosen image of analogy between the macro and the micro per-
Volcanoes are believed to be the foci of magical power and supernatural forces. They are considered spiritually endowed as they are seen as sites where gods and ancestor spirits dwell. These gods and spirits take active part in human affairs. Either they give blessing and fertility or they destroy by volcanic eruptions. This expresses ambivalent experiences as people feel life-giving qualities in volcanoes as well as powerful, awe-inspiring and destructive forces.

In most studies of contemporary natural disasters, research includes neither the interpretations of the affected people nor the symbolic and religious meanings in the context of their lives and worldviews. But disasters like volcanic eruptions must also be seen in terms of how they are perceived and estimated by those affected, including the symbolic basis of human perceptions of nature and natural disasters.

Although it is important to note that volcanic eruptions are conceptualized, structured and negotiated in multiple, changeable contexts, there are certain similarities in the ways in which nature is constructed as parallel to human society. Frequently volcanoes are anthropomorphized, and there are close associations between cosmos, morality and social conduct. Due to such analogies of nature and societies, seen as mutually constitutive, in Africa, Asia and Latin America, natural disasters often are not explained by natural causes alone but are traced back to incorrect conduct of human beings. Thus, in many regions of the world volcanoes are seen, among other things, as natural seismographs for social harmony or disharmony. They are sometimes considered as a sign of dissent or conflict between the native people or particular clans that provoke the tempers of the ancestors or of the gods. Based on the idea that the structure of the cosmos is mirrored in the religio-political realm, rulers of ancient Southeast Asian kingdoms constructed their legitimation through mystical connections with volcanoes. The mandate for political authority was connected with the role as divine mediator with the whole living universe. But once there were calamities, these were seen as signs for social injustice and connected to political revolts and upheavals, and as a consequence the ruler lost his power. In this context it is important to note that supernatural explanations of natural events do not only legitimize but can also delegitimize political power.

In the Vesuv region, the Roman people celebrated every year on 23 August a festival called Volcania, where they threw living fish caught in the river Tiber in the fire to calm down Vulcanus, the god of the fire, who was later treated as equivalent to Hephaistos, the god of the smiths. Fish sacrifices are still today a usual practice at the volcano Lewotobi perempuan on the Island Flores in Indonesia. In general, the more active and dangerous a volcano is, the more elaborate are the sacrificial ceremonies. The offerings sacrificed vary from region to region and are often accompanied by local dances, prayers and all kinds of ritual activities. In some regions human sacrifice was practiced, such as in Nigeria or Indonesia where some clans sacrificed boys or girls aged around 15 to the mountain spirits. Their blood was poured into the volcanoes, whilst their corpses were buried normally. In Tanzania the Maasai at Oldonyo Lengai worship the god Engai (the last elaborate ceremony with about 100 participants took place during an eruption in 1983) in offering him sheep and goats. At the volcano Lewotobi laki-laki (the last extensive ceremony took place during the eruption in 1992), a small goat is ripped apart with bare hands. The Chagga in Tanzania used to hold great ceremonies on the top of the mountain Kifunika, close to Kilimanjaro, during which they offered some pieces of meat and the blood of a cow, goat or sheep, mixed with mbege (local beer) and sale (holy yukka plant leaf) for the mizimu (spirits). Like in many other regions, the practice of sacrifice did not disappear completely after Christianization, but occurs rarely and only in secret.

Beyond that, volcanoes are, in almost all regions, considered in gender categories. Sometimes they are determined, either male or female, according to the kinship and political organization of the local population. Occasionally women or witches are treated as equivalent to volcanoes and are seen as responsible for an eruption. There are many stories in the large collection of Icelandic folktales concerning volcanoes. One story in the Icelandic Eyrbyggja Saga tells of Katla, a volcano located in Southern Iceland, and a wicked female cook in the monastery of Sókkvabæjarlaugur. After killing a shepherd who had stolen some of her magic trousers, she flung herself into a dark crevasse in the ice cap. Ever since, according to tales, she avenges her fate by pouring fire and water onto the nearby regions.

If there are two or more volcanoes located next to each other, the mythology of their origin is often connected with love or war stories, such as the myth about Popocatepetl and Iztaccihuatl in Mexico. Popocatepetl was an Aztec warrior who was in love with Iztaccihuatl, the emperor’s daughter. While Popocatepetl was at war, Iztaccihuatl was mistakenly informed that Popocatepetl had been killed. In despair she killed herself. When Popocatepetl returned and found Iztaccihuatl dead, he was overcome with grief. He built a mound and laid her body on it and vowed that he would never leave her again. Examining the two volcanoes one will notice in Iztaccihuatl the shape of a woman, lying on her back, covered with a white sheet of snow. At her feet stands Popocatepetl, eternally watching over her. Today the people of Pueblo worship the saint San Gregoria Chino by bringing their offerings such as flowers and fruits to the slopes of Popocatepetl.

At times, there are almost exactly the same stories told by people in different parts of the globe that create parallel worlds. This is the case for reports about giants or ghosts,
sitting inside the volcano and cooking meals for the neighbor mountains, their lovers or husbands, as in Indo-
nesia on the Island Flores at the volcano Inerie, and in
Iceland on the Island Heimaey at the volcano Hekla.

There are numerous stories about Pele who has long been
the fire-goddess of the Hawaiians. Her home was in the great
fire-pit of the volcano of Kilauea on the island of Hawai’i.
The word “Pele” has been used with three distinct defini-
tions by the old Hawaiians: Pele, the fire goddess; Pele, a
volcano or fire-pit in any land; Pele, an eruption of lava.

The Kelimutu in East Indonesia is a complex volcano
with three crater lakes of different colors. The frequent
color changes of the crater lakes are caused by mineral
reactions, primarily by iron oxidization. Schooling
throughout Indonesia – including the outer islands – has
disseminated a knowledge of volcanoes that is indeed
limited, yet comparable in part to the European standard.
Old Indonesian religious concepts remain nonetheless
extremely significant. For inhabitants of the volcano’s
vicinity, the Kelimutu is the home of the ebu nusi (ancest-
ral spirits) and nitu (natural spirits). The ruler of the Ke-
limutu is the volcanic spirit Konde, who is the grandchild of
Rongge and Ranggo the ancient ancestors of the village
Moni. This explanation of their descent – from “spirits of
the volcano” – is common to inhabitants of many regions
in the world. Konde lives on Kelimutu in a village that
looks like Moni. He regularly holds big parties there and
tries to take human women as prisoners. The first lake of
Kelimutu is called tiwu ata polo (lake of the evil demon)
and is the lake in which the “souls” of thieves, murderers
and practitioners of “black magic” land after their death,
also sometimes called api nereka (fires of damnation). The
second lake tiwu koö fai (lake in perpetual motion) is the
lake in which the “souls” of deceased children land, and
the third lake tiwu ata bupu (lake of very old men) is the
lake in which the “souls” of elderly people land after their
death. The “reactions” of the volcanoes – be these erup-
tions or color changes – are interpreted by the Florinese as
emotional gestures – as expressions of sadness or anger
about social events – and as a coded symbolism which is
of social interest.

Occasions of political and social conflict in Indonesia
are often accompanied by debates about volcanic activity.
This religio-political meaning is well known for the very
active “high risk volcano” Mount Merapi in Central Java.
Every year a ceremony is conducted by the members of the
Sultan’s palace in order to pacify the destructive power of
the spirits residing in the crater. The ceremony acts as a
reminder about a mythological promise that the country
will always be protected against Merapi’s eruptions
because the ruler of the volcano realm will never send the
lava toward the Sultan’s palace in the nearby city of
Yogyakarta. But in 1994 for the first time an eruption
turned to the south, in the direction of Yogyakarta. Many
people saw this as a sign that the spirits disapproved of the
behavior of Indonesia’s ruling elite. Thus, the symbolic
discourse on the Merapi can be instrumentalized not only
by the rulers to justify themselves, but also by the
oppressed.

Walker, Alice (1944–)

Alice Malsenior Walker was born in Eatonton, Georgia in 1944. She attended Spelman College in Atlanta, Georgia for two years and completed her B.A. at Sarah Lawrence College in New York in 1965. She is the author of over twenty-five works including novels, volumes of poetry, essays, short stories and children’s books. She has written and spoken out for human rights and ecological justice globally.

Walker is a “womanist” – a black feminist or feminist of color, committed to “the healing and wholeness of entire communities, male and female.” A womanist “loves the Spirit” and to love the Spirit is to love creation (Walker 1983: xi–xii). It is in Walker’s Pulitzer prize-winning novel The Color Purple (1982) that the healing power of creation becomes explicit. The sexually and physically abused Celie learns from blues-singer Shug that God is not an old white man: “it pisses God off if you walk by the color purple in a field somewhere and don’t notice it.” Celie finds salvation in creation – first trees, then air, then birds, then feels “being part of everything, not separate at all.” She “knows” that if she “cut a tree” her “arm would bleed” (Walker 1982: 167). “Creation” is more than “nature”; it also means creativity. Celie finds economic freedom by making pants instead of cutting “Mister’s” throat. Moreover, creation includes the erotic. God pleasures in Celie’s relationship with Shug. Walker’s novel, Possessing the Secret of Joy emphasizes the sacredness of women’s natural bodies and holistic experience of the erotic. A minor character in the novel is pansexual and makes love with trees, a boulder, the Earth, or a waterfall (Walker 1992: 175–76). Creation is imbued with love and invites loving response.

Walker describes herself as a “pagan” who worships nature. Baptized at age 7, she was fascinated by the leaves in the muddy creek.

I was unable to send my mind off into space in search of a God who never noticed mud, leaves, or bullfrogs. Or the innocent hearts of my tender, loving people . . . It is fatal to love a God who doesn’t love you (Walker 1997: 24–25).

It is not “Jesus” that Walker has a problem with but the Christian tradition’s alienation of Jesus from the folk and from nature. Jesus “coexists quite easily with pagan indigenous peoples,” she writes, because they have already learned the love that he preached (Walker 1997: 25). Feminists and womanists from a diversity of faith perspectives employ Walker’s writings. Such diversity is possible because Walker’s spiritual starting point is everyone’s common ground – the Earth. In The Same River Twice, Walker refers to her own Trinity: the Earth, Nature, and the Universe. She writes of Nature sustaining her happiness and as opening her “to love, intimacy, and trust” (Walker 1996: 43). She often cites the following poem in essays and public talks:

We Have A Beautiful Mother
We have a beautiful mother
Her hills are buffaloes
Her buffaloes
hills.

We have a beautiful mother
Her oceans are wombs
Her wombs
oceans.

We have a beautiful mother
Her teeth the white stones
at the edge
of the water
the summer grasses
her plentiful hair.

We have a beautiful mother
Her green lap immense
Her brown embrace eternal
Her blue body
Everything
We know (Walker 1997: 106–7).

The poem captures Walker’s admiration for the planet in the context of a larger universe, speaking from the heart of her Pagan spirituality. For Walker, the Earth is our
mother. She observes that the relationship is not always easy. In “Everything We Love is a Human Being,” she struggles with human destructiveness toward an alienated Earth. “I love trees,” she says to the trees. The trees respond, “Human, please,” ignoring her protest that it is the lumber company who mutilates them. “... we find you without grace, without dignity, without serenity, and there is no generosity in you either – just ask any tree” (Walker 1988: 141–2). The trees associate Walker with all humans, denying her claims to individual innocence. Walker has come to refer to herself as “earthing.” The term “earthing” represents a sharing of power, resistance to human supremacy, and places all individuals, animate and inanimate in mutual relationship.

Spirituality is not grounded in a father god for Walker, but in Mother Earth, who sends the “grandmother spirit” to teach wisdom.

Wallace, Alfred Russel (1823–1913)

Alfred Russel Wallace was among the leading English field naturalists of the nineteenth century who also wrote widely on non-scientific topics such as politics, social reform, and alternative religion. His best scientific works, including The Geographical Distribution of Animals (1876) and Island Life (1880), were highly regarded and contributed substantively to the emergence of modern biology. Perhaps his most noteworthy scientific achievement was his formulation of a novel evolutionary theory in the late 1850s. Although independently conceived, Wallace’s views were remarkably similar to the ideas that Charles Darwin had been working on (and largely keeping to himself) since the late 1830s. Both theorists emphasized variation among the members of a species, environmental pressures that led to competition, and the concept of natural selection. Wallace first proposed his ideas to Darwin in an essay and letter sent in 1858. Darwin, shocked to find that someone else had developed similar views, nonetheless made sure that Wallace shared credit when their ideas were first presented to the scientific community. Darwin was also prompted to write up a more comprehensive version of the theory, On the Origin of Species, first published in 1859. This work became the starting point for all subsequent discussions of evolutionary theory and thus largely eclipsed Wallace’s contributions. In their latter careers, the two men kept up a regular correspondence and often joined forces to defend the concept of natural selection against its various critics. However, they disagreed on some issues, notably the relevance of natural selection to the human mind and human destiny.

Although Wallace was raised in the Anglican tradition, he largely abandoned traditional religion as a young man. In the 1840s he began exploring alternative belief systems, including the burgeoning spiritualist movement, which emphasized communication with spirits that were thought to dwell in higher planes of existence that surrounded the Earth. Typical practices involved ritual séances presided over by mediums who claimed to contact the spirits and relay messages. Although skeptics (which included many of Wallace’s scientific colleagues) dismissed the movement as trickery or delusion, Wallace insisted that spiritualism could be studied experimentally, and had, to his satisfaction, passed numerous tests. During his latter career, he wrote numerous articles, books, and pamphlets that defended spiritualist phenomena.

Like other advocates, Wallace believed that spiritualism was entirely compatible with a scientific worldview and reform activism. For example, he supported women’s rights, the utopian experiments of Robert Owen, and various land reform movements. He also opposed what he felt were reactionary or cruel applications of science, such as the eugenics movement and vivisection. Linking these disparate activities was a master narrative of progress that spiritualists believed was at once natural (organic evolution), socio-political (progressive reform), and spiritual (survival and improvement of the soul after death).

How did Wallace’s spiritualism square with his views of nature? Most significantly, while he staunchly defended evolution by natural selection for nonhuman organic systems, Wallace eventually came to believe that the higher mental functions of human beings (the “moral and intellectual faculties”) could not be fully accounted for by natural selection. Instead, he invoked an “Overarching Intelligence” that guided the process of variation and
accumulation of beneficial changes and that ultimately produced brains capable of mental and moral progress.

In this he implicitly argues for a separation between humanity from other animals that many (including Darwin) felt was no longer viable. Ironically, it may well have been an overdependence on natural selection (what some call Wallace’s “hyper-adaptationism”) that led to his distinction from Darwin. Wallace felt that natural selection acted exclusively in response to environmental conditions and eventually created perfect adaptations to those conditions. When considering humans in a “primitive” or “savage” state, Wallace could imagine no conditions that would require such a large, complex, and versatile organ as the human brain, hence his recourse to supernatural guidance. Darwin, on the other hand, employed the principle of correlation to deal with this problem. He felt that the higher functions of the human mind, including self-consciousness and abstraction, could have emerged in connection with the advantages conferred by language development.

Outside of biology, however, Wallace’s attempts to situated organic evolution in a more comprehensive worldview that embraced progress, reform, immortality, spiritual belief, and ritual practice paralleled the efforts of much of the religious left of the late nineteenth century. Akin to various liberal theologies that developed in that era, Wallace yearned for a new synthesis of science and religion that would be consonant with various political and humanitarian reforms. In contrast to conventional liberalism, however, Wallace worked in an eclectic intellectual milieu that thrived largely outside of traditional religious institutions. Similar attempts to “spiritualize” science continue, most notably within the contemporary New Age movement. However, akin to Wallace, some resist what is arguably the major religio-ethical implication of evolutionary theory – that human beings are not exceptional to the natural process. Thus in spite of his obvious love of the natural world and his willingness to think boldly, Wallace’s legacy was a religiosity that continued the traditional Western pattern of looking to the transcendence of nature. A religious vision that combined evolutionary theory and was spirituality oriented toward powers and processes within nature would have to emerge from other thinkers.

**Washat Religion (Drummer-Dreamer Faith)**

The *washat* is the name for what was commonly called the “Drummer-Dreamer religion,” a Native American religious revitalization movement that began in the early part of the nineteenth century. The religion took its earlier name from the drums used in its rituals and celebrations, and from the belief that its leaders had died, obtained visions from the afterlife (and hence had been “dreaming”), then returned from the dead to lead their people. The movement began in the American Northwest and spread eastward, spawning other tribal religions with various specific rituals, but the emphasis on the discovery of tribal identity through religious practices was retained.

The precise roots of the *washat* are notoriously difficult to pin down, but the religion owes much of its origin to the Wanapum prophet Smohalla who lived on the Columbia Plateau in what is now central Washington State. Smohalla, whose name means “dreamer” or “preacher,” was born sometime between 1815 and 1820. After a vision quest on a nearby desert mountain, Smohalla moved to the isolated village of P’Na on the Columbia River (now Priest Rapids), where he refined his religion, rejecting the “gospel and plow” message of the missionaries, and embracing the ancient traditions of the elders. The faith was strongly animistic, believing that all creation was capable of being imbued with spirit, and hence deserving of respect. Thus, it is hardly surprising that Smohalla rejected what he saw as agriculture’s destruction of the Earth, and insisted that his followers return to traditional means of food gathering, social customs, and most of all, religion. Since many natives looked with alarm at the increasing encroachment of the whites, the *washat* found a ready audience.

The religion was steeped in symbolism that called the worshippers back to a foundational relationship with nature. Smohalla began the weekly ceremony with a meal that reminded some visitors of the Christian Eucharist, with the sipping of water from the Columbia, taken with bits of salmon. In addition, the religion’s calendar celebrated salmon runs and root harvesting; the flags over the lodges contained the nature symbols of sun, moon, and star; and a tall pole adjacent to the prophet’s tule mat lodge held a small wooden bird, carved by Smohalla himself that represented the Bullock’s Oriole, the bird that had...
revealed the religion to the prophet when he was on his vision quest.

As Smohalla’s fame spread during the 1860s and 1870s, other prophets, most notably Skolaskin, Haslo, and Wovoka took the religion’s basic message back to their tribes, where the latter’s refinements were the genesis of the famous “Ghost Dance” of the peoples of the Northern Plains.

Today at Priest Rapids, there is something of a resurgence of the washat, with the religion’s innate respect for the environment finding a receptive audience among both natives and whites. Gone is the insistence that natives reject agriculture and other devices of European-Americans. Instead, the modern washat stresses an attitude of thankfulness to the Creator, which in turn prompts worshippers toward looking at nature with care and respect. Men and women still worship apart in the lodge; the drums still beat for much of the ceremony; the dancers’ movements are much the same as they were in the days of Smohalla; and all participants continue to partake of the ritual meal of salmon and river water. But the washat’s move away from outward societal rejection reveals a religion that works through transformation of society.

Many Wanapums today carry this transformist spirit with them, working in local industries, orchards, and farms, with some actually employed on the Priest Rapids Dam, the dam that flooded some of the Wanapum’s prime fishing grounds. This evolution of the washat points to the relationship that the tribe enjoys with the Grant County Public Utility District (PUD), the organization that owns the dam. The District strongly supports tribal religious identity, and works with the tribe to assist its environmental efforts along the “Hanford Reach,” the last free-flowing stretch of the Columbia River in the United States. This part of the river is one of the few sites in the Pacific Northwest that still supports strong runs of Chinook Salmon, and the partnership between the Wanapums and the Grant County PUD is a significant reason for the health of the salmon population. Thus, despite the religion’s changes since its rebirth in the 1800s, the washat’s influence on the ecosystem of the Columbia Plateau remains profound.

Waskow, Rabbi Arthur (1933–)

One of the recognized prophets of eco-Judaism in the United States, Rabbi Arthur Waskow has been a principal and energetic proponent of such things as: “eco-kosher” practice, the “greening” of Jewish liturgy, reclaiming the ecological wisdom found in the Torah, and marrying ecological sustainability with daily spiritual practice. A lifelong political activist, Waskow began reinterpreting and opening up Jewish traditions to the concerns of the day after a pivotal Passover he spent in Washington, D.C. The year was 1968, Martin Luther King, Jr. had recently been assassinated, and Federal troops had been called out to control rioting within the District’s African-American community. Waskow’s visceral experience of African-American neighborhoods under “lock-down” conditions imposed by government troops prompted him to reexamine the traditional sacred narrative of Passover in light of current events. Waskow felt a need for the “haggadah,” the booklet that tells the liberation story of the Jews moving out of slavery from Egypt (a story read during the Passover Seder service or ritual meal) to address the dynamics of racial oppression and violence he witnessed that day. In 1969, Waskow wrote and published a “Freedom Seder Haggadah” that adapted the traditional story of Exodus to address the realities of contemporary racism within a narrative framework of Jewish and African-American liberation. Many adaptations of the haggadah have followed Waskow’s innovation, including feminist-based and eventually environmentally focused haggadot.

Since then, Rabbi Arthur Waskow’s name has become synonymous with “Jewish Renewal,” a trans-denominational movement that seeks to reclaim, renew, and reinterpret traditions of Judaism that it views as having been lost or regrettably “sanitized” in the face of the historical pressures imposed by cultural assimilation and anti-Semitism. In response, Jewish Renewal embraces and incorporates spiritual elements from Hasidism, as introduced by two of Jewish Renewal’s founding leaders, Rabbi Shlomo Carlebach and Rabbi Zalman Schachter-Shalomi, who left the Lubavitch Hasidic movement but retained its daily spiritual rhythms and mystical components. In addressing environmental concerns in particular, Waskow explores what wisdom might be gleaned from the daily prayer and spiritual mindfulness observed in Hasidic tradition and the powerful importance placed on Shabbat (a time of sacred rest) for transforming patterns of consumption, “workaholism,” and globalization, which he believes threatens the entire web of life.

In 1983, at the invitation of the Reconstructionist Rabbinical College, Waskow founded The Shalom Center in Philadelphia. The center is a self-described “network of Jews who draw on Jewish tradition and spirituality to seek peace, pursue justice, heal the Earth, and build community.” Later, Waskow distanced the center from its
Reconstructionist affiliation and embraced instead the trans-denominationalism of the Jewish Renewal Movement. His encounters and exchanges with Rabbi Schachter-Shalomi in 1993 were especially formative for this shift and ultimately helped to catalyze Waskow’s ordination as a rabbi in 1995.

The Shalom Center implements both social and environmental justice projects. Its members helped produce the *Trees, Earth, and Torah* anthology, a collection of resources for understanding and conducting the “Tu BiSh’vat” ceremony, a midwinter holiday that celebrates the “Jewish New Year of Trees,” and *Torah of the Earth*, an anthology that explores ecological wisdom in the history of Jewish thought.

Center programs and publications also encourage “eco-kosher” practice, which takes into account not only food choices but also other consumption choices and their effects on the well-being of the planetary community. For example, Waskow asks the pointed question, “Are tomatoes that have been grown by drenching the Earth in pesticides “eco-kosher” to eat at a wedding reception?” (Waskow 1996b: 297). For Waskow, such questions extend to other lifestyle choices such as what bank one chooses to do business with or whether one chooses to consume renewable or non-renewable energy sources. “If what we sow is poison,” warns Waskow, “what we reap is poison” (Waskow 1996b: 299).

In 1996, the United Nations named Waskow a “Wisdom Keeper,” a designation given to honor forty religious and intellectual leaders around the world who are actively working on environmental issues. Together with his wife Phyllis Berman, who is no less an activist than her husband, Waskow travels to universities, synagogues, and community centers to lead Torah study groups, conduct ritual observances, and lead services in the style of Jewish Renewal. Berman is co-director of Elat Chayyim, a Jewish retreat center for healing and renewal near Woodstock, New York, where visitors eat an organic diet, study Torah, pray, and meditate. Berman is also the co-author of *Tales of Tikkun: New Jewish Stories to Heal the Wounded World* (Aronson and Berman 1996) and specializes in new liturgies for women.

Water in Islam

The religion of Islam, as revealed in the Qur’an, which Muslims believe to be the word of God (Allah), emerged in the western part of the Arabian peninsula – a dry, mountainous region similar in many ways to the Iranian plateau. The Qur’an mentions water on more than sixty separate occasions, and rivers more than fifty times. There are also frequent references to the sea, to rain and hail, fountains and springs. It is not surprising that the Qur’an, and for that matter pre-Islamic Arab tradition, place enormous emphasis on the importance of managing scant water resources sustainably and equitably.

Consistent with contemporary scientific understanding, the Qur’an states that water is the very source and origin of life: “We made from water every living thing” (Qur’an 21:30). Water is also the source of nourishment and sustenance, a gift from God: “Behold! . . . In the rain which Allah sends down from the skies, and the life which he gives therewith to an Earth that is dead . . .” (2:164); “It is He who sendeth down rain from the skies; and with it we produce vegetation of all kinds” (6:99); “It is He who sendeth down water from the sky in due measure and thereby We quicken the dead land” (43:11); “And We send the water from the sky and give it to you to drink” (15:22); “We send down pure water from the sky, that We may thereby give life to a dead land and provide drink for what we have created” (25:48–49); and “We provided you with fresh water” (77:27). The Qur’an also makes reference to groundwater and springs: “He leads it through springs in the Earth” (39:21); “From it also channels flow, each according to its measure (13:17); and “Say: ‘Think: if all...
the water that you have were to sink down into the Earth, who would give running water its place?” (67:30). Finally, water, with which Muslims must perform ablutions before praying and after sex, has the religious function of purifying the believer: “. . . and He caused rain to descend on you from heaven to clean you therewith” (8:11).

It is noteworthy that the Arabic term shari’a, which later came to be the term for Islamic law, originally designated “the path which leads to the watering hole.” Qur’anic descriptions of heaven, furthermore, depict it as being watered with flowing rivers (5:119, 87:17). The abundance of water imagery in the Qur’an leads M.A.S. Abdel Haleem, a contemporary Islamic scholar, to assert that water has greater religious significance to Muslims than to followers of any other tradition.

The notion of community (umma) is of central importance in Islam, and social justice is one of the most prominent themes in the divine revelation. According to the Qur’an, water is community property: “And tell them that the water is to be divided between them” (54:28). The traditions of the Prophet Muhammad (hadiths – which following the Qur’an constitute the second source of Islamic law) report him as saying, “People share three things: water, pasture and fire.” The hadiths also prohibit the withholding of water from those who need it, and from using it wastefully: “Excess in the use of water is forbidden, even if you have the resources of a whole river.”

Classical Islamic jurisprudence was formulated mainly during the eighth and ninth centuries of the Common Era and set down in the texts of four schools recognized by Sunni Muslims (the Shafi’i, the Maliki, the Hanafi, and the Hanbali), plus a fifth school, the Jaf’ari, which is accepted only by Shi’ites. The latter are a minority within the Muslim world as a whole, but in Iran they constitute a majority of perhaps 90 per cent. For the most part Islamic jurisprudence has remained a theoretical construct, an ideal toward which Muslim societies should strive, rather than a system actually practiced. Even in the Islamic Republic of Iran today, the official view is that the country is “working toward” an Islamic state; it does not yet claim to be one.

Within the classical legal system, water rights are determined first and foremost by the need to quench thirst. This primary right was accorded not only to humans, but to animals as well. Thus, irrigation systems must be available to all who are in need, and must not be polluted so as to protect the rights of downstream users. Furthermore, according to John C. Wilkinson, “New upstream appropriations may only take place if they do not affect . . . prior rights” (1990: 61). According to the hadiths, the Prophet stipulated that “no more than an ankle’s depth” of water could be taken – that is, providing adequate moisture storage in the soil for a seasonal crop. Wilkinson notes that the terms of the Prophet’s restriction arise from the Arabian context, where water-flows typically result from flash floods. Classical jurisprudence, seeking “the spirit of the law,” therefore determined that the intent was to prevent accumulation of excess water for purposes of speculation.

The hadiths also establish the principle of protected zones (harim), which include watercourses, rivers, and, significantly, their adjoining lands, including lands adjacent to wells. The harim is “the buffer zone surrounding a water body within which human activities, apart from the lawful use of water, are prohibited. The cardinal rule of harims adjoining waters is that they must remain undeveloped.”

Islamic criteria for water purity, which perhaps reflect ritual more than health concerns, state that water is polluted (naqis) if it has undergone noticeable changes in color, taste, or smell as compared to its “clean” (tahir) state at the source. In short, as Wilkinson summarizes, the norms for managing water which are found in classical Islamic legal sources are comprehensive, sustainable and just:

The existence of both surface and groundwater flows are recognized and the harim rules ensure that tapping does not occur, nor that a new irrigation system or well are constructed too close to an existing one. The existence of problems of water quality and pollution, as well as of water quantity, are also treated in the Islamic code (1990: 63).

Water distribution systems in traditional Muslim societies, whether irrigation networks in rural areas or urban water supplies for public use, often fell under the classification of waqfs, which are pious endowments for the public good, protected from both taxation and government seizure. Those who made waqf endowments – usually wealthy families – were not only able to protect their wealth by investing it in this way, but could also exercise enormous power within their communities by controlling systems vital to the community’s survival. In Esfahan (Iran) province a system of regulating the distribution of water from the Zayandeh river was stipulated by an early sixteenth-century document, popularly but anachronistically attributed to the Safavid minister Shaykh Bahā’ī. Much of the traditional canal system still exists, although throughout the recent drought the channels have remained dry.

Throughout Iran and Central Asia the traditional qanat systems, which provided water both for irrigation and domestic uses for three millennia, have now largely been abandoned in favor of “modern” practices such as the damming of rivers and the pumping of groundwater. Likewise, control of water resources has been transferred from pious endowments to government bodies. These changes have been brought about as a result of the application of development models imported from the West.
Water in Zoroastrianism

From ancient times, Iranian civilization has possessed an ethical system that recognized both the ecological realities of the plateau's desert climate and the social imperative of conserving and distributing water in a way that ensures its availability to all. In Zoroastrianism, the original pre-Islamic religion of the Iranians, which is still practiced by a small minority today, each of the four elements is represented by a deity (izad) and revered through special invocations (yasht). Water is associated with the goddess Anahita (Nahid), whom Herodotus identified with Aphrodite. Another deity, Patet Apam, is described as guardian of rivers, springs, and the sea.

According to the Zoroastrian sacred text known as the Avesta, water must be kept pure and unpolluted. When Zoroastrianism approaches a stream, waterfall or spring, they should recite an invocation called the Ardvisura Banu (or Abzavar), from the Aban yasht in the Avesta. The ritual calendar of the Zoroastrians marks the fall harvest, Paitishahem, by commemorating the primordial creation of water.

Traveling through Iran in the fifth century B.C.E., Herodotus reported that Iranians did not defile water by spitting in it, did not wash their hands with it and could not stand seeing anyone pollute it. Strabo (ca. 63 B.C.E.–24 C.E.) corroborates this by observing that Iranians do not bathe in water, and will not throw anything unclean in it.

Most of Iran's Zoroastrians today live in the central desert regions of Yazd and Kerman. For them, the daily sprinkling of courtyards and alleyways (performed throughout Asia as a means of keeping down dust) is accompanied by the diffusing of fragrant herbs such as wild rue, frankincense, aloe and marjoram, and still has a religious significance.

Water Spirits and Indigenous Ecological Management (South Africa)

Many international organizations, such as the Convention of Biodiversity, the United Nations Working Group on Indigenous Populations (WGIP), and the Working Group on Traditional Resource Rights (WGTRR), are calling for the recognition of indigenous peoples' rights to self-determination, the value of their knowledge, and the need for strategies to protect and preserve this knowledge. This has largely been precipitated by the global environmental crisis, which has revealed the shortcomings of an exclusively scientific approach, often within the Western economic development paradigm, in solving the multitude of environmental problems facing present and future generations. There has been a corresponding awareness of the need to revisit how indigenous people have managed to live sustainably within their environments, both in the past and the present. The religious worldviews (cosmologies) and knowledge systems of many indigenous peoples are intimately embedded within their physical, spiritual and social landscapes and can only be understood within these contexts.

There is an intimate connection that exists between the physical, spiritual and social dimensions of southern African spiritual healers’ knowledge and practice; particularly with reference to water resources. There is a common corpus of knowledge linking the African healing traditions with water spirits over a wide area in southern Africa. Although there are regional variations, the recurrence of common themes and key symbols remain the same throughout and form the cornerstone of the spiritual healing traditions.

Among many of the southern African indigenous peoples, there exists a set of complex beliefs regarding water, river systems and riparian zones. The spirit world is regarded as the ultimate source of such life-sustaining resources, as well as the source of knowledge of healing and fertility. Integral to such beliefs are various zoomorphic spirit manifestations, primarily the snake and the mermaid, which reside in or beyond the water and which interact with humans in a variety of ways. The rivers and the sea are the dwelling places of such manifestations and are of fundamental importance to many of the African healing traditions and their practitioners (termed amagqirha by the amaXhosa, or izangoma by the amaZulu). The snake and the spirits of the water are specifically associated with the calling of individuals to become diviners and are seen as the providers of wisdom, knowledge and medicines, which are given to chosen individuals. This usually involves the physical submersion of the candidate under
the water of a certain river, pool, or the sea (for a few hours, to days or even years) after which it is alleged that the individual emerges wearing the full regalia of a healer: a symbolic snake wrapped around his/her body and medicines. It is the spirits that choose the client, not the other way around, and resistance to the “calling” usually leads to misfortune. Relatives are not allowed to display any grief at the disappearance of one who has gone under the water or he/she may never be returned to the living. Anyone who enters these water sources without the calling of the ancestors will disappear, never to return. Messenger animals that summon the “chosen” one to meet the spirits are remarkably similar within all the cultural groups, namely, the snake or python, the water monitor, the hippopotamus, the dolphin, the otter, the crab, and various insects.

Certain places are more favored by the river spirits than others. They are believed to live in deep pools of certain rivers, often below waterfalls or fast moving “living” water or in the sea. The occurrence of certain plants near pools, such as the reed, wild tobacco or water buchu, indicate the presence of the water spirits.

Among the amaZulu of KwaZulu-Natal the water spirits in the form of the snake are referred to as the amakhosi (the great ancestors). Local informants suggest that they distinguish between the snake(s) that is/are a manifestation of the “family” (shade snakes) and the big one, “The one which is the Lord,” representing the Supreme Deity. For example, one informant describes the python as iNkosazana (the lord of the shades) who resides in the pool.

The amaZulu also recognize the existence of another category of nonhuman water spirits or semi-daemons, that are half-human/half-fish (mermaids) and have stated that this is one of the forms the heavenly princess, iNkosazana, can take. These creatures very often have transformative powers. For instance iNkosazana can manifest as the mermaid, the snake, the rainbow and gentle soft rain. This link with the rainmaking forces and fertility is a common theme throughout southern Africa. iNkosazana, the Zulu heavenly princess, as the bringer of soft soaking rains, is responsible for both agricultural and human fertility. She has all the qualities of the archetypal Fertility Goddess. Propitiation and appeals are made to her by virgins at the beginning of spring each year, appealing to her to bestow her gifts of fertility and to help them select a suitable husband.

There are many other rituals that are performed for the water spirits at rivers throughout southern Africa. The purposes for conducting them and the ritual process may vary from group to group. They are mainly conducted for diviners at various stages of their training, but some households will propitiate periodically to appeal to the spirits to bestow them with wealth, rain, good harvests and fertility. Caves that are in close proximity to pools, especially those with rock art, are often used by healers as sites for rituals, and are viewed as very sacred. Archeologist Frans Prins has argued there is a close association between the San rainmaking trance rituals that are held in caves near deep pools, and the amaZulu and amaXhosa beliefs surrounding the water. Much of the rock art in the eastern Free State, northeast Cape and Transkei feature snakes and water animals such as hippos. These rain animals have been linked to experiences healers have of the spirit world while in trance.

As a result of the profound sacred status that the many rivers, pools and water sources hold for southern African indigenous communities, there existed in the past, and among certain communities today, a range of taboos surrounding their access and utilization. Certain pools are held with a mixture of awe, fear and reverence. Only healers associated with the water are allowed to approach such areas. It is strictly taboo for anyone to extract plants or resources from the water’s edge. This can only be done by healers who are allowed plants for medicinal use. Common people are forbidden to go near sacred pools where the snake, mermaids and spirits are known to exist. This injunction is reinforced with the fear that uninvited people will be taken under the water never to return. Many groups limit the distance within which residential units can be erected near rivers and where cultivation can take place. Many of these beliefs and practices have been abandoned over the last century, with devastating environmental effects. In certain places there has been a resurgence of interest in these beliefs and practices. Recently in the Mvoti river area of KwaZulu Natal certain rural communities have reinstituted the ancient day of rest (lesuku lutcnkosazana) for the heavenly princess, in response to claims made by a number of individuals who say she has visited them and complained that she needs the rivers to be left alone on certain days so that she can enjoy them and renew them without any disturbance. Collecting water, washing or utilizing any water directly from the river on her day (Mondays and Saturdays), is strictly prohibited.

The water spirits are generally believed to live in pools and swamps that never dry out. It is said that their role is to protect water sources and keep them alive. They are the guardians of the river and the providers of rain. They can however be chased away from their pools, which results in the drying up of water sources and the infliction of drought. This is precipitated by lack of respect demonstrated by people toward each other and the Earth’s resources. Pollution, noise, the use of cement in rivers and dam building can all negatively affect the spirits. Killing or injuring any of the messengers of the water (such as crabs, snakes, frogs or water birds) is also regarded as a great offence. Social conflict and disrespect at both the local and national level can offend these spirits, resulting in catastrophic floods or droughts. Scholars have
demonstrated how people harness the idiom of the water spirits to mount powerful community opposition to social, political and developmental projects (e.g., the Ambuya Juliana movement in southern Zimbabwe in the early 1990s).

Spiritual healers (diviners) are regarded as the repository and custodians of much valuable knowledge and wisdom accumulated from the past. This knowledge is by no means static as it is continually being revived and renewed through communication with the ancestors. However, their access to such knowledge is under sustained threat by the forces of modernity: globalization, capitalism and religious intolerance. Ensuring indigenous people access to these sites is essential since such features are integral aspects of the nature, formation and transmission of knowledge. Changes in land distribution and ownership patterns in South Africa over the last 150 years have profoundly affected healers’ access to certain sacred features of their landscape that are necessary to perpetuate their living heritage. Protection of such resources from the ravages of modernization is also crucial, as the presence of these spirits is believed to depend on healthy river systems. Rivers are under sustained threat in southern Africa as a result of commercial development, farming operations, large-scale agroforestry, dam building and toxic overflow. State and private landowners may also decide to install dams or draw off large amounts of water, which may negatively affect inflow requirements to sacred pools or submerge them altogether. Sacred sites, including pools and cave rock-art sites, are also threatened by tourism (and recreational fishing), which may damage them in both physical and spiritual terms. All these factors pose great threats to the resources and knowledge base of spiritual healing in southern Africa, and mechanisms are urgently needed to protect the rights of indigenous healers, their environments, and their communities from such intrusions.

T.H. Watkins was an impassioned environmentalist and author of twenty-eight books and hundreds of articles and reviews. Watkins exemplified the American sensibility of devotion to place that re-places an institutionally and historically centered sacrality with a commitment to, and awe before, the splendor of untamed and unspoiled land. Best known as editor of Wilderness, 1982–1997, the magazine
of the Wilderness Society, from which in 1988 he received the Robert Marshall Award for his “devoted long-term service to and notable influence upon conservation and the fostering of an American land ethic,” he was also a historian of the West and depression-era America. Watkins’s 1991 book, Righteous Pilgrim: The Life and Times of Harold L. Ickes, 1874–1952, was a finalist for the National Book Award.

As a nature writer and land-ethnic activist, Tom Watkins was devoted to the idea and experience of wilderness. His last book exemplified his call for the preservation of public lands and his celebration of place, written and photographic – from geology to political disputes – for the sheer wonder of the redrock canyons of southern Utah. The first Wallace Stegner Distinguished Professor for Western American Literature at Montana State University, Watkins was a tireless advocate for western lands and good writing about those lands. In the conservationist tradition, Watkins believed that wilderness would teach humans how to live: “For in wilderness,” he wrote,

as in the eyes of the wild creatures that inhabit it, we find something that binds us firmly to the long history of life on Earth, something that can teach us how to live in this place, how to accept our limitations, how to celebrate the love we feel when we let ourselves feel it for all other living creatures (Watkins 1994: 104).

In Stone Time Watkins reveals his attachment to wilderness rather like a young Wordsworth of the Prelude:

I have two important landscape memories from my childhood – that of the seashore and that of the desert . . . The sundown sea of my childhood gave me abundant joy, a sense of freedom and possibility, but it was an easy place, generous and forgiving; even the sea itself, its waves eternally flowing toward security, promised salvation. But this contrary landscape, this desert place of rock and sky, serene and implacable and forever challenging, gave up nothing easily (Watkins 1994: 5–6).

His romanticism was anchored to meticulous geological, historical, and legal information and insights. And as with many nature writers, he thought what was needed to save this land was to look upon it and reflect. As an environmental ethicist, he worked to affect legislation that would preserve the place for a walk, a look, a reflection. He loved the desert, and there his ashes were scattered.

Watson, Paul (1950–) and the Sea Shepherd Conservation Society

Terrorist to some, ecowarrior to others, Captain Paul Watson has been a looming presence over the animal rights and environmental movements for the last three decades. Since the 1970s, Watson has been a founding member of Greenpeace, a medic in the 1973 Wounded Knee face-off between the American Indian Movement and the U.S. government, and the founder and president of the Sea Shepherd Conservation Society. Although he has tracked elephant poachers in East Africa, saved wolves in the Yukon, liberated monkeys from zoos in Grenada, defended bison in Montana, and campaigned for the rainforests in Brazil, Watson is best known for his dramatic efforts to halt the slaughter of whales, dolphins, seals, and fish of the sea.

Watson’s militancy is fueled by his intense sense of connectedness to the living Earth as expressed in his biocentric philosophy that all life is rich, beautiful, intrinsically valuable, and sacred. Watson had a number of startling epiphanies that spoke of his destiny to protect animals, such as in 1975 when a mortally wounded whale looked him directly in the eye, expressing pity for human-kind, and communicating that he knew Watson was trying to help. Watson’s biocentrism is conjoined to a scientific understanding of the laws of ecology that dictate how human beings must live on the Earth if they are to live at all. Watson condemns the anthropocentric hubris that presumes the laws of society can override the laws of nature. He decries the violence human primates have long inflicted on the Earth, other species, and one another, and warns of an impending species extinction crisis the like of which has not been seen since the age of the dinosaurs. Echoing Aldo Leopold, Watson believes the human species is doomed so long as it sees itself as conqueror of the biocommunity rather than a respectful citizen within it. More explicitly than Leopold, however, Watson calls for “Biocentric Religion” (including in volume one of this encyclopedia).

Born in Toronto, Ontario, Canada in 1950, Watson’s love and protective instincts for animals and nature were
manifested early. Living in southern New Brunswick, he fell in love with the water and marine life. A “kindred spirit” to all animals, Watson protested any abuse he witnessed and destroyed snare traps. His Earth-consciousness was so intense that by age 15 he had “pledged allegiance not to Canada, the Church, or humanity, but to nature” (2002: 49).

In 1968, Watson signed up as a merchant seaman and found his true home at sea. He joined the Don’t Make a Wave Committee that protested nuclear testing by sailing activist crews into target areas. In 1972, with Watson as a co-founder, the group renamed itself the Greenpeace Foundation and cruised into French and American nuclear testing zones. During this time, Watson also did freelance writing and studied linguistic and interspecies communication at Simon Frasier University, thereby adding scientific weight to his belief that animals such as whales and dolphins have highly evolved brains and communicative capacities.

From 1972–1977, Watson emerged as the most militant member of Greenpeace. At his urging, the organization expanded its focus to include wildlife preservation issues and in 1975 launched the world’s first sea-going expedition to protect the whales. In 1976, Watson led the first Greenpeace expedition to the ice floes off the Labrador Front to rescue seals and document the killing. He returned the next year with a larger crew that included French actress Brigitte Bardot, whose presence drew unprecedented international publicity to the seal slaughters. Watson’s plan was to spray the seals with a harmless green dye to render their beautiful coats valueless to sealers, but the Canadian government quickly outlawed the tactic leading Greenpeace to renounce it. Saving the dye tactic for future campaigns, Watson instead shielded seals with his body, moved them to safety, and threw sealers’ clubs into the sea.

By breaking Canada’s “Seal Protection Act” Watson saved many seal lives and helped to inaugurate a new era of direct action for animals, but the Greenpeace board voted him out in 1975 after concluding that he violated their direct-action guidelines which stress nonviolence and bearing witness. Stung by the betrayal, Watson berated Greenpeace as the “Avon ladies of the environmental movement” because of their focus on fundraising over action. They in turn denounced him as a “terrorist” and interfered with his subsequent campaigns.

Watson started his own group, first named Earthforce and then the Sea Shepherd Conservation Society, which he calls “the most aggressive, no-nonsense, and determined conservation organization in the world” (1994: xvi). With the help of Cleveland Amory and the Fund for Animals, Watson purchased the first of many Sea Shepherd ships in December 1978. In a series of bold, notorious actions, Watson and crew rammed pirate whaling ships at sea and sunk others at dock, sprayed thousands of seals with dye, intervened to halt dolphin kills, and destroyed miles of drift nets that environmentalists denounced as “curtains of death.”

Influenced by Marshall McLuhan’s theories of electronic media, Watson argues that nothing is real or believable for the public until it becomes a media event. Through sensationalist tactics, celebrity supporters, videotaped evidence, and dramatic press conferences, Watson aimed to galvanize a sleeping global village to help protect marine mammals.

Unlike many activists who resort to sabotage in defense of animals and the Earth, Watson accepts that property destruction tactics can be called “violence,” but he argues sabotage is necessary to thwart a much greater violence and to capture media attention. As he explains it,

To remain nonviolent totally is to allow the perpetuation of violence against people, animals, and the environment. The Catch-22 of it – the damned-if-you-do-damned-if-you-don’t dilemma – is that, if we eschew violence for ourselves, we often thereby tacitly allow violence for others, who are then free to settle issues violently until they are resisted, necessarily with violence . . . sometimes, to dramatize a point so that effective steps may follow, it is necessary to perform a violent act. But such violence must never be directed against a living thing. Against property, yes. But never against a life (1982: 26–7).

Watson’s strategies and rationales place him squarely in the radical environmental camp, where illegal tactics are considered morally permissible if not obligatory to thwart the destruction of a sacred and intrinsically valuable natural world. Indeed, he made strong connections during the 1980s with the Earth First! movement, which musings considered the Sea Shepherd Conservation Society its Navy, as they were his Army. Indeed, at Earth First! gatherings, Watson’s heroism is often celebrated in poetry and song, and individuals who have served as crew for the Sea Shepherd have recruited there with some success.

Watson’s champions credit him with inventing a powerful new mode of activism and bringing bold warrior tactics and values to the defense of the Earth. His critics berate him as an arrogant vigilante and violent pirate, an “eco-terrorist” who recklessly destroys property and endangers human life. Like most radical environmentalists, Watson insists that he explored the “proper channels” for appeal, protest, and change, but found only corrupt governments that either ignore or defend immoral and unsustainable killing. He argues, moreover, that he has proposed credible alternatives to industries such as sealing only to be rebuffed without a hearing. Where laws such as the 1986 International Whaling Commission ban on whaling are flouted without consequence, Watson insists he is upholding, not breaking, the laws. He freely admits to
violating statutes such as the “Seal Protection Act,” while reminding us that Gandhi and King also disobeyed laws in contradiction with the just and the right. Watson feels the charge of terrorism carries little weight coming from those who profit from killing, and he finds no credible comparison between damaging property to save life and slaughtering life for profit. For Watson, the true violence and real terrorism lies with those who massacre animals and devastate the Earth.

Critics also accuse Watson of being a misanthrope, a Eurocentric imperialist, and a dictator on his ship. Watson is unapologetic about the kind of discipline and command required to run a ship in high-risk conditions. He unflinchingly affirms that his primary allegiance is to life itself, and especially sea life, as he openly expresses contempt for a human species plundering the planet and exterminating species. Privileging animals over humans, Watson repudiates claims advanced by some members of indigenous societies, such as a number of the Inuit and Makah, who assert they have a right to kill seals or whales in order to preserve their cultures and identities. Watson believes that when marine species are at risk of extinction further killing cannot be justified, no matter what group of people is involved or rationale they articulate. Watson thus epitomizes “no compromise” radical environmentalism as he calls others to such activist, biocentric religion. Despite such radicalism, he continues to work with mainstream environmental and animal liberation organizations including the Sierra Club, whose members elected him to serve on its national board of directors in 2003.

Watsuji, Tetsuro (1889–1960)

Tetsuro Watsuji played an important role as a major twentieth-century nativist philosopher in the Japanese response to modernization and Westernization. The 1867 Meiji Restoration ended a 250-year seclusion to reestablish the imperial throne to power and to survey Western models and train abroad to construct a new Japan as the best defense against Western colonization and commercial exploitation. By the 1890s, many knowledgeable Japanese who had gone abroad despaired at the great gaps between the West and Japan, some reacting by reexamining the values of the Japanese cultural past.

Tetsuro Watsuji trained under several famed nineteenth-century nativists (such as the novelist Natsume Soseki and the imperial ideologist philosophy professor Inoue Tetsujiro). In 1927 he spent a year in Germany studying Western philosophy; in direct response to the publication of Martin Heidegger’s *Existence and Time*, Watsuji developed his theory of “natural environment” (fudo in Japanese), which he would subtitle “Considerations about Human Ecology” (Ningengaku-teki kosatsu). While others before him had considered the Japanese sense of nature, Watsuji was the first to do so in a modern Western philosophical style.

His starting point was Heidegger’s emphasis on “beingness” (sein) as the singular foundation of human existence. Watsuji felt this to be incomplete because it stressed individual self-discovery in a temporal context; his Japanese experience of a communal society anchored in a unique awareness of nature led him to incorporate a spatial (i.e., natural environment) foundation to human self-discovery, which he termed fudo. It is usually translated as “climate, scenery, geologic conditions, weather” and so on, but is better rendered the “natural environment,” and includes as well the nuances of the French milieu (“surroundings, social sphere”). Watsuji’s starting point for developing the concept of “natural environment” was the human awareness of cold – that cold is much more than a characteristic of surroundings external to the human or a sensation or an interior mental event, it is actually a human subjectively experiencing an objective awareness. The context of the experience as well as the process itself is fudo, “natural environment.” He interpreted Heideggerian self-awareness to involve both beingness and fudo, for the latter makes any objective self-discovery possible (Watsuji 1988: 12–13); since it enables humans to stand outside themselves, fudo is the “self-active physical principle of the human spirit objectifying itself” (1988: 10). This natural environment provides the opportunity or turning point (keiki) for concrete human activity. Humans face the challenge of survival because of the natural environment (the “tyranny of nature” [1988: 6]), so that all basic elements of survival such as food, shelter, and clothing, are inevitably tied to it. Tool making and the
invention of all material products and all cultural acts occur within this natural environment; thus culture and the natural environment are interrelated.

Watsuji did several things with fudo. 1) He rejected any standard Western deterministic relating of culture and natural environment. 2) He applied the traditional Japanese sense of a natural world populated by indigenous spirits or kami (as described in archaic times in the Japanese myth cycles in the seventh-century Kojiki and eighth-century Nihon-shoki) that was subsequently refined by the worldview of the Buddhist Kegon (Chinese: Hua-yen or “Wreath of Flowers”) school which posited a thoroughly integrated holistic cosmology of beings, contexts, and processes. 3) Noting that human awareness occurs existentially (Watsuji’s Japanese natural environment consists of immanent kami as an interrelated holism) he thus conceptualized an ontological relationship between natural environment and culture – this is fudo.

But this was only the first half of an essentially nativist project. In his travels during the 1920s, Watsuji noted great variations in vegetation, landscape, natural light, architecture, urban design, transportation, etc., across Asia, Europe and the Middle East, so he proposed three basic kinds of fudo: desert (Arabia), meadow (Europe), monsoon (South and southern East Asia). Since fudo structures all human activity as culture, he saw humans developing distinctive material lifestyles in each of these natural environments, but also social structure, cultural acts, and national temperaments. Desert fudo is the most intense human struggle with nature – echoed in a nomadic survival with fierce possession of essential resources, intra-human resistance and conflict, religions of stark ethics and a totally dominant, all-powerful one god. Meadow fudo began with classical Greece and Rome in a brilliant Mediterranean light and comfortable nature, making possible much contemplation about order and structure – thus Greek philosophy and science and recent European civilization leaps across the globe. Monsoon fudo is an over-intense nature – from the archaic deification of nature phenomena in Vedic India through a common trend toward seeking either a single powerful unity underlying such luscious and ever-changing life (brahman in Hinduism) or the universe as the unity itself (dharmadhatu in Buddhism). (Thus humans master nature in the meadow environment, but at best struggle and respect nature in the desert and monsoon environments.) Japan is part of this monsoon fudo, so his challenge next became how to clearly distinguish Japanese culture in relationship to its natural environment in contrast to the giants India and China, but also to the contiguous cultures of southeast Asian, Korea, and the Pacific.

Japan’s environment is unique among monsoon fudo in Watsuji’s eyes because 1) it is an island off the east coast of the Asian continent, 2) it lies on a geographical north/south axis, 3) unlike any other East Asian nation, its northern half receives cold Arctic air from Siberia and the Japan Sea, while 4) its southern half is both mainland monsoon belt-influenced but also Pacific island-related.

In his earliest writings in 1918, Watsuji had already linked Japanese culture to its natural environment, and soon did not limit this relationship to the development of material culture, but extended it deeply into the development of national character and ethos. With broad cultural sweeps, he linked such institutions as the Japanese corporate family, for example, to the traditional layout of the Japanese house, compared Buddhist temples to gothic cathedrals, Western gardens to Japanese, and so on. In parallel with such other well-known twentieth-century nativists as Okakura Tenshin and Suzuki Daisetsu, Watsuji also labored to isolate a uniquely Japanese national temperament as evidenced by its material culture. Here Watsuji built off of the Meiji imperial government’s advocacy of a new national religion/ideology of kokutai (“nation-as-corporate body,” the Japanese people as individual cells, and the imperial government as the head). As the Japanese began to establish the first modern Asian empire, the Greater East Asian Co-Prosperity Sphere (Dai-toa-kyoiken, 1940–1945), Watsuji expanded fudo to legitimate the role of the state in integrating “territorial opportunities” (keiki) as human ecology. He became best known for his Ethics, his life’s work about collective relationships and responsibilities in Japanese society. He would never see the Japanese state, its nation-as-corporate body ideology, or its martial spirit as reasons for Japan’s World War II defeat, his nativism always sending him back in Japanese history to moments of foreign contact – so Watsuji could only find the reason for Japan’s downfall to have been its two and a half centuries of seclusion (1508–1867) which denied it long-range access to and mastery of modern Western technology.

Weather Snake

Among the Zulu-speakers of KwaZulu Natal, Southern Africa, there is a myth of an immense snake that rides upon storms, wreaking havoc and destruction. Greatly feared, this sinuous goliath is kaleidoscopic in appearance, able to change its form, carnivorous, irate and itinerant. In the Midlands its abodes are the many dams and rivers that run from the heights of the Drakensburg mountains some 70 kilometers to the northwest.

This creature is both a monster and a deity, associated with the negative power of the ancestors and the destructive forces of weather and nature. It is also associated with major landmarks such as Mpendle Mountain, some 10 kilometers outside of the town of Howick. From the summit of this mountain this brilliant creature is said to fling its full length upon the back of the storm, although some would say that it is the very storm itself.

As he races across the landscape upon the high winds, the glitter of corrugated roofing, so typical of shacks in southern Africa, attract his attention, leading him to mistake this for the shimmer of water. He drops from the sky and hits the roof, only to realize his mistake. Frustrated and furious, he throws himself back upon the storm, twists his torso into a tornado and takes revenge upon the domestic landscape below. His tortured path rages from Mpendle Mountain through the scenic softness of white-owned farms, toward the expanse of Midmar Dam and on toward the Howick Falls.

This waterfall is regarded by Zulu sangomas (diviners) as a sacred place of power. Here for innumerable years, during the training of initiates, they have offered sacrifices to the ancestors and to the inkanyamba who are associated one with the other, and have even become each other in a blurring of boundaries. To awaken the snake from its watery sleep here is to invite its wrath in the form of storms, tornadoes and flooding.

The water-snake myth appears to have been introduced into southern Africa with the Bantu-speaking people some 2000 years ago, for the concept is prevalent throughout the southern sub-continent. But while this concept has taken the form of a water-snake among Bantu-speaker’s, among San hunter-gatherers it was regarded as the rain-animal who could take many forms, and was a creature associated with the otherworld and responsible for weather and rain. The San were the great rainmakers, the controllers of weather and nature. For these abilities, and for their magical qualities, the Nguni feared them, yet sought their services.

In the Drakensberg region, the San were present until relatively late, having been driven out by various fugitive African groups, by the expanding Sotho and by white colonial groups, from about 1838 onwards. The last raid in the Midlands took place at Kamberg in 1872. The descend-

ants of the San continue to linger on in these their old hunting-grounds. Here, in the rock shelters of these mountains, they left an immense lithic, or stone, gallery of rock art – a celebration of superb paintings. Among these are depictions of the rain-animal in the forms of the rain-bull and rain-herds of cattle, or presented as snakes, some of supernatural appearance. Among these are the rain-snakes.

Descriptions of the inkanyamba are similar to those for lake and water serpents the world over. Some of the features shared in such cases are the sinuous serpentine form, a mane, or integument of long hair or scales down the elongated neck, and sometimes an equine head. A creature resembling the inkanyamba is evident in a number of San rock paintings in the Drakensberg range. These serpents sometimes have a hogged mane like that of a zebra, horns, and either the head of a serpent, an equine head, or that of an Nguni cow or wildebeest. Whiskers occasionally adorn its face.

It appears that the Nguni and San engaged in a borrowing and merging of beliefs manifesting in the bovine or equine-headed serpent of the rock art, and with the weather-whipping inkanyamba of the Zulu-speakers, which flies along the old raiding routes of the San during its celestial journeys.

A giant mythical snake is not so far from European tradition. European descendants in this area have interpreted this mythical creature for themselves as a water-monster similar to that of Loch Ness in Scotland. Indeed, residents of this small town have reported sightings of a plesiosaur-type creature, or snake-like creature; sightings that have caught the attention of both national and local media. Part of the sensationalism surrounding the creature includes fake photographs of the monster and its young – published in a local newspaper – and crocodile eggs obviously imported into this area and said to be the eggs of the monster found at the pool at the base of the falls.

Clearly the water-monster is a means by which English-speaking European descendants have appropriated a local legend and presented it in a form to which they can better relate. The taming of the Howick Falls monster is just one way in which they have re-created an aspect of British culture and landscaped the African environment into a familiar domestic and cultural setting. Indeed, they are just one of three diverse groups, all of whom have manipulated a concept, to be found in many cultures worldwide – that of the dragon. Here, in the Midlands of KwaZulu Natal, European descendants have tamed the dragon, while the Zulu-speakers’ inkanyamba is clearly a manifestation of the dark side of nature. Among the San, the creature is simply an expression of their magical qualities and mastery over a biddable nature – indeed, an expression of their mystical selves.

Wenger, Susan (1916–), Yoruba Art, and the Oshogbo Sacred Grove

Susanne Wenger was born in 1916 at Graz, Austria. She arrived in Nigeria in 1950 and this marked the beginning of her involvement with Yoruba religion. Before coming to Nigeria, she had exhibited her works in Paris, Zurich, Austria, and other parts of Europe. Ajagemo, a high priest of Obatala (god of whiteness), introduced her to Yoruba religion in Ede and there she began her artistic works for the gods. The first of such works was the reconstruction of the Soponna cult at Ede and subsequently the renovations of the shrines of other gods in the Osun groves at Oshogbo. Her main work over the years has been the constant reconstruction, renovation, and conservation of the shrines in the Osun Oshogbo groves. The fusion of art and religion is at the core of Susan Wenger’s art, and she says the singular purpose of her work is to protect the sacredness of nature. Her works present a mixture of architecture, religion, and art.

Works of art consist of two elements, the inner and the outer, as well as two levels of knowledge, esoteric and exoteric. The esoteric knowledge level usually informs the inner element of art through knowledge, which is informed by the artist’s intended meaning(s) for the work of art. This knowledge is accessible to a few people, the artist and/or cultic functionaries in the case of religious art. The outer element of art gives expression to the inner element and manifests at the exoteric knowledge level, for it is accessible to all. It is expressed in aesthetic values and decorations. The outer element gives the work of art its visible and audible qualities. Both elements are significant and affect the performance/presentation of any work of art.

The site where Wegner carries on her art is the Osun grove. The Osun grove is located at the outskirts of Oshogbo town in Nigeria. It is an expanse of land fenced round, within which one finds the Osun River, Osun shrine, shrines for other Yoruba deities, and sculptures for the deities by Wenger and her assistants. The grove is a blend of fauna and flora and is usually a quiet and serene place. The art of Susan Wenger at the Osun grove in Nigeria exhibit the influence of both the inner and outer elements of art in Yoruba religion. The sculptures, put in place by Wegner and her assistants, are expressions of and means of conservation in Yoruba religion. The forms of the sculptures are wholly organic, with components used in proportions determined by religious injunctions. The cement is mixed with a prescribed amount of the grove’s red Earth. To ensure the conservation of nature in the grove, Wenger has been able to get the Osun grove onto the list of the Nigerian Antiquity conservation areas. Understandably, farmers who perceive these areas as a means of livelihood opposed the move vehemently, but with adequate information on the usefulness of such a stance, harmony has been achieved. Because Susan Wenger is a Yoruba by conversion/calling and not by birth/origin, her art presents some paradigms that may proffer significant import for existing relations between nature and religion.

The Yoruba hold that a combination of art and ritual remains indispensable to communication between humans and the divine. Further, nature is perceived as being sacred. Consequently, the Yoruba are more apt to think of art as an act of creative imagination (ọjọ ona), executed with skill and an understanding of the subject, rather than see art as an object. For the Yoruba then, artistry is the exploration and imaginative re-creation of received ideas and forms, usually from the divine. Art is a vital part of being, and creativity is associated with the divine. This stance informed the state and significance of the Osun grove prior to Wenger’s work. Emphasis was on verbal art and recitations rather than a prevailing need to erect sculptures for the Osun gods, as done by Wenger and others. While it is true that figures of Yoruba gods existed prior to Wenger’s artwork, this was more at the level of individual worshippers – an example is the twin figures (ere Ibeji).

The shrines of the gods are for them a ceremonial home, while the sculptures embody their myths. Embedded in these myths are characteristics and taboos of each god. The main features of Susan Wenger’s sculptures are life-size or larger figures and bulging eyes. Both features are known characteristics of Yoruba art, in pre-colonial times and presently. In addition, the bulging eyes are signs of spiritual power in mythology and religious experiences, depicting a higher consciousness. Her figures are usually larger than human figures, but these sculptures are representations of deities and records of mythology. She sometimes works with assistants in the restoration of these shrines within the grove. Most of these assistants are artists and adherents of Yoruba religion. Some of the sculptures produced by Wenger and her assistants in the Osun grove at Oshogbo include: Ontotoo (a senior deity in the heavenly abode), Obatala (the deity of purity and
whiteness), and Iya moopo (protector of all women’s crafts and trade). These figures are characterized by a blend of fauna and flora. Natural vegetation can be seen clinging to the shrine while monkeys, birds and other animals visit at their pleasure. Wenger’s sculptures for the gods and goddesses are therefore at home in nature. These sculptures enhance the vividness of the deities to observers and worshippers alike.

The cooperation between religion, nature and culture in the Osun shrine could best be described as a collaborative phenomenon. Features of the sculptures emanate through myths from the people’s religion and cultural ethos. Whereas nature nurtures the sculptures, religion and culture manifest themselves through them. Wegner and her assistants further collaborate in the Osun grove by combining their intellectual endeavors.

The resilience of Yoruba religion is being manifested continually within and outside Nigeria. The sacred grove of Osun Oshogbo is a big monument where the intertwining of the flora and fauna with the aesthetic presence of ritual artwork coexist. The grove serves as a conservation matrix and, at the same time, proclaims the record of Yoruba myths and deities; in so doing, it contributes to the vitality of Yoruba religion worldwide.

West Africa

West Africa is a vast region, encompassing a land mass of 2.4 million square miles, bounded on the north by the Sahara Desert, on the west and south by the Atlantic Ocean, and in the east by the mountain ranges along the Nigerian-Camerounian border. It is Africa’s most populous and diverse region, with nearly a third of Africa’s 800 million inhabitants. Its northern limit, the Sahel, receives less than 500 mm of rain per year, concentrated in a short dry season, but it is traversed by two major rivers, the Senegal and the Niger, which bring life-giving water for human settlement and irrigated or floodplain agriculture. As one moves south, rainfall increases and becomes more regular. In the Sudanic region, rainfall ranges from 500–1100 mm, the rainy season is longer, and vegetation is lusher. It was in this region that major African kingdoms developed, centered on control of the trans-Saharan commerce. Still further south, are Guinean forests which receive rainfall from 1100–3000 mm, whose lush vegetation sheltered tsetse flies and African Sleeping Sickness, which protected its inhabitants from the Sudanic kingdoms and their cavalry-focused military power.

These climate zones tend to correspond with religious affiliations. Today, the Sahel is overwhelmingly Muslim; some areas have been Muslim for over a thousand years. The Sudanic region is predominantly Muslim, but includes notable communities of followers of traditional African religions, most notably the Dogon of Mali, and also Christians, most notably the Mossi of Burkina Faso. Islamic communities are much newer in the Guinean forest areas and remain distinct minorities behind substantial Christian and traditionalist communities along both the Upper and Lower Guinea coasts. Islam tended to follow trade across the Sahara to the trading centers of the Sahel and Sudanic regions, and was a weaker influence in forest areas that relied on human porterage to transport goods through forest zones where African Sleeping Sickness was endemic. Nature is a critical aspect of African traditional religions in the Sudanic region and forest zones of Upper and Lower Guinea.

West African traditional religions are monocentric; that is, they focus on a supreme being who created the universe and is the source of all life-enhancing powers. They also emphasize the role of lesser gods or lesser spirits and ancestors. Particularly in the Sudanic region and along the Upper Guinea coast, the supreme being tends to be associated with the sky and with rain. For example, the Diola of Senegal address their supreme being as Eimitai or Ata-Emit, which means “of the sky,” and call rain “Eimitai ehlahl,” “falling from God.” Given climates where plants wither and die during the long dry season and return to life overnight after the first rains of the year, it is no wonder that the supreme being as giver of life is closely linked to the sky and to life-giving rainfall. This is particularly true in the Sudanic region and the northern part of Upper Guinea. In Lower Guinea, where rainfall is less of an issue, Earth goddesses attain greater prominence. Lesser gods and spirits may also be associated with rain, the ocean, particular rivers or springs, forests, fire, or with the forces of procreation.

Creation myths associated with particular religious traditions provide important insights into their representations of nature. For example, Dogon religious traditions describe various ways in which the Earth was created, but in all of them, an initially androgynous creator god becomes a predominantly male god in the process of creating the universe. As creation continues, this supreme being, Amma, becomes identified with the sky and the life-giving properties of rain. Amma rapes a passive and voiceless Mother Earth and fathers a solitary trickster figure, the jackal, which wanders the Earth seeking a partner. It is Amma’s breath, nyama, which is seen as a dynamic, life-enhancing power that flows throughout the universe.
It is embodied in the moist, serpent-like Nummo, who purify Earth with the power of the First Word, which is identified with cloth made out of natural vegetation, twisted into coils in a primordial loin-cloth. As other disruptions in the creative process occur, the Nummo bring new, more sophisticated Words to restore order. The last and most complex is associated with the powers of the forge and of agriculture, which work in tandem restoring the Earth's life-giving powers and bringing order out of chaos. In Dogon cosmogonic traditions, one finds a common dichotomy between the settled areas of villages and towns and the dangerous, solitary chaos of the bush. Among the Bambara, the supreme being is initially seen as a seed and agriculture is central to their religious life. As part of their transition to adulthood, Bambara boys are initiated into the tyiwara society, which celebrates the role of an antelope deity, Tyiwara, in introducing agriculture to the Bambara, and the necessity of performing agricultural rituals to ensure the fertility of the land.

Other myths describe agriculture in more disruptive terms, seeing the act of planting seed and pounding harvested grain as the reason why the supreme being withdrew from a place just above the world, to a safer place high up in the heavens. Other myths describe creation in terms of their observations of the natural order. Thus, the Yoruba describe how the supreme being, Olodumare, gave a lesser god, Obatala, a chicken and a shell filled with sand and told him to create a world. Obatala poured the sand on the primordial waters and placed the chicken on it. It began to scratch in its constant search for food, and quickly spread the sand out, creating the dry Earth. Then Obatala began to create other living things from clay and did so in an orderly fashion, until he became drunk on palm wine and began to create deformed people and animals.

The gods and lesser spirits themselves reveal important ideas about West African representations of the natural order. The Fon and Ewe of Lower Guinea group their deities in three pantheons corresponding to the three most important realms of the universe. Mawu-Lesa, a complex god that is both female and male, heads the sky pantheon. Their children and grandchildren are associated with the pantheon of earth gods and the pantheon of ocean gods.

In many West African societies, the Earth is seen as a goddess. This is not only true of the Dogon, but is equally true for the Igbo of southeastern Nigeria and the Ashanti of Ghana. Ala, the Igbo earth goddess, guards the fertility of the land and is closely associated with the enforcement of moral codes. The Igbo term for morality, omenani, refers to “what happens on our land.” Prohibited actions can render the location of such acts barren and incapable of producing crops. This is true of the Diola as well. Asase Ya, the Ashanti earth goddess, is also linked to the maintenance of the moral order and of fertility.

Similarly, the Yoruba’s Ogboni Society, associated with a male Earth god, is responsible for conducting the judicial investigations into violent crimes; the shedding of blood is regarded as a profanation of the Earth. “The Beng of the Ivory Coast also have a male Earth god, whose priests, the Masters of the Earth, play an important role in reconciling the social order of humanity and the life-enhancing powers of the Earth. To the Beng, the Earth is all-knowing, able to distinguish between lies and truth and with a long memory as to the ritual obligations pledged to him when seeking his assistance. As Beng establish villages, the Master of the Earth ritually plants a Kapok tree, marking the space as one of human habitation, as opposed to the forest. This planting also permits the development of family life, especially sexual relations without the danger of conceiving a forest creature, a problem if sexual relations occur in lands unseparated from the bush. The Beng also worship lesser earths, refractions of the earth god, but capable of assisting them with more local tasks and punishing them for neglecting their obligations. The Earth is seen as so powerful that one day of each six-day week is set aside for his worship.

Many gods are associated with bodies of water. Thus, the Bambara of Mali link a stretch of the Niger River with the water spirit, Faro, who is a guardian of fertility. Yemoja, Oshun, and Oya, three Yoruba goddesses, are all associated with rivers, whose apparent stillness and depth mask powerful currents that can overcome human initiatives. The Igbo’s goddess of wealth, Idemili, is associated with a river of the same name. These goddesses can bestow riches in children and in economic power to their devotees. The Diola identify a whole category of spirits, the amnahl, with water. They are often linked to some of the most powerful Diola shrines or can remain independent, revealing themselves only to a chosen few. Powerful gods of thunder, like the Yoruba’s Shango and the Igbo’s Amadioha, demonstrate the destructive power associated with rainfall.

Other gods are associated with diseases. Afflictions can either be a source of punishment for wrongdoing or neglect of one’s responsibilities or a summons to take on ritual responsibilities. Thus, the Diola’s family shrine of Hupila seizes men with a disease that makes their body feel like it is bound with rope. Part of the healing process involves building a shrine; it may require learning to become a priest as well. The Diola fire spirit, Gilaite, associated with blacksmithing, punishes thieves or their families with leprosy. The Yoruba deity, Shopona, and the related Fon and Ewe Sakpata, used to be associated with smallpox, seizing those who survived it as its priests and killing those who had violated its edicts. Since the elimination of smallpox, however, this deity has found a new disease to manifest its power, HIV-AIDS.

Finally, trickster gods are common in much of West Africa where they are closely associated with particular animals who are regarded as extremely wily and outside of
human control. Thus, the Akan’s Ananse is identified as a spider. The Dogon’s tricksters are identified with foxes and jackals, who speak in crude, highly symbolic language, the language of divination. These deities are not evil, but forces of disorder that disrupt human attempts to impose order on the world. They introduce diseases, natural disasters, animal pests, and powers of the bush against the people of settled townships. In the case of the Fon’s trickster, Legba, and the Yoruba’s Eshu, they portray the disruptive power of unsocialized, that is, natural, sexual powers and the disorder that they engender. All of these tricksters provide vivid evidence of the persistent ability of natural forces to disrupt humanity’s attempts to construct a world order. They provide powerful explanations of the idea that the frequent droughts of the last quarter of the twentieth century were caused by peoples’ abandonment of their religious obligations and their embracing of Christianity or Islam, which have had little to say about environmental issues. Among the Diola of southern Senegal, this has led to the intensification of a prophetic tradition, focused on the performance of rain rituals. The most famous of these prophets, a woman named Alinesitoué Diatta, also rejected French agricultural schemes which would have shifted the emphasis of Diola agriculture from rice to peanuts, and led to the cutting down of the forest areas within Diola territory, which she saw as linked to the persistent droughts. She also criticized those Diola who converted to Islam and Christianity and refused to participate in Diola rituals or observe a Diola day of rest for the land, every sixth day. The rapid growth of Islam and Christianity, coupled with their relative neglect of rituals focused on nature, occurred at a time when droughts and desertification became increasingly severe. Whether or not the perception that religions indigenous to West Africa can more effectively supplicate the powers that govern nature will affect the continued growth of these newer religions remains to be seen. Conversely, one might predict that the instrumental aspects of Christianity and Islam that are focused on links to the powers of nature may become accentuated by African spiritual concerns brought by their converts and the growing ecological crisis affecting so much of West Africa.

Western Esotericism

“Esotericism” has become a highly popular term during the last three decades. Like “New Age,” it is a catchword for a lot of quite disparate religious or cultural phenomena, and its usage in the wider public differs considerably from its usage in academic contexts. Since its first appearance in the nineteenth century, a definition of “esotericism” often refers to the meaning of the Greek esôteros (“inwardly,” “secretly,” “restricted to an inner circle”) and lays the main emphasis on secrecy and concealment of religious, spiritual, and philosophical truths. This characterization turned out to be not very helpful, given the fact that a lot of “esoteric” knowledge has been published and openly discussed – especially (but not only!) in the twentieth century. Therefore, other definitions have been proposed. Among the most influential is the concept of Antoine Faivre, who became the mentor for “history of esotericism” as a new branch of religious studies.

Systematic Definition

Faivre argued that esotericism should be defined systematically as a certain worldview or as a means to conceptualize cosmos, nature, and humankind. He distinguishes six characteristics, four of them being crucial for esotericism and two being indicative only in certain contexts. 1) The most important characteristic is the doctrine of correspondences. In this view, each part of the visible and invisible universe is connected and every single part mirrors one of the others in a symbolic way. The correspondences take the form of two different approaches to reality: following the well-known principle of “Microcosm-Macrocosm,” there exist obvious or veiled correspondences between different layers of the material and immaterial world (e.g., between the planets on the one hand and metals, the human body, or plants on the other). But correspondences may also exist between nature (or cosmos), history, and revealed texts. Nature and scripture are believed to be in harmony, which is the key to understand medieval and early modern talk of the “book of nature” being revealed like the Bible itself. 2) The doctrine of living nature conceptualizes the universe as a dynamic system, in which all interconnected parts are animated. This is also an essential assumption of a particular branch of the Western philosophy of nature, as it is of magic since ancient and Renaissance times. 3) Imagination and mediation is a characteristic that follows the doctrine of correspondences, insofar as it implies the possibility of meditation between the higher and lower world(s), by way of ritual and symbolic performance or through revelatory agents like angels and intermediate spirits. Imagination is not only a form of clear concentration necessary for magical rituals but was also depicted in early modern times as a particular “organ of the soul” that can establish a cognitive and visionary relationship with an intermediate world. 4) Borrowing a term from alchemy, the fourth characteristic is called experience of transmutation. It denotes the process of personal initiation on a spiritual path, either through a social event (like in freemasonry) or as a private change of status. Transmutation also means that the old person is entirely left behind, providing room for a new birth into wholeness and illumination, a process of regeneration and purification.

In addition to these four “intrinsic characteristics” – meaning that all of them have to be present to qualify a cultural setting as “esoteric” – there are two relative or non-intrinsic features that often occur. One (point 5) is called the praxis of concordance, which alludes to the frequent attempt to display the commonalities between two or more – ideally even all – different traditions. Prominent examples are the belief in a prisa theologia (“old theology”) or a philosophia perennis (“eternal philosophy”) that captured the imagination of medieval and Renaissance scholars. Another example is the seminal work of Helena Petrovna Blavatsky and the Theosophical Society; Blavatsky searched for a common denominator of all spiritual traditions and presented her Theosophy as the revelation of the secret key to true (and universal) knowledge. A final component (point 6) can be seen in the transmission of esoteric teachings from master to disciple. This is either a sociological characteristic indicating the necessity of being introduced to a spiritual tradition or the legitimization of authority and “authenticity” by means of an “age old” chain of masters. For instance, Freemasons present King Solomon as the founder of their tradition; Rosicrucians refer to the mythic figure of Christian Rosenkreutz; in contemporary parlance the notion of “avatars,” “ascended masters,” or the “Great White Brotherhood” plays a decisive role in securing authenticity and spiritual identity.

Esoteric “Disciplines” and Their Historical Development

Applying the systematic characterization of esotericism mentioned above to the Western history of science and religion, several cultural phenomena show their obvious relation to esotericism. Furthermore, there were times of thought in Western history that appear crucial for the evolution of esoteric thinking. To begin with the esoteric “disciplines,” it might be argued that astrology provides a key to all other esoteric explanations of the cosmos. It directly follows the doctrine of correspondences to search for the
symbolic – rather than the causal – relation between the astral world on the one hand and mundane or human events and dispositions on the other. Astrologers try to translate the all-encompassing dynamics of the world’s visible and invisible features into the symbolic language of planetary energies, thus creating a fundamental tool for esoteric interpretation. Magic, then, can be described as the practical application of astrological symbolism. If one wants to perform a ritual, it will be advisable to assemble those components that are likely to support one another because they belong to the same cosmic principle; for a “Venus ritual” one might burn incense of Mugwort (Artemisia vulgaris), use an Aventurine stone, put up the Tarot card “III – The Empress,” light green candles, chant the vocal “a,” and so on. Those features are thought to “invite” the cosmic energy of Venus and help the magician to focus her or his concentration (imagination) on the ritual’s goal.

Magic and astrology share a lot with the third esoteric discipline – alchemy. Using astrological symbolism and magical ritualizing, alchemy is focused on the inter-relationship between mind and matter. But rather than being interested in the mere transformation of lower material into higher material – to turn lead into gold – the alchemists regard this process as mirroring the purification of the adept’s soul, thus connecting the alchemist to the hidden levels of nature. It is important to note that both alchemy and magic are not opposed to “science.” Until the eighteenth century, they were inseparably linked to the scientific disciplines. Although alchemy and magic build on a holistic model of the cosmos, their relation to nature was by no means a “sacramental” or devotional one. Alchemy and magia naturalis in many respects aimed at subordination and control of nature (through nature’s “purification” and “improvement”), even when animistic or pantheistic perspectives were involved.

From a historical point of view, the origins of esotericism unquestionably are to be found in antiquity and can be regarded as a confluence of philosophical and religious assumptions. The Stoic philosophy conceptualized the universe as a dynamic system of interrelated and animated parts, whereas Middle and neo-Platonism contributed to esoteric thinking with its idea that the material world is only a very insufficient mirror of the “real” world lying hidden in the transcendental or – as Christian Gnostics would have it – in man’s “sacred core,” which is undefined by “nature.” The Greco-Egyptian tradition attributed to Hermes Trismegistus (the “Thrice-Greatest Hermes”) as the divine revelator of universal truths contributed significantly to the formation of esotericism, especially with its macrocosm-microcosm doctrine and the enshrinement of Hermes Trismegistus as the “founder” of the occult sciences. In late antiquity, astrology, magic, and alchemy were fully developed and enjoyed a high reputation, despite the fact that Roman and Christian emperors periodically tried to punish experts who exercised those discip-
name but a few important protagonists of that time: Emmanuel Swedenborg (1688–1772) was among those arguing for a presence of spiritual dimensions in the material world, for which Immanuel Kant attacked him; the mysticism of Jakob Böhme (1575–1624) was adopted by philosopher of nature and alchemist Friedrich Christoph Oetinger (1702–1782). The tension between a holistic esoteric worldview and the dualistic or mechanistic model established by Isaac Newton (who nevertheless wrote alchemical treatises and a commentary on the Tabula Smaragdina, which was attributed to Hermes Trismegistus himself!) became even more imperative in the nineteenth century, when increased rationalization and mechanization of science, religion, and nature provoked a counter-reaction. What Max Weber called the “disenchantment” of the world was answered by romantic authors in Europe and North America with an intensified focus on the wholeness and sanctity of nature. In doing so, these philosophers, scientists, and artists built on esoteric doctrines of “living nature” and “correspondences,” not to mention the revelatory aspects of divine knowledge now being “experienced” in nature. Although there had been trends of pantheism and nature’s admiration before, it was Romanticism that fully brought about a religious dimension of esotericism’s attitude toward nature. Like in today’s “deep ecology” – which is a follower of nineteenth-century thought – for Romantic authors, nature was not the mere object of study, but an object of adoration.

When in 1875 H.P. Blavatsky and others founded the Theosophical Society, a movement took on institutional form that must be regarded as a kind of turntable between nineteenth- and twentieth-century esotericism. Blavatsky’s works – especially her Secret Doctrine – remained standard reference-books for people searching for a philosophia perennis, now including even Buddhist and Hindu traditions that have been popularized by the Theosophical Society. In accordance with the esoteric tradition – and to some degree contrasting pantheistic Romanticism and Transcendentalism – Blavatsky and her followers described nature as a revelation of the primordial truths, still containing in essence the symbolic formula of the cosmos. In doing so, nature does not necessarily have intrinsic value, but it serves as a means for humans to understand the universe and their place within it. What counts is the perfection of humankind and the transformation of the spiritual self into a cosmic consciousness. This basic attitude is still discernable in those areas within the “New Age movement” where Theosophical traditions have been adopted.

In sum, one could say that esotericism is an integral part of the Western history of thought, influencing both science and religion. It employs a holistic model for interpreting the universe and focuses on the refinement and accomplishment of humans. As can be seen in alchemy, this also implies an “improvement” of nature (i.e., a transformation of impure matter into a state of pure essence). Hence, esotericism does not lead to any kind of environmental ethics, in which nature would have intrinsic value and rights. When nature is adored, it is adored for being a mirror of humankind’s primordial (and utopian) state of sacredness and perfection.

Whales and Japanese Culture
Whales have for centuries been hunted and eaten by the Japanese, and whaling activities are intimately bound up with religious beliefs and practices. According to a widespread Japanese view, which stresses the interdependence of supernatural, human, and animal worlds, the whale is seen as a manifestation of Ebisu, the patron deity of fishing, who often disguises himself in this way when on festive days he approaches shrines to pray. Whales are believed to sacrifice themselves for the benefit of humans, and in return the whalers ought to utilize the carcass to the fullest – wastes are seen as an insult to the whale – and to take care of their immortal souls. Failure to do this may
cause the whales to turn into “hungry ghosts” that can cause illness, accidents and other misfortunes.

The souls of whales have in many whaling communities therefore been treated in ways similar to the souls of deceased human beings. Tombs and memorial stones can be found on at least 48 places, from Hokkaido in the north to Kyushu in the south, and annually at least 25 festivals (matsuri) and memorial rites (kuyô) are held in honor of whales. A tomb at Koganji (an old temple dedicated to whales) has been designated a national historical monument and marks the burial of 75 whale fetuses. In late April, the temple hosts elaborate memorial ceremonies with Buddhist priests reciting sutras for several days in order to help the souls of deceased whales to be reborn in a higher existence. Such services have a number of meanings. The temple priest may perform the memorial service in the belief that the whale will reach enlightenment and thus be released from rebirth into this world and enter Paradise as “Buddha.” Some villagers may believe that the whale will be reborn as another whale to be hunted. Finally, memorial services are held to ensure that the whales, and the gunners in particular, are forgiven for the sin involved in taking life. Memorial services therefore carry special meanings to the gunners, and they frequently go directly to the temple upon returning home in order to conduct memorial services for the whales they have killed.

A number of lesser ceremonies and rituals are performed in order to repay whales for their personal sacrifice and thus secure safe voyages and rich catches. Whaling companies gather whalers and their wives for ceremonies before, as well as after, the commencement of the seasons, and in some places the wives go on pilgrimages to local shrines. Daily religious observations are conducted in front of the family Shinto altar, praying for the husband’s safety and good catches. Similar rituals are performed on the boats, where a piece of the whale’s tail may be offered to the Shinto altar. Rituals tie whalers to each other, to their families, and to the whales, thus giving the local residents both a feeling of the common heritage and meaning to their lives. This common cultural heritage is expressed and reinforced in festivals, songs, dances and local dishes of whale meat. Rituals give the community its distinct character: the set of Shinto deities is unique to each community and the festivals are different as well. But they are all variations of common themes based on a conception of the whale as a creature with an immortal soul and a worldview stressing the interdependence of supernatural, human, and animal worlds.

Successes as well as failures are explained in relation to the divine. Accidents may be caused by failure to repay the whale’s sacrifice through ritual neglect, but can also be caused by breaking taboos. There are several stories about the malevolent spirits of whales, some of them known throughout Japan. The most famous is the disaster that struck Taiji in 1878 when whalers broke an old taboo and attacked a right whale with calf. More than one hundred whalers lost their lives in the following gale. Such accidents, which have become part of the communities’ cultural heritage, and thus help in giving them their peculiar identities, have reinforced the validity of the taboo, a taboo that, incidentally, might carry some value in the conservation of the stocks.

Today many people, particularly in the Western world, see whaling as barbaric and eating whale meat as close to cannibalism. Anti-whaling groups have been especially critical of Japan, and their anti-whaling campaigns have ranged from ecotage and consumer boycotts to attempts to change Japanese views. At first sight, it seems they have had some success. Images of “cute” whales and dolphins adorn bridges, gateways, post offices, fire stations, manholes, and pachinko parlors. The number of Japanese who go whale-watching has soared, and visitors to “Whaleland” – a museum located in a whaling town – are invited to listen to “the messages of the whales.” Certainly, the Japanese have not been immune to Western discourses on whales.

At the same time, there is considerable resentment against Western environmentalists as well as the International Whaling Commission for what many Japanese see as a double standard. When the United States goes to great lengths to secure quotas of endangered bowhead whales to its Alaskan population while denying Japanese whalers the right to hunt the non-endangered minke whales, this triggers a national discourse that asserts the Japanese are victims of Western racial prejudices. It is felt that not only whaling but Japanese culture and its most important symbol, food, is under attack. In response, eating whale meat has acquired new significance: to some it has become a ritual act through which the partakers express their belonging to the Japanese nation. Moreover, whaling festivals, music and dances – most of which underscore the interdependence of the supernatural, human and whale worlds – have been strengthened and even reinvented to foster feelings of local identities in the name of cultural diversity.

Two global discourses on the uniqueness of whales and on the value of cultural diversity meet in Japan without creating contradictions. While “Whaleland” asks people to “feel like a whale,” its souvenir shop sells whale meat and other whale products. Compassion does not rule out consumptive use, and their coexistence is made possible by the holistic and contextual approach to nature found both in Buddhism and Shinto.

Whales and Whaling

Whales (or cetaceans, a term that also include dolphins and porpoises) have fascinated people all over the world and figure prominently in myths from the Greeks of antiquity to contemporary Amazonians and Californian New Age adherents. The best-known myth in Western societies is probably the biblical story of Jonah who was swallowed by a huge “fish” (usually believed to be a whale). The myth may symbolically represent Christ’s crucifixion, entombment and resurrection on the third day, with the darkness of the whale’s womb representing Hell. This is a very different perspective than that in an Inuit myth where the interior of the whale – its soul and heart – is a young and beautiful maiden who demands only one thing from her guests: never to touch the oil-lamp. But a raven cannot resist touching the sacred flame, the heart of the whale, whereupon the maiden dies. In this myth the whale’s interior may represent a Garden of Eden destroyed by human greed and curiosity. The myths disclose very different views on the human–nature relationship, but we should be careful not to draw premature conclusions about their impact on management ethics.

Several themes can be recognized in many of the myths. Some of them are trivial: whales assist people to catch fish, save them from drowning or engage playfully with human beings. Others are more spiritual. In many cultures whales are seen as embodied deities. In Greek mythology, Apollo turned himself into a dolphin to rescue people lost in a gale; in Japan whales might be regarded as the embodiment of the patron deity of fishing; and in Vietnam cetaceans receive human-like funerals to become “Angels of the Sea.” In most cases the whale is beneficial, but on Tikopia in the Solomon Islands stranded whales represent manifestations of potentially harmful spirits that must be appeased.

Another common theme is metamorphosis, particularly between dolphins and human beings. Both in the Amazon and in Micronesia, dolphins are believed to take human form to attend village celebrations, but the metamorphosis may also go the other way. According to Greek mythology, the first dolphins came into existence once the wine god Dionysus traveled between the Greek islands. Discovering that the crew plotted to sell him as a slave, he transformed the oars into snakes and filled the ship with vines. In panic the crew jumped into the sea where Poseidon, the god of the seas, took pity and turned them into the first dolphins. In many Pacific societies people are believed to transform into dolphins when they die, particularly if they have drowned, and the Haida in British Columbia believed that in such cases they would take the form of a killer whale. From here it was but a short step to regard whales as ancestors and guardians.

A related theme is anthropomorphism; whales live in societies remarkably similar to those of human beings. In Oceania, in the Amazon and on the American Northwest Coast, whales live in underworld societies where they behave and live much like human beings. People and whales live in parallel worlds; the whales may even be known as “underwater people.” The parallel marine and terrestrial worlds may also create a pairing of land and sea creatures, a common phenomenon in much of the Pacific. The ritual pairing of taro and whales seems to be particularly common in Micronesia, as on the Woleai atoll in the western Caroline Islands. One interpretation is that whales and taro constitute important binary oppositions symbolizing the dualities of land versus sea and male versus female. Similar pairing has been reported for killer whales and wolves among the Siberian Chukchee and American Northwest Coast Indians. In some cases each marine species has a counterpart on land.

Whale-related myths are not found only among whalers, but it is among whalers that we find the most elaborate beliefs and practices. Most whalers share with hunter-gatherers throughout the world the belief that the prey voluntarily gives itself to the hunter. This notion is strong among the Inuit and Japanese as well as in Micronesia. The exception are whalers in Western societies where, for example, Icelanders and Norwegians may rather regard whales as a gift from God. In either case, the whalers become tied in relationships of indebtedness. Svend Foyen, the Norwegian inventor of modern whaling and a very pious man, felt the same obligation to utilize all...
parts of the carcass as has been reported from Alaska and Japan, and among the Faroese it may be regarded not only as laziness but also as a sinful act not to catch and accept this gift from God.

However, the notion of indebtedness is much stronger and more all-encompassing in non-Western societies, where whaling typically is seen as a sacred act that unites animals and human beings in webs of reciprocity. This is particularly noteworthy among the Inupiat in northern Alaska where people and bowhead whales are believed to communicate in subtle ways. In order to attract a whale, the hunter and his family must prove that they are worthy of the whale's sacrifice. The whales are believed to be very knowledgeable and able to hear, see and smell over long distances and can immediately tell a good and generous person from a bad and stingy one. Great care must therefore be taken not to displease the whale, or else the animal will evade the hunter. Conflicts, noise, quick movements, dirt, blood, and death are all believed to be offensive to the whale and must be avoided.

A number of taboos have to be observed during the preparation for the whaling season, during the hunts as well as during butchering and distribution of the meat. Some of these are shared with other whaling cultures. Boats and equipment must be repaired, painted and cleaned before the season can commence, and new clothing prepared. During hunts, whalers may observe taboos pertaining to food, clothes, shelter and behavior. Among the Inuit, as well as in Norway, one should keep land clearly separated from the sea: the Inuit may refrain from eating caribou and berries during the whaling seasons, and in the past did not bring dogs to the ice at this time. Most Norwegian whalers will not bring waffles, goat cheese or rucksacks aboard the vessel. Nor should they mention terrestrial animals by their proper names. In Lamalera, Indonesia, this prohibition extends to places, whales, and persons as well.

In times of poor catches, whalers may perform magic rites. The Lamalera whaler may "turn the luck" by washing his mouth with holy water, formerly with blood. Sometimes the magic may involve deliberate breaking of taboos. A Norwegian whaler, who for a long period of time had been stuck in port due to adverse weather conditions, smeared horse excrement (doubly defiling because the dung came from a farm animal) on the cannon, the most sacred place on board. The storm calmed and the crew was released from their sacrifices after the animal was handled with respect. In northern Alaska, a successful catch initiated a ritual period during which time no sharp implement should be used for fear of hurting the whale's shade. However, recently much of the respect has been given way to merrymaking and a festive mood. But the captain's wife is still given the flipper to keep for the whale's reincarnation, does not easily promote sustainable use of the carcasses but also to share them with others. Generosity and sharing are among the highest values in most hunting societies. And the whales will know to reward the generous. Among the Inuit in particular, there is a notion that the more one gives away, the more will come – a notion that, together with a belief in whale reincarnation, does not easily promote sustainable use of the resources. The whaling captain and his wife will feast the people several times during the year. The most important event is the whaling festival, nalukataq, held in

Whales and Whaling 1733
June after the end of the bowhead whaling season. Held inside a sacred ring, this three-day feast is a major social event among the Iñupiat. But the feast is also held in gratitude and honor to the whales caught, and as a reenactment of the hunt itself. The meals mark a communion with the whale’s soul, thus uniting people and whales spatially and temporally. Hence, the feast not only marks the end of one whaling season, but begins the preparations for the next. The ritual distribution of meat is an invitation for the whales to come again the following year.

Since the 1960s, there has been a marked shift in many people’s perceptions of whales, particularly in the industrialized Western world. Several whale stocks had by that time become severely depleted and whaling became a symbol of environmental destruction. A new image of the whale was created and this was endowed with all the qualities we would like to see in our fellow human beings: kindness, caring, playfulness. An important element of this new image is the notion that whales are extraordinarily intelligent. This is widely believed, although the cetacean brain according to Dr. Margaret Klinowska – mammalian researcher at the University of Cambridge and a member to IUCN Cetacean Specialist Group – is quite primitive. In an article in New Scientist, she suggests that when the whales returned to live in the oceans some 20 to 40 million years ago, their brains were stuck at a stage today only found among the most primitive terrestrial mammals such as hedgehogs and bats. Another widely held notion is that whales, particularly small toothed whales like dolphins and porpoises, are spiritual beings.

At first sight these perceptions seem to resemble those held by many non-Western whalers. This is, however, to ignore one fundamental difference. According to the worldviews of Inuit and Japanese whalers, among others, the spirituality of the whales creates webs of reciprocity linking whales and whalers. Whereas their view helps to bridge the divide between animal and human realms, Western environmentalists tend to do the opposite. This is particularly the case with animal rights advocates, such as Tom Regan, who claims that whales have rights not to be interfered with in any way, whether for commerce, research or recreation.

The final connection between human and animal worlds is thereby broken. Not even beached whales may be utilized. The Maori, the indigenous people of New Zealand, have recently been denied access to stranded whales, which they regard as theirs by treaty rights. Seen as gifts from Tangaroa – God of the Ocean – beached whales have been utilized for their meat, oil, teeth, and bones, and access to them has become a symbol in the Maori struggle to safeguard their rights as indigenous people. The Maori, hosting the 3rd General Assembly of the World Council of Whalers, in 2001, underlined the importance of this issue.

Other native peoples see whaling practices as part of their cultural revival. In 1999, the Makah in Washington State took their first gray whale in about seventy years amid a storm of protests from animal rights groups. One of the leaders of the campaign against Makah whale hunting was Paul Watson of the Sea Shepherd Conservation Society. In a 1973 dream at Wounded Knee, Watson allegedly received an instruction from a bison to save all marine mammals, particularly whales. Whereas the U.S. Government defended the rights of the Makah, it reacted strongly against Canada when the Inuit there resumed bowhead whaling in the 1990s. In retaliation the United States has vetoed all discussions of marine mammal issues at the Arctic Council.

The International Whaling Commission has authorized “aboriginal subsistence whaling” that shows strong cultural ties related to whaling and the use of whales. The Japanese have long argued that they have strong cultural ties to whaling, but Norway did so only after resuming commercial whaling in 1993. Japan had not resumed commercial whaling as of 2004. Whale protectionists have tended to divide humankind into two opposing categories: those who care for the Earth versus those who seek short-term profit. As long as native peoples do not engage in trade (i.e., “live close to nature”), their takes of whales may not upset this dichotomy. In this worldview, whales serve as totem for “nature-loving” people: whales are not only used as an emblem by protectionists who care about nature, but protectionists also claim a ritual and spiritual relationship between themselves and whales. But the totem system of the protectionists is different from those reported from non-Western societies. In combination with a missionary zeal, it is more than a system of classification; it can be argued that it has unleashed a crusade against those with other perceptions and ideas. To whalers around the world the protectionists and their governments are therefore little better than fanatical fundamentalists, again in plain contrast to the importance of context found in many non-Western creeds.

White, Lynn (1907–1987) – Thesis of

The “Lynn White thesis,” articulated in its most well-known form in White’s “The Historical Roots of Our Ecologic Crisis,” (1967) was one of the most important interpretations of history to come out of medieval studies in the second half of the twentieth century. Linking the ethos of medieval Christianity to the emergence of what White called an “exploitative” attitude toward nature in the Western world during the Middle Ages, White’s ideas set off an extended debate about the role of religion in creating and sustaining the West’s increasingly successful control of the natural world through technology. The explosiveness of this debate, which still reverberates, was touched off by a confluence of factors: urgency in the late 1960s and 1970s over the newly discovered environmental crisis, White’s ability to reach an audience beyond that of professional historians, and the perception that White’s ideas constituted an “attack” on Christianity which needed to be answered before additional damage was done to the value of conventional religious beliefs. Alongside and to some extent at odds with this debate, were the responses to White’s work by medieval historians and historians of technology. These historians, concerned with specific issues raised by historical evidence and methods, found much to criticize about White’s arguments, yet acknowledged White as the founder and shaper of the new field to which they themselves now belonged. White’s ideas, and the range of responses to them, constitute an essential chapter in contemporary discussion about the relationship of religion and attitudes toward nature.

Lynn Townsend White, Jr. was the first American historian seriously to examine the role of technological invention in the Middle Ages. Although best known in the larger world for his ideas on the causes of contemporary environmental problems, within the scholarly community he was regarded first and foremost as a pioneer in the field of medieval technology. After receiving his Ph.D. from Harvard in 1938, he taught briefly at Princeton and Stanford until becoming president of Mills College in 1943. In 1958 he left Mills and until his retirement in 1974 was Professor of History at the University of California at Los Angeles, where he published Medieval Technology and Social Change (1962), demonstrating the profound effects of technological innovation on medieval society, and Medieval Technology and Religion: Collected Essays (1978). He continued to write and engage in intellectual debate until his death in 1987.

White’s work was informed by his view that not only were the Middle Ages the decisive period in the genesis of Western technological supremacy but that the uniquely activist character of medieval Christianity provided the “psychic foundations” of modern technological inventiveness. White was hardly the first scholar to associate Christianity with the birth of Western science and technology. Max Weber, Robert Forbes, and Ernst Benz, among others, had earlier suggested general causal links. However, White refined these arguments by pointing not only to broad elements within the Judeo-Christian tradition (the biblical mandate of Genesis 1:28 giving humankind “dominion over the Earth,” Christian compassion, the destruction of pagan animism, and the notion of matter as inert material) but also to the specific characteristics of Western monasticism as the fundamental cause of Western technological development. European monks, White argued, believed work to be an essential form of worship and embodied this assertion not only in the Rules governing their lives but also in their practice of their faith. Monastic communities spearheaded new technological techniques. Their cathedrals, in marked contrast to Byzantine churches, were typically equipped with mechanical clocks and organs, two of the most complex machines known prior to the early modern period. Additional evidence that medieval Christianity sanctioned technological advance can be found in manuscript illuminations, among them a ninth-century illustration of David’s army using a rotary grindstone driven by a mechanical crank to sharpen their swords while the heathen enemy uses an old-fashioned whetstone, and a fifteenth-century illustration of a personification of the virtue of Temperance, standing on a windmill, a bridle and bit in her mouth, spurs on her feet, holding eyeglasses and wearing a clock on her head. This kind of evidence, taken together with the record of medieval technological invention, White argued, demonstrated that deep-seated values embedded within Latin Christianity made the pursuit of technology appear morally virtuous, leading ultimately not only to Western technological dominance but also to the continuing impact on the environment of an aggressive stance toward nature.

White’s ideas on the relationship of Christian values, technological dynamism and environmental decline can only properly be understood within the context of his overall approach to the study of history. White believed that religion was perhaps the most important force...
shaping human societies and, furthermore, that religious values often operated below the level of conscious expression yet had direct effects on human behavior. As a medievalist, he was inclined to see the Middle Ages as the wellspring of Western culture. He also thought that the study of history was not a merely antiquarian enterprise but held meaningful lessons for the present. Finally, despite his negative assessment in “Roots,” elsewhere he frequently asserted that technology was a fundamentally humane and liberating force, and he implicitly suggests an image of an inherently dynamic, progressive and Christian West in which “values” rather than politics or economics determine history. These underlying views informed his work, giving it a power and resonance beyond narrower historical interpretations.

The impact of White’s thesis on the community of environmentalists, philosophers of technology, and religion scholars concerned with environmental issues was immediate and long lasting. In the twenty years following the publication of “The Historical Roots of Our Ecologic Crisis,” over two hundred books and articles used White’s ideas as a focal point. His ideas penetrated the popular press, appearing in *Time Magazine, Horizon, The New York Times, The Boy Scout Handbook* and *The Sierra Club Bulletin*. The great bulk of these responses were to one particular aspect of White’s argument, his claim in “Roots” that Christianity inculcated a specifically “exploitative” attitude toward nature and consequently that Christianity bore “a great burden of guilt” for the current environmental crisis. Biblical scholars and eco-theologians, among them James Barr, Carl Braaten, John Cobb, and Joseph Sittler, argued instead that the Judeo-Christian tradition could more accurately be described as mandating a care-taking or stewardship relationship to the natural world; Christianity therefore was not part of the problem, but part of the solution to environmental issues. Guidance should be sought from those many elements within the Judeo-Christian tradition that mandated that humans should be the guardians of nature, not its despoilers. Paradoxically, although many eco-theologians argued vociferously against White, they could use his thesis to reinforce the view that environmentalism was at bottom a religious and ethical movement. Like White, they believed that religious values were the most effective antidote to environmental degradation and, like White, who had suggested that St. Francis be made the patron saint of ecologists, they believed that Christianity was a sufficient repository of environmentally sensitive attitudes.

Among historians and philosophers of technology, however, White’s thesis stimulated a rather different debate. These scholars called for a closer look at the history of Western attitudes toward nature, labor and the environment and questioned whether White’s characterization of medieval values might be overdrawn. In company with the eco-theologians – scholars such as Susan Power Bratton, Paul Santmire, Roger D. Sorrel, and Clarence Glacken – White found an appreciation for nature on its own terms and a sense that human use of nature and animals should be governed by spiritual and moral obligations found to be normative within medieval theology. A detailed study by Jeremy Cohen of the medieval exegesis of Genesis 1:28 showed that medieval commentators typically dealt with questions of God’s covenant and human sexuality, bypassing the issue of technological dominion of nature altogether. George Ovitt, Jr. argued, against White, that by the thirteenth century most monastic orders no longer directly performed work with their hands and, far from elevating manual labor in and of itself, consistently subordinated it to spiritual ends. A number of scholars provided evidence that non-Western and pre-Christian cultures also had records of environmental damage. Other scholars, including Carl Mitcham, John Passmore, Robin Attfield and others, found a sympathetic attitude toward human control of the natural environment in Classical, chiefly Stoic, writers, similarly cutting into White’s argument that Christianity had a uniquely aggressive approach to nature. Finally, some writers questioned whether White had done more than show an association between Christianity and technology in an age in which a religious perspective permeated every dimension of human life. Had White shown that religion was a cause of technological development, or simply that technological development taking place for economic and political reasons was framed in Christian terms by medieval and later people?

This broad range of responses demonstrated that the links between religion, technology and environmental decline were hardly as direct or straightforward as White had made them appear. Nevertheless, White’s powerful and original reading of history, which has shaped a generation of scholarship, remains the touchstone for current and future discussion.

Whitehead, Alfred North (1861–1947)

Alfred North Whitehead’s life and work can be divided into three relatively distinct phases: an early period of mathematics and logic (1885–1913), a middle period of epistemology and philosophy of science, (1914–1924) and a later period of constructive metaphysics (1924ff.).

In 1885 Whitehead became a fellow of Trinity College in Cambridge where he remained until 1910. His *Treatise on Universal Algebra* in 1898 won him election to the Royal Society in 1903, but the mathematical period was epitomized by *Principia Mathematica* I–III (1910–1913), co-authored with Bertrand Russell, Whitehead’s earlier student. *Principia Mathematica* argued that mathematical symbols are derived from intuitive schemes of logical reasoning. This rooting of abstract mathematical concepts in basic human activities anticipated a tenet in his later constructive metaphysics, as did his distinction between pure and applied mathematics, laid out in *An Introduction to Mathematics* (1911), which can be seen as a forerunner of the later distinction between eternal objects (EOs), or mere possibilities, and the actual occasions (AOs), which embody specific configurations of order.

In his middle period Whitehead worked mostly in London, where he taught mathematics at University College (1910–1914), and held a professorship in Applied Mathematics at the Imperial College of Science and Technology (1914–1924). Already in *The Concept of Nature* (1920) Whitehead aimed to overcome the “bifurcation of nature,” which is the result of a mind–body dualism but also follows from the epistemic dichotomy between “real” nature and “mere” phenomena. Whitehead’s way here departed from Russell’s. Since the apprehension of the world is part of the way the world is, “knowledge is ultimate” (Whitehead 1920: 22). Whitehead here laid the ground for his later doctrine of panpsychism (the view that mental properties apply to all things, including atoms).

In 1924 Whitehead moved to Harvard University where he remained Professor of Philosophy until his retirement in 1937. In *Science and the Modern World* (1925) he set out to account philosophically for the new physics of relativity and quantum theory. With relativity he argued that there is no simple location of things as assumed by Newtonian physics; space-time-matter makes up a unified field of internally related energies-and-events. With quantum theory he argued for a temporal atomicity, according to which the constituents of matter are not solid substances but ephemeral events (cf. Planck’s Constant). This view was later developed in his main work, *Process and Reality* (1929). In contrast to a mechanical view of nature, however, Whitehead endorsed a panexperientialist position. Actual occasions “prehend” their immediate past environment and possess a freedom in the process of their becoming; immediately after their actualization they perish and become the stuff for future processes of emergence, or “concrescence.”

Since *Religion in the Making* (1926), Whitehead assumed three ultimate principles, 1) creativity, or the chaotic energy presupposed by all actual occasions, 2) eternal objects as the source of information or possibility, and 3) actual occasions which combine creativity with some specific combination of eternal objects. Neither creativity nor eternal objects “exist” on their own, but only as ingredients in actual occasions. God is the chief example of these metaphysical principles. Just as anything else, God is an actual entity with both physical and mental aspects. God’s “consequent nature” is derived from the past occasions of the world, while God’s “primordial nature” is derived from the divine envisagement of eternal possibilities.

As said in *Process and Reality*, God is both a creature of the world, and the world’s creator (Whitehead 1978: 348). Accordingly, God is not the creative source of all that is (as in the Abrahamic traditions), but the formative source of order and novelty in the universe (as in Plato). God is therefore not omnipotent, but has the consistent will of stimulating the growth of complexity in the universe by offering divine “lures” to each actual occasion. God is only one agent among others, but is a formative cause in all worldly events. Moreover, God is one actuality among others, but God is unique by being an everlasting actual entity who never perishes. As everlasting, God encompasses all past reality, which achieves “objective immortality” by being preserved and evaluated in the “consequent nature” of God.

Whitehead considered his own thought as an “inversion of Kant’s philosophy.” The world cannot be construed on the basis of a perceiving subject; rather, mind and subjectivity are “superjects” which are co-determined by their environment and immediate past. Whitehead termed his own philosophy “organicism,” but his metaphysical scheme seems to be influenced by mathematics and physics more than by evolutionary thought. It has been up to later process thinkers such as Charles Hartshorne, John B. Cobb, David Ray Griffin and Charles Birch to develop the evolutionary and ecological aspects of process thought. In the science–religion discussion, Whitehead’s philosophy has been carried forward by Ian Barbour.

Whitman, Walt (1819–1892)

Walt Whitman, the self-professed bard of the people, was born on Long Island in 1819. Whitman spent much of his life in Brooklyn, where he worked as a printer, school teacher, and journeyman. These experiences and the myriad people of New York who Whitman met as a result would later frame the ideas of democracy and equality at the heart of so many of his poems.

Whitman’s best-known collection of poems, Leaves of Grass, probably would have – like its author – fallen into utter obscurity had it not been for a letter of praise for the volume written by New England Transcendentalist Ralph Waldo Emerson. Emerson extolled the volume for its unadorned language and bold treatment of nature in a letter written to Whitman, which the latter published in well-read papers for all to see. Whitman’s decision to do so was a successful marketing ploy: following the publication of this letter, the poet and his volume were vaulted into the literary public eye. It ought to come as no surprise that Emerson was taken by Whitman’s poetry: influenced by Eastern texts such as the Bhagavadgíta, Whitman articulated many of the beliefs held and articulated by Emerson and other Transcendentalists, such as Thoreau, who was a welcome visitor at Whitman’s home in Brooklyn.

Whitman’s writing also demonstrates his affinity for the works of long-time friend, John Burroughs, and his talents as a naturalist. Readers of his Specimen Days will find detailed descriptions of the Midwestern prairie and the geology of the American West. The work also contains extensive lists of wildflowers and animals as well as keen observations concerning migration patterns of many bird species and panegyric praise for the immense power of the Mississippi River.

Walt Whitman was raised in a family with long-standing ties to the Quaker Church; however, any influence he might have received from the Society of Friends is eclipsed by his Eastern and Transcendent cosmology. Whitman, like Emerson and others, held that any idea of God is best understood in terms of a universal energy that manifests itself in every living creature. Although Whitman’s later writings do suggest a turn toward Christian theology, much of his œuvre is marked by this sense of universal connection and ecstasy.

Whitman worshipped the physical: the blade of grass that revealed the oneness of the Earth and the cosmos, the prostitutes in Philadelphia, the odor of an arm pit after a day of work. He saw a clear division between the soul and the body and contended that the fault of many religions is that they reject the physical while privileging the spiritual. In place of this ideology, Whitman suggested that we view the two aspects as married to one another, and he set about celebrating the divine within the maligned physical existence. To this end, he contended that the universe and all its transcendent splendor could best be found in the common elements of the natural world. Our willingness to step outside the constructs of society and self in order to revel in these elements allows us to actualize these ideas of universal connection in our own lives. This idea of universal connection is often expressed by Whitman in highly sexualized terms. In “Song of Myself,” Whitman depicts spiritual rapture through sexual union. This connection, he held, makes manifest the unity between individuals, their environment, and the divine.

Whitman’s belief that sexual union – both metaphorical and literal – grants access to the eternal was the cause of much controversy surrounding his work. His homoerotic overtones along with his unconventional and often explicit marriage of sexuality, nature, and God caused him to fall out of favor with Emerson, his initial champion. He was also fired from his governmental job at the Bureau of Indian Affairs in the U.S. Department of the Interior for the “obscene” nature of these beliefs. The controversy surrounding Whitman was heightened by his self-described role as a messianic figure. Convinced of the verity of his beliefs, Whitman saw himself as a sort of savior or oracle for the people, and he held that his “democratic literature” articulating this universal connection could help Americans fully actualize their spiritual imaginations.

These same elements of Whitman’s poetry are what
have allowed for his continued popularity. Whitman’s willingness to break out of hegemonic culture and its mores in order to celebrate the mundane and unconventional has ensured his relevance today. His belief in the organic connection of all things, coupled with his organic development of a poetic style that breaks with many formal conventions have caused many scholars and critics to celebrate him for his innovation. His idea of universal connection and belief in the spirituality present in a blade of grass succeeded in transmitting a popularized version of Eastern theology and Whitman’s own brand of environmentalism for generations of readers.

Wicca

Wicca emerged in 1940s’ England as a highly ritualistic, nature-venerating, polytheistic, magical and religious system, which made use of Asian religious techniques, but operated within a predominantly Western framework. It arose from cultural impulses of the nineteenth century, in particular from the occult revival of the 1880s onwards and Romantic literary rediscovery of Classical ideas of nature and deity. Various threads were gathered together and woven into Wicca by Gerald B. Gardner (1884–1964), a British civil servant who retired in 1936 and lived in Highcliffe and London, England before moving to the Isle of Man in 1954. He visited archeological sites in the Near East, and joined esoteric groups like the Folklore Society, the Co-Masons, the Rosicrucian Fellowship of Crotona, and the Druid Order. Gardner claimed that the Fellowship of Crotona contained a hidden inner group of hereditary witches who initiated him in 1939 and whose rituals he wrote about in fictional form in the novel High Magic’s Aid (1949) under the pseudonym Scire. Gardner’s writing borrowed from many sources, including the work of magician Aleister Crowley (1875–1947), writer D.H. Lawrence (1885–1930), a ritual magic group called The Golden Dawn, Freemasonry, spiritualism, and archeology, to name a few.

According to Gardner, witchcraft had survived the persecutions of early modern Europe and persisted in secret, following the thesis of British folklorist and Egyptologist Margaret Murray (1862–1963). Murray argued in her book, The Witch Cult in Western Europe (1921), that an old religion involving a horned god who represented the fertility of nature had survived the persecutions and existed throughout Western Europe. Murray wrote that the religion was divided into covens that held regular meetings based on the phases of the moon and the changes of the seasons. Their rituals included feasting, dancing, sacrifices, ritualized sexual intercourse, and worship of the horned god. In The God of the Witches (1933) Murray traced the development of this god and connected the witch cult to fairy tales and Robin Hood legends. She used images from art and architecture to support her view that an ancient vegetation god and a fertility goddess formed the basis of worship for the witch cult.

From the 1940s on many Wiccans believed, based on Murray’s work, that they were continuing this ancient tradition of witchcraft. However, since the first appearance of Murray’s thesis, historians and other scholars have refuted her evidence and, over time, dismissed most of it. Most, though not all, Wiccans today acknowledge that there is little evidence for a continuous witchcraft tradition, but claim that their religion is a revitalization and re-invention of ancient folk practices that existed in pre-Christian Britain, even if they were not part of any organized tradition. Some Wiccans today continue to identify “The Burning Times,” as they call the witch persecutions, as their “holocaust,” even though historians have shown that the so-called witches of early modern Europe existed in the imaginations of their persecutors, though many may have participated in folk practices such as herbal healing that were prevalent at the time in the general population.

After the repeal of the 1736 Witchcraft Act in England (an act that made the practice of witchcraft a crime) in 1951, Gardner was able openly to publish accounts of Wicca under his real name in Witchcraft Today (1954) and The Meaning of Witchcraft (1959). Witchcraft Today brought public attention to Gardner and he made numerous media appearances promoting Wicca. Both books contained information on Wicca as it existed at the time and in the following years Gardner initiated many new witches. Covens also sprang up and operated according to the outlines provided by Gardner’s books. By the mid-1950s, Wicca had become relatively popular, at least in part because of Gardner’s love of publicity, which drew public attention to it. In the early 1960s it was exported to the United States by Raymond Buckland. Gardner died in 1964, but by that time his tradition of Gardnerian Wicca was firmly established.

The religion described in Gardner’s books and spread by his students takes nature as a central aspect of devotional life. Gardner’s ideas about god and goddess drew
from British literature and occult circles that promoted Romanticism's fascination with the gods and goddesses of the ancient world. Over time specific deities such as Demeter and Pan were transformed into an archetypal mother goddess and an archetypal fertility god. According to historian Ronald Hutton this process was complete by the 1940s and represented post-war Britain's desire for a fear of wilderness: "the domains that civilized humans had traditionally found most alien and frightening; they were those of the two deities to whom the modern imagination, frightened, jaded, and constricted by aspects of civilized living, had turned" (Hutton 1999: 50). The attraction of urban dwellers to deities that embody nature and rituals associated with seasonal changes that many modern people have lost touch with continues to be an important aspect of Wicca and among the reasons for its growth throughout the twentieth and into the twenty-first century. Gardner's rituals also offered an alternative to the modern world in that participants were nude and sexuality and the body were seen as sacred.

Four main rituals were celebrated on the four seasonal festivals described by Murray as the witches' sabbats (Candlemas, May Day, Lammas, and All-Hallows Eve). Most Wiccans today also celebrate four other festivals: winter solstice, summer solstice, spring equinox and autumn equinox. These eight festivals make up the Wiccan “Wheel of the Year.” At each of these seasonal rituals the god and goddess are addressed in their aspects appropriate to the season, and they are embodied by the priest and priestess leading the rituals. For instance, on May Day the goddess/priestess as embodiment of giver of life and nurturer of new seeds is most prominent. Many contemporary Wiccans call this festival Beltain, an Irish name for “Bright Fire,” and weddings or “handfastings” are often performed at this time. A midwinter ceremony or Yule ritual might celebrate the return of the sun during the longest night and the rebirth of the sun god. Wiccan festivals are intended to remind participants of the cycle of life, of human death and rebirth, and the changes evident around them in the natural world.

Gardner's Wicca was initially described as a fertility cult rather than a “nature religion,” although Wiccan perceptions of both male and female deities are linked to nature and regarded as empowering forces for both men and women. One of Wicca's most well-known ritual texts – *The Great Charge*, written by Gardner's one-time High Priestess and collaborator Doreen Valiente (1922–1999) from earlier versions – concentrates specifically on the Wiccan perception of the goddess as the world of nature. The “Charge” describes her as “the beauty of the green Earth,” “the white moon among the stars,” “the mystery of the waters,” and “the soul of nature who gives life to the universe.” The goddess’ male counterpart is also connected to nature and moves through The Wheel of the Year. He is The Lord of the Greenwood, Sun King, Corn King, Lord of Life and Death, and Leader of the Wild Hunt.

Wicca is a religion in which the divine is immanent; its goddess and god live in the Earth, the moon, the stars, the bodies of men and women. Humans, nature and gods are all interconnected and sacred. The basic ritual form of Wicca – the circle casting – illustrates another way in which the divine is in the world, not outside it. While different variations on circle casting exist, most circles are oriented with the four cardinal directions and these directions are typically associated with forces of nature: fire, air, water and Earth. Some Wiccans address the “powers” of a particular direction while others address the “winds” while casting their circles. In preparation for ritual work Wiccans shed their clothes or don special robes, then someone marks the perimeter of the circle with a knife or wand and the four directions are greeted and invoked, as a way of asking for the powers that they represent to be present. For Wiccans ritual space is thus oriented in relation to the natural forces identified with each direction, in order to remind participants of their relationship to the world around them.

Since Gardner's first covens, Wicca has spread across North America, northern Europe, Australia, New Zealand and South Africa, evolving, and at times mutating quite dramatically. Wiccans have only a few beliefs that most of them adhere to, and these include “The Witches Rede: An it harm none, do what you will,” and “The Law of Threefold Effect,” the belief that any action a person commits will return to that person threefold. As Wicca has spread to different parts of the world, debates about belief and practice have surfaced. For instance, in the Southern Hemisphere Wiccans disagree as to how the seasonal rituals of the Wheel of the Year should be celebrated, given that winter solstice/Yule in the Northern Hemisphere is midsummer in the Southern. In the United States and Canada, practices borrowed from North American Indians have been adopted by Wiccans and this cultural appropriation has been criticized by other Wiccans as well as by native people. But this debate means little to some Europeans who turn to Celtic, Saxon or Germanic traditions for inspiration, making links to the supposed indigenous traditions of northern Europe. Likewise, feminist Witchcraft, which was shaped by the American feminist movement, has had a profound impact on Wicca in the United States, and is in part responsible for the fact that many Wiccans have dispensed with the god and focus on one great goddess. In the United States in particular a multitude of derivations have developed, including Reclaiming, Faery Wicca, Dianic Wicca and Seax Wicca, all of which have in turn crossed back to Europe.

Both Gardner and Murray emphasized the importance of polarity, of goddess and god, and identified men with masculine qualities and the god, and women with feminine energy and the goddess. However with the influence
of feminism and gay rights movements many Wiccans today believe that same sex couples can work effective rituals together and that men can embody goddess energy just as women can embody the god. Within Wicca there is much diversity of opinion concerning whether or not masculinity and femininity are essential qualities each sex is born with, and these issues remain controversial in some Wiccan communities.

The increase in Wicca’s popularity is partly due to the parallel rise in environmental awareness since the 1970s. Vivianne Crowley, a Wiccan priestess and author of Wicca: The Old Religion in the New Age (1989), notes the changing emphasis within Wicca from nature veneration to nature preservation: “Wicca . . . moved out of the darkness, the occult world of witchery, to occupy the moral high ground – environmentalism” (Crowley 1998: 177). Crowley asserts the centrality of the veneration of nature, which is “considered to be ensouled, alive, ‘divine’ . . . The divine [being seen] as a ‘force’ or ‘energy’ and as manifest in the world of nature” (1998: 170). She further points out that the processes of nature, such as “conception, birth, mating, parenthood, maturation, death” are portrayed in The Wheel of the Year.

However, Wiccans demonstrate a wide range of attitudes toward protecting the natural world. Some are radical environmentalists while others view nature more abstractly. The development of Wicca was influenced by idealized views of nature in the writings of English Romantics as well as more recent works of literature such as J.R.R. Tolkien’s description of the woods of Lothlorien in The Fellowship of the Ring (1954). Understandings of nature in Wicca also derive from Western esotericism, particularly as transmitted by nineteenth-century Romanticism. Nature, in esoteric thought, is a reflection of a greater divine reality or part of a greater magical totality, and as such it requires a different level of engagement. The esoteric theory of correspondences portrays the cosmos as complex, plural and hierarchical, with living nature occupying an essential place within it. Nature is at once both an intermediary between humanity and divinity, and imbed with divinity itself. “Nature” is often perceived by Wiccans as something different from “the environment.”

For those Wiccan groups which retain a link to their heritage in high ritual magic and hence the Western esoteric tradition, there is every reason for a focus on inner nature due to the basic law of magical correspondence: humanity is a part of the cosmos, and therefore any operation performed on or in a person will affect the entire universe. In treating the self as well as nature as sacred center, Wicca follows in the wake of esoteric and occult philosophy, in which these are one and the same. While there may be a spiritual and/or magical engagement with nature, this does not necessarily translate into environmental action.

For some urban-dwelling Wiccans, imaginative descriptions of the natural world may provide a more “real” experience than an actual walk in the woods. Anthropologist Susan Greenwood observed that some Wiccans show no interest in nature other than as a backdrop for rituals, with celebrations held in the woods becoming in effect a celebration of the liberation of the inner self from the domination of the everyday world. “One Wiccan, when invited to go for a walk, cried off because it was raining and he might get his feet wet: ‘Can’t we just visualize it?’ he said” (Greenwood 2000: 113). The Wiccan response to nature is thus often confused, revealing both intimacy and distance as nature is shaped by the Wheel of the Year, sacred circles, and ritual to suit people’s needs for relationship with the Earth. There is a turn to nature as a source of revitalization, an attempt to reengage with a nature from which participants feel estranged, to reenchant the natural world which they feel has been exploited and dominated. The veneration of nature, the concern for the Earth, and the pantheism of seeing the divine in all of nature has led to an attitude of reverence for a romanticized wild, untamed landscape on the one hand, and to sadness or revulsion at human estrangement from this ideal, living in towns and cities away from the land, on the other. For some Wiccans veneration of nature and identification as “Wiccan” or “Pagan” manifests as a romantic attachment to the countryside, a dream of living away from towns and nurturing a closer relationship with nature. Some Wiccans do live in rural areas, but most continue to live urban lives and very few depend on the land for their living. Nature and Wiccans’ understanding of it are extraordinarily complex, and this is exacerbated by the diversity of contexts in which an examination of Wicca’s engagement with nature must occur.

Some Wiccans have become involved in environmental struggles as a way of putting their beliefs into practice. One of the most vocal of these is the American Starhawk, whose writings have been heavily influenced by feminist and environmentalist movements. Starhawk’s popular book The Spiral Dance: A Rebirth of the Ancient Religion of the Great Goddess (1979) is largely responsible for spreading feminist Wicca in the United States. Starhawk has also been the most vocal American Wiccan in promoting activism of all kinds and has involved herself in numerous protests that range from anti-nuclear demonstrations, to forest activism blocking logging in old-growth redwood groves in northern California, to anti-globalization resistance. Although much of her environmental activism has been in high-profile protests, she has also organized workshops combining watershed conservation and forest ecology with magic and ritual. Other environmentalists also hold Wiccan beliefs and practice “eco-magic,” such as organizations like the Dragon Environmental Group in England and both British and American Earth First! radical environmentalists. While Wicca and environmentalism do not automatically go hand in hand, although some Wiccans argue that they
should, in practice Wiccans live their relationship to nature in different ways.

Wicca has become a global phenomenon and significant Wiccan communities can be found in most countries inhabited by significant populations of people of European descent, including Great Britain, the United States, Australia, New Zealand, Canada and South Africa, but Wicca has also spread to countries such as Japan that are closely linked to Western cultures by the global economy and media. Gardner’s original prototype of a coven meeting in the woods and dancing naked under the trees retains its attraction as a fertility religion that allowed men and women to feel closer to the natural world and to pass on their knowledge by secret initiation, but today it is as likely to be spread through internet sites and how-to books that can be ordered from online stores, even while it maintains a focus on nature.

Wicca – Dianic

Dianic Wicca, sometimes called feminist Witchcraft, began in Southern California in 1971, when Z Budapest and five friends met to celebrate the Winter Solstice. The time was ripe for a meeting of Wicca and feminism. Both were gaining in visibility. By 1969, “Marion’s Cauldron” was being broadcast over the airwaves regularly in New York City, and Central Park was the site of a 1970 “Witch-In” attended by over 1000. In the same year, some 50,000 people marched down Fifth Avenue in support of the Women’s Liberation Movement. A few years earlier, a small group of radical feminists calling themselves W.I.T.C.H. had publicly and theatrically linked the image of the witch to women’s empowerment. Arguing that all oppression, including the abuse of nature, was due to male domination, they saw themselves as resistance fighters, and proceeded to use Halloween costumes and guerilla street theater to get their message across with drama and humor. Their success led to autonomous covens of W.I.T.C.H. springing up in major cities across the country.

W.I.T.C.H. was decidedly political, not spiritual. Like other feminists critical of religion, Budapest argued that the spiritual was political. She claimed that patriarchal religions had colonized women’s souls and her unique contribution was to embrace the image of the witch as a symbol of women’s empowerment and use it to create a feminist version of Wicca. Building on the then-popular belief in ancient Goddess-worshipping matriarchies, she called her new tradition Dianic Witchcraft after the Goddess of the Witches in Charles Leland’s Aradia. That the Goddess Diana was independent of men added to the attraction of the name. Presented as a new religion with ancient roots, the Dianic Craft incorporated many elements of Gardinanerian Wicca, so many that it is considered a Wiccan tradition.

Dianic Witches do a radical feminist analysis of gender and power, seeing women’s oppression and environmental abuse as intimately linked and firmly rooted in patriarchal religions, in hierarchies that privilege the spiritual over the material, the mind over the body, and men over women. Like other Wiccans, they celebrate the Earth and the turning of the seasons. Unlike them, Dianics also celebrate women’s “blood mysteries” – birth, menstruation, birth/lactation, menopause and death – which are understood as women’s ability to create life, sustain it, and return it to the Source. In doing this they attempt to link what they
believe is the sacred within them to the sacred around them in the natural world.

Divinity is envisioned as an autonomous female goddess. Some Dianics believe she is an entity, others see her as a metaphor for the Earth. Almost all agree that it is not necessary to believe in Goddess in order to experience her, as she is also understood to be immanent in nature as well as the interconnection between every living thing. The dynamic cycle of birth, life and death is represented in Goddess’ three aspects of Maiden, Mother and Crone and mirrored in the phases of the moon. This image of the Triple Goddess represents major stages of women’s lived experience, and provides a symbol with which they may identify throughout their lives. She is seen as the Original Creatrix, drawing all life out of herself in an act of divine parthenogenesis. She is the matrix from which all else arises. Acknowledging Goddess, the Divine Self, within themselves allows Dianics to spiritually give birth to themselves as they leave behind male-dominated and sometimes misogynist religious conditioning.

Unlike other Wiccans, Dianics do not incorporate concepts of male divinity into their practice and reject the belief in the need for sexual polarity in order to practice magic. Men are traditionally not allowed to participate in Dianic rituals nor become members of Dianic covens. Hierarchy is seen as a patriarchal “thought form,” and most Dianic covens attempt to govern themselves by consensus or through a circle of elders, rather than incorporate the more familiar Wiccan role of high priestess. An exception to this is the McFarland Dianic tradition out of Texas. Developing independently from Budapest’s lineage, this feminist group functions with high priestesses and includes men. However its impact has been limited and the name Dianic usually refers to those whose spiritual roots can be traced back to that first winter solstice in Los Angeles.

At least two Dianic groups in the United States do a great deal of teaching, and welcome to their classes any women who are open to “Goddess consciousness,” whether or not they are or become Dianics. These are the Reformed Congregation of the Goddess (RCG) out of Madison, Wisconsin, and its affiliate, the Circle of Aradia (CoA) in Los Angeles. Literally thousands of women have passed through their training classes, making their influence felt far beyond their numbers would suggest. Although Starhawk – Witch, theologian and widely read author – is not Dianic, she has also had a significant impact upon the Dianic Craft, especially in the strong commitments to the environment and peace that are present in the practice today.

Wilber, Ken (1949–)

Drawing on thinkers ranging from Plotinus and Aurobindo to Hegel and Piaget, and grounding his own thought in extensive meditation practices, Ken Wilber synthesizes modern science and traditional spirituality to provide a progressive understanding of cosmic, biotic, human, and divine evolution. In Up From Eden: A Transpersonal View of Human Evolution (1981), Wilber describes the three basic modes of human development: prepersonal, personal, and transpersonal. The prepersonal characterizes societies oriented by magical and mythical modes of consciousness. Personal consciousness emerges in a few elite persons thousands of years ago and eventually culminated in the mental-egoic consciousness of Enlightenment modernity. Unfortunately, mental-egoic or personal consciousness often (but not always) involves dissociation of ego-mind from body, emotions, nature, female, and God. Mental-egoic consciousness entails heightened death-anxiety, which people (especially men) have sought to assuage through Atman projects that seek to make the mortal ego immortal. The technological domination of nature may be understood in part as such an Atman project. Although alienated and dissociated both from nature and from God, mental-egoic consciousness may continue its evolutionary trajectory toward the centauric stage, which reintegrates mind/body while recognizing the perspectival and thus partial character of worldviews. In subsequent transpersonal stages, humankind would experience the divine presence in all phenomena, thereby generating compassion for all sentient beings. According to Wilber, all phenomena are manifestations of the divine, the Alpha and Omega of cosmic history.

Despite the drawbacks of mental-egoic consciousness, Wilber maintains that worldwide achievement of it and the institutions related to it (including constitutional democratic government, freedom of inquiry, sustainable economic development) could have a dramatic positive
impact on humanity’s treatment of nature. Rational-democratic societies do not make war on one another; moreover, they can alter their practices in ways that avoid environmental catastrophe, thereby making possible the continuing evolution of consciousness needed for the long-term well-being of the Earth and humankind.

In Sex, Ecology, Spirituality (SES) (1995) and A Brief History of Everything (1996), Wilber lays the groundwork for “integral” thinking. Deemphasizing his earlier emphasis on death anxiety and Atman projects, Wilber now seeks to unite the perennial idea of the Great Chain of Being, as informed by spiritual, cultural, social, and natural scientific evolutionary concepts, with a four-fold set of distinctions allegedly capable of analyzing all phenomena. Drawing on the notion of holons developed by Jan Smuts and Arthur Koestler, Wilber maintains that virtually all phenomena are wholes from one perspective and parts from another. A cell in an organism, for example, is a whole that includes parts, but is also a part of the organism. Emphasizing that holonic evolution generates emergent qualities, Wilber divides the Kosmos into four grand domains: physiosphere, biosphere, noosphere and theosphere. The physiosphere includes the non-biological features of the universe, including the stars and planets that arose in the billions of years following the Big Bang. The biosphere, the domain of life, depends upon the much older and much vaster physiosphere, but involves features that transcend the physiosphere. Finally, the biosphere gives rise to the noosphere, which includes complex sentient life such as mammals and humans. Again, the noosphere both depends on physiosphere and biosphere, but also transcends them, by exhibiting emergent characteristics, including self-consciousness, language, and rationality. The theosphere, which both includes and transcends the other three domains, refers to dimensions of consciousness that include what is traditionally understood by the notion of God.

In a controversial move, Wilber argues that just as the biosphere contains the physiosphere in the sense of comprising all its basic features (although plainly not its material expanse), so too the noosphere contains the biosphere in the sense of comprising all its basic features (although not its biotic mass), while adding new ones. Affirming that neither biosphere nor noosphere were “destined” to emerge on Earth, Wilber joins proponents of the anthropic principle in arguing that the cosmos is ordered such that biosphere and noosphere would eventually emerge somewhere.

To this vision of cosmic evolution, Wilber adds his four-quadrant analysis. The four quadrants are: Upper Left (UL), individual as experience internally; Upper Right (UR), individual as experienced externally; Lower Left (LL), collective as experienced internally; Lower Right (LR), collective as experienced externally. Consider how the four quadrants may be used to analyze someone purchasing tickets for a figure-skating competition. Seen from UL, the activity is the first-person experience of someone eager to witness athletic and artistic prowess; seen from LL, the person shares certain cultural views about sport, artistic expression, and so on; seen from the UR, the object of investigation is an organism whose constituent parts obey natural laws and whose behavior accords with predictable patterns; from LR, the individual’s actions are interpreted in terms of social, political, and economic categories. In SES, Wilber reduces the four quadrants to the Big Three: UR/LR, LL, and UL, which correspond to the topics of Kant’s critiques of pure reason, practical reason, and judgment. According to Kant, Weber, and Habermas, modernity’s triumph was to differentiate among domains (for example, religion, politics, art) that are collapsed together in pre-modern societies. Although the Big Three originally distinguished three legitimate modes of inquiry and behavior (natural science, politics/morality, and personal experience and aesthetic expression), eventually the UR/LR quadrants (natural and social sciences) marginalized the UL and LL quadrants, which take into account domains that can be understood only from the inside.

Wilber argues that a constructive, integral postmodernity will restore legitimacy to all four quadrants. Instead of viewing sentience as an accidental feature of the cosmos, integral thinking adheres to Whiteheadian panpsychism, according to which all phenomena – even atoms – have at least some meager interiority. Greater interior complexity confers higher moral status on entities. Because a cow screams louder than a carrot, many people have fewer moral qualms about eating the latter than the former.

Although endorsing the valid ecological concerns of deep ecologists, Wilber criticizes them for holding “romantic” views involving worship of nature, especially when that “nature” in fact involves the same reductionistic materialism and systems theory that forms what Wilber calls “industrial ontology.” Authentic nature worship, as described by nature mystics such as Emerson, involves discerning that material nature is but the lowest-level manifestation of nature, understood as creative Spirit. A vigorous opponent of naïve yearning for pre-modern social formations, while simultaneously a critic of heedless technological exploitation of nature, Wilber affirms the dignity of modernity while acknowledging the crucial contributions of pre-modern peoples. Although his views are at times sharply contested, he is widely admired for his ambitious effort to integrate nature, humankind, and Spirit in order to form a constructive postmodernism that re-enchants the world without inviting personal and social regression.

Wilderness Religion

The conceptual associations of religion with wilderness, and religion with nature, are enormously complicated, whether considered semantically, historically, epistemologically, metaphorically, scientifically, or ethically. The challenges of definition alone are daunting. “Nature” is one of the most semantically confused words in English. Definitions for “religion” abound, yet none is universally accepted. “Wilderness” offers no respite from confusion. Such semantic and conceptual tangles frame the account here, beginning with the apparent antagonism between the spiritual domain of religion and the material domain of nature.

If wilderness is conventionally associated with the natural, that is, the evolved composition, structures, and functions of the world, and religion is conventionally associated with the supernatural, that is, phenomena such as God outside the evolutionary pale, then how conceivably can religion be meaningfully conjoined with notions of wilderness? Heaven and all things godly – the supernatural – are sacred. And the Earth and all things wild – the natural – appear profane. Thus religion appears to be antithetical to wilderness and nature.

There is considerable evidence to support such a conclusion. Religion has long been associated with the cultural legitimation of the economic exploitation of the natural world. Although preservationists associate wilderness with those areas of the Earth that are “untrammeled,” that is, landscapes free of economic utilization where humans are visitors only, the religious mainstream tends to position nature as a resource provided by a supreme being to serve human needs. The natural world is conceptualized as “fallen,” as a material domain that, despite its fallen nature, offers redemptive possibilities. Through economic utilization and technological control the faithful might recover in part from the Fall, thus restoring the human spirit – which is associated not with the natural and material world but the supernatural and spiritual world.

On this account, relatively wild places, such as mountains, deserts, forests, and bogs, are conceptualized as the “ruined Earth.” Thus domestication, whether harnessing a wild river, mining gold from a mountain, logging an ancient forest, or draining a wetland, is religiously warranted as part of the recovery from the Fall. Apparently, with perhaps exceptions such as Native American and other Earth-friendly religions (e.g., Wiccans, goddess feminists), religion legitimates an assault on the wild Earth. So viewed, the metaphysical divide between the natural and the supernatural is inescapable.

Nevertheless there are strategies, especially for the religiously faithful who believe in the possibilities of a continuing revelation, by which wilderness, religion, and nature can be related. Lynn White, Jr.’s. famous essay, “The Historical Roots of Our Ecologic Crisis” (1967), can be interpreted as the beginning of a continuing reconsideration of the relationships between wilderness, religion, and nature. If we think of religious narrative as simultaneously describing a reality that is and prescribing a reality that ought to be, then the world’s religions can be influential in rethinking humankind’s place in, actions upon, and obligations to the Earth’s remaining wild and natural places. Such an analysis begins by attempting to uncover the religious sources of contemporary beliefs about nature and wilderness.

The idea of wilderness does not easily equate with the idea of nature. One conventional meaning of “wilderness” is that part of nature which is untrammeled or free (for example, as reflected in the language of the Wilderness Act in the United States of America). Wilderness connotes those lands which are part of the “pristine biosphere,” a term used by ecologists to denote natural systems continuing on evolutionary trajectories largely free of human influence. (Some analysts believe that such a notion of wilderness is a “received idea” that is scientifically untenable.) Many scientists, including conservation biologists and ecological restorationists, believe that the conservation and restoration of extensive core wilderness areas are essential to the future of life.

But “wilderness” does not have the same connotation as “nature.” Clearly, the former connotes habitat whose conservation is a necessary condition for continuing the evolved composition, structure and function of natural systems. As the history of science makes clear, the latter connotes an epistemic object for scientific study. Wilderness draws our attention to the world beyond ourselves. Nature draws our attention to the world that can be known.
and their habitat – should remain wild and free. While this ideal is conventionally associated with the wilderness preservation movement, it increasingly finds religious warrant. The other ideal is that those areas of the Earth and the associated flora and fauna whose continued existence has been jeopardized by human activities should be restored to a relatively wild trajectory. Again, this ideal finds religious justification, since restoration is as much about normative human self-conceptualizations as it is about actions on the world.

Arguably, given the hold of narrative traditions on human consciousness, the continuing articulation and later realization of these prescriptive ideals has been argued by many as necessitating the commitment of religionists. Some have argued that only through the engagement of religiously faithful communities can culturally dominant notions of nature and wilderness be reconsidered, and a turn toward sustainability be made.

How then do world religions figure in such reconsideration? While no comprehensive account can be attempted here, there are many possibilities. Indigenous, Eastern, and so-called nature religions offer various points of departure for challenging sedimented beliefs that the natural world is nothing but an economic resource. Or that nature is merely material. Some of these sources are ancient, with origins before the onset of literacy, as with the Vedas in the Upanishads. The notion that Atman is Brahman implies that the ever-increasing hold of egoic-consumerist consciousness within the new world order is a contingency rather than a necessity imposed by human nature. Such an ancient insight clearly resonates with the contemporary ecological realization that interconnection within systems is a more fundamental reality than individuation. Likewise, Native American traditions, such as those of the desert Southwest in the United States, position the natural world as one which is spiritually alive rather than dead matter moving mechanically.

The Forum on Religion and Ecology, a continuing academic project involving dozens of scholars, is actively exploring the potential of the world’s religions for ecological reform, including the preservation and conservation of wild species and their habitat. The Forum website contains essays exploring the ecological possibilities of most of the world’s religions, including Buddhism, Christianity, Confucianism, Hinduism, Indigenous, Islam, Jainism, Judaism, Shinto, and Daoism.

There can be little doubt that the world’s religions provide narrative sources that serve as the basis for reconsidering human relations and obligations to the naturally evolved world. However, because industrialized European and North American nations are the world’s most prolific consumers and polluters, and thus impose the heaviest load on wilderness areas such as the Amazon, because the sources of the governing attitudes toward wilderness and nature in the West are grounded in biblical
sources, and because the global political economy is largely dominated by nations whose religious roots are in Judaism and Christianity, the biblical religions are crucially important.

Biblical sources of Western attitudes toward wilderness and nature reflect a lingering consciousness of what was lost in the ecological transition from the Paleolithic to the Neolithic. Just as the “3K” background radiation is interpreted as evidence of primordial cosmological events, so biblical texts, such as the Garden narrative in Genesis, can be interpreted as evidence of a recent (ca. 15,000 B.C.E.) yet receding past, that is, the transition from a 200,000-year era of nomadic hunting and gathering to sedentarism and agriculture. This epochal ecological transition arguably leads to a psychic sense of the loss of connection with the natural world which in turn underlies the mythic narrative of expulsion from the Garden of Eden. Expelled from the Garden, humankind falls into agricultural drudgery and a perpetual longing for return. Some argue that ecological dysfunction will not be resolved until environmentalists escape this dream.

Likewise, Psalm 104 can be read as remembrances of things past, when humans lived in close association with and possessed an intimate knowledge of the natural world—its seasons and cycles, flora and fauna. Psalm 104 is interpreted by some as the textual underpinning of natural theology and, finally, the ecological sciences themselves. Such biblical themes are also clearly resonant in the Romantic poets, such as William Wordsworth and Percy Bysshe Shelley. Their poetry celebrates the created world and mourns the loss of our connection to it. The Romantics, in this sense, see a further fall from grace in the industrialization of the world.

These streams of thought from Genesis to the Romantics constitute the narrative sources for nineteenth- and twentieth-century ideas of wilderness. Conditioned in part by the Romantics, nineteenth-century writers often saw the wilderness and nature through a biblical lens. George Perkins Marsh, considered by many as the first environmentalist in a modern sense, exemplifies this idea. Recognizing the pervasive and deleterious consequences of the actions of humankind on the natural Earth, he argued that these changes were the consequence of the failure to heed the created order.

Wilderness was viewed also through a biblical lens by Henry David Thoreau and John Muir (less obviously in Thoreau than Muir). Thoreau, read as critically responding to Ralph Waldo Emerson’s transcendentalist notion that nature was made for Man by God, came to the realization that the wild Earth needed no purpose other than its own. In wilderness alone, he argued, was the preservation of the world. He equated the walker with a pilgrim in search of holy ground, and characterized wild nature as a sanctum sanctorum. John Muir, read as one of the first evolutionary thinkers, believed that he saw the Creator still at work in the mountains of California. Wild nature, the flora and fauna, the mountains and valleys, the forests and the rivers were sacred ground to Muir. Their value exceeded any economic utilization. Every day in the mountains, Muir proclaimed, was a resurrection day for the human spirit.

Biblical sources continue to influence the late twentieth and early twenty-first century. Aldo Leopold, a seminal wilderness thinker and staunch defender of wilderness, critiqued a biblically based Abrahamic ethic that saw the land community as nothing but an economic resource. He argued that only by superseding such an ethic for a land ethic could humans live on the land without spoiling it. Lynn White’s later critique (1967) set in motion a continuing theological reassessment of humankind’s relations to nature. Religious conservatives such as Francis Schaeffer and liberals such John Cobb, Jr. were among the first to respond to White’s arguments in the early 1970s. Today there are literally thousands of biblically based and religiously inspired reassessments of humankind’s place in and obligations to the natural world. And scholars from the scientific community, such as E.O. Wilson, now recognize new ecological possibilities in biblical sources. “For the Abrahamic religions, Judaism, Christianity, and Islam, the environmental ethic is compatible with belief in the holiness of the Earth and the perception of nature as God’s handiwork” (Wilson 2002: 157).

As the new millennium begins there is a growing energy among the religiously faithful to engage themselves with the questions of their faith-based relations to the wild Earth and nature more generally. While there is enormous theological diversity, there is also a convergence on a central idea. Roughly, the notion that there is an order to the created and still evolving world that transcends and in many but not all cases takes precedence over humanly created orders.

What conclusions, if any, can be drawn from this study of the complicated interrelations of wilderness, religion, and nature? Clearly, religion figures significantly in reinterpreting our place in nature, and especially our relations to those few habitats and species that remain relatively wild. Religion must play such a role, since humans cannot reinvent themselves ex nihilo but only move on from the culturally accumulated experiences of the past into an imaginative future. Charles Taylor argues in his monumental Sources of the Self that

It would greatly help in staving off ecological disaster if we could recover a sense of the demand that our natural surroundings and wilderness make on us . . . The world is not simply an ensemble of objects for our use, but makes a further claim on us . . . This demand, though connected with what we are as language beings, is not simply one of self-fulfillment. It emanates from the world (Taylor 1989: 513).
Many religious sources embody these demands, requiring only that the religiously faithful identify such interpretations therein.

There are some, of course, who deny the possibilities for tomorrow existing at the convergence of wilderness, religion, and nature. And clearly there remains antipathy among some religionists toward the natural (and thus fallen) world. Yet religion, in all its diversity and whatever its insufficiencies, is one of the richest and potentially most promising sources for discovering and articulating the claims the world makes upon us.

**Wilderness Rites of Passage**

Across time and in countless ways, people of many cultures have gone into the wilderness to mark life transitions and seek guidance. They sought closeness with God, the Mystery, or a higher self. They found a time alone, exposure to the elements in an unfamiliar place, a radical shift in self and world, a trial and a gift, and a ritual death and rebirth. The core of the form was clear: leaving the ordinary world, crossing a threshold, and returning with a gift and a task. It was an initiation, a rite of passage, a new birth in the womb of the natural world.

Modern cultures seem to have forgotten most of what our ancestors knew about the importance of initiatory rites for sustaining individuals and their communities. Instead, we find ourselves strangers in our own lives, unsure of our status and value, and hungry for a connection with the abiding rhythms of the Earth and an enduring spirit.

Yet, the roots of this search remain alive. Recently, a growing number of people have created wilderness-based rites of passage for a modern context. Stephen Foster and Meredith Little, authors of *The Book of the Vision Quest* and *The Four Shields*, are among those most influential in developing and articulating a form appropriate to our time and place, the vision fast. Since the 1960s, they have trained vision fast guides through their School of Lost Borders and spearheaded the development of professional groups such as the Wilderness Guides Council. Recent developments in this field include greater collaboration among those doing such work in North America, Europe, Africa, and Australia and the development of programs and training in academic settings.

In general, people seek wilderness rites of passage in times of significant life transition or to complete life transitions begun earlier but not completed. The transition from adolescence to adulthood is an important time for initiation. Adolescents need the chance to confirm their fitness and willingness to step toward adulthood. Mid-life, marriage, divorce, loss, or simply a time of confusion and disillusionment are also common calls to a wilderness rite of passage.

These practices facilitate ego-transcendence and an opening to spirit. In doing so, they also bring healing and renewed connections with lost or abandoned capacities for guidance, vitality, and joy. Their goals include bringing back to one’s people and place something of value:
personal power, stability, energy, wisdom, or a maturity that is expressed in service to others and to the Earth.

**Structure of a Typical Wilderness Passage Rite**

While there are many specific forms these quests can take, they all express a common deep structure. The anthropologist, van Gennep, used this deep structure to describe traditional rites of passage, and Carl Jung and Joseph Campbell use it as the basis for the archetype of the Hero’s Journey. Despite variations in surface structures, this pattern is broadly crosscultural. Here, I will describe a form currently being used by many wilderness rites of passage guides. It is built around a one- or two-week wilderness trip.

**Preparation**

This is a time for participants to identify their reasons, inner resources, and commitment for this undertaking. More mundane issues of logistics, equipment, and safety are equally important.

**Severance**

Participants travel to a wilderness setting and set up a base camp where they become accustomed to living close to the land, opening their senses to the features of that place, and tuning in to the rhythms of the Earth. Wilderness is a relative term, and many vision fast groups without ready access to wilderness have found that more cultivated lands can support this work. Processes for life review are helpful here. They use council-style group discussions and simple Earth-centered ceremonies along with walks, journaling, and contemplative practices such as meditation and sensory awareness.

**Threshold**

This phase usually comprises three or four days of solitude and fasting from food (with water, a buddy system, and other safeguards). Participants may engage in awareness practices and self-generated ceremonies, but aside from safety considerations, there are few rules. The threshold is the doorway into sacred time and space and the edge of relating to the world.

The wilderness (or wilder) setting is an important part of the threshold phase, providing both challenge and support for the inner work of disidentifying from old psychic structures, creating deeper integration both within one’s psyche and with the world, and discovering deeper sources of relating to the world.

**Return**

The return, or reincorporation, phase is a symbolic rebirth. This begins upon the return to base camp with quiet celebration and reflection and continues as we rejoin our communities. Sharing stories and reflecting on them, participants begin to integrate their insights and visions. The goal is to help participants discover their own meaning in their experiences and apply their own belief systems, not to impose meaning.

**Implementation**

After the wilderness trip, participants are supported in bringing their experiences into their lives more fully. However, it is necessary that the work of this phase belongs to each participant. This is the phase in which the gifts of the initiation are shared. Essentially it is the rest of one’s life.

**Elements of Wilderness Passage Rites**

Key elements of these trips are the stages of the rites of passage model, a ritual or ceremonial attitude, and the wilderness environment. Underlying them is exposure. Participants are exposed to new terrain, weather, and wildlife, large and small. They are exposed to their own vulnerability, boredom, frustration, strength, contentment, delight, and curiosity – all the states that can emerge from being alone in a living place with an authentic intention of openness. The patterns and meanings of personal history, self-concepts, ideals, and shadows are exposed as well.

Changes in sensory and cognitive input from living closer to nature lead to changes in ego structures. Familiar ego structures are no longer supported, leading to changes in self-images and less fixated conceptual structures. The natural world mirrors, evokes, and develops those inner qualities usually assigned to the realm of religion and spirituality - unconditional love, joy, power, peace, support, grace, and guidance.

Making intimate contact with the wild world brings us into contact with our “wild selves,” the parts of us that have not been conditioned by familial and cultural forces. Wild places are those not under our control and not subject to our wills, walls, or arbitrary boundaries. On wilderness rites of passage, as in all forms of deep psychological or spiritual work, we are going into wild places. We are entering realms where the artificial structures and demands of the ego and society have not restricted or walled off our innate guidance, aliveness, generosity, or fascination with the world. At the same time, wilderness rites of passage cultivate and refine those qualities necessary for living in the world in a full and engaged way, knowing our own hearts and minds, tolerating ambiguity and discomfort, being autonomous, searching deeply, and staying open to new answers.

Sometimes, the “visions” of a vision fast resemble shamanic experiences with unusual sensory or psycho-spiritual manifestations. More often, however, the most transforming and longest lasting changes are prompted by subtle, more ordinary experiences. It is the totality of the
rite rather than a specific experience that usually carries the deepest impact.

In most modern wilderness rites of passage trips, participants discover a renewed relationship with the natural world, a sacred relationship. To the detriment of this relationship, participants can idealize and romanticize wild nature and the ceremony, causing a split between the wild and their familiar worlds. Such a split tends to foster dissatisfaction and depression as well as rejection of the needs of one's home community and its natural setting. One of the goals of wilderness rites of passage is to support participants in returning home with a new or renewed commitment to living in a more sustainable way and caring for the Earth as well as a new sense of self.

Such responsible environmental action arises not from a sense of imposed obligation or coercion, but from the deep psycho-emotional bond arising from spending such ceremonial time alone in nature. Environmental action, whatever form it takes, becomes an expression of love, joy, and caring rather than a product of shame, guilt, or fear. The world becomes less a collection of commodities to be used or exploited, and more the embodiments of an alive, enchanted, sacred world. Many of these trips conclude with specific practices, often ritualized to deepen their meaning, which support participants in articulating and accepting a sacred task related to environmental responsibility. A lesson of modern wilderness rites of passage is that living authentically means living here and now, in whatever form it takes, becomes an expression of love, joy, and caring for the Earth as well as a new sense of self.

This is not easy work, nor does it promise a quick fix. However, wilderness rites of passage and Earth-centered initiatory practices do develop confidence, trust, wholeness, a sense of enchantment and home in the wilder parts of ourselves, and a natural impulse to contribute to our world. These are the foundations for maturity, inner freedom, and service.

In the post-war years, The Wilderness Society broadened its arguments for wilderness preservation, particularly in response to new threats posed by increased timber harvesting and dam building by the federal government and new developments in the biological sciences. Led by Executive Secretary Howard Zahniser and Director Olaus Murie, the Society played an instrumental role in the passage of the Wilderness Act of 1964, which defined a wilderness as “an area where the Earth and its community of life are untrammeled by man, where man himself is a visitor who does not remain.” Since then, The Wilderness Society has helped to add 104 million acres to the National Wilderness Preservation System, often in collaboration with other environmental organizations that share its worldview. Despite the growth of its membership and the evolution of its arguments, The Wilderness Society remains committed to its founders’ emphasis on preserving wilderness for the recreational and spiritual renewal of future generations.

Williams, Delores S. (1937–)

Delores Williams is an African-American Presbyterian theologian who has played a formative role in the development of womanist theology, centering on historical and present testimonies of black women. Like other types of feminist and liberation theology, Williams’ womanist theology rejects traditional dichotomies between body/spirit and humanity/nature that pervade mainstream Christian thought. Williams offers a theological response to the defilement of black women’s bodies and identities in antebellum and postbellum America. She analyzes the surrogacy roles that were imposed on black women’s bodies, raped and forced to substitute for white women sexually and economically and used to breed slave offspring. She makes parallels between such surrogacy and the exploitative rape of nature perpetrated by strip-mining the land and clear-cutting forests – both cases represent sin involv-
It is time for us to take off our masks, to step out from behind our personas – whatever they may be: educators, activists, biologists, geologists, writers, farmers, ranchers, and bureaucrats – and admit we are lovers, engaged in an erotics of place. Loving the land. Honoring its mysteries. Acknowledging, embracing the spirit of place – there is nothing more legitimate and there is nothing more true (Williams 1994: 84).

Williams is best known for Refuge: An Unnatural History of Family and Place (1991), which interweaves natural history and personal family narrative. In this work, she juxtaposes her experiences “midwifing” her mother through her ovarian cancer death to the simultaneous destruction of the Bear River Migratory Bird Refuge from human-produced flooding. Williams’ grief over both is palpable. More than anything, she witnesses to the environmental cancer that is upon the Earth and the continuity between the earthly body and the human body. In “Clan of the One-Breasted Women,” the epilogue to Refuge, Williams recites the list of (clean-living, non-smoking, non-drinking) Mormon mothers, aunts, and grandmothers in her family who have all been stricken with breast cancer and who have died or been rendered unlikely Amazons through mastectomies. She also links these cancers to the years that the U.S. Government bombed the American West, conducting atmospheric testing of atomic weapons in Nevada and exposing other western states as well to radioactive fallout drifting on wind currents. Williams rails at this injustice and deems the cancers a price far too high to be paid for obedience – the unquestioning acceptance of authority instilled and reinforced in Mormon culture. She writes,

as a Mormon woman of the fifth generation of Latter-day Saints, I must question everything, even if it means losing my faith, even if it means becoming a border tribe among my own people. Tolerating blind obedience in the name of patriotism or religion ultimately takes our lives (Williams 1991: 286).

Williams is a self-described “edge-walker,” who travels the narrow space between the religious tradition she credits for having “forged her soul,” and her direct and very personal experiences in nature that have revealed a truth of their own. Throughout her work, she negotiates this edge by embracing themes that resonate for both Mormons and environmentalists – the importance of community, home, family, heritage, and commitment. Her co-edited anthology, New Genesis: A Mormon Reader on Land and Community (1998), carefully presents essays from a variety of Mormon writers who promote principles of ecological care and conservation as grounded in Mormon scriptural sources. The ideal of the nineteenth-century Mormon village is revisited as a model of self-sufficiency and sustainability, and Brigham Young’s advocacy of water conservation is repeatedly invoked. The anthology ultimately succeeds in marrying Mormon and environmental perspectives in a way that is inviting rather than threatening to more conservative readers.

If Williams is an “edge-walker,” then her “edgiest” book is Desert Quartet: An Erotic Landscape (1995). In this work, she explores the land as mystical lover and embodies a kind of “eco-eroticism” that blurs boundaries between skin and rock, wind and breath, blood and water, and fire and flesh. Williams leads the reader on a poetic journey through the desert and into intimate encounters with the Earth’s four basic elements (Earth, air, fire, water). In so doing, she engages the Earth’s “body” in a primal mystical union that pulses with pleasure and erotic intensity.

Williams sounds similar “eco-erotic” themes in her collections of essays, An Unspoken Hunger (1994) and Leap (2000), a book dedicated to her obsession with painter Hieronymus Bosch’s medieval triptych “The Garden of Delights.” The burning question within Williams while she was writing An Unspoken Hunger was “How do we make love to the land?” (1995), a question she confesses intrigues her in part because eroticism is so taboo in Mormon culture (Jensen 1995: 312). In Leap, Williams explicitly draws parallels between a fear of intimacy and eros within Mormon culture and the narrow valuing of nature solely for its practical human utility. She observes, “I see my community’s fear of homosexuality, even wilderness, as a failure of imagination. Sex is like land. It must be used for something” (Williams 2000: 195).

Issues of land use and wilderness preservation are indeed central to Williams’ activism. She has testified to protect Utah’s wild lands before a U.S. Senate subcommittee hearing on the Utah Public Land Management Act and has spoken before Congress on behalf of “America’s Redrock Wilderness Act.” She has also compiled and presented to Congress a volume of writers’ witness to the historical and spiritual importance of preserving America’s public lands. At a time when the idea of “wilderness” has been exhaustively deconstructed and its use aggressively critiqued within academia, Williams continues to “buck this trend,” boldly making the case for the spiritual, psychological, and ecological importance of protecting wild places. “I choose to err on the side of preservation,” writes Williams,

and stand shoulder to shoulder with brothers and sisters in our shared desire to protect the last large expanses of wilderness we have left . . . I want to speak the language of grasses, rooted yet supple in the presence of wind before a storm. I want to write in the form of migrating geese like an arrow pointing south toward a direction of safety. I want to keep
my words wild so that even if the land and everything we hold dear is destroyed by shortsightedness and greed, there is a record of beauty and passionate participation by those who saw it coming (Williams 2001: 19).

In 1995, the Utne Reader named Terry Tempest Williams one of its “100 visionaries.” She is a Rachel Carson Institute Inductee in recognition of her work as an environmental leader; she is also the winner of a Guggenheim Fellowship and a Lannan Literary Fellowship for her creative non-fiction.

Wilson, Edward O. (1929–)

An entomologist by training, E.O. Wilson’s hypotheses have had far-reaching influence not only in the biological sciences, but in the humanities and social sciences as well. Wilson’s ideas connect religion and nature on two levels. First, he argues that religion, like social behavior in general, is subject to natural selection. Second, Wilson’s primary intellectual endeavor has been to demonstrate the religiosity implicit in the natural sciences. His litany of publications includes several well-respected contributions to the field of ecology, but he is most widely known for his theory of sociobiology, and for his championship of environmental issues. This hypothesis established a scientific field devoted to finding the biological origins of animal social behavior at both the genetic and the environmental levels. Sociobiology presents challenges to current conceptualizations in the biological sciences as well as the social sciences. Sociobiological studies seek to understand the evolutionary foundations of social behaviors in animals, and to apply an ecological model to the social sciences. At the heart of E.O. Wilson’s ideas is the assertion that scientific investigation can radically improve the production of knowledge, and can be synthesized with other disciplinary systems.

Due to a boyhood fishing accident, Wilson’s vision is good in only one eye; and he has subsequently trained himself for close observation. His career in insect biology supplied him with many resources for the extension of scientific study into other fields. He is renowned for his work on the behavior of social insects, but has branched out tremendously into studies of ecology, gene-culture co-evolution, sociobiology, biogeography, environmental ethics, environmentalism, and environmental policy. He is the recipient of two Pulitzer prizes: one for his work in On Human Nature, and the other for his co-authorship of the definitive entomological work The Ants. Following his fieldwork in Cuba and New Guinea, Wilson joined the Harvard faculty of biology. He remains active there as a professor in the Department of Organismic and Evolutionary Biology, and as the honorary curator in entomology at the Museum of Comparative Zoology.

As a part of his larger project to understand human social life scientifically, Wilson has argued that religion is a product of natural selection. Beyond Wilson’s sentiments that religion is biological in origin, he also believes that traditional religions are ill-equipped to deal with the environmental and social problems of the modern world. In Consilience, one of his most accessible works, Wilson seeks to renew the enlightenment project of finding ultimate meaning through science. As a voice of twentieth-century biology, Wilson presents a continued call for an empirically grounded metaphysics, a religion based in fact, sounded a century earlier by such thinkers as Auguste Comte. Such a worldview would invalidate anthropocentric conceptualizations of the universe, and seek to create social harmony based on a coordinated effort between biology and the social sciences. His quest is lofty; not only does he advocate a massive research endeavor to establish scientific consensus on moral issues, he further believes that this new faith in facts needs to be created in poetic form, as an epic cultural narrative. He is a board member of the Epic of Evolution Society, and collaborates with those engaged in the consecration of scientific narratives in this way. His call for such a scientific undertaking has, however, been refuted directly by Wendell Berry in Life is a Miracle, and many non-scientists look at sociobiology as a highly controversial theory. Feminists,
cultural anthropologists, and many religious leaders present serious challenges to the legitimacy of Wilson’s scientific ideology, arguing respectively that such a position reinforces a patriarchal, scientific, and one-sided view of moral and cultural issues.

Wilson’s call for a scientific ethic in relation to environmental issues, specifically biodiversity, is espoused in *Biophilia*. His call for a conservation ethic grounded in scientific understanding parallels Aldo Leopold’s ideology, and harkens back to Thoreau’s idea of nature as the refuge of the spirit. Wilson’s version of environmental ethics adds a new dimension to these older ones: he situates it amid the knowledge of a more mature ecology, and focuses on the complex dynamics of both genetic coevolution and biodiversity. Wilson shares the straightforward understanding of humanity as dependent upon nature for survival with his predecessors, but comes armed with a more sophisticated understanding of the fundamentally intertwined existence of humans and their environment. *Biophilia* is the innate human tendency to affiliate with other organisms. From a biological point of view, humanity is an interdependent member of the complex energy cycles of the world ecosystem. To study this system, and to further our understanding of ourselves as a part of it, is for Wilson, the central task not only of the sciences, but also of human moral and religious activity. *Biophilia* posits that true meaning can only come from science. This is not an epistemological claim for the superiority of scientific knowledge. Wilson is setting forth the idea that as humans are biological organisms, what they find meaningful should itself be biological. This suggestion is at the core of Wilson’s thinking: scientific understanding of the biological world allows humanity to renew its entire mode of being, in essence to invent a new religion.

**Winter, Paul (1939–)**

The music of Paul Winter defies easy categorization. A recent characterization of his work is “ecological jazz,” but his music has also garnered such titles as “chamber jazz” and even “symphony world beat.” Winter credits his fusion of styles to a combination of his background playing jazz and bee-bop in Chicago, his time living in Brazil, his frequent ocean trips with zoologist-friend Roger Payne to record the complex songs of whales, and his annual pilgrimages to visit famously self-sufficient Maine home-steaders Helen and Scott Nearing. Considering this eclectic and quintessentially postmodern blending of influences, it is not surprising that Winter has often been described as a “musical shapeshifter” (Oliver 1992: 76). Not only does his music cross music genres: jazz, bossa nova, world music, chamber music and, more recently, Celtic music, it also crosses artistic media so that his songs are often referred to as “sound paintings” or alternately “tone poems.”

Indeed, in his own personal life, raised a Presbyterian as a boy growing up in Altoona, Pennsylvania, and now a world traveler and longtime Zen meditator, Winter is no stranger to crossing genres in the combined realms of music and religion. Not unlike the prevailing patterns in American spirituality, Winter’s artistic and spiritual leanings are both energetically and unapologetically combinatory. A self-identified “Earth musician,” Winter explicitly and negatively compares singularity in sound to the environmentally detrimental practice of “monocropping” (Parmalee 1990: 17). Instead, Winter and his “Paul Winter Consort” of world musicians cultivate a kind of ecospiritional polyphony that brings together the voices of endangered species, as well as the voices of “endangered” musical instruments – symphonic instruments that are rarely heard in favor of the much more popular electronic and synthetic sounds that dominate today’s music sales. It is this commitment to what Winter calls “natural music” that helped give rise to the creation of Winter’s famed “Owlegy” – a composition dedicated to the preservation of owls and ancient forests, as played by “endangered” instruments.

For his CD *Prayer for the Wild Things*, Winter embedded the voices of 27 indigenous birds and animals into his music, creating a virtual “soundscape” of the Northwestern Rockies. Each participating creature is considered by Winter to be a “musician from the symphony of wildlife,” and each is brought to the foreground of the piece, then recedes into the mountain landscape. Not only do instru-
ments represent animals in classic “Peter and the Wolf” style, but Winter goes one step further, allowing the animals to vocalize for themselves, as his human “Earth Band” echo these voices with their own hummanmade sounds.

Winter’s most famous work, the “Gaian Mass,” was composed and recorded in alternate locations: in the Cathedral of St. John the Divine in New York, with its forest of gigantic stone columns, and also in the Grand Canyon, dubbed by Winter “the Earth cathedral.” In both places, Winter has been fascinated by the dynamics of echo and the similarity and degree of “reverb” caused by both cavernous spaces as multiple voices come in contact with multiple surfaces. It so happens that both the Cathedral in New York and the cathedral of the Grand Canyon have the same eight-second reverb. This acoustic similarity carries both symbolic and artistic significance within Winter’s work. The parallel acoustics unite the more institutional space of the Cathedral (connected with the history of the Church and more structured, formal forms of worship) with the freer, nature-identified spirituality inspired by the canyon space. This kind of nature-inspired spirituality has permeated American philosophical and cultural movements from the Transcendentalists, to twentieth-century back-to-the-landers like Helen and Scott Nearing, to contemporary New Age forms of worship (Albanese 1990).

By including actual echo and by using “echo” as trope in his music, Winter conjures a sacred antiphonal relationship with the land. This call and response and Winter’s play of surfaces and sound evoke a sense of intimacy, a reciprocal love affair between the human and nonhuman world that imbues Winter’s composition and performance. In many respects, Winter’s commitment to the importance of so-called “natural music” or “Earth music” echoes David Abram’s argument in Spell of the Sensuous that in modernity cultures ultimately end up losing “a common discourse that opens directly onto the evocative sounds, shapes, and gestures of the surrounding ecology” (Abram 1996: 139). For Abram, it is the move from oral performance to the written word that goes hand in hand with a discourse that becomes closed off to the “voices” of nature. In contrast to the kind of tone deafness Abram describes and a silencing of the natural world, Winter’s inclusion of whales, loons, wolves, and wind effectively demonstrates an attempt to compose or rather re-compose a spiritual soundscape that is intrinsically “alive, aware, and expressive” in its planetary diversity.

Wise Use Movement

The term “wise use” was used by the first forester and chief of the United States Forest Service (USFS), Gifford Pinchot. It can refer to the “multiple use” doctrine that is supposed to guide the management of public forests, allowing recreation and resource extraction compatible with ecosystem health. But the more common contemporary usage of the term as the name of a movement, first applied by Ronald Arnold, a former Sierra Club activist and a major figure in the wise use movement, implies that the wise use of land overrides environmental constraints. This understanding owes much to James Watt, Secretary of the Interior under the U.S. Reagan administration, and founder of an early wise use group, the Mountain States Legal Foundation (MSLF). Although the wise use movement (called the share movement in Canada) has a diversity of groups and priorities, participants in the wise use movement agree that natural resources are here for human use and that immediate concerns hold priority in the “use” of land and resources. Some of the individuals and groups involved in the movement are motivated by religious concerns.

The “wise use movement” emerged first in the 1980s in the western United States as an alliance of disgruntled ranchers, loggers, hunters, off-road vehicle owners, gun owners, outdoor sports enthusiasts, farmers, land developers, and extractive industries united to fight a common enemy — environmentalism. The movement, which now reaches beyond its U.S. origins, includes those who desire more access to public lands, resent government regulation against the use of their lands, oppose environmental restrictions on free-market economies, dispute consensus scientific understandings of environmental threats such as global warming, and oppose environmentalism by claiming it is Pagan, a religion in itself, or anti-Christian. According to Richard Wright (1995) some even see environmentalism replacing communism as the next, great threat to liberty and claim that environmentalists are trying to establish a “one world” government. An early
articulation of the movement's goals was Alan M. Gottlieb's *The Wise Use Agenda* (1989). The Cornwall Declaration on Environmental Stewardship (2000) provides an example of the ways in which conservative religionists support the movement.

The wide range of interests involved in these movements often pits “wise users” against the National Parks, the Environmental Protection Agency, the U.S. Forest Service and other federal and state agencies, as well as major environmental, religious and scientific organizations. From the perspective of environmentalists, however, state and federal enforcement and land management agencies are frequently viewed as supportive of wise use and corporate interests. Similar conflicts are seen around the globe. In addition to trying to influence public opinion, media representation and legislation, gain members and protest current polices, other more intimidating tactics are sometimes used. Corporations involved in conflicts often request that media access and coverage be blocked or censored, as in the anti-old-growth forest logging campaigns in Victoria, Australia. Frequently lawsuits are filed. These range from money- and energy-draining “SLAPP suits” (strategic litigation against public participation) to lawsuits against environmental regulations. Wise use groups have argued in the courts, for example, that the U.S. Clean Air Act is unconstitutional and that Forest Service decisions to protect lands sacred to indigenous people for ritual use amounts to the establishment of religion and are therefore unconstitutional. Going beyond legal means, some participants in wise use groups have been engaged in the desecration of sacred sites, illegal logging and hunting, character defamation, harassment, death threats, and violence against environmental activists, as detailed in David Helvarg's *War Against the Greens*. Public Employees for Environmental Responsibility (PEER) documents harassment, threats and violence on their website and publications.

Wise use groups are sometimes named in ways that seem to support environmental values. The Evergreen Foundation, the Wetlands Coalition and the British Columbia Forest Alliance, for example, are all industry fronts. The anti-environmental agenda of the movement can more clearly be seen in the titles of the books written by its proponents, such as *Ecology Wars or Undue Influence: Wealthy Foundations, Grant Driven Environmental Groups and Zealous Bureaucrats That Control Your Future*, by Ronald Arnold. Arnold is well known for two statements: “Our goal is to destroy, to eradicate the environmental movement,” and “Environmentalism is the new paganism. Trees are worshipped and humans sacrificed at its’ altar. It is evil” (*Boston Globe*, 1/13/1992). Arnold also claimed that there is a green conspiracy to eradicate rural America. In the aftermath of 9/11, he and other wise use advocates intensified efforts to have civil disobedience such as tree sitting and blockading logging roads declared “ecoterrorism” and urged stronger laws against such activities.

Arnold and Gottlieb (who also promotes gun ownership rights) are both associated with the Center for the Defense of Free Enterprise (CDFE). The title of this organization, like that of Citizen's for a Sound Economy (CSE), the American Freedom Coalition, or the Acton Institute of Religion and Liberty, illustrates the centrality of the defense of free enterprise and economic liberty, the links between wise use ideology and libertarianism, and the way conservative religion sometimes becomes intertwined with these efforts. The Competitive Enterprise Institute (CEI) proclaimed that its mission is “advancing liberty from ecology to the economy,” while the Cato Institute (called the most important environmental thinktank by the Wall Street Journal) advertises its own with a banner reading, “Individual Liberty, Limited Government, Free Markets and Peace.” The Cato Institute focuses in part on “environment and climate change” (the term climate change is used to imply that it is just a natural part of the Earth’s history) and its staff includes a vocal opponent of global warming theory, Patrick Michaels, co-author with Robert Balling, of *The Satanic Gases: Clearing the Air about Global Warming*. Cato, and others who frequently deny or downplay the existence of environmental problems, promote themselves as “eco-realists.” Wise-use groups and institutes, such as CATO's and CSE, are funded in part by multinational corporations, including extractive industries and biotechnology. The Reverend Sun Myung Moon's Unification Church, motivated by his enthusiasm for free enterprise capitalism, is a backer of groups such as the American Freedom Coalition which had ties to Arnold's CDFE. Many of these organizations have close ties with various U.S. Republican presidential administrations, for example: U.S. Secretaries of the Interior James Watt and Gale Norton were both closely associated with MLDF, and the back cover of *The Wise Use Agenda* pictures author Alan Gottlieb with President George Bush.

These close connections are evident in the religiously oriented Acton Institute, whose website claims to be a “leading voice in the national environmental and social policy debate,” while also saying that environmental activists want companies to “commit suicide” and stifle their rights to “economic initiative.” At a 2003 ExxonMobil shareholders’ meeting, Acton’s president, Catholic priest Robert Sirico (a former director of the LA Gay and Lesbian Community Center) spoke against interfaith activists, such as CERES (the Coalition for Environmentally Responsible Economies), who file shareholder initiatives urging corporations to improve their human rights and environmental records. Reverend Jerry Zandstra, director of Acton’s Center for Entrepreneurial Stewardship, praised the company on its “excellent” record in human rights and the environment. Acton also helped found the Interfaith Council for Environmental Stewardship (ICES), made up of
Jews, Catholics and Protestants, as a way to counter what it views as wrong and misleading religious environmentalism. ICES board members E. Calvin Beisner and Robert Royal have published influential books, _Where Garden Meets Wilderness_ (Beisner 1997) and _The Virgin and the Dynamo_, which warn of “the use and abuse of religion in environmental debates” (Royal 1999, book subtitle). Beisner is a board member of the Committee for a Constructive Tomorrow (CFACT), whose website “boldly proclaims that the Western values of competition, progress, freedom, and stewardship can and do offer the best hope for protecting not only the Earth and its wildlife, but even more importantly, its people.” Both CFACT and Acton produce hundreds of radio spots on environmental issues. Many of the major groups, such as CDFE and Acton, fund conferences and have active publishing programs.

Acton, ICES, Sirico and Beisner are well known within conservative Jewish and Christian circles for the “Cornwall Declaration on Environmental Stewardship” (CDES), signed by two prominent evangelical Christians, Focus on the Family president Dr. James Dobson and Campus Crusade for Christ founder Bill Bright. The declaration was produced in order to respond to the Evangelical Environmental Network’s “Evangelical Declaration of Creation Care” (EDCC) (signed by other high-profile evangelicals as Cal Dewitt and the directors of World Vision and Intervarsity Christian Fellowship). The differences in the two documents are instructive: the Cornwall Declaration affirmed private property ownership and market economies, while the Evangelical Declaration (1994) promoted “lifestyle choices that express humility, forbearance, self restraint and frugality” and “godly, just and sustainable choices.” The CDES prioritizes the needs of humans over nature, argues that free-market forces can resolve environmental problems and denounces the environmental movement for embracing faulty science and a gloom-and-doom approach. In contrast, the EDCC encourages Christians to become ecologically aware creation care-takers. Other differences revolve around the place and privileges of humans relative to nature, issues of biblical interpretation, the definition of stewardship, God’s sovereignty, and the worry that saving the Earth is replacing the central Christian emphasis on saving souls.

These disagreements reflect more than internal Christian conflict; the Cornwall Declaration reinforced the wise use emphasis on the ongoing improvement of the environment through human technology, the abundance of resources put here for human use, the privileged place of humans, and the opposition to seeing more-than-human nature as an idyllic, harmonious state that must be preserved. Other major targets by conservative religious opponents are environmentalists’ concern over overpopulation and animal rights (“pro-abortionists and animal rights advocates” are often presented as synonymous with environmentalism). Mainstream environmental and religious groups are viewed as radical. Acton staff member, Phillip DeVous, (2002) called the collaboration, between the Sierra Club (a “radical” group) and the National Council of Churches, to try to prevent oil drilling in the Arctic National Wildlife Refuge an “unholy alliance.” Other opponents charged that the EDCC held Christian doctrine hostage to an environmental agenda.

Richard Wright, a Harvard-trained scientist and evangelical Christian who wrote a widely used environmental textbook, responded directly to the wise use movement’s attack on the Evangelical Declaration in “Tearing Down the Green.” He argued that those who attack environmentalists use poor science and falsely accuse environmentalists of nefarious conspiracies, including of serving the anti–Christ by trying to bring about a global, totalitarian government. Rush Limbaugh, who in the 1990s and early twenty-first century had become the most widely listened to right-wing radio commentator in the United States, frequently has claimed that environmentalists are leftist or religious fanatics, and enemies of liberty. Such claims are common to both secularist and religious anti-environmentalists. The former Idaho Republican U.S. Representative Helen Chenoweth, for example, in a speech delivered to the U.S. House of Representatives on 31 January 1996, attacked “environmental policies [that] are driven by a kind of emotional spiritualism that threatens the very foundation of our society.” She added,

> there is increasing evidence of a government sponsored religion in America. This religion, a cloudy mixture of new age mysticism, Native American folklore, and primitive Earth worship (Pantheism), is being promoted and enforced . . . in violation of our rights and freedoms.

This conflation of some of the religious and philosophical sources of environmental concern leads some conservative Christians to label deep ecologists George Sessions and Arne Naess “eco theologians” (CFACT) and to warn Christians not to “let the trees do the talking,” as they think Native Americans and Pagans do. Environmentalists are frequently accused of “worshipping Creation” rather than the Creator.

Despite significant diversity within the movement, which includes both avowedly secular and explicitly religious voices, participants in the movement see environmentalists as threatening sacred values: either that of the American nation-state, the world’s guarantor of freedom, of free-market economics, or of true religion, or all three.

Women and Animals

Western cultures have theoretically equated women, children, animals, and “the natural” with one another and with the body. This constructed connection served and continues to serve as a means of oppression in patriarchal cultures. Why did this begin and where?

Historically, women’s seemingly more obvious reproductive functions resulted in women being identified as more animal-like in their bodily functions than men. Therefore, many cultures functioned under the assumption that women’s bodies supposedly intruded upon their rationality. Since most Western theorists construed rationality as the defining requirement for membership in the moral community, women — along with men of color and animals — who were seen as less able to transcend their bodies, were long excluded.

We cannot know precisely when and where this began, though a few argue that a matriarchy preceded patriarchy and that its overthrow — due in part to a change in human’s relationships with the other animals — enabled both women’s and animals’ oppression. Others argue against this interpretation. Some believe that through the domestication of animals, the role of the male in insemi-
tion of animals, the development of urban centers, the creation of slavery, and the creation of the inequality of the sexes. Lori Gruen suggests various cultural and historical frameworks for these connections, including the shift from nomadic cultures to stationary agrarian communities with the accompanying increased demand for laborers; thus women became "breeders of a workforce."

In response to the historical alignment of women and the other animals, feminist analysis at first chose to sever the woman–animal identification, asserting that women are not animals and must be seen as equally human as men. Since the 1970s, an alternative analysis has been proposed by feminists, primarily in the U.S. and U.K., that women’s oppression must be seen as a part of an understanding of the interlocking systems of oppression that organize the world (and the oppressed) by gender, race, class, and species, and that feminism, as a transformative philosophy, must embrace the amelioration of life on Earth for all life forms.

From this analysis, rich scholarly insights have arisen. This entry can only briefly summarize some of them.

- The association of women, animals, and body manifests itself in violence on a personal level (domestic and sexual violence), and a cultural level (for instance, depiction of "meat" animals as sexualized bodies).
- The recent development of anthropornography ("depicting animals as whores") takes place in a context of women’s sexual inequality, and illustrates the construction of inequality.
- Anti-violence interventions and theories will be inadequate if they ignore the control perpetrators gain by violence toward animals loved by the victims. In fact, by analyzing violence to the animals in the household, the deliberate nature of this violence is clearly established.
- Species, like gender, race, and class, is socially constructed, and should not be the basis upon which ethical decisions rest.
- Patriarchal science fosters biological determinism not only regarding women, but also regarding other animals.
- The defense of hunting by some environmentalists arises from its association with male self-identity.
- Falsely generic words (such as man and mankind) that elevate men to full human status must be analyzed alongside animal pejoratives for women (catty, bitch, sow, shrew, dog, chick, cow).
- A patriarchal culture feminizes animal victims; this explains the low status of animals confined for food.

The role of religion in maintaining these oppressions or as a source for liberation is much debated. Myriad questions are being posed within the ongoing dialogue. Is the resistance to examining the treatment of the other animals in religions a way of avoiding a recognition of the animality of human beings? Is the result of anthropomorphizing God that God and humans, especially male humans, are seen as more alike than humans and animals? Is it the case that the more theology moves from being androcentric, the less likely it is to be anthropocentric? Would a body-affirming theology justify the exploitation of animals for food, clothing, or entertainment? Can religious concepts of alienation, brokenness, and separation address the treatment of devalued bodies? Could theologies of relinquishment, for men in their control over women, and for humans in their control over the other animals, emerge as sources for embodied transformations?

As ecofeminist philosophies and theologies continue to engage these issues, the links between women and animals, and the reality of human beings as animals, is poised to remain in the forefront of ideological discussions and practical applications.

Wonder toward Nature

Broadly conceived, wonder toward nature includes awe and dread in relation to the cosmos, a sense not only of transfixion but also of the numinous in specific locations, a marveling over something remarkable or some “first moment,” and a felt loss of explanation before the unusual or mysterious. Wonder, then, is a crucial psychological state for bringing nature and religion together (though in this state nature will often be taken as more than ordinary and thus super-natural). Wonder is a matter affecting
Western theories of religion, and has been crucial in the construction of constituting modern motions of “primitivity.”

The acclaimed founder of capitalism, the Scotsman Adam Smith (1723–90), was first to devote a third of a treatise – his History of Astronomy – to the sentiment of wonder. Wonder, by his definition, is the response to “extraordinary and uncommon objects” (meteors, comets, and eclipses being of obvious singularity among them), and in humanity’s earliest state, “every object of nature . . . considerable enough to attract his attention” will be enough to imbue wonder in the “savage’s” mind (Smith 1982: 48–9). To anything quite overawing, such as lightning, simple people will respond with a reverence that approaches fear, being totally without the rational explanations known to men and women of the Enlightenment.

Smith imagined that “primitives” were very anxious lest they offend the gods. This was a position more famously accentuated by his near-contemporary Giambattista Vico of Naples (1668–1744). Vico speculated that both morality and religion first began when “Jove’s lightning bolt” struck with horrendous surprise while promiscuous couples were having sex, this happening at an early stage when humans were almost like beasts. The brilliant Vico, who could be said to have founded the theory of animism in a few brief passages in his New Science of 1744, did not stop with negativities, for he conceived the primitive mind to be one of “prodigious imagination” (Vico 1959: 412). Smith would have agreed. He assessed many phenomena we now see as “perfectly beautiful and agreeable” what were in earliest times “the proper objects of reverence and gratitude,” inspiring wonder as proceeding “from some intelligent beings” (1982: 40–2, 48–9). And the Scot saw the absence of causal thinking as a key factor in this complex. The sentiment of wonder behind either “consternation” and “complacency” had arisen very early, as philosopher David Hume (1711–1776) doubtless influenced Smith to conclude that early humans were not able to make a connecting, “imaginal” bridge between events. This could have occurred in much the same way as an eighteenth-century European rustic would wonder, given no explanation, over the peculiar movements of iron before a loadstone.

For the titular founder of the discipline of comparative religion, Anglo-German Friedrich Max Müller (1823–1900), a century later, wonder was a wellsprings of religiousity, but in his approach the Enlightenment outlook tended to be replaced by Romanticism. What he described as the natural “appreciation of the infinite” was the naïve, child-like freshness with which the most ancient poets continually experienced their worlds. “A new life flashed by every morning before their eyes, and the fresh breezes of dawn [that] reached them like greetings wafted across the golden threshold of the sky.” Such new life was from “the rainer, the thunderer, the measurer,” or especially from those “bright beings, the Sun, the Sky, the Day, the Dawn . . . opposed to the powers of night and darkness,” this “contrast of light with dark being of very ancient date” (Müller 1899: 618).

Müller inferred what he took to be the earliest textual evidence of humanity’s spiritual life; namely, the signs of reverence behind the most ancient body of Sanskrit texts, the Rig Veda or Vedic hymns. Müller trusted little else but texts for revealing the nature of religions in the distant past, yet he was reacting against a more popular trend. For, by the late eighteenth century, the amount of ethnographic reporting on indigenous peoples had expanded exponentially, and the new fashion of evolutionism tempted many intellectuals to extrapolate from the most apparently primitive among contemporary indigenes back to the prehistoric origins of religion. Müller, however, was a decided “historist,” and he took a different tack by giving such priority to the Vedic hymns and what could be inferred behind them. On the other hand, he held the intriguing view that, long after the more-aware stage reflected in these hymns, many dispersed human groups lapsed into a confusion of thought – through a “disease of language” – that brought about the enormous, “curious array of belief systems . . . too often called savage,” found in the “anthropological religions” of tribal Africans, Australians, Pacific Islanders and the like (in Trompf 2002: 42). A true son of Romanticism, Müller placed the prismatic impetus of an authentic wonder first, as response to a primal revelation, and the peoples his contemporaries were calling primitives and savages came only later.

Out of Müller’s views arose the common assumption that primitives, while they may be struggling with the connections of things, may also be very curious or wondering – but only “to get it wrong” (1962: 49).

This did not square, however, with the theory of Herbert Spencer (1820–1904), the English inventor and social evolutionist, arguably the first sociologist of comparative religion. Wonder, or even curiosity, he had decided by 1856, were not properties of the savage mind. That could be safely inferred even from the behavior of village rustics he observed while on his holidays, who, because they showed little interest in Spencer’s makeshift scientific demonstrations, led him to comparative insights about the reception of newly created goods. He likened the reactions of rural folk to the relative “indifference which low savages display, when shown looking-glasses, watches, or other remarkable products of civilized life,” as missionary accounts had allegedly shown. “Surprise or curiosity are not the traits of the utterly ignorant,” Spencer argued (1904: 476–7). By the act of his imagination, or an extrapolation from an alleged relic in the English countryside both across to the inexperienced modern primitive and then backwards to a supposed “original” one, we find
Spencer representing “first peoples,” or the members of most small-scale, traditional societies, as duller of wit or as often lacking in curiosity and a sense of wonder – being the very opposite to Spencer’s ideal scientist, who is a person more naturally prepared for surprise and educated by higher religion to marvel in a civilized way.

Spencer’s social evolutionism, influential in the capitalist West, bears comparison with the theories of the founder-figure of communism Karl Marx (1818–1883), who was a protagonist of historical evolution (or development) in his own manner. Apropos wonder, Marx’s The German Ideology has history begin with a primal fear of overwhelming elements in the environment and end with complete mastery over both technology and society. Although Marx thought there were some reasons to admire the earliest societies – especially because they had not dissolved “their relations to the Earth” (1973: 497) – primitives are nonetheless in utter awe of external forces and inevitably create the gods out of them because they are at the mercy of the not-yet-controllable. Through fear, humans are naturally driven to a mutual (his friend Engels would add “classless”) dependence on each other, and from then on history is a story of lessened uncertainty and wonder, and increasing control over the environment.

With the turn into the twentieth century, the European projection of the “wondering savage” had taken on various aspects. By then Oceania had come into the picture. What early field researcher R.H. Codrington told of central Melanesian notions of mana – that “power or influence, not physical,” belonging “to the region of the unseen” (1891: 118–19) – had been construed as an apprehension of the “supernatural” that surprised “the natives” in their daily round. Thus, while English religious thinker F.B. Jevons (1858–1936) felt compelled by the new ethnographic data to reject the (Müllerian) thesis that “primitive man lived in a state of perpetual surprise,” he thought it fair to assume that “at any rate occasionally” any unexpected, “startling frustration” in calculations during the “natural” routine of life would make primitives realize that they were “in the hands of a mysterious and supernatural power” (Jevons [1896] 1927: 18, 20).

The Scot James George Frazer (1854–1941) was having some effect here, because he had given back to the primitive (in spite of Smith and Spencer) a sense of “the experimental.” The attempt to work magic, for all the mistaken assumptions involved, was the predecessor to modern science (and was also prior to religion). For Jevons, though, it was implicitly the failure of expectations in a world of magic that induced wonder, and thus religiosity.

A famous English theorist of religion, R.R. Mallet (1866–1943), paid homage to Jevons’ approach when he argued, almost a decade before Rudolf Otto in Germany, that the word “awe” is “the one that expresses the fundamental religious feeling most nearly,” that sense of “thrill . . . whereof the component ‘moments’ are fear, admiration, wonder, and the like, whilst its object is, broadly speaking, the supernatural” (Mallet 1914: 8, 10, 13). The Melanesians’ mana was invoked – and, too, the comparably vague (and for Mallet pre-animistic) conception of the supernatural among the African Masai, who not only took mysterious steaming holes as ngai, but also the white man Joseph Thompson, and his lamp as a sign of interest in indigenes’ wonder upon contact with outsiders. Mallet was influenced by Scotsman Andrew Lang (1844–1912) and what he had written about primitive actions to the unexpected – and to the spooky. Mallet consequently played down talk of magical experimentation and heightened his emphases instead on psychological states – on feeling and states of uncertainty before the supernatural.

The story of such European imaging has further developments in Continental and Anglophone theory. Austrian Sigmund Freud (1856–1939) speculated about the “omnipotence of thought” as common to both infants and savages (in his Totem and Taboo). Essentially he argued that one could infer “latent” psychological states in primitive peoples that were generated from the surprises of life “present to the senses and the consciousness” (Freud [1913] 1946: 122). The phenomenologist of religion, Dutchman Gerardus van der Leeuw (1890–1950), picked up on the inheritance of scholarship and stressed the primacy of wonder in religious consciousness; yet, like Freud, he pronounced on the greater suggestibility of primitives. For him, as a child of his times, “the natives” had a habit of over-exaggerating and letting their thoughts run away, as little-known expeditions to Melanesia – one by Anglo-American psychologist William McDougall to the Torres Strait in 1898, and another by psychological anthropologist Richard Thurnwald to German Neuguinea in 1906–1909 – had already been designed to confirm.

Less denigrating models were canvassed by the German theologian Rudolf Otto (1869–1937) and the Swiss psychologist Carl Jung (1875–1961). For Otto the feeling of “something uncanny,” “eerie” or “weird” . . . emerging in the mind of the primitive human being forms the starting-point for the entirety of religious development in history” (Otto [1917] 1959: 29). Of this shuddering before the numinous, however, apprehension of “the ‘supernatural’ has nothing to do with the case,” according to Otto. In qualifying Maret, Otto contended that this was “much too imposing an expression” for the primitive case. What he called “the vestibule of religion” was the product of “naïve, rudimentary fancies” paying “homage to natural objects that were frightening or extraordinary” (Otto 1959: 134–5). Otto, however, wrote of this incipience of holy dread less out of empirical interests than out of a desire to solve a philosophical problem, that of giving the religious sense a status sui generis; and thus the primitive mind, embodied above all in the savage wonderer, was constituted as preface to high theological insights.

As for Jung, what Otto conceives more in terms of outer
relations, with primitives responding to shadows and lakes, and eventually theological minds to the “Wholly Other,” comes to be transformed in analytical psychology into interior events. Primitives operate in a world affected by “unconscious regulators-dominants” that invade the inner numinosum, generating astonishment, awe and fear. This view, however, entailed Jung’s problematic subscription to Frenchman Lévy-Bruhl’s theory of the indigenes’ “mystical participation” with nonhuman agencies in this cosmos, or pre-logical mentalities that conditioned the fearful images and phantasms erupting as interior astonishments in dreams.

The goal-posts for the better understanding of les sauvages, in any case, tended to be shifted in accordance with specialist games played in European academic disciplines. That earthier English soul D.H. Lawrence (1885–1930), for one, who was a theorist of religion in his own right, and who knew some Jung but surprisingly never read Freud, wondered where bodies had gone in all this. He apparently wanted primal wonder to be relocated in the close encounter with or near touch of nakedness, when “blood,” not just mind, was thinking (Lawrence [1923] 1971: 102–16). When blood did come into it further down the track, the interest in awe and wonder took on sinister-looking undertones, and the Dionysians’ cultivations of fascination for the lost pagan mysterium led on to the sacred Teutonic grottos of the Nazis, and the tragic misappropriations of Otto’s Das Heilige. Concern for wonder, on this account, began to lose what momentum it had left. If the unhheimlich (uncanny) could metamorphose into the grausig (horrible) politically, that had to be reckoned with experientially. Awe, dread and curiosity became in psychological texts “mixed emotions” – of surprise and fear, fear and expectancy, surprise and acceptance respectively – sometimes indistinguishable from other mixed emotions, and wonder hardly coming into view at all.

The American psychologist B.F. Skinner was quick to categorize wondering under “superstition,” when, in consolidating earlier work by fellow countryman Thorndike and the Russian Pavlov, he found animals were “startled” to find reinforcement (food availability) by performing some action “totally irrelevant” to the norm (of pressing a bar), and so by experiencing what in the language of Jevons and Marett “defeats reasonable expectation” (Marett 1909: 12).

The Western intellectual community was losing its own sense of wonder – symptomatically perhaps, considering the Era of Violence – and from Durkheimian talk about collective excitements or effervescence to fancy new language about “cognitive engrossment” and “effortless disassociation,” wonder was obscured behind other categories rather tangential to it. It apparently was being “dis-spelled” by hundreds of a hundred-and-one photographic books, by the exponentially quickened appearance rate of new inventions, and by an ethos combining smart technology with the blasé. It has just managed to hold on with the naïve delights of children; and it somehow remains as a sense of “political correctness” when a person realizes that he/she should not dupe others with “tall stories” or play on their susceptibilities for too long.

Reckoning that the culture of high technology has subtly and tragically suppressed our older sense of wonder, Rollo May holds that social psychological health in the West is under threat. The disenchanting of the world, another way of describing the decline of wonder, seems symptomatic of the decay of religion itself. Paradoxically, the globalized access to new consumer goods from Western-originated markets has produced reactions of religious wonder among First Peoples and in other quarters. “Cargo cults” of various kinds come to mind, these not only being confined to Melanesia; and one contemplates the recently emergent Indian goddess, Santoshi Mata, to whom one prays for new commodity items. In all such reactions, however, nature portends to be the sufferer and the nexus between wonder and nature is impoverished.

In this light, it is no wonder there are religious voices calling us to attune our attentions afresh to the wonders of creation (e.g., Matthew Fox), depth ecologists persuading us that we should treat planet Earth as a living being (J.E. Lovelock), and philosophers encouraging us to “re-enchant” nature (e.g., Morris Berman).

Smith, Adam. Essays on Philosophical Subjects [1795] in
World Conference of Indigenous Peoples (Kari Oca, Brazil)

The religious traditions of indigenous peoples of the world weave together religion and nature. The extent to which these traditions are still observed today depends both on the political and economic contexts in which they are now situated, and the degree of dedication of regional spiritual leaders to conserving a traditional heritage at variance with contemporary cultural ideas and practices from the dominant societies in which they are located. In the Americas, for example, after centuries of efforts by Euro-American religious and political leaders to eradicate American Indian rituals and erase Indian culture; centuries of taking away Indian lands whose boundaries had been guaranteed by signed treaties; and more than a century of government and business control over economic development on those lands, the people in many Indian communities live in poverty and suffer the ravages of unemployment, family destabilization, alcoholism, dilapidated housing and dependence on government assistance granted at the whims of political authorities. Federal government statistics on employment and poverty witness to the state of Indian lands and communities. The casual traveler through “Indian Country” in parts of the United States, and non-Indians living on or near reservations, often note the poverty and environmental degradation of such areas – but often without probing their underlying causes. Despoiled terrain and depressed people in these contexts do not mean that native cultures reject rather than retain traditional values; rather, they reveal the chasm between those values – sometimes maintained by only a few, often termed “traditionalists” – and perspectives and practices absorbed from or imposed by the wider social milieu.

In this situation, Indian peoples in the Americas (and in

Indigenous Voices from Kari Oca

Why do we call animals, birds, fish, trees, and plants our relatives? Because we believe we are intrinsically related. And by calling them our relatives, we show respect for our environment and the world in which we live. Life is community.

Joaquisho (Chief Oren Lyons), Haudenosaunee Nation (Six Nations), United States

In the spiritual life, what we see and what we follow are the instructions that were given to us when the Peacemaker came. He came to this world and he instructed us in the things we must follow . . . The Creator created the world, the universe, and put things here for our benefit. We must give thanks to the Creator for all the things he has given us . . . We need to seek a balance between the spiritual and the political. There should be no separation of spirituality from political or social life. Americans have two houses, one for government and one for prayer. Our people keep them together.

Leon Shenandoah, Tadadaho (Chief of Chiefs), Haudenosaunee Nation

The forests, which are still preserved as a common reserve for the people of the world, are mostly in indigenous territories. Because we live in the natural world, we treat the natural world as our Mother. In Panama, in the last ten years, the desertification has been great. The forests that remain are on indigenous lands.

Atencio López, Cuna Nation, Panama

We, the children of the Earth, have come to share with the world and the United Nations our way of thinking, our visions, our way of life, an alternative. We do not speak of the “environment”; we speak of the spiritual and physical world in which we live, a territory in which people and nature are interrelated. “Land” is only the soil, but a “territory” is land in cosmic relation with nature, with rivers and animals and air and people, a place in which all are related. “Territory” means also our language and our values. We indigenous people are protectors and keepers of the territory, the “environment,” because we are part of it.

Valerio Grefa, Ecuador

If we have no water, we have no life. We are responsible for seeing that the lives of generations to come will be possible. Our individual lives are a part in time of the longer life of the people. If men create an environment that harms us, the life of the community will end.

Pauline Tangora, Maori, Aotearoa (New Zealand)

John Hart
other parts of the world) began in the twentieth century to reaffirm their history and their environment-related spirituality. This took various forms. Some activists have used language as a means of social transformation, cultural affirmation and political regeneration: recovery of their native tongue, and teaching it in native schools; using “nation,” rather than “tribe,” to refer to their people, focusing on treaties as agreements between sovereign entities; and transforming the word “Indian” into a transnational reference to native nations and individuals, although usually replaced by a specific reference to their own ethnic identity (Lakota, Hopi, Haudenosaunee, Muskogee, for example) in describing their particular origins. Others have focused on renegotiating treaties and economic contracts, using Indian lawyers rather than depending on advice from the Bureau of Indian Affairs and the benevolence of corporate attorneys; and on filing successful lawsuits against federal and state governments. Numerous American Indians (including Hopi, Haudenosaunee, Lakota and Dine’) have used their own national passports when traveling abroad, beginning in the 1980s, rather than U.S. passports; these have been accepted by foreign governments as official credentials.

Concerns and efforts such as these led to the organization of the “World Conference of Indigenous Peoples on Territory, Environment and Development” which was held in 1992 at Kari Oca, a site on the outskirts of Rio de Janeiro, Brazil, during the week immediately preceding the United Nations Conference on Environment and Development (UNCED, otherwise known as the “Earth Summit”). Indigenous leaders from throughout the world, concerned about devastation of Earth, which peoples from North America referred to as a sacred “Mother Earth,” and peoples from South America called “Pacha Mama,” met to address issues of sovereignty, conservation and restoration of their lands, intellectual property, racism, and cooperation with non-Indian peoples to care for the Earth environment and promote concern for the human rights and cultural identity of native peoples.

During preparations for Rio, indigenous representatives had urged the UN to speak not of “indigenous people” but of “indigenous peoples,” thereby acknowledging the diversity of peoples throughout the world and the responsibilities of nations to respect their lives and culture – including their traditional nature-based spirituality – and the territorial and ecological integrity of their land bases.

At the Kari Oca site, some 650 indigenous representatives celebrated their cultures from 25–30 May 1992. Through diverse religious ceremonies incorporating elements of pristine creation, they offered prayers to the Creator and Mother Earth, and pleaded for help on behalf of animal, plant and bird life; some sought the healing power of herbs and natural forces. They spoke of seeking freedom to conserve and express their spiritual beliefs and engage in their religious rituals. In a nod to contemporary conservation efforts, solar-powered lights illuminated the dirt roads at night with their stored energy.

Marcos Terena, a leader from the Terena people of Matto Grosso, Brazil, was a conference organizer, the Coordinator of the Brazilian Intertribal Committee, and the elected spokesperson to address the Earth Summit on behalf of the World Conference of Indigenous Peoples. In an interview after the World Conference of Indigenous Peoples event, he emphasized the relation between religion and nature:

We have organized this global conference because we did not have space within the United Nations, or in the debates of the NGOs [non-governmental organizations], and because we, as indigenous peoples, wanted to be treated in a specific manner, in a special manner, as peoples who know nature . . . We, the indigenous peoples, for many years, have always had a harmonious relationship with nature, from which we have taken our sustenance – not only material sustenance, but also our spiritual resistance and sustenance. Many people, including religious people, do not understand what we mean when indigenous peoples speak in this way. What we mean is that we do not have a “religion.” We do not have a “church.” We have only our spiritual power. Everyone has their spiritual power. But now [non-indigenous peoples] are far from their spiritual power. They are much closer to their technological and scientific powers. Because of this, they cannot know what nature and Mother Earth want to say. But we, the indigenous peoples, have tried to show that in daily practice we the indigenous peoples are knowers of nature and also that our resistance, our strength comes from a spiritual relationship with nature.

The indigenous peoples have suffered a great rejection, a great genocide . . . The indigenous culture previously was treated as folklore, but now we have been able to demonstrate that our cultural force represents our own dignity as a people. If we can demonstrate this day after day, we can also demonstrate that indigenous culture is something very alive, very strong, that has sustained us in this time. We are always joined in a perfect relationship of harmony with nature and with Mother Earth (Interview with and translated by author 30 May 1992, Kari Oca village, on the last evening of the event).

On the final day of the conference, the indigenous peoples from around the Earth issued the “Kari Oca Declaration.” The declaration expressed the intergenerational consciousness of traditional cultures when it declared that indigenous peoples “walk to the future in the footsteps of
our ancestors.” The document affirmed cultural and historical continuity, and a claim on native territories, by stating that those footprints are “permanently etched upon the lands of our peoples.”

Indigenous peoples’ human, territorial and civil rights, even when supposedly guaranteed by treaties, often have been violated by national governments in which native lands are situated. The Kari Oca Declaration condemns rights violations by asserting that indigenous peoples “maintain our inherent rights to self-determination,” despite “centuries of deprivation, assimilation and genocide.” On their lands and territories, they maintain “inalienable rights” to their waters and to all resources, and profess their “ongoing responsibility to pass these on to the future generations.”

Earth Summit organizers had sought in vain to have the United Nations delegates approve an “Earth Charter” that would promote ecological integrity and the well-being of the biotic community. At Kari Oca, the assembled delegates were successful in promulgating a 109-point “Indigenous Peoples’ Earth Charter.” In it, they asserted their rights to their traditional manner of life and their spiritual way of life, beginning with a forceful demand to “the right to life.” They noted that their territories are “living totalities in permanent vital relation between human beings and nature.” They stated that the UN Convention on Genocide must specifically include genocide against indigenous peoples. The “Indigenous Peoples’ Earth Charter” recalled the link between land, spirituality and self-determination by asserting, “Indigenous peoples were placed upon our Mother, the Earth, by the Creator. We belong to the land. We cannot be separated from our lands and territories.” The charter called for the establishment of an indigenous peoples’ environmental network; condemned the dumping of toxic wastes and nuclear wastes on native lands; called for the return of indigenous peoples’ human remains and artifacts to the original peoples from which they had been taken; asserted that “traditional knowledge of herbs and plants must be protected and passed on to future generations”; and stated that indigenous peoples should be free to use their own development strategies, ones which would promote “economic and ecological viability.” (In the U.S., ideas from the “Indigenous Peoples’ Earth Charter” have been put into practice by such organizations as the International Indian Treaty Council NGO, founded in 1974 and with offices now in San Francisco, California, New York City, and Palmer, Alaska; and the Indigenous Environmental Network, founded in 1991 and headquartered in Bemidji, Minnesota.)

The Kari Oca gathering was important for six significant accomplishments. It provided a forum for indigenous peoples to exchange particular and universal spiritual insights and to integrate them with diverse social-political-ecological-economic perspectives; it established a foundation for and inspired ongoing collaborative work; it reinforced an ongoing pan-Indian sharing of religious perspectives and ethical values; it strengthened international indigenous cooperative efforts to promote the material well-being of native peoples, particularly through rights to natural resources and territorial sovereignty; it affirmed global native efforts to weave together nature-oriented spiritual values, environment-related religious ethics, and indigenous communities’ efforts to conserve and control natural resource use and to retain religious traditions; and it taught peoples of non-native cultures about indigenous concerns for territorial and spiritual integrity, both linked to a profound respect for Mother Earth. Although the Kari Oca ideals are still, for the most part, visions of what the future might bring, Indian traditional spiritual leaders, social activists, NGOs, and local grassroots organizations are planning and working to make those visions a concrete reality in the lives of their peoples.

World Council of Churches and Ecumenical Thought
The institutional center of ethical thought about environmental issues inside the World Council of Churches is the working group on Justice, Peace and Creation. Theological and ethical ecumenical thought relevant to environmental concerns has a wide base and a long history, which is embedded in the ecumenical thought of the twentieth century. One can trace the history of ecumenical thought through the various conferences sponsored by the WCC in
the decades since World War II, key discussions and decisions taken at Central Committee meetings or assemblies of the WCC in the last decades, and through publications of the WCC and of the people related to it. One can similarly trace ecumenical environmental thought in this way and also through the participation of WCC staff and those of member churches in such events as the United Nations environmental conferences in Rio de Janeiro in 1992, and Johannesburg 2002.

The environmental thought of the WCC is closely related to, and in close conversation with, long-standing concerns of the WCC. It reflects the ongoing attempt of the WCC to develop overarching ethical themes which encompass in different ways the almost 400 member churches of the WCC, and thus reflect the global reach of the organization, as well as reflecting the centrality of its often-stated ethical commitment to justice, especially for the poor and the weak around the world.

While its ethical concerns have varied according to the issues of the times, one finds in the ethical thought of the WCC an ongoing interest in global economics and an often-stated concern for the uneven and unjust effects of capitalism on communities and individuals. This concern has changed shape according to the times, so that what was once an ethical critique of colonialism and Northern domination of Southern economies currently takes the form of a thoroughgoing critique of economic globalization, and corporations and international financial institutions which impose their logic and their will and demonstrate little or no concern either for the life of local communities or for their natural environments.

Another ongoing concern of the social thought of the WCC directly related to issues of the environment is that of science and technology. As was made clear in the well-known conference, “Faith, Science and the Future,” sponsored by the WCC which took place at M.I.T in July in 1979, ecumenical thought is concerned about the many ways in which both science and technology can escape community controls and aims, thus achieving a kind of autonomy that can result in the undermining of central values and practices relating both to the human social world and the natural environment.

In contrast to those who would let science and technology develop autonomously, ecumenical thought has stressed the inescapable moral responsibility human beings have for the social world in which they live, including the responsibility over the developments of science and technology. Such developments often largely determine human social relationships and relationships with the natural world, and cannot be left to develop on their own.

While members of the WCC work closely with other religious and secular groups, it is clear that the root of concern for the environment in ecumenical thought is a shared Christian conviction that nature is God’s creation, and is therefore sacred, possessing its own worth which cannot be determined by humanity. The sacredness of nature means above all that it is to be cared for and not ruined by human beings, who themselves are of course a part of nature. Thus faith communities can be and should be sources of values that are alternative to those that see nature as simply a resource to be exploited for human ends of pleasure and commerce. The Orthodox Churches have contributed considerably to this ecumenical theology of nature.

While the WCC member churches and staff often work with others to actualize their values, the WCC has also established several programs of its own which deal directly with issues of the environment, such as the WCC Climate Change Program, which started in 1988. The WCC has also sponsored programs and research on mobility, and on biotechnology, nuclear arms and genetic engineering.

The title of various programs and conferences of the WCC in the last several decades demonstrate both the continuity and the change in ongoing ecumenical environmental thought and action. In the 1970s the WCC developed the ethical goal of a “Just, Participatory and Sustainable Society.” In the 1980s it talked about “Justice, Peace and the Integrity of Creation.” In the 1990s the phrase “The Theology of Life” described a decentralized, contextual, community-based approach to the integration of these same basic elements which are critical for what ecumenical thought calls sustainable communities.

One strength of ecumenical environmental thought is clearly this long-standing insistence on keeping the values of justice, sustainability, peace and environmental responsibility together, and relating them to other issues such as science and technology, capitalist development, and globalization. Another unique strength is the incredible diversity of the experiences of its member churches around the world which require ecumenical social thought, including ecumenical environmental thought, to be methodologically both very general and very specific and contextual simultaneously.

The diversity of experiences and contexts as well as theologies and interests contained in the ecumenical movement which make it so rich can also make it difficult for substantive ecumenical environmental ethics to move ahead. It is difficult to achieve ethical consensus across the many kinds of diversity of member churches. It is also difficult to hold member churches accountable to each other in concrete efforts to achieve in their own contexts and communions some of the goals to which they have agreed in voting for general statements of the ruling bodies of the WCC.

World Heritage Sites and Religion in Japan

Adopted in 1972 for the protection and preservation of precious natural and cultural sites; the World Heritage Convention of the United Nations Education, Science and Cultural Organization (UNESCO), thirty years after its founding, had inscribed 730 properties (563 cultural, 144 natural, and 23 mixed “cultural landscapes”) from 125 countries on the World Heritage List. Nominations for World Heritage designation require well-documented governmental commitment to protect a site in perpetuity, clear and undisputed boundary surveys, and unambiguous arguments for the “outstanding uniqueness” of sites representing certain historical, aesthetic, or scientific genres.

Though in its formative years World Heritage selections were largely informed by Western aesthetic notions favoring monumental architecture and national parks, more recently UNESCO has worked to counterbalance this Euro-American bias by including “intangible” heritage such as sacred mountains, ritual performance traditions, and prayer (UNESCO 2001:2).

Japan’s World Heritage sites

By 2003 the World Heritage Convention had recognized eleven Japanese sites, including Hiroshima’s Peace Dome, Okinawa’s Ryukyu castles (gusuku) and Yakushima’s ancient cryptomeria forests. The sacred Kii mountain range running through Mie, Nara and Wakayama prefectures, with its unique combination of ascetic training grounds and lush forests, was nominated for consideration as Japan’s twelfth designation.

Shugendô Mountain Asceticism

Asceticism as practiced in Japan’s Kii mountains, known as Shugendô (“The Way of Acquiring Supernatural Power”), is a marginalized tradition that borrows selectively from Buddhist, Daoist, and Shintô sources. None of these borrowings is “final or authoritative” – when cosmology does not fit natural mountain formations, writes Paul Swanson, “so much the worse for cosmology” (Swanson 1981: 79). Denying themselves adequate food and sleep during long, treacherous climbs, Shugendô practitioners perform extreme austerities to access patron deities’ spiritual power for worldly benefits.

Though Shugendô has no founder or formal doctrine, the basic procedure for achieving catharsis and healing is explained by priest-guide Gojô Kakugyô like this:

You must discover the Buddha or deity within each of you. Weep for all the words left unspoken, the acts unfulfilled. Recognize your smallness in the face of the beauty and grandeur of great nature. This is the essential meaning of sange (repentance, recognition). If you cannot apologize face to face, apologize to the mountains, stones and rivers. But above all you must weep (naku). Only by shedding tears will you re-emerge whole (interview, Yoshino Japan, July 2002).

Humankind, animals, supernatural beings, and great nature exist in mutual interdependence, connected by the ability to weep. Because the individuals from whom practitioners sought forgiveness are no longer living or else their relationships are too chaotic, practitioners welcome the empathy and contemplation nature affords. Joblessness, infertility, alienated family relationships, and disquieted ancestors are common motivations for participating.

Mythmaking Potential of World Heritage

Throughout history, Shugendô has reinvented itself in response to proscription, ideological attack, and followers’ changing needs. Priests at Kimpusen-ji temple (Nara prefecture) cleverly sought UNESCO’s aid to imbue its sacred mountain Mount Omine with the aura of World Heritage. If successful, the designation will have honored and protected a pilgrimage trail (the Okukake) that neither the Bureau of Cultural Affairs nor Nara Prefectural Government planned on designating as National or Prefectural Cultural Properties. UNESCO designation, said Tanaka Riten-san, the priest who initiated the nomination, is a critical step toward reclaiming Japan’s religious consciousness “thrown out” (tsuterareta) by American Occupational forces’ separation of Church and state (interview, Yoshino Japan, July 2003). Terence Hay-Edie’s analysis of a Tibetan minority in Nepal finding opportunities for “new mythmaking exercises in world heritage ordered space,” illustrates a similar convergence between UNESCO and marginalized communities’ interests in heritage protection. In both cases, claims for uniqueness and authenticity
Prior to the Kii peninsula’s World Heritage nomination, an active community-based campaign promoted pride of place, cleanliness, and keeping its festivals well attended. Other voices from within and outside the community, however, questioned UNESCO’s rhetoric of “promoting peace and security in the world through collaboration among nations” while ostensibly appropriating Japan’s sacred sites for a global consumer market. Though UNESCO strives to help local and international organizations convert its ideals into effective “instruments for action,” as in the case of Biosphere Reserves which Ron Engel discusses in these volumes, critics such as McGuire have charged that Japan’s World Heritage designations have strayed from UNESCO’s founding principles of protecting endangered sites and degenerated into a system of elite cultural prizes. Far from being endangered, Japan’s World Heritage sites have long been protected by the domestic cultural property system and have been designated to boost sagging tourist markets. The resultant tourist deluge has been so great that some sites actually became endangered after UNESCO designation. On Yakushima, for example, hordes of mainland day-trippers have trampled sacred cryptomeria trees’ exposed roots, forcing caretakers’ to construct unsightly wooden rampways around the trees.

Wakayama’s Environmental Crisis
Tateishi Kôshô-san, another Kimpusen-ji priest, has been successful manipulating the forces of World Heritage designation to protect the natural environment in nearby Wakayama. Among his devotees are individuals diagnosed with terminal lung cancer and heart failure who recovered completely after performing austerities under Kôshô-san’s guidance. Kôshô-san is frequently described as “wild” (yasei-teki), “aboriginal” (senjuminteki), and an “authentic mountain ascetic” (honmono no yamabushi). He established his own sect called “Shizendô” (“The Way of Nature”) blending Shugendô with yoga, environmentalism, and dance. His spiritual practices are grounded in criticisms of Japan’s environmental exploitation, cultural chauvinism, and floundering national education system. The Shugendô “boom” that began in the late 1990s, occasioned partly by UNESCO designation, has given Kôshô-san the ear of a growing international clientele who discovered Shugendô on the internet.

Kôshô gives greatest priority to protecting Wakayama’s natural environment. He has been a strident critic of the Bureau of Cultural Affairs and prefectural government’s declaring prominent religious sites “Important Cultural Properties,” but then creating special laws and funds to protect only individual sites. This has left a mess of the overall environmental scene in surrounding areas. Former sacred peaks and riverbanks have been smashed into gravel pits. Over 50,000 used tatami mats were dumped into a ravine, creating a thirty meter high “tatami mountain.” Junked buses and cars protrude from sacred waterfalls. Meanwhile government officials congratulate each other about forthcoming World Heritage designations to protect sacred peaks.

A major problem Kôshô-san and Wakayama residents face occurs when corporations buy land in the countryside promising to compost tatami mats or build dairy farms but instead carve gravel or dump illegally. Locals upset by these practices have been too weak, frightened, or poor to respond effectively.

Enlisting the Help of Local Bureaucrats and the Media
Kôshô-san has been successful working with local public officials, television and print media to raise awareness about Wakayama’s environmental problems. In 1996 he first confronted the Japanese mafia who created these dumping grounds – a single man standing against wealthy corporations. Blowing his conch shell, reciting sutra, and with the force of Shugendô’s patron deities Zao Gongen and Fudô-myô-ô behind him, he tried to stop them. At first his adversaries were amused and simply continued. But after getting the public officers and reporters behind him his movement gained traction. The tatami mountain was relocated to a legal dumpsite in 1996; by 1998, Kôshô’s san and his environmental team bankrupted three corporations’ gravel production ventures.

Spiritual Eco-tourism
Kôshô-san has kept meticulous records of media reports documenting his activities and shows practitioners damaged sites where trucks and machinery remain. He asks, “Is this World Heritage?” Seeing ascetics perform ablutions in a sacred waterfall with a protruding Toyota Land Cruiser provokes a direct, spiritual impression that statistics cannot convey. He hopes clients will appreciate the area’s natural beauty and help protect it. Kôshô-san’s efforts are a type of spiritual eco-tourism. He encourages university students who participate to choose environmentally responsible careers. After performing austerities in Wakayama’s ancient forests to gain self-knowledge and overcome depression, students develop a sense of environmental stewardship. He appeals to their desires for rigorous exercise and communion with wild nature, but then gives them spiritual and ecological guidance which helps “green” their worldviews and consumer habits. Kôshô-san has also seized upon foreigners’ interests in protecting Kumano’s natural environment to motivate Japanese people who might not otherwise recognize its value.

Conclusions
In his role as ascetic mediator between environmentally destructive corporations and concerned locals, Kôshô-san
has raised questions and confronted practices ignored by others. Fortified by austerities performed in the local mountains and waterfalls, Kōshō-san appears to be uniquely qualified to assess and respond to Wakayama’s environmental crises. He leverages the potency and prestige of local and national media outlets, divinities, and foreign clients to protect Wakayama’s natural environment. Kōshō-san is in spiritual kinship with similar charismatic reformers in Japanese religious history such as Ippen and Kukai, as well as with contemporary spiritual leaders in global environmental resistance movements, such as the Dalai Lama and Chief Oren Lyons. Local individuals with global vision and savvy media skills, like Kōshō-san and to a lesser extent Tanaka Riten-san, have mobilized UNESCO’s universal vision of World Heritage to advance their own political agendas and inspire a generation of spiritually inclined environmentalists in Japan and abroad to protect their ascetic training grounds in the Kii Mountains.

P World Pantheist Movement

The World Pantheist Movement is an international grassroots membership organization promoting a completely naturalistic religious response to nature and the universe, with nature as the central focus of beliefs, practices, activities, and ethics.

The WPM emerged from public interest generated by the pantheism website of its founder and president, United Kingdom environmentalist Dr. Paul Harrison. It was incorporated in the U.S. in 1998, and opened for membership in 1999. Its core beliefs are incorporated in the Pantheist Credo, a statement drawn up democratically by a group of 15 volunteers and revised at intervals.

The pantheist credo begins with a statement of reverence for the self-organizing universe’s overwhelming power, beauty and fundamental mystery. It views all matter, energy, and life as an interconnected unity. It asserts that humans are an integral part of nature, which we should cherish and preserve in all its magnificent beauty and diversity, living in harmony with nature locally and globally. Acknowledging the inherent value of all life, human and nonhuman, it urges that all living beings be treated with compassion and respect.

The credo’s “social clause” asserts that all humans deserve a life of equal dignity and respect, and actively endorses freedom, democracy, justice, and non-discrimination, in a world focused on peace, sustainable ways of life, full respect for human rights and an end to poverty. It supports religious freedom and the separation of religion and state.

The WPM credo has a strongly naturalistic base. Nature, the entire living and non-living universe, is all that exists. There are no supernatural entities and no separate spirit realms. There is a single kind of substance, energy/matter, which is vibrant and infinitely creative. Consciousness and mind are emergent qualities of energy/matter. The senses and science are our best means of developing our ongoing knowledge of the universe, and the most solid basis for aesthetic and religious feelings about reality. Nature is seen as the only real basis on which religious feeling can be built.

Death is also viewed naturalistically, as a return to nature through the natural recycling of our elements, which should be facilitated by cremation or natural burial in simple linen shrouds or wicker baskets. There is no afterlife for the individual consciousness, but we live on through our actions, our ideas and memories of us, giving us a powerful incentive to do good.

The credo is not a requirement of membership, it is a “notice on the door,” a guide to core WPM tenets for people who are thinking of joining. These beliefs are closely related to those of deep ecology, religious humanism, religious naturalism, Unitarian Universalism, and modern Western versions of Stoicism, Daoism and Zen Buddhism, and the WPM welcomes membership by anyone who self-describes as one of these.

Ritual is optional in the WPM and there are no prescribed practices. Ceremony is seen not as magical placation of a supernatural being or beings, but essentially as self-expression of reverence and belonging. Members enjoy complete freedom of expression, and this may vary from nature walks, through individual meditation within nature, to shared organic meals or even pagan-like rites of a purely symbolic character. Some members are comfortable using religious terms in pantheistic ways, while others avoid them. The WPM aims eventually to provide a network of civil celebrants for nature-oriented weddings and funerals. As of 2003 this was limited to authorizing
members to celebrate weddings and funerals on behalf of friends and relatives.

Many of the WPM’s members are active environmentalists, but the organization also directly facilitates nature-related activities. It encourages members to join its group, saving wildlife habitat by daily clicking at the Ecology Fund’s website. By summer 2003 this group had saved 25 acres. This activity is funded by sponsors. The World Pantheist Movement itself sponsors this aspect of Ecology Fund and of Care2’s Save Rainforest sites, and by summer 2003 had saved an additional 62 acres in this way. Finally, in association with the National Wildlife Federation in the United States, the WPM encourages its members to set aside land (even small amounts) for wildlife, through wildlife-friendly gardening and sustainable management in the interests of native wildlife. So far 42 acres have been dedicated to wildlife.

The WPM also encourages direct contact among members and other pantheists. Local groups tend to meet in natural settings for walks, picnics, star watching and so on. The WPM set up the first generic pantheist mailing lists, the pantheist Usenet list, as well as almost sixty mailing lists and bulletin boards of its own devoted to discussion, local activities, specific topic areas, and organizational development.

World Wide Fund for Nature (WWF)

The World Wide Fund for Nature (World Wildlife Fund in the U.S.) has organized and supported a series of initiatives on religions and conservation, to build new partnerships with the world’s faiths in the struggle to save the natural world. The first event was an Interfaith Ceremony in the Basilica di S. Francesco in Assisi, Italy, organized as part of WWF’s 25th anniversary celebrations in September 1986. Five major religions were invited to make declarations on Religion and Nature. These declarations, addressed by religious leaders to the faithful in the Buddhist, Christian, Hindu, Jewish and Muslim worlds, describe the values and ethics that lead them to the conservation of nature. In the years following that event, other religions joined in making similar declarations, including the Bahá’ís (1987), the Sikhs (1989), the Jains (1991), and the Daoists of China (1995).

WWF, in collaboration with Martin Palmer of the International Consultancy on Religion, Education & Culture (ICOREC), built on the Assisi event to establish a Network on Conservation and Religion to link faiths worldwide working on conservation projects. As a result, in the first nine years, an estimated 100,000 religious communities became involved in conservation activities. The faiths launched programs of work, education and instruction based around their teachings on nature. Undamaged native forests on monastery land on Mount Athos, Greece, were protected from logging. A Hindu Environment Center was established in the pilgrimage town of Vrindavan, India.

In 1995, after nine years of activity, WWF invited the religions to review progress and plan for the future at the Summit on Religions and Conservation which it organized in two parts. The first session of activists and thinkers within the faiths was held in Japan on 3–9 April 1995. It took stock of what had been achieved since Assisi, and drafted Faith Reviews and Future Plans. This was followed by the second session, a summit meeting of top religious leaders in England, 29 April–3 May 1995. The event was hosted by Prince Philip at Windsor Castle, meeting in the room where William Shakespeare first performed the Merry Wives of Windsor. Participants included Madame Rabbani, leading Bahá’í dignitary; Venerable Kushok Bakula, twentieth incarnation of the Arhat Bakula, for the Buddhists; The Ecumenical Patriarch Bartholomew (Orthodox); Rev. Bernard J. Przewozny, Pontifical Adviser on environmental issues (Catholic); Rev. Dr. Samuel Kobia, World Council of Churches, and the Archbishop of Canterbury (Anglican) for the Christians; Swami Vibudhesha Teertha, Acharya of the Madhva Sect for the Hindus; Dr. L.M. Singhvi for the Jains; Rabbi Arthur Hertzberg, Vice President Emeritus, World Jewish Congress; Dr. Adnan Bakhtit, President of the University of Al al-Bayt, Jordan, representing Crown Prince El Hassan bin Talal, for the Muslims; Sri Singh Sahib Jathedar Manjit Singh, Jathedar of Akaal Takhat (Throne of Timeless Being) for the Sikhs; and Mr Xie Zongxing, Vice President, China Taoist Association; all accompanied by supporting staff. Each of the nine religions presented a paper on ecology and faith describing their accomplishments, commitments, initiatives and future prospects.

At the summit, four experts were invited to present the issues to the religious leaders for discussion: Andrew Steer, Director of the Environment Department at the World Bank; Dr. Arthur Dahl, Deputy Assistant Executive Director of the United Nations Environment Programme; Dr. Susan George, author and Associate Director of the Transnational Institute; and Sam Younger, Managing Director, BBC World Service. Various themes were
discussed over the four days of the summit. The harmony among the distinguished participants demonstrated how much their spiritual principles in this area converged.

At the beginning of the summit, an ecumenical celebration was held in the St. George’s Chapel in Windsor Castle, with each religion presenting something of particular significance to their tradition. The summit was followed by a procession of the leaders in London from Westminster Abbey to Westminster Cathedral.

One result of the summit was the formation of an Alliance of Religions and Conservation as the successor to the WWF Network on Conservation and Religion to follow up on the commitments made. The Alliance assembled a series of projects relevant to ecology and faith for which it sought outside support. The summit also increased the engagement of the faiths with secular organizations such as the World Bank, which led to a continuing dialogue.

Another step in this WWF initiative was the preparation by the faiths of sacred gifts for the living Earth which they announced at an interfaith celebration in Kathmandu, Nepal in November 2000 during WWF’s annual conference. Two additional religions, the Zoroastrian and the Shinto, joined the Alliance of Religions and Conservation at that time. The initiative continues to spread, with WWF France organizing an interfaith colloquium in 2003. WWF has also published various books on world religions and ecology.

Wright, Judith (1915–2000)

Judith Wright (b. Armidale, Australia; d. Canberra, Australia) was one of Australia’s best-known poets, twice nominated for the Nobel Prize. One of the generation of poets who emerged from World War II – about which she wrote so passionately in early poems like “The Company Of Lovers” – she brought a new note to a tradition which, largely secular and patriarchal, had ignored the erotic and religious. Writing the “feminine” into it, she brought it closer to the culture of the land’s First Peoples with whom she had a lifelong affinity – the Aboriginal poet and activist Oodgeroo Noonuccal was one of her closest friends.

Her feeling for nature was essential to this. Born into a pioneering pastoral family she grew up not only on the land, “my blood’s country” (Wright 1994: 20), but also with it, “. . . riding the cleared hills, / plucking blue leaves for their eucalypt scent, / hearing the call of the plover / in a land I thought was mine for life” (316).

As she grew older, however, she began to realize how destructive her colonial inheritance had been: “What swells over us now is a logical spread / from the small horizons we made – / the heave of great corporations / whose bellies are never full” (407).

The task was to make amends, to live with the Earth, not to exploit it. Poetry, the voice of feeling and empathy, became her way of doing this. But she also became an environmental activist and champion of Aboriginal Australians.

Her experience as a woman of love, pregnancy, and birth also drew her into the life of the cosmos. In “Woman To Child,” for instance, mother and child are part of the unfolding story of creation: “Then all a world I made in me; / all the world you hear and see / hung upon my dreaming blood. / There moved the multitudinous stars, / and coloured birds and fishes moved. / There swam the sliding continents” (28).

This moved her beyond the merely anthropocentric into the dimension of the sacred. Another poem is addressed to Ishtar, goddess of childbirth: “You neither know nor care for the truth of my heart; / but the truth of my body has all to do with you. / You have no need of my thoughts or hopes, / living in the realm of the absolute event” (102).

Her religious sense was thus essentially sensuous and bodily, immanent and transcendent, as the sequence “Flesh” makes this clear:

God walked through all my ages. He set in me the key that fits the keyhole; use it right and eternity’s lightning splits the rock of time.
And there I was begun and so begotten in that unspeakable heart of flame (146).

Significantly this cosmic and mythic perspective echoes that of Aboriginal culture: “Earth watches through our eyes, and as we stare / she greets, by us, her far compatriots there, / the wild-haired Suns and the calm Wanderers. / Her ancient thought is marked in every name; / hero and creature mingle in her dream” (203).

But it also led her to grieve over the land’s sufferings at our hands: “I am what land has made / and land’s myself, I said. / And therefore when land dies? / opened by whips of greed / these plains lie torn and scarred. / Then I erode; my blood / reddens the stream in flood” (279).

In this way, too, she shared the feelings of the land’s First Peoples, “the night ghosts of a land / only by day possessed” (354) who represented the other side of the triumphantist story of settlement.

This identification combined with physical frailty as
she grew older made her increasingly angry and she identified with the darker energies of the cosmos. In this poem to the moon, “ruler of women / and singler-out of poets,” for instance, she claimed the powers of a crone:

...To you, chill Domina,
I make the prayer of age. In my last quarter
let me be hag, but poet.
The lyric note may vanish from my verse
but you have also found acceptable
the witch’s spell –
even the witch’s curse (341–2).

To the end she insisted on involvement: “... who wants to be a mere onlooker? every cell of me / has been pierced through with intergalactic messages” (422).

Her sense of self has become truly cosmic here, attuned to the language and energies of creation beyond good and evil as we know them, energies she glimpsed hanging over a rockpool’s “wild embroideries.” Admiring it, “... the devouring and mating, / ridges of coloured tracery, occupants, all the living, / the stretching of toothed claws to food, the breeding / on the ocean’s edge” (419).

But there was also the deep sense of belonging, of being attuned to the language of the world, expressed in “Rainforest,” for instance: “We with our quick dividing eyes / measure, distinguish and are gone. / The forest burns, the tree-frog dies, / yet one is all and all are one” (412).

That is perhaps why after the age of seventy she wrote no more poetry. But the world would continue to speak. Self, nature, poetry and the sacred are one. In one sense, that involved a return to a more “primitive” sense of reality. But in another, it pointed a way out of the crisis posed by our present technological culture. So her Collected Poems conclude:

All’s fire, said Herclitus; measures of it
kindle as others fade. All changes yet all’s one.
We are born of ethereal fire and we return there.
Understand the Logos; reconcile opposing principles.

Perhaps the dark itself is the source of meaning,
the fires of the galaxy its visible destruction . . .

... “Twisted are the hearts of men – dark powers posses them.
Burn the distant evil-doer, the unseen sinner.”
That prayer to Agni, fire-god, cannot be prayed.
We are all of us born of fire, possessed by darkness (426).

Xhosa–Speakers’ Traditional Concept of God

The Xhosa-speaking peoples of South Africa, living along the eastern seaboard between the Great Fish River in the south and the KwaZulu-Natal border in the north, were the first Bantu-speakers to engage with the expanding white colonists in the late eighteenth century. Their traditional religion, like that of all Southern Bantu, comprised four main elements: the belief in a Supreme Being, the veneration of the ancestors, the manipulation of medicines and the fear of witchcraft. Of these, the belief in God was the least developed, although there is evidence that it was early influenced, to some extent, by concepts derived from neighboring San (Bushmen) and Khoekhoen (“Hottentots”). Later, under the teachings of missionaries, the concept was greatly modified.

The belief in a supreme creator being can be traced at least to 1100, when Late Iron Age agropastoralist Bantu-speakers moved out of the coastal plains of the Transvaal Lowveld onto the interior plateau or, as among Nguni, down the fertile corridor between the Drakensberg range and the Indian Ocean. Belief in a Supreme Being may, indeed, go back to the first settlement of Early Iron Age peoples south of the Limpopo River, dated to ca. 600. The Xhosa-speakers (or Cape Nguni) over the centuries split up into a number of chiefdom clusters, such as Thembu, Xesibe and Mpondo; the Xhosa proper, discussed here, were the southernmost group, living in what was formerly the Ciskei and southwestern Transkei.

The Xhosa had a number of names for the Supreme Being. Some obviously derived from the pre-Khoesan contact period, as both Xhosa and Zulu share them. These comprise distinct sets of reference. One set perceives God as a craftsman – the Maker, the Molder or, by extension, as *uHlanga*, referring, in Xhosa, to a mystical cave and, in Zulu, to a bed of reeds, from which all beings came forth by God’s command. Another set of concepts conceived him as a nature god, seeing him in the natural phenomena of lightning, thunder and rainbow, and in the all-important rain. Thus God was called the Lord of the Sky, *uNkosi yeZulu*. He acted by his powerful will; his actions – good or evil were beyond question, whether he struck human or beast with lightning or withheld rain. No sacrifice was offered to him: only prayer or entreaty could propitiate him. He was different from and beyond the ancestors, and his actions would never be confused with witchcraft, even though it was believed that God sometimes sent the “lightning bird.”

The pre-Khoesan period also undoubtedly employed a kinship-related metaphor in its theology. The association of God with *uHlanga* and the emergence of humans and animals was as the creator of the world, the First-in-Time, Mvelatangi or Mvelanqangi. But he seems to have been likened also to a firstborn son (invelanqangi), forever identified as the First Authority, on the model of a homestead head, autonomous over his family and expressing the vitally important principle of agnostic authority characteristic, particularly, of Nguni. But he was not in any way a type of super-ancestor, for he was utterly outside the realm of ancestorhood. An authoritative explanation of misfortune, evil, ill-health and death is an important function of all religions. Here the explanations of choice among Xhosa (as in all South African groups) were ancestral wrath, witchcraft and pollution. Explanation in terms of God was more in the nature of an ultimate residual category when these failed – rather like the exasperated statement “God only knows!” In this sense, God was peripheral to the everyday, practical religion of the common man or woman. The ever-present, brooding, spiritual influences resided in the ancestors.

Among Xhosa, however, there appears to have been a new elaboration of the God concept, related to the institution of chieftainship, and possibly influenced by Khoe culture. This change is expressed by the introduction of two new names for God, *uQamata* and *uThixo*, the most typical Xhosa names for God today. Both derived from San (or from Khoe) sources, possibly after Xhosa began to intermarry with San and Khoekhoen.

The term *uQamata* first appears in the literature only in the 1870s, but Xhosa oral tradition holds that it is the most ancient of the two San (Khoe) terms. L.F. Maingard speculated that *uQamata* was perhaps the name of a Khoe culture hero. Tentative reconstruction of the *uQamata* cult suggests that it only operated in times of national crises, was orchestrated by the chiefs and held on mountaintops – unlike the ancestral rituals, which always took place in the cattle byre. If all the rainmakers’ medicine had failed, then the chief prayed to *uQamata* on behalf of the people for rain, or the warding off of storms. This cult contrasted strongly with the kin-based ancestral blood sacrifice, officiated over by clan elders. It, significantly, consisted of prayer only. With one exception, none of the old records mention sacrificial killings or libations in *uQamata*’s honor. It thus reflected God’s role in the interface between society and
nature, not, typically, the relationships between kinsmen – the essence of the ancestor religion. It also had a national, political dimension. Probably due to Christian practice, the name of God most widely used today is uThixo, deriving from Khoe Tsui//Goab, meaning “Wounded Knee,” the name of the divinized hero and Rain God of the Khoekhoen. It was adapted in this form by the missionaries, to clearly distinguish traditional concepts from that of the new, universal deity that they proclaimed.

Yakama Nation

The peoples now commonly called the Yakamas traditionally lived in much of what is now central and eastern Washington State. Under provisions of the Walla Walla Treaty of 1855, the tribes ceded over 10 million acres to the United States government, and what is called the Yakama Indian Reservation was created. The Yakamas, who now number nearly 9000 tribal members, actually comprise 14 different bands and tribes, sharing a Sahaptin linguistic base, and a similar social history involving a migratory hunter-gatherer existence.

The Yakama Reservation itself is the largest in the Pacific Northwest, comprising nearly 1.4 million acres, nearly half again as large as Rhode Island. It stretches from the summit of the Cascade Mountains east to the irrigated farmlands and native range lands of the Yakima Valley (the Yakamas changed their own name to reflect original spellings). The Reservation has significant natural resources, with extensive farming and grazing lands, proximity to both the Yakima and Columbia Rivers, and healthy stands of commercially viable timber, including both Ponderosa Pine and Douglas Fir.

This biological diversity and richness is connected to the present religious diversity of the Yakamas, and how the various spiritual traditions view the environment. It is essential, however, to note that all three religious traditions – despite different theological orientations – have made room for a significant amount of agreement on the importance of environmental respect. This agreement often translates into a significant power base in deciding questions of environmental policy on the Reservation.

There are three major spiritual traditions on the Reservation: the traditional washat (sometimes called the Seven Drum Religion or Longhouse Religion), more traditional expressions of Christianity as brought by missionaries in the nineteenth century, and the Indian Shaker Faith. The washat was founded along the Columbia River by the “Dreamer Prophet” Smohalla in the mid-nineteenth century, and represents a native revitalization movement that combines certain religious elements from Western Christianity with native spirituality. At the outset the religion was adament in its stand against agriculture and mining, believing such practices to be antithetical to the proper attitude toward the Creator and toward the Earth. Today, the faith no longer rejects these practices, but the washat still takes environmental respect as one of its cornerstones.

Its modern strongholds also reflect the environmental tenets of the religion, which mirror the Yakamas’ ties between Creator and nature. The modern washat is celebrated at a number of locations both on and off the reservation, including the traditional fishing villages of Priest Rapids and Rock Creek, both on the Columbia River. That the washat is celebrated along the banks of what was once the greatest salmon fishery in the world is no accident. This connection between religion and geography emphasizes the fact that the washat celebrates the salmon as one of the Creator’s principal gifts to his people.

Much of traditional Yakama mythology centers on the Columbia River and the salmon, and often spotlights “Spil-yay” the trickster (portrayed by the coyote) acting on the people’s behalf. In the Yakama story “Spil-yay Breaks the Dam,” Coyote acts to save his people when the greedy Swallow Sisters dam the Columbia, preventing the salmon from reaching the traditional fishing sites. In “Legend of the Lost Salmon,” even Coyote is ineffectual in reviving the salmon when the people disregard the Creator’s rules about the proper way to fish. Only through the miraculous intervention of an elder are the salmon restored, reminding the people that greed and disrespect for the Creator have no place in their lives. Such stories are an essential part of the washat heritage, and reflect the intense love and respect for the environment that is at the heart of the religion.

The washat enjoys certain cultural and historical advantages due to its being interwoven into the very fabric of traditional native social life, and its beliefs on nature are disseminated far more often than at formal times of worship. For example, at times of crisis such as the death of the tribal member, Yakama storytellers are still retained to relate traditional stories about nature’s creatures, the connections between worship toward the Creator and tribal morality, and sacred places on the reservation. The stories function both as explanation for cultural and tribal morality, and distraction for the grieving family. Thus, the recent surge in the washat’s popularity among the Yakamas has been accompanied by an increased focus on encouraging traditional ways of looking at social structures.

There are also Yakamas who worship in traditional Christian denominations, represented in mainline and Pentecostal churches. These churches are mostly situated in the most populated areas of the reservation, from the middle Yakima Valley northwest to the border of the Reservation at the city of Yakima itself.

Most Yakamas who attend traditional Christian services
1776  Yakama Nation
dos at churches started fairly recently, and aimed specifically at reaching native populations. Some, however, attend churches started by missionaries during the nineteenth century, during the days of federal policy that gave priority to one religious group for each reservation.

For the Yakama Reservation, the Methodist-Episcopal denomination was selected by the administration of President Ulysses Grant as the religion that would be responsible for the “moral and spiritual education” of the Yakamas, and in the formative years of the Reservation, Methodism’s popularity was boosted by this governmental sponsorship. During this time period, Methodism’s opposition to traditional native spirituality – especially toward Smohalla and the washat – was personified in the person of James Harvey Wilbur, Indian Agent from 1864–1882. Wilbur did everything in his power to defeat the washat’s influence, believing that traditional native religious views toward nature were the single biggest barrier to “Indian civilization,” and his promotion of native agriculture was second to none in the entire Indian service of that time.

Today, Christian churches on the reservation do not attempt to change traditional Yakama attitudes and beliefs toward the environment, preferring to focus more on evangelism. To be sure, since traditional Yakama spirituality knows little or no separation between theology and morality, and since many of the traditional spiritual beliefs contain animistic elements that are more directly confrontational with traditional Christianity, some conflict is unavoidable. Nonetheless, the Christian churches’ otherworldly focus results in many Yakama worshippers retaining traditional views toward nature, at least in part. Thus, Yakamas who consider themselves as Christians are free to side with washat attendees on environmental issues – despite a different spiritual orientation.

The Shaker religion in the Pacific Northwest was founded by John Slocum near Olympia, Washington, in the late 1800s, and represents a third religious option on the Yakama Reservation. Shaker beliefs have always been centered more on individual piety and morality, rather than the rejection of any particular culture’s practices (e.g., agriculture), and the churches’ present location reflects this concern. The three Indian Shaker Churches are located not at traditional villages (as is often the case with the washat), nor close to populations centers (like more traditional Christian churches), but in the heart of the Reservation’s prime agricultural lands. Historically, many Yakama Shakers have been employed in the agriculture industry, and Shaker teachings have never equated modern technology with impropriety.

The religion itself combines ritualistic elements from both Protestantism and Catholicism, and considers itself a type of Christianity reserved for Native Americans. The Shaker faith does not focus on extensive doctrinal subtleties, however, and hence there is a great deal of latitude amongst individual worshippers on beliefs considered tangential to individual holiness. Thus, many believers have not rejected the traditional Yakama views on nature, and, on many key issues such as water rights or salmon restocking, both washat attendees and Shakers often present a united front.

Thus, despite three very different religious traditions amongst the Yakamas today, there is a growing voice on the need to respect the environment – a voice not lost by the very real religious diversity on the reservation. Certainly not rejecting agriculture or logging, but insisting on wisdom as a foundational value for environmental policy, this voice serves in many ways as a counter-voice to the surrounding voice of the majority culture. To cite just one example, despite the mostly dismal picture on the state of the northwest salmon, the Yakamas have been at the forefront of an intense program of stream revitalization and salmon stocking, and there have been a number of local successes in terms of fish returns. Thus, when focusing on the connections between religion and nature, the Yakama Nation is serving as an important example to other native peoples. Large in size, rich in resources, the Yakama Reservation and its peoples have demonstrated that religious diversity need not be a barrier to environmental progress.

Yamuna

The Yamuna is a river that flows from its source of Yamunotri high in the central Himalayas for about 826 miles to its confluence with the Ganges on the plains at Allahabad. It has long been considered one of the holiest rivers of northern India, and for centuries has been worshipped as an aquatic goddess. Today, however, much of the river has become polluted, causing a variety of responses from the religious community that is associated with the worship of the Yamuna.

The Yamuna originates from the Yamunotri glacier at an elevation near 20,000 feet above sea level. This glacier is nestled on a steep slope just below the crest of Mount Kalinda, located about six miles west of the Bandarpunch peak (20,735 feet), the dominant mountain in the central Himalayan region of Garhwal that divides the watersheds of the Yamuna and Ganges. The Yamuna rushes out of the morainic snout of the glacier to fill the pond Sapta-rishikund, named after seven sages who called the river down from heaven for the benefit of Earth, and from here cascades down the southeastern face of Mount Kalinda. Accordingly, the Yamuna is also called “Kalindi.” The cold water stream drops into a canyon where it joins the other recognized source of the Yamuna: a hot spring that flows from a stone wall of the canyon. Here, at an elevation of about 10,500 feet, is located the Yamunotri complex, an important temple site and destination of a popular pilgrimage. Pilgrims have been coming to this site for centuries to worship Yamuna and seek her blessings.

Yamuna is depicted at her Himalayan source in her Puranic form as a goddess having a dark complexion, clothed in red garments, holding in her hand a pot filled with good fortune, and sitting on the back of a turtle. Because the goddess Yamuna brings life-giving water from the mountains, and is associated with the creative powers that animate all life, she is often addressed as “Mother.” Yamuna is considered to be the sister of the goddess Ganges, who sits by her side in the Yamunotri temple. Yamuna is also considered to be the daughter of Surya, god of the sun, and the twin sister of Yama, the god of death, and as such the priests who attend the Yamunotri pilgrimage complex regard her as an auspicious goddess who blesses the lives of her pilgrims and protects them from death. Pilgrims visiting the Yamunotri complex cook food in the hot spring’s boiling water, which is considered to be a gift of the sun to his daughter, and bathe in a tank filled with its hot water to be blessed, purified, and freed from sins.

The Yamuna descends rapidly from the Yamunotri pilgrimage complex to carve a valley through the beautiful Garhwal Mountains before forcing its way through the Shivalik foothills and emerging onto the Indo-gangetic plains at the town of Dakpathar. Here where the Yamuna leaves the wild mountains and enters the “civilized” plains a great change takes place: Dakpathar marks a transition from the natural to the industrial, from river worship to river management, and from the Yamuna as a majestically unimpeded river to Yamuna as a greatly reduced stream, for here a huge barrage (a dam-like structure comprised of a long series of gates that regulate water flow for irrigation and hydro-electric power) has been built across the entire river and the great majority of the water is removed from the riverbed to be channeled off into utility canals. A little further downstream, the Yamuna reaches Tajewala, site of another massive barrage that blocks the river for irrigation and channels its water into the Western and Eastern Canals. The Yamuna then flows through the industrial towns of Yamunanagar, Karnal, Panipat, and Sonepat before arriving in the huge metropolis of Delhi, capital of the modern nation of India. Only 10 percent of the volume of water leaving the mountains reaches Delhi; almost all of the water remaining in the riverbed is extracted for domestic and commercial use in the capital city, which has borne the major weight of the rapid development that has occurred in India since the late 1980s. Although Delhi was built on the bank of the Yamuna long ago because of the river’s bounty and beauty, today the city dumps millions of gallons of untreated sewage and industrial effluents into the Yamuna, making the stretch of the river downstream one of the most polluted in India.

What remains of the Yamuna, after Delhi, flows past the ornate temples and magnificent sandstone bathing platforms of the pilgrimage centers of Vrindaban, Mathura, and Gokul in Braj, the important cultural region associated with the Hindu god of love, Krishna. This is also the area in which Yamuna is most celebrated as a goddess and her theology has been most fully developed, for here she is regarded as a goddess of supreme love. Consequently, there are more temples dedicated to Yamuna in this region than anywhere else along her course. Much of the theological association with Yamuna is the lasting result of a cultural efflorescence that took place in this region in the sixteenth century.

Although the river is becoming increasingly polluted, religious practices directed to Yamuna are still common: her devotees bathe in her daily, they sip her water reverently, make special offerings to her liquid form, and honor her presence in the many temples of Braj. Her water is also an essential ingredient in many of the temple rituals conducted in this region. For her Braj devotees, Yamuna is a goddess of exquisite love and compassion who initiates souls into the divine love affair. Among the pantheon of Hindu goddesses it would be difficult to find one more representative of divine love than Yamuna. In Braj, she is considered to be a chief lover of the youthful god Krishna. So great is her eagerness to join Krishna that, rather than being pictured on the back of a slow turtle, Yamuna is portrayed in this region running to offer her beloved a flower garland. Moreover, she experiences the deepest of
inspiration for cleaning the river has come from the Yamuna Action Plan inaugurated in 1993, most of the problems of Yamuna pollution through some of the efforts of the government to save rivers, and how river worshippers express their devotion through environmental activism.

Yanomami

The Yanomami are indigenes who live on either side of the border between northern Brazil and southern Venezuela in the Amazon rainforest near rivers in the lowlands and streams in the Guyana Highlands. Some 20,000 Yanomami reside in up to three hundred or more separate communities, which range in size from a few dozen to a hundred or more individuals. Their subsistence economy is characterized by a sustainable rotational system of bow-and-arrow hunting, fishing, gathering, and swidden farming. This economy is associated with low population density and high mobility. Sub-groups or a whole community forage from camps in the forest, on treks of days to months in duration, several times a year. Thus, Yanomami interact daily in intimate ways with each other and their natural habitat.

The Yanomami do not rigidly distinguish between the natural and supernatural realms. Religion permeates their daily life, society, culture, and ecology. Their variety of animism or nature religion focuses on numerous and diverse spiritual beings which inhabit the forests, streams, mountains, and other physical features in their habitat. Some of these spirits are contacted and manipulated by shamans, part-time ritual specialists. Several men in each community may practice shamanism. One or more shamans dramatically chant and dance ritually almost every afternoon or evening in the communal house, frequently combining their complementary powers as a team. A shaman usually employs a hallucinogenic snuff powder developed from psychoactive plants to contact helper spirits. Through spirit possession the shaman helps fellow villagers cope with practical problems like fostering success in hunting, avoiding danger in the forest, healing the sick, and taking revenge on enemies in other villages. If,
for example, an individual’s spirit counterpart or alter-ego which dwells in the forest is lost, then the person becomes sick and may even die. A shaman can find and restore this spirit for the individual. Shamans are the most highly respected individuals in society and the reputation of a spirit for the individual. Shamans are the most highly respected individuals in society and the reputation of

Yanomami also employ a wide variety of numerous plants for medicinal purposes. However, their religion, including the associated oral literature, focuses overwhelmingly on animal spirits. Indeed, the Yanomami believe that humans and animals may be transformed into one another. A shaman, for example, may not only imitate the behavior of an animal like a jaguar when possessed by its spirit, but even be physically transformed into the animal and roam the forest.

Up to a year or more is required for an apprentice to learn the mysteries, ritual chants, dances, and practices of shamanism. The apprentice is supposed to abstain from sex, certain foods, and various kinds of hunting and other activities. There are food taboos for menstruating, pregnant, and lactating women as well. Fathers of new babies must also follow certain food prohibitions. Such taboos, in conjunction with a multitude of various other practices like regular trekking, reduce the environmental impact of the Yanomami and usually allow the normal regeneration of nature.

Yanomami interact with animals in their habitat on a daily basis both physically and spiritually. Ornamental body-paint designs usually symbolize animals and certain ones are believed to protect an individual from dangers like poisonous snakes. Even personal names, which are essentially considered sacred as well as private, are usually those of animals. Every Yanomami has an animal spirit counterpart in the forest. Accordingly, the hunter cannot kill members of that species without potentially endangering himself. When an individual dies, his or her soul travels to a paradise above Earth. However, if the corpse is not treated with proper mourning, respect, and ritual by relatives, then the deceased’s spirit may return to the village and cause harm. Also after death, the spirits who reside in an individual’s body become spirits or animals in the forest. A wild animal that strangely appears in a village may be interpreted as a bad omen or evil spirit.

Reciprocity is the pivotal principle that underlies the worldview, attitudes, values, and behavior of the Yanomami. The natural, social, and spiritual components of the Yanomami world influence each other in many different ways. The unity, interconnectedness, and interdependence of all life from the perspective of Yanomami philosophy and religion permeates their rich oral literature as well.

While Yanomami religion has yet to be thoroughly studied, let alone its ecological meaning and significance, it is quite probable that their worldview tends to promote respect and reverence for nature in general. Whether in natural or social relations, harmony prevails on a daily basis in Yanomami life, in spite of occasional eruptions of disharmony. Part of the role of the shaman is to monitor and adjust these relations.

The survival and welfare as well as harmony of the Yanomami are, however, increasingly threatened by the encroachment of external forces. Most devastating have been introduced Western diseases, which often become raging epidemics, especially in areas where alien wildcat goldminers have intruded into Yanomami territory. In the matter of religion, Christian missionaries have had only nominal success in converting Yanomami, even though they have worked in several areas since the 1950s. Consequently, missionaries have precipitated relatively little disruption of traditional shamanistic animism which remains a vital part of Yanomami life. However, missionaries have introduced substantial changes in other aspects of Yanomami culture which could eventually impact on their traditional religion and ecology as well. At the same time, missionaries usually provide regular and long-term medical, educational, and other types of sorely needed assistance, given the dismal failure of state governments to fulfill its responsibilities to all citizens in Brazil and Venezuela. The Yanomami, including their spiritual ecology, will continue to face many serious challenges in the future.

Leslie E. Sponsel
Yoeme (Yaqui) Ritual

The Río Yaqui is the northernmost of five Mexican rivers that drain the mountains of what was once called New Spain and which is now called the state of Sonora. Sitting within this land, alongside the Yaqui River, are the Yoeme Pueblos, often referred to as the original Eight Pueblos. (The term “original” marks a distinction between these communities in Sonora and those created much later on the other side of the U.S.–Mexico border.) Within these villages live the Yoeme Indians, often called the Yaquis. Based on the direct translation “Yoemem” = “People,” and joining a recent cross-tribal move to reference tribes by names in their respective languages, I retain the use of “Yaqui/s” in the contexts of proper place-names, previously published quotes, and titles, while using “Yoeme/m” within the following descriptions.

Yoeme oral tradition places their homeland in northwest Mexico long before European contact and sometime earlier than human existence as we know it today. Any research into aboriginal Yoeme lifeways will undoubtedly lead to the world of the Surem, small proto-Yoemem who lived in complete unity with their environment. These ancestors of the Yoemem are said to have communicated telepathically with all living beings and were the original inhabitants of the hiakim, or Yoeme homeland. Oral histories of this primary era recount the presence of a tree that was making an unintelligible humming sound. After much confusion, a young woman was able to translate the tree’s prophecies that a group of people were coming over the ocean from the west and that some of them would try to take the land, and others would bring new technologies, baptism, and subsequently a whole new way of living. The prophecy leads to some of the Surem leaving to the hills and the ocean, to remain enchanted beings. The other half of the Surem decided to stay in the hiakim, Yoeme “homeland,” preparing to fight the Conquistadors and welcome the Jesuits. According to some Yoeme historians, the Konkista (the real “conquest”) took place as the people responded in factions to the prophecy, before the Europeans ever arrived.

Having defeated Spanish armies three times between 1533 and 1609, Yoemem were said to have communicated telepathically with all living beings and were the original inhabitants of the hiakim, or Yoeme homeland. Oral histories of this primary era recount the presence of a tree that was making an unintelligible humming sound. After much confusion, a young woman was able to translate the tree’s prophecies that a group of people were coming over the ocean from the west and that some of them would try to take the land, and others would bring new technologies, baptism, and subsequently a whole new way of living. The prophecy leads to some of the Surem leaving to the hills and the ocean, to remain enchanted beings. The other half of the Surem decided to stay in the hiakim, Yoeme “homeland,” preparing to fight the Conquistadors and welcome the Jesuits. According to some Yoeme historians, the Konkista (the real “conquest”) took place as the people responded in factions to the prophecy, before the Europeans ever arrived.

Military strength provided Yoemem control over their own combining of pre-contact traditions and Catholicism. We are immediately faced, therefore, with a different colonial situation than that confronted by most Native Americans and many indigenous peoples elsewhere. Yoemem powerfully enforced and strategically maintained their territorial and cultural boundaries, allowing for self-management from pre-Columbian time up through Jesuit collaboration. Thus, the Yoeme clearly cannot be quickly included within popular scholarly imaginings of “The” indigenous colonial experience. Primarily, in contrast to forced “conversions,” we know from both Yoeme and Spanish sources that the Yoeme invited the Jesuits into their territory. Both Jesuit documents and Yoeme oral traditions record that the Yoemem were eager to learn new approaches to civil planning, including farming and ranching. According to the primary Yoeme myth, The Singing Tree, the people had already received prophetic knowledge that such changes were coming.

The Singing Tree, many Yoemem claim, also prophesied that outsiders to the tribe would seek to push Yoemem off their homeland. The relationship between history and myth is nowhere more important than in these issues of boundary maintenance. In the early nineteenth century, approximately fifty years after Spain expelled the Jesuits, the emerging Mexican administrators began instituting an encomienda system of land tenure which slowly and steadily led to the more familiar colonial relations we see across the globe between indigenous peoples and colonizers. Throughout most of the next century, Yoeme people were deported, massacred, and driven off their homelands. Perhaps the crux of this disregard for Yoeme sovereignty came in the early twentieth century, when Angostura Dam was being built to direct water to larger Mexican cities and away from the original Eight Pueblos. The remaining half of the twentieth century framed Yoemem rebuilding villages, reinvigorating religious societies, and developing ways to regain control of their Aboriginal homeland. The control of land and the continuation of indigenous identity are co-dependent for most Yoemem.

One movement toward environmental sovereignty includes working with Mexican banking institutions to develop credit relations using the land as collateral. However, a widespread concern among the Yoeme is that the land has become a means of exchange with the banks. In order to support themselves and accumulate collective wealth for such things as education programs and ceremonial performances, Yoemem in the Río Yaqui are repeatedly forced to borrow money to work their own land, the profits of which are distributed so thinly that they are in constant debt. Essentially, they are working their own land, but only earning enough for the most basic level of sustenance, always in fear of losing that land to the banks. Another option some community members want to explore includes selling land outright to the banks or non-Yoeme individuals, thereby avoiding the long process of slow debt accumulation and possible loss of land. Either of these two maneuvers put the tribe in a disadvantageous position: living in debt, or selling their tribal inheritance. So although Mexican President Lazaro Cárdenas in 1937 decreed a Zona Yaqui, members of the Eight Pueblos still struggle for complete control over their hiakim. Understandably, the struggle is fueled by a collective sense of belonging to a native community and is secured by a landscape and religious tradition that
reaches beyond the times of Spaniards and Jesuit missionaries.

Still, most of the ethnographers of Yoeme culture have struggled to make sense of Yoeme religious identity since the cultural performances suggest that they converted; and most Yoemem themselves claim to be Catholics. For example, almost every village performs a season-length passion play of the life of Jesus (a man who walked through the hiakim) while simultaneously bringing to life masked beings, deer dancers, and their related dimensions. But scholars have previously been looking for pre-conceived categories of sacred or profane, Christian or pagan, ritual or art, pre- or post-contact; all of which fail to characterize Yoeme notions of religious action. Thus, some of the most well-versed ethnographers of Yoeme culture understood the deer dance as a folk art left over from a pre-Christian culture [Painter 1986: 271; Spicer 1984: 289–99]. How do we make sense of rituals that clearly signify a previous mode of sustenance when those relationships with “nature” are no longer available or feasible? As of recently, very few Yoemem continue to hunt deer in the Eight Pueblos. Yet, few scholars have been attentive to the ways that Yoeme rituals utilize Christian symbols or characters within an indigenous logic, a conceptual framework that is inseparable from the geography, landscape and dimensionality that many might call “nature.”

Many Yoemem understand their world as dimensionally composed of overlapping, yet distinct worlds or realms, called “aniam.” The literature suggests as many as nine different aniam: tenku ania: a dream world, tuka ania: night world, huya ania: wilderness world, yo ania: enchanted world, nao ania: corncob world, heaven, hell, purgatory, and sea ania: flower world. Each of these worlds provides a home for powerful beings or forces, and Yoeme relate deer dancing with three specifically, since the deer emerges from an enchanted home, yo ania, into the wilderness world, huya ania, and dances for us in the flower world, sea ania. Understanding the importance of the sea ania in Yoeme religion is fundamental, since flowers, seewam, are the actualization of sacrifice and the nurturing acts of giving. The most nurturing aspects of nature are found in the sea ania: streams, lakes, clouds, rain. The deer lives in the sea ania and when he is killed, he is laid atop a bed of flowers. Hunters must have sea taka, or flower power, to hunt deer successfully. Flowers adorn the deer dancer’s antlers and skirt, as well as the necklaces and hair of the pahko’olam. In their extensive study of deer songs, Larry Evers and Felipe Molina write that the most common words found in the songs are Yoeme terms for flowers. For Molina, a well-respected scholar and Deer Singer, the main purpose of the songs is to bring Deer’s voice from the sea ania to the ceremony. He adds that, “almost every piece of regalia and every instrument used in deer dancing and deer singing may be called ‘seewa’ or ‘sea’ as well” (Evers and Molina 1987: 52).

The deer dance always entails the dancing of the pahko’ola (fester). Wearing black masks in either the shape of a humanoid face or of a goat’s head, pahko’olam lead the deer dancer into the performance area where he will spend the evening dancing with him, the two clowning around with each other, and entertaining the guests. When not dancing with the deer, pahko’olam wear their masks backwards or hang them from the left side of the head, since the devil is said to come from the left. Common mask designs include the elongated goat-face style with ears and horns. Small insects or desert animals are often painted on the masks. Typical Yoeme pahko’ola masks feature a hand or small triangles pointing inward around the outside circumference, considered to be goat’s teeth, sun rays, or mountains. Additionally, many masks have cross-like paintings which some relate to Christianity, although I have also heard in various conversations that this was a pre-contact, sand-painting symbol for the sun. Both the elongated and face-shaped masks have horse hair dangling over the eyes and from the chin. There is a strong connection in the ethnographic literature between pahko’olam, goats and the yo ania. Their pre-colonial beginnings are referenced by their often used title, “old men of the fiesta.” Since they also are sometimes called “sons of the devil,” we should again be conscious of the tendency to relate the yo ania to concepts of evil and the devil. When attending an all-night pahko, the banter and antics of the pahko’olam help elevate the moods and energy of the crowd. The dancers are charged with passing out cigarettes to the audience members and more often than not create quite a stir by attempting to humiliate the deer dancer, musicians, the female societies to their right, and even the spectators.

Undoubtedly, the most well-known and most often described Yoeme rituals are those within the ceremonial season associated with Lent. From January 3rd to May 5th, the pueblos are governed by the religious society authorities. During these months, the atmosphere changes as both indigenous and Christian dimensions come together in a fantastic spectacle on Easter Sunday. On the morning of Holy Saturday, the Fariseos (pharisees, religious soldier group) and masked beings use a series of procession formations and building and staccato rhythms to rush the church repeatedly. As protectors of the church and the saints inside, anhelitom (“our angels,” children dressed as beautiful angels) whip these “evil” aggressors with willow twigs and chase them out of the church. After the last assault, the black curtain – which had dissected the front quarter from the rest of the church – is thrown wide open to reveal all the anhelitom and saints. Christ has risen, the tomb is empty, and the anhelitom chase the defeated aggressors out of the church for the last time. The ceremonial society of Mary, the matachinis, play their music and dance flowers for her, holding flower wands and wearing flower hats. First in the church and then mov-
ing outside the front doors, the pahko’olam dance around the flower patio. Simultaneously, the deer dancer is bringing his cosmic dimension, the sea ania, into presence. The sea ania, or flower world, is another realm of the Yoeme cosmos where the deer live, often conceived as under the dawn, and wherever the huya ania (wilderness world) opens up into the blossoms of complete being. Thus, through this ritual sacrifice the various Yoeme dimensions coexist: the pueblo, the church, the huya ania, the sea ania, and since these latter two are pre-Christian derivatives, they also signify the enchanted world of Yoeme ancestry, the yo ania. Here at the place where these worlds come together, the onlookers throw confetti flowers at the attacking soldiers (Farises). For what seems like hours, the community is showered by multicolored flowers drifting on the wind and upon a sea of swirling being. After the whole community defeats evil, fireworks shoot into the sky, heralding Saint Michael’s return to heaven since he has collected everyone’s sacrifice in the form of the flower. Everyone who has come and given of themselves during the previous season (performers, family members, observers) are considered to be sharing in this flower, this grace that originates not from God on high but through collective sacrifice.

As other contributors have noted in this volume, the word “nature” has no direct translation in Yoeme; nor can we directly translate “religion.” I quickly learned in my work in Yoeme villages that to talk about religion, I would use the word “kohtumbre” (a Spanish loan word for “custom” but used also for “society”), which most closely approximates the idea of religion. To ethnographically unpack the concept of “nature” entails the discussion of all seven or eight aniams, or possible states of being, which roughly relate to geographical/cosmological spaces. Perhaps the best term to draw all this material together is lutu’uria, which translates as “truth” but entails a socially performative component, a sharing of ritual knowledge. Thus, references to the aniams, as well as experiential knowledge of cultural traditions and religious practices, are expressed in performances that socially assert and test truth claims. These dances and speeches are religious obligations and ways of representing core aspects of Yoeme identity. Thus, lutu’uria provides a means by which Yoeme share their sense of the “real” world, namely, “nature.”

Yoga and Ecology

The Yoga tradition originated several thousand years ago in India. Early evidence of Yoga practice can be found in Indus Valley seals unearthed in Mohenjodaro and other cities that date from 3500 B.C.E. Textual references to Yoga appear in the middle Upanisads and the Mahabharata, dating from about 600 B.C.E. The Buddha and the Jina (ca. 500 B.C.E.) both taught yogic styles of meditation. By around 200, Patanjali summarized Yoga practices in a classic text known as the Yoga Sutra. Sanskrit texts such as the Yogavasistha (ca. 1000) and the Hatha Yoga Pradipika (ca. 1500) describe various forms of Vedantic and esoteric Yoga. Haribhadra’s Yogadrstisamuccya (ca. 750) and Hemacandra’s Yogasastra (ca. 1250) discuss the adaptation of the tradition to the Jaina faith, while the later texts of Kabir and Guru Nanak allude to Yoga meditation from universalist and Sikh perspectives. Yoga continues to be practiced throughout India and has become increasingly popular worldwide.

In its various manifestations, Yoga includes practices and philosophical positions that accord with values espoused by modern ecologists. Unlike many other schools of thought in India, Yoga is thoroughly realistic. It builds upon the Samkhya school of philosophy, first espoused by a near-mythical sage named Kapila who perhaps lived in northeastern India around 900 B.C.E. Kapila’s teachings were later systematized by a philosopher known as Isvarakrishna, who composed the Samkhya Karika in the early centuries of the Common Era. In this seminal text, the author exerts great care to articulate the existence and importance of the natural world. He posits that the world
is known to us through its effects, and the effects stem from a common cause, prakriti, a term that many scholars choose to translated as “nature.” Nature provides experience and liberation for her silent observer, the spiritual consciousness or purusa. According to the Samkhya Karika, all things exist for the purpose of serving and liberating this consciousness. Through understanding the nature of the creative force known as nature, one advances toward a state of freedom. To understand the structures and purposes of things one is able to cultivate a state of nonattachment that, from the perspective of this philosophy, entails a state of appreciation and respect, not disdain and abnegation for nature.

The earliest depictions of Yoga, found on sculptures that date from 5500 years ago, show persons imitating various aspects of the animal domain. An early statue from Mohenjadaro shows a man with his jaw wide open and his eyes bulging, approximating the roar of a lion. This pose later earns the name of simhasana, lion’s pose. A tableau first found in Indus Valley steatite seals and then repeated thousands of years later etched into the pillars of countless temples, shows a meditating deity, now known as Pasupati or Lord of the Animals. This imposing figure sits cross-legged and austere, surrounded by devoted and attentive animals such as goats, cattle, and what today seem to be make-believe creatures. This genre of representation exudes a sense of being in harmony and perhaps communion with the animal realm, and convey a sense of comfort in the company of nonhuman realities.

In the middle, Upanisadic period of Yoga, we find speculative discourses and dialogues about the nature and function of the human body and mind. By reflecting on the functions of the body, particularly the breath, and by seeking to still the mind, the Upanisads state that one can establish a connection with one’s inner self or Atman, often translated as soul. Passages from the early Upanisads such as the Chandogya and Brhadaranyaka Upanisads emphasize the primacy of breath and the relationship between the microphase and the macrophase aspects of reality. By getting to know oneself through focusing on the power of the breath, one feels an intimacy with the larger aspects of the Earth and heavens, perhaps most aptly conveyed in the first section of the Brhadaranyaka Upanisad, which first correlates the various functions and regions of the universe with the cosmic horse, and then makes a similar series of correspondences with the human body. By understanding one’s desires and impulses, as well as the structures and functions of one’s body and mind, one gains an understanding of the cosmos.

The later Upanisads and the Bhagavadgītā speak directly of Yoga as the technique to be utilized in order to feel that intimate connection with the flow of life and one’s place within reality. The Svetasvatara and Maitri Upanisads state that by drawing the senses inward and controlling the breath, one can reach a state of equipoise. The Bhagavadgītā comes to describe the Yogi as one who comprehends the relationship between the “field” or nature (prakriti) and the “knower of the field” or spirit (purusa). Within the body of Krishna, the entire world, in its splendor and terror, can be seen, appreciated, and embraced. The metaphor of the human body becomes extended in the Gītā to include all aspects of the universe.

The Yoga Sutra of Patanjali outlines an eightfold practice to ascend toward the state of self-realization through which one realizes one’s connection with the universe. The underlying philosophy of Yoga places great value on feeling the connection between one’s self and the larger world of nature. This continuity becomes celebrated in the term samadhi, the goal of Yoga, which describes an experience of non-difference between oneself, one’s sensory and mental processes, and the world. As described by Patanjali, the practitioner of Yoga becomes like a clear jewel, with “unity among grasper, grasping, and grasped” (Yoga Sutra 1: 41). This state of consciousness allows one to melt into one’s surrounding and in the process diminish and eventually reverse past tendencies (samskara) bringing one to a state of clarity and immediacy.

The eight practices identified by Patanjali can be seen in light of environmental ethics. The beginning stage of Yoga includes five ethical practices (yama), held in common with the Jain tradition. First and foremost, Patanjali discusses nonviolence (ahimsa), which entails not harming any living being by thought, action, or assent to harmfulness. This precept advocates the protection of all forms of life, and certainly can be applied to cultivating an attitude of respect toward individual creatures as well as ecosystems. To support this discipline, Patanjali includes four additional vows. Truthfulness (satya) can be used to inspire acknowledgement of wrongdoing to the living realm. Not stealing (asteya) can be applied to remedy the imbalance of resource consumption in modern times. Sexual restraint (brahmacharya) can be used as a corrective to the crass commercialization of sex as well for population control. Non-possession (aparigraha) allows one to minimize the greed and hoarding that has plundered the planet. These five practices entail holding back, disciplining oneself, saying no to such behaviors as violence, lying, stealing, lust, and possessiveness.

The second stage of Patanjali’s Yoga seeks to cultivate positive behaviors that can similarly be interpreted through the prism of heightened ecological awareness. Five practices are listed. Purity (sauca) can be seen in terms of keeping one’s body, thoughts, and intentions clean in regard to one’s surroundings. Contentment (santosa) encourages a philosophy of accepting what is “enough” and not striving to gather more than one truly needs. Austerity (tapas) entails putting oneself in difficult situations for the purposes of purification and the building of strong character. Self-study (svadhyaya) generally entails reading and reflecting on philosophical texts and
in the case of environmental applications might include reading the nature poets. Devotion to god (isvara pranidhana) for an environmentalist might encourage regular forays into the wilderness to feel that important connection with the awe that nature inspires. Each of these serves as a touchstone for self-exploration and appreciation of one’s place within the world.

The third phase of Patanjali’s eightfold system, the practice of yoga postures (asana) receives relatively scant mention in the Yoga Sutra. Patanjali states that the purpose of performing the physical exercise of Yoga is to gain “steadiness and ease, resulting in relaxation of effort and endless unity” (YS II: 46–47). In later centuries, this aspect of Yoga was adumbrated and expanded in writing, where writers draw extensive parallels between the practice of physical Yoga and the ability to see one’s relationship with the animal realm.

In order to understand the significance of animals as it develops in later Yoga traditions, we need to discuss briefly the nature of shamanism. Mircea Eliade describes the importance of shamanic rituals that display intimacy with specific animals as follows:

Imitating the gait of an animal or putting on its skin was acquiring a superhuman mode of being . . . by becoming this mythic animal, man becomes something far greater and stronger than himself . . . He who, forgetting the limitations and false measurements of humanity, could rightly imitate the behavior of animals – their gait, breathing, cries, and so on – found a new dimension in life: spontaneity, freedom, “sympathy” with all the cosmic rhythms and hence bliss and immortality (Eliade 1963: 460).

These remarks by Eliade underscore the important relationship cultivated between humans and animals from prehistoric times. Animals were noted for their particular abilities and accomplishments. To imitate these fine qualities was considered a sign of spiritual attainment.

In the later Yoga texts, animals play an important role. Many postures (asanas) carry the names of animals. The Hatha Yoga Pradipika, written by Svatmarama in the fifteenth century, lists several poses named for animals. Some examples are the Cow Head’s Pose (Gomukha-asana) [HYP 20], the Tortoise Pose (Kurma asana) [HYP 24], the Rooster Pose (Kukkuta asana) [HYP 25], the Peacock Pose (Mayur asana) [HYP 32], and the Lion’s Pose (Simha asana) [HYP 52–54].

Additionally, later Yoga manuals such as the Gheranda Samhita include several additional poses named for animals, including the Serpent Pose (Naga asana), the Rabbit Pose, the Cobra Pose (Bhujanga asana), the Locust Pose (Salabha asana), the Crow Pose (Kakasana), the Eagle Pose (Gauruda asana), the Frog Pose (Manduka asana), and the Scorpion Pose (Vrischika asana), to name a few.

Yoga practice does have an emotional effect that goes beyond mere strength or flexibility of the body. In the performance of the Peacock pose, one feels a sense of balance, a sense of pride, an affirmation of one’s ability to move competently in the world. In the Eagle pose, one feels a sense of entwinedness and focus, a honing of one’s vision and purpose. In the Cobra pose, one feels both a tremendous gravity and a rising up, a sense of being weighted and glued to the Earth, yet yearning and stretching to rise above. In the Lion pose one feels positively regal, refreshed and energized. At the close of a Yoga session one feels renewed and in a sense redefined, prepared to encounter the world with greater agility and balance.

In India, animals are part of one’s everyday reality, even in the cities. One encounters cows, goats, cats, dogs, and numerous other animals on a daily, sometimes continuous basis. People often feed birds before taking their own meal, birds that fly into the home at dinner time, expecting acknowledgement. Gurani Anjali, a contemporary teacher of Yoga, has urged her students to observe animals, to learn from animals. One has a sense that the attention required to move into and sustain a Yoga pose carries a connection with the ancient shamanic tradition of animal imitation.

However, it could also be argued that a danger lies in over-romanticizing the mysterious or shamanic aspects of animal mimesis. For instance, Denise Kaufman, a prominent Yoga teacher in Los Angeles, suggests that one adapt a largely empirical attitude toward doing Yoga and relating with animals. In an interview she commented:

Animals move; people can learn about movement from animals. House pets stretch all day long, creating space in their joints. Animals sit in different kinds of positions. Monkeys and apes do things with their hands. Perhaps as humans we need to reclaim our four leggedness. Getting down on all fours stimulates the pranic flow. Sitting in chairs tightens the hamstrings and the lower back. Animals don’t sit on furniture; they have not built things contrary to their nature (personal communication, February 1999).

From her perspective, Yoga involves recapturing our animal physicality, reconditioning the body to establish itself within a non-technologically enhanced environment.

The relationship between sacred power and the human cannot be divorced from the harnessing of the deep images evoked by intimacy with the animal world. Early peoples of India revered animals. They depicted animals in tableaus of adornment. They surrounded their early sacred meditating Yogi with animals. Animals find prominence
in classical literature. The later medieval Yoga texts explicitly prescribe animal poses as integral to mystical attainment.

We learn to be empathetic and connected from our experience of and relationship with animals. As Thomas Berry has noted, our consciousness as humans, our development and affectivity, radically depend upon our openness and sensitivity to the natural order. To the extent that Yoga heightens our senses and brings us into visceral relationship with the nonhuman realm, our own sense of worth, well-being and connectedness becomes enhanced.

Following the mastery of the physical realm through Yoga postures, one reaches the capacity to effectively control the breath (pranayama), the fourth phase of Yoga. As noted earlier, the breath plays an important role in the philosophy of the Upanisads, and in the Yoga Sutra the mastery of the inbreath and outbreath leads to “dissolving the covering of light” (YS II: 52). The *Yoga Pradipika* and the *Gheranda Samhita* describe intricate techniques for manipulating the breath. Through this process, one reaches into the core of one’s life-force, sees the relationship between breathing and thinking, and cultivates an inwardsness and stability, leading to Patanjali’s fifth phase, the command of the senses (pratyahara). This ability to draw one’s energy into oneself opens one to the higher “inner” practices of Yoga: concentration, meditation, and *Samadhi*, collectively known as samyama. Conversed through an ecological prism, the inner work from the controlling the breath to *Samadhi* can be seen as enhancing one’s sensitivity to nature, an increase in empathy, and a willingness to stand to protect the beauty of the Earth. In a sense, the culmination of Yoga leads one to the very beginning point of nonviolence, a sense that no harm must be allowed.

The beginning of this inner threefold process requires sustained exercises of concentration (*dharana*). A standard concentration practice entails attention given first to the great elements (mahabhutas), then to the sensory operations (*tanmatras*), the sense and action organs (*buddhindriyas* and *karmendriyas*) and finally to the threefold operation of the mind (*manas, ahankara, buddhi*). By concentrating on the Earth (*prthivi*) one gains a sense of groundedness and a heightened sense of fragrance. By reflecting on water (*jala*), one develops familiarity with fluidity and sensitivity to the vehicle of taste. Through attention to light and heat (*tejas, agni*), one arrives at a deep appreciation for the ability to see. Awareness of the breath and wind (*prana, sava*) brings a sense of quiet and tactile receptivity. All these specific manifestations occur within the context of space (*akasha*), the womb or container of all that can be perceived or heard.

Intimacy with the sensory process allows one to maintain focus on the operations of the mind. Thoughts (*citta-vrtti*) generated in the mind lead one to question and investigate the source of one’s identity and ego (*ahamkara*). Probing more deeply into the constituent parts of one’s personality, one begins to uncover the maze and mire of karmic accretions housed in the deep memory structures (*buddhi*), lightened and released gently through reflective and meditative processes. However, in order for any of these purifications to arise, an intimate familiarity with the body and collection of habits must occur, an intimacy that takes place through an understanding of time and place. Yoga enables a person to embrace and understand the close connection between the body and the world. By understanding each, one attains a state of clarity.

From an ecological perspective, the practice of Yoga can prove beneficial. Through Yoga one can begin to see the importance of the food we eat in constructing our bodies. One can find a calmness of mind through which to appreciate the stunning beauty of landscape and sunset and sunrise. Through Yoga, one can understand that all things within the universe rely on the creative expression of the five great elements and that we gain access to all experience and all knowledge through our own sensuality and intuition. The practice of Yoga provides rich resources for persons to reconnect with the body and with the world. Through the insights and applications of Yoga, one can begin to live with the sensitivity, sensibility, and frugality required to uphold the dignity of life, stemming from a vision of the interconnectedness of all things.

Yolngu Ceremonial Architecture (Australia)

The religious beliefs and practices of the Yolngu people of northeast Arnhem Land in the Northern Territory of Australia are manifest in, and expressed through, their ceremonial or religious architecture.

As for other Aboriginal Australians, the world of the Yolngu was created by the travels of their ancient Ancestors imbuing sacred powers within the landscapes, flora, fauna, and people that they created. Through their activities the Ancestors marked the landscape: with their digging sticks they created waterholes and springs; where they swam they created rivers; when they rested they left permanent marks and tracks on the ground; and when they left objects behind on their journey such things were transformed into natural landscape features. As the Ancestors travelled, they also passed on knowledge and law to the Yolngu people, encompassing all aspects of their social and physical environments. This knowledge, and the actions and power of the Ancestors, are maintained and continuously reinforced through the process of ceremony.

Yolngu ceremonies not only reenact ancestral events at places, but they create a temporal and spatial reference in which the people, places and actions “become” those of the Ancestors. Hence, Yolngu Ancestors are not considered part of the past, they are “ever present” in the places, things, people and marks they made in the landscape. The social identity of Yolngu people is partly constructed through their connection to particular Ancestors and places.

Yolngu ceremony grounds are places of worship that allow Yolngu to connect with their Ancestors, and although they are “unroofed,” the combination of place, structures and symbols constitute an indigenous ceremonial architecture. Structures that can be called “ceremonial architecture” are not shelters or dwellings per se, but are important religious symbols and spatial/architectural tools that are employed during ceremony. Although a number of these structures may be similar to those employed in everyday domiciliary life, their meanings change and are enhanced when used in ceremonial contexts. For example, in certain Yolngu sacred histories, flaming dwellings act as “vehicle for change” in which Ancestral Beings are burnt and metamorphosed into another state following the breaking of a moral code, and then continue their respective journeys.

During the process of Yolngu mortuary ceremonies the deceased’s soul is transported back to their ancestral homeland through the invocations of song and actions of dance, incorporating sacred objects, structures and sculpted landforms. The sculpted landforms can be either representations of Ancestors themselves, the remnant marks of ancestral actions left on the landscape, or maps of the places they created. The sculpted landforms, which are low Earth ridges creating a diagram when viewed from above, are particular to the deceased’s social identity. They are also a metaphor for the ancestral homeland to which the soul of the deceased will be transported through the process of the ceremony. Around and within the sculpted land forms, the Yolngu “dance” the actions characteristic of the Ancestors and undertake purification rituals in circular pits or wells by washing and cleansing themselves, as well as burning items that have had direct contact with the deceased’s body.

Accompanying the sculpted landforms may be specially constructed shelters to hold the body of the deceased until the burial stage of the ceremony. Each shelter is specific to each mortuary ceremony and is given the name of the ancestral resting place that it symbolizes. The shelters are often decorated with feathers, shells, string and applied patterns, every detail of which relates to the social identity of different kin who are aiding the deceased on their journey. Mortuary shelters can be laden with symbolism and religious knowledge about the deceased that can only be interpreted by initiated members of the group. The form of the shelter may represent both the Ancestor, a geographical place that was the resting place of the Ancestor, and other physical manifestations of the ancestor.

Other objects representing particular characteristics of the Ancestor or ancestral homeland may also be incorporated into mortuary ceremonies. Externally, these objects may be present as upright forked posts and a ridge-pole (sometimes symbolic of a dwelling of the Ancestor), a rock, a dead tree trunk positioned vertically in the ground with suspended barkpaper parcels of bones, or a line of decorated string (symbolic of all the Yolngu groups associated with the Ancestor and linked through country and ceremony). Such objects act as spatial and semiotic markers for the ceremonial participants.

Hollow logs and mortuary flags are other elements of Yolngu mortuary ceremonies. Hollow log coffins were traditionally used to store the deceased’s clean and crushed bone remains and were placed in a vertical position on the ground. Such log coffins are highly decorated with Yolngu symbols and have been transformed into a contemporary art form. Mortuary flag poles are used to denote or bring news of death, and were erected in the ground near a customary camp, or outside houses in
contemporary settlements, or on special mortuary grounds. Mortuary flags of the Yolngu come in a variety of colors, each associated with a particular group of people and their traditional country.

The forked post and ridge-pole are esteemed as religious objects, rich in meaning, and are used across both the profane and sacred spectrum of Yolngu life. They are employed in a variety of ways depending on the nature and ancestral origin of the ceremony. Traditionally they were often used as a storage place for the deceased’s bones (wrapped in bark) as well having a role in ritual dance. Their significance originates in the mythology of the Wagilag sisters who built the first dwelling in the region. In the Wagilag sacred history for Yolngu of the mainland in northeast Arnhem Land, a vaulted shelter supported on forked posts is built by two sisters as they camp beside a sacred waterhole where an Olive Python Ancestor resides. In this story, which is regularly depicted in Yolngu paintings, the shelter plays an important role in the protection of the women from both the Python and the environment. The archetypal shelter of the Wagilag takes on further sacred meanings in other ceremonies where male initiates are placed inside the shelter and emerge as part of a “re-birth” ritual. The shelter represents the womb and its regenerative qualities. A more general interpretation of the forked post and ridge-pole, taken together, is that they symbolize the themes of the intersection of male and female principles, the theme of swallowing and enclosing, and the interrelated themes of support, nurturance and protection.

Yolngu Waters of Being (Australia)

In northeast Arnhem Land, Australia, the Yolngu people have a sensory awareness of the land and waters in which their personal and group identities and essences reside. All human, animal, vegetable, mineral, and atmospheric elements are placed in a complex, interwoven web of social and spiritual connections and significations. This web of belonging is determined by affiliation to one or other of two exogamous patrilineal moieties, or halves of the cosmos, called Dhuwa and Yirritja. These ties bind all things together and underpin the Ancestral Law – a set of social, moral and spiritual rules laid down in the distant past by ancestral beings. Ancestral beings were simultaneously human and animal and left human essences in the landscape as they transformed country by making rivers, carving out headlands, creating waterholes and leaving ancestral power in the environment. The first Ancestors birthed people at different waterholes and then returned inside, marking the land and the waters where their spiritual essence remains today.

So, when Yolngu look at waters they do not just see a clear liquid substance, but they perceive the embodiment of living and deceased relations as well as Ancestral Beings. These waters hold the memories of loved ones while reflecting images of their own bodies and spiritual essences that will one day come to be subsumed in water at death. Different waters resonate, meander, bubble, gurgle and change color as they tell of family members, their personalities and influence upon others. When freshwater and saltwater merge, they communicate processes of conception and birth, while particular water movements depict the consummation of marriage in the mingling and swirling of waves. A senior Wangurri man commented to me:

There’s a good relationship there – for marriage. It shows how we are related to other people because the water forms that relationship for us. The freshwater and the land have overlapping stories with the sea as they form the basis of close relationships (Mathulu, personal communication).

Currents are always viewed in relation to river sources where freshwater and saltwater mix in swirling streams at particular points, generally at the mouth of a river. These confluences occur most commonly between mother, ngängdi, and child, waku, currents or between grandmother, māri, and granddaughter, gutharra, watercourses. When waters come together the Yolngu call it ganma and say the water tastes brackish, dhákay-murrkthuna (a term that provokes much amusement from those singing or talking about it) as it can imply the mixing of bodily fluids in sexual intercourse. In particular, the frothy bubbling of major water courses is known as gapu-djulk, also
the term for the breaking of waters at birth and the placenta.

The topography of ancestral waters further embodies human anatomical parts: the fresh waterholes are referred to as the eye, mgunjii; a stream is the neck, mayang. Adjoining tributaries are the arms, wana; and the points of confluence of two tributaries are known as the elbows, likan. The lower reaches of the river are referred to as a tail or leg, yangara, and are referred to more generally as the bottom, dhudi; while close to the shoreline coastal waters are known as chest waters, gumurr gapu. Bundurr ritual group surnames identify freshwater and saltwater people with the upper or lower reaches of rivers. For example, in the Yirrita moiety, the “bottom” Gumatji, Gumatj-dha lukulili, are known by one surname, Munungguritji, and come from Bawaka. Their surname is synonymous with the tail portion of their ancestral crocodile in the saltwater. The two other sub-groups, Burarrwanga from Matamata and Yunupingu from Biranybirany are aligned with the headwaters of the crocodile in the form of a spring that joins with the lower reaches of the river.

Personal and group affiliations to and authority in water can only be fully accessed through ritual language as Rev. Dr. Djiniyini Gondarra, leader of the Golumala clan and Aboriginal representative for the Australian Church Congress, told me, “The relationship between these identities can only be known as you sing.” Songs tell of waters washing upon the land, reflecting the genealogical ties of individuals and groups through their movements, colors and sounds while simultaneously marking those who do not belong to an area. Performing identities from the sea and land, then, becomes a way of knowing the self and others as waves of song invoke ancestral power through musical experience, combining movements of the ancestral past in the landscape and seascape with Yolngu identities in the present.

Yoruba Culture (West Africa)

The Yoruba constitute a linguistic, cultural, and political entity in West Africa. They claim common ancestry in Oduduwa and they developed the concept of ebi (kinship) as a symbol of unity. The Yoruba established kingdoms, many of which survived until the nineteenth century when the imposition of colonial administration engendered a new geopolitical configuration in Nigeria. The political rearrangement affected the Yoruba because while the majority of them are in Nigeria, others found themselves in what later became the present-day Republic of Benin and Togo. People of Yoruba ancestry also constitute a sizeable portion of the African Diaspora, the result of the trans-continental migration occasioned by the Atlantic slave trade. Wherever the Yoruba people exist, their interlocking concept of religion and nature remains with them. Their emphasis on the sacredness of life underscores the importance they place on religion and nature as well as their political and socio-cultural institutions. For example, Ori (“head,” signifying the origin of life), land (that produces food and supports the living and the dead), kingship, marriage, naming, death, places of worship and religious rituals are held sacred. The Yoruba worship many deities, revere and deify ancestors, and use natural phenomena to personify deities. In the past, Yoruba religion contributed to the preservation of the natural flora and fauna in that virtually all settlements were surrounded by green belts in addition to numerous groves, which harboured various species of shrubs and trees as well as animals. Until the assault of Islam, Christianity, and Western civilization, Yoruba religion not only attached sacredness to nature, it also helped to preserve physical environment from human encroachment. Clearly, nature plays a prominent role in Yoruba religious beliefs and practices.

The Yoruba refer to the beginning of life as oriran or orisun (the source of the stream of life) therefore every household worshipped Ori, the god of fate. The Yoruba, however, possess the concept of a Supreme Being. In Yoruba religion, there are no temples, no sacrifices, no regular prayers, and no priests to the Supreme Deity because he is assumed to reside in the remote sky called Orun (Heaven). According to their cosmogony, Olodumare (the Creator), also known as Olorun (the Owner of Heaven), designated divinities to create the Earth. One strand of their tradition states that the Earth existed as a watery, marshy waste and divinities, possibly human beings, used to descend from heaven on a spider’s web to hunt on the vast expanse of water. To create solid Earth, Olodumare gave Obatala (or Orisa-nla), one of the divinities, a handful
of sand, a pigeon, and sixteen palm kernels. Obatala let loose the pigeon to spread the sand in order to create dry land. Obatala planted the palm kernels to explain how trees came into being. The spot on which these events took place is called Ile-Ife (that which is wide).

A variant tradition believes that although Obatala was originally designated, it was Odudua, another divinity, who carried out the assignment of creating dry land and all living things. Odudua supposedly supplanted Obatala and descended to the Earth through a gold chain, equipped with a snail’s shell filled with sand, a white hen, a black cat, five pieces of iron, and a palm nut. Odudua led the delegation to the world and landed on a hill called Oke-Oranfe (the hill of expansion) in Ile-Ife. The hen spread the sand and farmland appeared. Hence, the Yoruba regard Ile-Ife as the nucleus of life and their “Garden of Eden.” The Yoruba creation story accentuates the importance of nature and why it constitutes a major part of their religion. They conceptualize religion and nature as intricately interwoven because all natural phenomena originated from Olodumare, as indicated in the attribute Oba a s’eda aye (King, the creator of the Earth).

The Yoruba worship many Orisas (gods and goddesses), which Bolaji Idowu referred to as the ministers of Olodumare. They act as intermediaries between humans and Olodumare and the leading ones include Ela, Esu, Obatala (Orisa-nla), Ogun, Orunmila, Osun, Sango, and Yemoja. The places of worship, which are approached with an aura of sacrosanctity, include the grave of ancestors, shrines and temples, groves, hills and mountains, trees, banks of rivers, and markets. Land, on which these places of worship are erected, is also held sacred. D.O. Fagunwa, a prominent Yoruba novelist, became popular through one of his books Igbo Olodumare (The Forest of the Almighty). Although the Yoruba claim that they have 401 divinities, there seem to be more when several other local deities are added. The worship of numerous gods and natural phenomena is not unique to the Yoruba people, for their pantheon compares with other African peoples. The slave trade, which forced many Yoruba people to North and South America, and the European partition, which arbitrarily divided the Yoruba, helped the spread of these divinities. For example, some of the divinities are worshipped in the Republic of Benin, Brazil, Cuba, and Trinidad and Tobago.

Most of the divinities personify nature and spirit. Orunmila, the oracle divinity and second in rank to Olodumare, possesses a vast knowledge of heaven. Orunmila communicates with other divinities through Ifa (divination). Ifa is a literary and divination system, which is found especially among the Yoruba-speaking people but also among other peoples of West Africa. Samuel Johnson, the father of Yoruba history and culture, contended that the Yoruba met Ifa at Ile-Ife but it became an official religion during the reign of Alaafin Ofinran, which coincides with the period of exile. The Yoruba use natural objects such as a palm kernel in the opele, or chain, the carved wooden tray, and the tapping staff or iroke. The Yoruba believe that Olodumare empowered Esu, the trickster divinity, to mediate between the forces of good and evil and convey the secret power of rituals and sacrifices to other divinities, in order to reduce evil exploits on humans. Wande Abimbola, a distinguished scholar of Yoruba religions, asserts that Esu changes his appearance and is capable of assuming 256 different forms of existence. Represented by a block of ironstone upon which worshippers pour palm oil, and by a wooden carved staff, Esu favors those who sacrifice to him. Hence the Yoruba say eni o robo ni Esu u gbe (Esu supports he who offers sacrifice). Esu, in Yoruba belief, is therefore different from the Christian concept of the devil. Yemoja is known as the goddess of waters and motherhood because the lagoons, oceans, rivers, and seas flow out of her body. Because of Ogun’s nature, he is variously referred to as a violent god, the forest god, master of iron, and god of war, and is widely worshipped by hunters, blacksmiths, or people whose occupations deal with iron. Other sobriquets associate Ogun with wealth for he is called Onile owo, Onile ola, Onile kangunkangun ode orun (the owner of the house of money, the owner of the house of riches, the owner of the innumerable houses of heaven). Sango, a historical figure as the fourth Alaafin (King) of the Oyo Empire, was deified after his death. Owing to his violent disposition and ability to emit fire from his mouth, Sango is known as the god of thunder and lightning while Oya, his wife, is the goddess of thunderstorms. One of the songs devotees render during the worship of Sango partly states: A so’gi d’eniyan; bi o soro, a s’eniyan d’eranko (He turns a tree into a man; when he choosess to be ferocious, he turns a man into an animal). Sacrifice is an indispensable aspect of worship in Yoruba religion and every divinity has its favorite food items for sacrifice as well as taboos. For example, food items such as egbo (mashed maize), pounded yam, goats, and fish are offered to Oya but dog is her taboo. While Esu accepts grains of maize, fowls, hogs, and dogs, he despises adin (oil extracted from palm-kernels).

Like the Borgu people, the Yoruba also venerate animals and reptiles as totems. According to Yoruba belief, animals and plants have souls. The land, hills, rivers, rocks, and trees, which spirits inhabit, are held sacred. Samuel Johnson referred to totems as denoting the origin of a family. There are Erin (Elephant), Oni (Crocodile), Agbo (Ram), and Oken (the Lovebird), Ojo (Rain), Lion, Python, and Cobra families. Clan or lineage members recognize these animals and reptiles as members of their families and their assistance can be sought from time to time for various reasons. Oni (Crocodile) families observe an elaborate burial ceremony for a dead crocodile. The crocodile is wrapped in a white piece of cloth and buried like a
human being in a grave. During the ceremony, three fowls are sacrificed, drums are beaten, guns are shot, and clan members entertain their friends with food and drinks.

Secret societies formed part of the Yoruba religious belief system. The societies were secret because membership was restricted and they often engaged in mysterious activities (only the initiates having knowledge of these activities). Secret societies with a religious background are mainly concerned with the cult of the dead and they wield enormous power over their communities. The cults include the Aje (Witches), Ogboni, Oro, Egungun, Agemo, and Eluku. Some of these cults also performed social and political functions. The Ogboni, a political society, held the symbol of metal images of human figurines (Edon), which the uninstructed could not see. The society is known as Imole in Ile-Ife and Oshugbo in Ijebu. Robert Smith, a historian of the Yoruba people, described the Ogboni society as “a semi-cult devoted to the worship of the Earth, which wielded both religious and political sanctions” (1988: 93–4). The religious activities of the Ogboni included the worship of the Earth spirit (ile) and members wore beads on their necks and wrist, tied a wrapper across the left shoulder, and wore a sash (Itaqbe) over their right shoulder.

The Egbe Awo (Association of Diviners) is often misconstrued as having maleficient purposes and activities. The training of an Ifa student lasts about ten years with a complex initiation process. During this time, the individual acquires knowledge and skills in the field of divination, medicine, pharmacy, psychiatry, psychology, and philosophy. There is a great deal of interaction between religion and nature in these branches of religious and healing practice.

The concept of life after death predominates in Yoruba religion. The Ifa corpus clearly states that the soul does not die but transposes to a new world. Thus the Yoruba regard the Earth as a marketplace, or as a journey, and heaven is their permanent home. It is believed that the ancestors watch over and influence the affairs of the living. To maintain a good relationship and to receive blessings from the ancestors, regular or annual visits and sacrifices are offered at the oju ibo (“the place of worship” that is, the gravesites of ancestors), often located within the compound. The different types of sacrifice include thanksgiving, votive, propitiatory, and preventive. Sacrifices also occur during the laying of the foundation of a house or at the beginning of a business venture. Requests for childbirth, improved health, and success at work are made to the ancestors. The concept of an afterlife also calls for good behavior on Earth because people will reap in heaven what they sow on Earth. Egungun (masquerades), believed to embody the spirits of the ancestors, appear during funeral ceremonies.

The Yoruba express their religious beliefs in names, epithets, proverbs, and songs. Proverbs such as “good character is a god; the better the worship, the more the blessings”; “there is no god like the throat; it accepts sacrifices everyday”; “no god favors a lazy person; he can prosper only by using his hands to work”; and “nothing can be done to the Ifa oracle to prevent it from behaving like palm kernels” (palm kernels are used in the consultation of the Ifa Oracle) illustrate the extent of the intersection of Yoruba religion and nature.

Many rivers, hills, and trees in Yorubaland are also objects of veneration. Notable among the rivers are: the Niger (Oya), Ogun, Owena, Oni, and Osun. River-spirits are appeased to prevent flooding and disaster during the rainy season. Yemoja (the deity mother of all rivers and fishes) is believed to be a generous giver of children. Prominent hills such as Iyamopo in Igbeti, Oke-Ibadan in Ibadan, Olumo Rock in Abeokuta, Oke Ila in Igbomina, and Asabar in Saki are worshipped. Iyamopo’s appellation, “The hill of protection, the mighty hill that flattens its back to carry its children,” indicates its protective role in Yoruba warfare. Sacrifices are offered to the Orosun hill at Idenre and the Ajo and Okelota hills at Ado-Ekiti on an annual basis for their protective values. The Yoruba respond to their forest environment by venerating the deities who live in trees such as iroko (Chlorophora excelsa), cotton tree (Eriodendron orientale), baobab (Andansonia digitata), and ayan (African satinwood where the god of drums resides).

The Yoruba apply their artistic skillfulness to express their religious beliefs. Wood carving, drawing, and painting found in shrines depict their high level of artistic imagery. The style and features of an image more often than not portray the religious emotions of the artist. Carved images are mere symbols and not the real objects of worship. But because Olodumare is supreme and remote, there are no images, no liturgies, and no shrines dedicated to him.

Religion and nature are almost inseparable elements in Yoruba history and culture. The deifying of people, the worshipping of deities, and the reverencing of animals, reptiles, and trees prevail in Yoruba religious practices. Nature has been so ingrained in Yoruba religion that food items are offered to the gods and leaves and roots are used for charms, and treatment of illnesses. Severing nature from religion is tantamount to rendering the Yoruba culture and belief system worthless.

The introduction of Christianity through the European missionaries and Islam through Muslim merchants has not detached Yoruba religion from nature. Christianity made significant inroads among the Yoruba, most especially because of its attractive elements of Western education and medicine, and Islam is fast growing. Christianity and Islam have drawn their adherents from and have denigrated the Yoruba religion. Each opposed its closeness to nature. The impacts of Islam and Christianity have been crushing on Yoruba religion, particularly since both of them received encouragement during the colonial period,
and subsequent political administrations after independence have promoted them.

The number of adherents of the Yoruba religion is dwindling in the face of competition from Christianity and Islam, but the religion has not been completely displaced in the society. Although still struggling to survive, the most persistent attempts at revitalization come from Africans in diaspora who see a commitment to Yoruba religion as an identity or a key in the search for their roots. The preservation and revitalization of the Yoruba religion is carried on at the Oyo town, outside Beaufort in South Carolina, where the religion is practiced. The frequent pilgrimages to Yorubaland, such as during the Osun festival at Osogbo and the Ifa festival at Ile Ife, have become pointers to the greater global dimension that Yoruba religion has assumed. There is also the quasi-academic attempt to preserve knowledge of Yoruba religion in the World Osurah Congress, which seems to be of some attraction in the Americas. However, contemporary economic problems faced by people on the African continent have had negative effects, giving rise to charlatans, just as attempts to modernize have resulted in bastardization. Divination and traditional healing systems, which are intricately interwoven with Yoruba religion and nature, are still carried out in modern times. This shows that Yoruba religion continues to exist in spite of the challenges it faces from other religions.

Yuchi Culture and the Euchee (Yuchi) Language Project (Southeastern United States)

The struggles of the Yuchi (also spelled Euchee) community to pass forward its ancient language to younger generations is representative of challenges facing the majority of indigenous nations bounded by elaborated colonial economic and social structures. As of this writing there are only six remaining elders out of perhaps 2400 Yuchi who are available to help teach the language to younger members of the Yuchi community. The Yuchi nation arrived at this point of extreme urgency in the life of its language only after exhibiting extraordinary resilience across many generations. Yuchi people were accosted by successive and overlapping waves of physical genocide, brutal dislocation, and forced assimilation.

In ancient times Yuchi people were found in the area now known as Tennessee and lived primarily in the areas that became known as Georgia and Alabama throughout the colonial and early American periods. They had established towns along the ample rivers in the region, living primarily from corn and other crops, with seasonal celebrations for the gifts that sustained their society. During the decade of the 1830s they, along with other nations in the region, suffered deadly dislocation under President Andrew Jackson with many Yuchis taken in chains a thousand miles to what became known as Oklahoma.

Although the displaced peoples brought their sacred ceremonial fires as centers of their social, economic and political lives to their new locations, they were faced with an enormous and accelerating shift in their subsistence patterns and traditional ethos with dramatic implications for ceremonial life and their understanding of the world. In the old homelands the major ceremonial traditions and daily ritual activities related rather directly to the long-standing subsistence patterns and lifestyle of the society. They mediated a fit between the regular requirements of hunting and planting and the broad understanding of how the world worked, both reinforcing proper behavior and reflecting this larger worldview.

The central ceremonial cycle focused on what has been
discussed in scholarly literature as Green Corn ceremonialism. The annual ceremonies celebrated the beginning of a new year with fresh crops and was marked by a new fire rite. Community members were forbidden to partake of fresh corn until these ceremonies of purification and thanksgiving had been completed. This was a time of renewal and cleansing for the community as members carried out their founding instructions, reenacting ancient primal events. The timing was based on the seasonal movements of the sun and moon and required careful observation of plant life for gathering all the proper medicines. The special use of certain animals, such as garfish and terrapins, also required an intimate engagement with the animal world.

All these ceremonial traditions are still followed by those community members who remain active in one or more of the three ongoing Yuchi ceremonial grounds. The “clean ground,” as it is referred to in the language, where the ceremonies are carried out, becomes a sacred space where expressions of strife between members is forbidden. The central ceremonial area, often referred to as the “big house” in the language, is carefully oriented within the cosmos along the four directions and founded with sacred medicines in the fireplace at the center point. This ritual space is where the entire family of the Yuchi community is welcomed with their friends and where ceremonial ground members, from both the present day and earlier times, gather to carry out their ceremonial responsibilities for another year. The longer cycle of four ritual ball games and four dances culminates in a structured time of ritual separation between men and women, fasting, taking medicines, and purification rites. Only after the sacred ground itself has been fed medicine can the fast be broken and a time of communal feasting begin. These ceremonies hinge explicitly upon using the gifts of particular medicine plants and on the special songs given long ago by a specific large bird. It is through a set of special dances (misleadingly referred to as social dances by some scholars) that relations are renewed and maintained with specified plants and animals.

These traditions now face great challenges. The process of physical displacement in the nineteenth century had created an extremely difficult transition period for keeping proper relations with the new living environment. Community members increasingly came under the influence of the material arrangements and social values of the larger society. There was a broad shift in such areas as the traditional family, clan relations, residency patterns, medicinal practices, and reliance on traditional agriculture. These mounting pressures combined with corrosive influences from both native and non-native churches through the late twentieth century, from Euro-American education, and “allotment,” the breaking up of communal lands into small individual holdings by the federal government.

All of this created pressure on the ceremonial traditions and challenged the underlying worldview. The displacement of traditional foods by store-supplied items had perhaps the greatest impact on the underpinnings and practices of traditional society as many of the daily ritual activities and traditional arts fell into disuse. The ceremonial calendar was adapted to fit modern work schedules. Current community members no longer live by farming and do not normally raise traditional crops of corn, beans, squash or tobacco. The strong link between the celebrations of the main ceremonies and this form of livelihood is no longer so apparent. The natural environment around the community was subjected to degradation and modern waterway management techniques instituted by the U.S. Army Corps of Engineers resulted in the flooding of ecological niches where many of the important plants were previously collected, making it harder to find plant sources for traditional foods and medicines. The relationship with animals was greatly attenuated as many species were driven to near-extinction.

Against these imposed difficulties Yuchis still perform the buffalo dance at their annual ceremonies despite having virtually no contact with the animals since the mid-nineteenth century, whereas they were once common in the original homeland areas of the Yuchi in what is now referred to as the southeastern United States. Responding to the rhythms of the Earth, many within the Yuchi nation continue to maintain their ancient ceremonies as the center of community life, with its implicit ethic teaching a life of balance and harmony. The health of the Yuchi nation in proper relation to the larger community of life depends on these vital ancient activities. Indeed, in traditional perspective the continuity of the cosmos itself is tied to the successful completion of these ceremonial duties. In turn, the ceremonies themselves rest on the use of the Yuchi language. While the language has always been an essential bearer of Yuchi culture, the role of the language is now further heightened. As the ethos in the community continues to tilt in the direction of the enormous weight applied by Euro-American society, the value of the language becomes even more critical for passing forward a tradition-rich view of the world.

In the case of the Yuchi – like many other nations – the long-term processes of physical genocide and cultural assault were coupled with a kind of intellectual erasure in which the very existence of the Yuchi nation and language were denied for over a century and a half in government reports and published authoritative sources. The published denials continue into the present and now include internet sources and current reference publications. The community was again denied formal recognition by the federal government in 1995. The language itself is spoken by few, has no known cousins from which to borrow or learn, and has no standard orthography.

Despite these many obstacles, the Yuchi people remain as bearers of a unique language, even as they maintain
their traditional ceremonies. Yuchi has been identified as a language isolate, standing apart from groups of related languages in what are termed language families. As such, the language transmitted by today’s elders represents one of the world’s cultural treasures from an immemorial human past. With only a handful of fluent speakers the community has launched into an aggressive revitalization effort led by the Euchee (Yuchi) Language Project with the goal of passing their ancient language forward from current speakers (whose average age is over 80 years) to a new line of younger speakers who will be enabled to carry forward the language for the benefit of coming generations. Even as there were those who carried the coals from our ancient ceremonial places a thousand miles to unknown lands so that the fires of our traditions could be rekindled and spread again among the people, so we now pursue the goal of developing a second handful of competent speakers who can carry forward the language to later generations.

This goal has necessitated a focus on immersion learning in small clusters of master and apprentice teams. The most valuable and essential asset to the project has been the support and knowledge of the gifted speakers of the language, as we rely on elders who grew up in the 1920s—the last generation with a large percentage of first-language speakers of Yuchi. Various arms of the Euchee (Yuchi) Language Project (ELP) include community outreach through a newsletter and Yuchi language radio and a Yuchi language page in the Muscogee Nation News. Weekly language classes for children and beginners have been conducted since 1993 building off of several earlier community classes. These classes not only seek to address in an appropriate manner the language needs for the ceremonial ways but have also sought to pass forward through hands-on methodologies traditional arts, agricultural practices, and older lifeways built around identifying, gathering, and preparing traditional foods. Perhaps the greatest challenge for second-language learners is to develop enough competence in the language to absorb the fullness of the underlying worldview reflected in the language. Another arm of the ELP deals with documentation and archiving of extant recordings. The purpose of creating and maintaining these recordings is to expand the memories of the Yuchi learners, as an aid that will allow them more time in which to absorb the rhythms and words that are their natural heritage. That is, the cohesive focus of these various aspects of the project is on finding potential dedicated learners and developing new speakers as quickly as possible.

While this approach specifically addresses the most urgent needs of the community it also serves to highlight the divergence between community needs and the interests of the academic enterprise (see Grounds 2003). Given the context of the extremely fragile status of the language, with so few fluent speakers the community is forced to decide between meeting the agenda of the academy with its focus on textual production or addressing the challenge of passing forward the oral language to a new generation of speakers with its time-consuming requirement of immersion in the spoken language.

The urgency and importance of the language revitalization work is of utmost value to the Yuchi community and, indeed, to the diversity of global humanity. As a linguistic isolate the Yuchi language provides a unique and direct link to an ancient human past. The language is the vehicle for intimate knowledge of medicine plants, local ecosystems, and hidden histories of the Yuchi people, and remains vital to the traditional ceremonies. The richness of the community life, as reflective of a unique worldview, is born by the language—a world that remains inaccessible through the English language, a world in which men and women speak different forms of the language. This is a world in which the people referred to as Yuchis in history texts are known by a different name in their language, as the offspring of [the] Sun, who is recognized as female. There is an exceedingly musical and lyrical quality to the spoken rhythms of fluent Yuchi. This quality is bound up with the meaning of the language and effectively prevents first-language speakers from understanding the staccato delivery of English speakers in their early attempts to learn the Yuchi language.

The Yuchi cosmos is one that has no general term for animals and one whose grammar does not separate humans from animals. All living beings are recognized as part of the greater living world. Every Yuchi sentence that refers to an individual person (including animals) or to any non-person necessarily speaks in terms of their physical form in relationship to the Earth. In the evocative Yuchi language the place where one lives is where one habitually sits upon the Earth. The deepest beliefs of the most important rituals are mediated through the language. The healing process using powerful medicinal plants does not rely solely on their pharmaceutical properties but is traditionally administered with specific songs or chants that are essential for effecting a cure. Yuchi words are not empty symbols but are understood to have power and efficacy. The passage from this world to the next is mediated through ritual words in the language.

This extremely compelling understanding of the world—a beautiful and profound grasp of it—is at the same time fragile and precious due to its orality. Like other indigenous languages it can become all-but-lost in the span of a single generation. The Yuchi language is now making its last call to a younger generation to get in the dance, to join the ancient spiral of Yuchi culture bearers and learn the language, the depth of its melodies and the richness of its rhythms, so that a new generation will understand their place within the cosmos in the fullness of their primordial relation to the created world.

Yunnan Region (Southwest China and Montane Mainland Southeast Asia)

Yunnan, meaning “south of the clouds,” is located in Southwest China bordered by the Tibet Autonomous Region and Sichuan, Guizhou, and Guangxi provinces of China on the west, north and east, and the countries of Vietnam, Laos, and Myanmar to the south and southwest. Geophysically, Yunnan serves as the roof of Mainland Southeast Asia due to its location on the headwaters of all the major rivers within this montane region. The ecological health of this “roof” of southwest China and Southeast Asia is the concern of many stakeholders in all the surrounding countries and provinces. A planned increase in regional development will bring new and vast construction of communication and transportation infrastructure along the Mekong and other river systems. Yunnan, with a total area of 394,000 square kilometers, consists of 128 counties in 16 districts or prefectures and has a population of 42.9 million people, including 14.6 million ethnic minority peoples with diverse indigenous cultures and livelihoods. The ethnic minorities of the Yunnan uplands include Tibeto-Burman peoples, such as Tibetan, Naxi, Yi, Hani (Akha), Jingpo, Lisu, Lahu, Nu, Derung, Primi, and Jinuo; Mon-khmer, such as Wa, Bulang, and Deang; and Miao-Yao including the Miao and Yao. The ethnic minorities in Yunnan are characterized by complex dialects within groups and distinctive socio-economic systems because of the region’s biological complexity.

Sacred Knowledge
Many activists and scholars fear the loss of local knowledge in the region. Despite the dynamic cultural practices of indigenous people, their knowledge systems or indigenous knowledge, as they are called by outsiders, are rapidly fading away. Due to market penetration, out-migration and external education, the local languages, sacred knowledge and religious practices linked to worship of sacred space and maintenance of biodiversity have already been extinguished in some places. Although the indigenous people have been living in the mountain regions for thousands of years as hunters-gatherers, pastoralists, and agriculturalists, they are viewed by outsiders as objects to be managed rather than citizens in the mountain ecosystems. As managed objects, the political-administrative structures they are located in systematically marginalize their aspirations and the knowledge they apply to achieving them.

Sacred knowledge, as part of indigenous knowledge systems, is locally rooted in the culture of a particular geographical territory. Sacred knowledge refers to the nature (both geophysical and ecological environments), mythical cosmology, cultural beliefs, religious rituals and stories of a place assigned by people to their space. Sacred knowledge is mostly culturally or religiously transmitted, with the help of collective memory encoded in stories, myths, legends, songs, dances, rituals, and systems of classification of resources. Sacred knowledge constitutes a significant part of the identity of each cultural group and is a specialized knowledge often held by persons with special experiences, such as religious leaders within local communities. Some individuals in the local culture achieve a degree of coherence in rituals and other symbolic behavior and act as intermediates between the material and spiritual world. They are persons who possess sacred knowledge like the Bimo in Akha and Yi societies, or the Dongba in Naxi society or the Lama among the Tibetans. As young people are not taking over these roles and no longer know many practices recalled by elders, large gaps in knowledge are emerging between generations.

Sacred Space
Sacred space refers to sacred places (mountains, hills, lakes, rivers, temples, shrines, etc.), sacred objects (religious sculpture, stone, painting, hierogram, costumes and other sacred objects), and their associated life (animal, plants, trees, forest) and imaged super-nature (e.g., kylin, an imaged totem animal, with a deer-like body, covered scute, single horn, cattle tail. Chinese believe the kylin always bring good luck). Therefore sacred spaces are “contextualized” by the way they are expressed through “material culture,” such as any religious objects or any product of human expression in the geophysical landscape. The sacred space can vary from a few square meters to hundreds of square kilometers in the geophysical scale, and from household, community, multiple communities to multiple ethnic groups in the socio-cultural scale. Sacred spaces are maintained through practicing religious rituals, ceremonies and sanctions and participating within a specific cultural group. The sacred places or sites are the sources of powerful forces or energy; sacred objects are revelatory and powerful instruments in religious rituals; the associated life are either reincarnated human beings or
communicators between humans and nature; the imaged super-nature represents the soul of nature, which formulates the sacred ecological system for the natural landscape in the mountain region. Cultural identity is the vehicle to direct experience of the sacred. The sacred ecology refers to non-productive and non-reproductive, and the cultural dimension of interactions between human and nature in the particular terrain. The concepts of “connectivity” between humans and nature, existing in this and the next life, and the “spirituality” of nature and human behaviors and decision making are key principles for sacred ecology. The sacred ecology emphasizes that human beings are only part of the ecosystem and all life is equal in terms of power, skill, and moral responsibility.

Sacred Ecology: Indigenous Perceptions of the Nature

Spirit of nature "shu": The Naxi people’s perception

Dongba is a term for a Naxi priest meaning “wise man” or “sage.” According to the mythological records in the manuscripts of Dongba religion, Dongba priests could communicate between humans and the spiritual world, and they advised clan chieftains. They are considered by the Naxi people to be wise men since they have sacred knowledge about the supernatural and natural worlds. They know how to pray for good luck, blessings and happiness and prevent bad luck and evil, and they know how to deal with relations between humans and nature. Various rituals are performed in different occasions for harmonizing relations with nature, such as worshipping the gods of grains and animal husbandry, the hunting spirits, the mountain god, the god for protection of villages, the spirits for the fireplace in the house, the god of blacksmith, the god for war and victory, the god for herb medicine, etc.

Shu is worshipped by the Naxi as a spirit of super-nature or god for governing nature. Shu has the shape of a human body with a snake tail, wearing a wuhsao hat (a hat with five treasures). In Naxi oral history, Shu and human beings used to be stepbrothers from the same father. When the two brothers split family property, humans got valleys, crops, and domestic animals, while Shu got mountains, rivers, forests, birds, and wild animals. Ever since, humans kept invading the property of Shu, and the latter became very angry and decided to take revenge by making it difficult for humans to survive. Humans appealed to Dongba to control Shu. Shiluo sent a rock warrior to conquer Shu. Under the mediation of Shiluo, humans and Shu made an agreement that they would never harm each other again. Humans could obtain the necessities of life from nature, but they had to pay Shu at certain times by worshipping it. This is the origin of the Shu Worshipping Ritual. Each year, on either the day of the dragon or the day of the snake in the second month of the lunar calendar, people get together in order to worship Shu and pray for blessings for their offspring, favorable weather for agriculture, prosperity, and longevity of the community. People usually choose a water source or pond near the village as the site for the Shu Worshipping Ritual. The ritual consists of two rites: to repel evil and to worship Shu. The rituals take place on the sacred altar, Shu’s place, and the evil spirits’ place.

The first ritual is the rite to repel evils. In Dongba belief, evils (hui) have two meanings, one is the dirt in nature and the other is human misbehavior or behavior against moral codes. A Dongba blows a white shell, beats the gong and drum, burns incenses to heaven, and lights the sacred lamp while another Dongba lights an azalea torch and smokes the evils on the sacred altar and in Shu’s place. Usually the Dongba will chant scriptures, such as “setting up the sacred altar,” “offering food to gods,” “inviting gods,” and “worshipping gods” to invite the gods in. Then, the Dongba will dance at the evil spirits’ place as one of them chants verses from “The Origin of Evils” and some other scriptures. Later they will feed the Dan, which are three puppies, the nonhuman descendants of the human ancestor Congrenli’en and the straight-eyed girl from heaven. After being fed, the Dan are separated from the evil spirits. Then the participating villagers and Dongba cleanse the evil spirits’ place with water and torches. They also kill a chicken to feed the dirty spirits with its blood and feathers and to drive the spirits to where they belong. At the same time, the Dongba begin the dance of the gods to destroy the evil spirits’ place. The Dongba also fell the tree of evil spirits until all the spirits are suppressed.

The Shu worshipping rite follows the evil repelling rite. Shu’s place is characterized by wood: plates representing heaven, Earth, and the five Shu kings, and the so-called repayment wood consisting of plates with drawings of different animals, the tower of Shu, and mountain bamboos. Shu’s place; consists of three parts: the first is heaven, Earth, and the five Shu kings; the second is the guard of Shu’s palace and the third is the foolish Shu’s place. One Dongba will chant scriptures in front of Shu’s place: “The Origin of Shu,” “Inviting Shu,” “Burning Incenses,” “Offering Food,” and “Locking Shu’s Door.” This chanting indicates that they have invited heaven and Earth and all the Shu kings to stay in the village and enjoy the offerings of the humans. The Dongba will also chant “Wake Up Shu When The Rooster Crows,” “Offering Food,” “The Fight Between the Rock and Shu,” and stories about how human ancestors offended Shu and how Shu took its revenge, as well as how humans and Shu fought and were reconciled. Then they offer and serve Shu with medicine as they chant “The Origin of Medicine,” “Using Medicine,” and other scriptures to heal Shu’s wound from the bite of the rock, thereby repaying all the debts. They set free a chicken whose neck is tied with a ribbon of five strips of cloth which symbolize five dimensions as a promise to sacrifice another chicken the next year. The Dongba chant “Praying For Longevity” and “Praying For Blessings Befalling on
Offspring," give gifts to all the Shu from different places, and then send them all back when they came, accompanied by a chant of “Sending Off Shu.” Finally, they burn incense on the sacred altar, dance the godly dance, and send the gods up to the eighteenth layer of heaven with the chant “Sending Off Gods.” The Shu Worshipping Ritual is a solution that the Naxi ancestors found to the reconciliation of humans and nature in history. It is a means of reminding humans of their agreement with Shu. Only by disciplining themselves and living in harmony with Shu can humans ensure a good living environment and sustainable social development.

**Dai people’s “Holy Hills”**
The Dai people can be found in Northwest Vietnam, Upper Laos, Shan Hills of eastern Myanmar, Northern Thailand, and Southern Yunnan in southwest China. The valley-based Dai People in Xishuangbanna have practiced a predominantly Buddhist religion since the middle of the Tang Dynasty (618–907). Before the introduction of Hinayana Buddhism, the Dai people appear to have practiced a polytheistic religion bound heavily to the natural world. Like many early groups, the Dai associated forests, animals, and plants that inhabited them and the forces of nature with the spiritual realm. Proper actions and respect for the gods were believed to result in peace and well-being. Improper activities and disrespect incurred the wrath of the gods who punished the Dai villagers with a variety of misfortunes. Thus, the early Dai were encouraged to live in harmony with their surroundings, such as cultivating fuel wood (*Cassia siamea*) in the foothills and planting religious plants in the temple yard. In the traditional concepts of the Dai, the gods reside on the forested Holy Hills, or *Nong* in their own language. All the plants and animals that inhabit the Holy Hills are either companions of the gods or sacred living things in the gods’ garden. In addition, the Dai believe that the spirits of great and revered chieftains go to the Holy Hills to live, following their departure from the world of the living.

Holy Hills are an important visual landscape with good forest cover nearby the Dai village. They are a key component of the local ecosystems, which consists of paddy fields, home gardens, and cultivated fuel-wood forest. There appear to be two types of Holy Hills. The first, *Nong Man*, refers to a naturally forested hill, usually 10 to 100 hectares, worshipped by a natural village (called *Man*); the second, *Nong Meng*, refers to much larger forested hill, often hundreds of hectares, worshipped by the traditional administrative village or a governed area (called *Meng*). The traditional Dai people’s practice of the Holy Hills has made a significant contribution to environmental goods and service the local and regional landscapes. Studies show a high concentration of endemic and endangered species in the Holy Hill forests.

The Hani concepts of village and nature
The Hani people, with a population of 1.25 million in Yunnan, are originally from the Tibetan Plateau. *Hani* meaning snow, strong and brave, combines with *ni*, meaning the people who live in mountains, to create the strong, brave mountain-dwelling Hani. The Hani people migrated from the Hong He, the Red River region of central Yunnan, where they are believed to have practiced irrigated agriculture toward what is now Xishuangbanna more than a thousand years ago. Other members of the same group migrated south, reaching northern Thailand and Myanmar early in the eighteenth century. Finding the river valleys of the warm, humid, sub-tropical regions already occupied by other groups, the Hani learned to practice shifting cultivation in the still vacant uplands.

During a long history of migration and readaptation to their new environment, a group of people, including *zoema*, *biemo* and *nipa*, who hold sacred and ecological knowledge about nature, have played a key role for cultural identity and continuity. The Hani are a patrilineal clan. The village chief (*zoema*) is normally a hereditary position but may be selected by a group of knowledgeable and well-to-do village men. The role of the village chief was traditionally imbued with legal authority and religious functions, but never as an absolute ruler.

The *biemo* is the natural encyclopedia of Akha society. He is the knowledge keeper of the genealogy tree, or all male ancestors of the clans, generally committing over sixty generations to memory. He recites all the ancient oral traditions about the origin of the Hani or Akha, the history, the migrations, the plant and animal cycles, etc. He is in charge of precisely establishing in the Akha calendar the date of every festival. He plays the role of an intermediary between the spiritual world of the ancestors (the past) and this world (the present). The Biemo also holds ceremonies for funerals. Every village has a *zoema* village head but not necessarily a *biemo*. Sometimes several villages share one *biemo*, or there are several *biemos* in a village.

Another knowledgeable person is the *nipa* or shaman. Most are women who have been designated by the spirits to fulfill this role. She learns from her dreams and can easily communicate with the spirit world. If somebody gets sick, *nipa* is asked to diagnose the illness and communicate with spirits for treatment, often combining rituals, dancing and medicinal plants. The *Nipa* and *biemo* have a close relationship. If somebody is sick because they have broken a natural law, or taboo, the *nipa* will identify whose spirit the person has violated. As she does not have the power to ask for pardon from the spirit, the *biemo* performs the rituals for facilitating dialogue with the spirit.

The Hani village is surrounded by a village protection forest (*pucang*) of several hundred meters divided into a human lived place (*pucang*) and nature (nonhuman) world
(baolcang), with a village gate entrance (lanlkang). There is another gate to the ancestors living area (laqobiml), the cemetery forest. The super-nature, mother of the Earth, governs all gods related to agriculture, who live in the village sacred forest (milsani-sanqua) and is often represented by a big, strong and long-living tree (such as oak, Castanopsis mekongensis or Ficus religiosa), called dragon trees by some Hani people. In a lucky day every June, a big ritual is held by zoema with participation of an adult male representative from each family. Hani people believe that different spirits have their own habitats, such as wetlands, lakes, strange stones, and particular trees (e.g., Terminalia myriocarpa).

The Hani people in Yunnan have a tradition of preserving forests in the mountainous areas where they live. As an ethnic group primarily living in southern Yunnan and bordering northern parts of Myanmar, Lao, Vietnam and Thailand, the Hani have kept harmonious relations with their natural surroundings for many centuries. According to their cultural beliefs, humans are a part of the natural world in which everything has its own spirit, and most of the spirits reside in certain forests. Human activities, like collecting forest products, hunting, and cutting trees in these forests are taboo for the villagers.

Tibetan sacred mountains and concepts of space
As high mountain dwellers, mountain worship is the most characteristic cultural belief and practice of Tibetan peoples. The spread of Buddhism on the Qinghai-Tibetan Plateau imbued their sacred mountains with new or even greater significance. There are different kinds of sacred mountains for Tibetan people. Songre is a little peak designated for the spirit, with small shrines but no residential houses, worshipped only by a small village or even one or two families. Nieda/Reda (some use them interchangeably) is a whole mountain body, bigger than Songre, and shared by larger village communities within a small region. People may live on it, though some Tibetan communities view such a mountain as very spiritually sensitive, believing that it is especially propitious to supplicate such a sacred location with prayers. Nieqian/Niere is a holy mountain highly regarded by the Tibetan community at large. It refers to the whole mountain from bottom to top. Nieqian is a respectful term such as Nieqian Qumalangma (Mt. Everest) and Khabadkapo. Reincarnated Buddhist Lamas purposely make sacred mountains cover a very large area because they believe that the bigger the area, the less likely it is that spirits will be disturbed. There is also evidence of concern among some Lamas that a rapid opening of pristine nature to tourism development might result in destruction of such sacred places. Some even go as far as designating religious names to new sites in an attempt to prevent their being disturbed.

In Deqen Tibetan Prefecture of northwest Yunnan, local Tibetans believe that the land, animals and people are governed by mountain gods residing on the peaks. There are over 15 sacred mountains found in the region of different sizes and religious power. Among them, the Meli Snow Mountain (Khabadkapo), the highest peak in Yunnan, is considered sacred by not only local Tibetans but all believers of Mizong (Kagyupa, one of the most important branches of Tibetan Buddhism). The Khabadkapo, with a height of 6740 meters above sea level and a total area of over 200 square kilometers, is ranked as one of the eight most important sacred mountains in the Tibetan Plateau. Each year, thousands of believers from Yunnan and other parts of the Tibetan region make pilgrimage to the mountain.

The Tibetan people have named and classified space into internal and external worlds. The internal world or human community is the permanent residence and village, including each named piece of land, each named house built on the named piece of land. The people adopt the name of the house as the family name. The external world, outside of the house or house walls, consists of arable lands, wild lands, lakes and forestlands with plants, trees, fish, rocks, wildlife, etc. The sacred objects, such as incense burning stands, pagodas, and mani stone piles, function as sacred places for Tibetans to have dialogue with life and spirits in the external world. The graveyard is considered a transitional place between earthly life and transcending into the “world of the death,” the external world controlled by spirits. Those spirits associate with each other to form a group of mountain gods represented by mountain ranges centered on Mt. Khabadkapo. Tibetans believe that these mountains can transform into human beings and vice versa. The concept of reincarnation pervades the Tibetan worldview. The key to good reincarnation into the next life is to undertake pilgrimages to commonly recognized sacred spaces; Mt. Khabadkapo is considered the most holy in northwest Yunnan.

Yi people’s polytheistic beliefs
The Yi people have a large population living traditionally in the provinces of Yunnan, Sichuan, Guizhou and Guangxi of southwest China. They believe that human beings and wildlife are offspring of the snow clan. The offspring of the snow clan had twelve categories, including six categories with blood (frog, snake, eagle, bear, monkey and human) and another six without blood (grass, trees, firs, etc.). Everything is divided into male and female: big trees are female, small trees male, big stones female and small stones male, big mountains female and small mountains male. All beings, human and non-human, have a soul or spirit. These communicate with and respect each other. In the Chuxiong Yi Prefecture of central Yunnan, local people believe that humans survived through calamities with the help of these plants, while others are associated with gods or spirits. Recent surveys conducted in this prefecture by Liu and others have
indicated that at least 21 plant species are generally worshipped and protected by local Yi communities due to various cultural beliefs. Historically, the Yi people evolved and practiced a polytheistic religion, which is an integration of Shamanism, Daoism, Buddhism and Confucianism. In their practice, 1) everything has a soul, whether it is tree, water, stone, wind, star or animal; 2) nature is worshipped and there is a super-nature of those gods (as of land, mountain, and tree) that have power to control human beings; 3) the tiger is considered to be the original totem for Yi people; 4) reproductive fertility is also worshipped, for example, in the alder tree (*Alnus nepalensis*) due to its plentiful seeds; 5) ancestors are worshipped, as is the god of Earth (which is next to ancestors in terms of importance), and sacred places and sacred forests.

Most rituals are held by the *biemo*, the Yi priests. The mosaic of sacred sites of Yi people forms an important cultural landscape, which contributes to local environmental goods and services.

**Conclusion**

Sacred spaces are found in different geographical scales and are worshipped and protected by different social groups, households, villages, religious sub-groups, ethnic groups and regions. The designation of sacred mountains has profound cultural and political implications while it also serves an important ecological function. Sacred mountains, besides serving as locations of deities connecting the human with the spiritual world, this life and the next, deliver products and perform ecological functions and services. The most obvious to local people as well as to outsiders is as sources of streams, benefiting both humans and wildlife. Old people often recall seeing collections of wildlife, such as deer and parrots, gathering along the streams. Therefore, good water-source forests, even when located outside of sacred forests, still receive extra protection from nearby villages and are usually designated as sacred sites closed to fuel-wood harvesting.

The relationship between natural resources and people has been forged within religious, moral, cultural, political, economic, and ecological boundaries. Respect for these boundaries by different communities and social groups resulted from historically accepted formal and informal rules and norms. For the Dai people of Xishuangbanna, their forest-oriented philosophy and the religious basis of traditional life have instilled a respect for forests, plants, animals, and their own ecological niche and imbued them with the formal and informal norms and rules of their society. The traditional worldviews or cultural beliefs of the Naxi, Dai, Hani, Tibetan, Yi and other minorities in Yunnan, combined with indigenous management strategies for natural resources for productive purposes, have succeeded in maintaining the forests of this region, and have effectively managed biological diversity in their environment over a long period of time. These factors can be seen as an example of the positive impact of the interaction of human culture with the environment and the conservation of biological diversity that existed in many earlier societies.

Indigenous people have drawn on their own sources of knowledge about biodiversity and environment, which features its diversity and adaptation in mediating their relationship with the local environment and ecosystems. Indigenous knowledge of this kind is a pluralistic approach to conservation and management of resources in the mountain region. It is a subjective understanding and social construction process, which incorporates a distinct corpus of understanding of the cosmos (worldviews), a praxis, and institutions to guide human action by adaptive processes. Indigenous knowledge about biodiversity and environment in mountain regions is composite and diverse, and yet it remains also holistic due to its gradation in altitude and latitude, as well as ethnic diversity in the mountain ecosystems. This knowledge comes from diverse sources – from one generation to the next, by way of indigenous experts and religious leaders. Both indigenous and conventional scientific knowledge are always imperfect and incomplete, and using one does not necessarily mean rejecting another. Conservation and resource management thus requires mutual respect and involves an iterative learning process. Indigenous knowledge systems bring a cognitive diversity to the scientific learning process. Just as biodiversity is essential to nature and invaluable for human beings, so too is cognitive diversity. Among the many things we can learn from indigenous knowledge and indigenous people is how to shift from a reductionist to a systemic view of the world, which includes ourselves, as living beings, in the ecosystem, and how to shift from expert-based environmental management to a participatory-based ecosystem stewardship.

Z Budapest (1940–)

Known simply as Z Budapest, Zsuzsanna Emese Mokcsay was born in 1940 and was only 16 when she fled to Austria escaping the Soviet crackdown on the Hungarian Revolution. By 1958, she had immigrated to Chicago and married. An aspiring actor/director, Budapest took drama classes in Chicago and then in New York, where she moved with her husband and their two sons. At the age of thirty, Budapest left for a three-week vacation in Southern California. She never went back.

Almost immediately she became involved with the women’s liberation movement in Los Angeles, but feminist politics failed to meet her spiritual needs or address her growing belief that women needed to reclaim their souls from male-dominated religions. On the winter solstice of 1971, Budapest and five friends created the Susan B. Anthony Coven Number 1, a circle of feminist separatist Witches. With Budapest as High Priestess, the group began to do religious rituals and call their practice Dianic Witchcraft. Members opened a small occult supply store called Feminist Wicca that became a gathering place for a growing spiritual community.

An arrest in 1975 for reading Tarot made Budapest a national figure and a hero to many who found her “wimmin’s religion” (a popular spelling among radical feminists that signified men were not included) empowering and even transformative. But for over a decade, this charismatic leader known as the Mother of Dianic Witchcraft was a controversial figure among other feminists who saw Dianic Witchcraft as an embarrassment, and among other Wiccans who objected to its highly improvisational nature and female-only focus.

The primary focus of Budapest’s message has always been women’s empowerment, but a secondary element of nature religiosity has become more visible over time. Although she always preferred to hold her rituals in wilderness areas, her earliest writing said simply that the Dianic Craft was rooted in paganism and that practitioners worked in harmony with “Mother Nature.” As in other Wiccan traditions, the major ritual celebrations were on the days that mark the changing of the seasons, and the Earth was understood to be the body of the Goddess. But so was the greater universe.

By 1986, Budapest called the Dianic Craft an “Earth Religion,” writing that the Goddess was life on Earth. By the end of the decade, the concept had changed slightly. The Earth was now a living, breathing, conscious being and the Goddess present in all living beings. The increasing emphasis on the environment and growing understanding of the divine in and through nature present in the Dianic Craft today are largely due to the priestesses who came after Budapest. But there is no doubt that it was she who planted the seeds when she first picked the Goddess Diana as the representation of the numinous and called her the “Soul of the Wild.”

Z Budapest lives in Oakland, California, where she continues to mentor, teach, organize rituals and conferences, and publish books that attempt to provide women with tools for spiritual empowerment.

Zen Buddhism

Zen (Chan in Chinese, Son in Korean) is a form of Buddhist practice that developed and flourished in East Asia, and, since the latter part of the twentieth century, has become part of the spiritual landscape in North America and Europe. Tracing its fundamental inspiration to the enlightenment experience of Gautama the Buddha (ca. fifth century B.C.E., India), Zen presents as its model the Buddha seated cross-legged in a state of yogic contemplation (dhyāna). Seated meditation (zazen in Japanese) enables a practitioner to cultivate inner stillness leading to illuminative insight, which in turn enhances clarity of vision and spiritual discernment. Zen can be a transformative factor for one’s entire way of life, as it opens the practitioner to an experiential realization of oneness with nature, bringing about a heightened ecological awareness.

The philosophy and practice of Zen can be situated in the wider context of the Buddhist tradition. As such, it derives features of its cosmology from the Hindu tradition. Hence we must first look at this wider picture in attempting to understand the view of nature implied in Zen.
There is a notion stemming from the Hindu tradition assimilated into Buddhism, as articulated by Indian commentators beginning with Vasubandhu (fourth century), to the effect that the universe exists within a cyclic pattern of origination, maintenance, and annihilation. The physical world, undergoing this cyclic pattern, is taken simply as the objective environment in which sentient beings, conceived of as belonging to six distinguishable modes, including the hell-dwellers, hungry ghosts, malignant spirits, animals, humans, and heavenly beings, live out their spans of existence. Sentient beings are born into the universe in one of the six modes, and upon death, depending on the karmic merit or demerit accumulated by one’s actions in this life or previous spans of life, are reborn as one of the six, again to repeat the cycle.

The basic message of Buddhism in such a context revolves around the liberation of sentient beings from the cycle of birth and death and further rebirth within the six modes of existence, and entry into a realm called nirvana, described as “the other shore.” Early Buddhist texts suggest that nirvana was understood as a state attainable in this life by one who has extinguished one’s defilements and has freed oneself from inordinate attachments, thus arriving at a place of inner peace. However, later developments led to a view of this attainment as pertaining to an afterlife, or after multiple lifetimes of continued striving.

This aspiration for liberation from cyclic existence, or samsara, is the dynamism underlying the central Buddhist doctrine of the Four Ennobling Truths. The way to this liberation is spelled out in the Ennobling Eightfold Path, culminating in the seventh and eighth, Right Mindfulness and Right Concentration.

Buddhist meditative practice thus pertains to the cultivation of attitudes and habits that are conducive to personal liberation and transformation. As such, strictly speaking, in Indian Buddhism, there arises no specific interest in or concern for the natural world, regarded merely as the “environment” or stage wherein sentient beings live out their lives, a provisional reality that is itself subject to the cyclic pattern of origination, maintenance, and annihilation.

As Buddhism developed and flourished in Chinese, Korean, and Japanese soil, however, the meditative practice encouraged in the tradition that came to be known as Chan/Son/Zen took on elements from these East Asian cultures that became constitutive aspects of its worldview. Daoist perspectives on nature in particular came to inform the way practitioners articulated their understanding of the world in the light of their Zen experience. This Daoist influence on Buddhism as it was transmitted into Chinese soil is the crucial factor that made East Asian Buddhism distinctive and different from Indian Buddhism with regard to views on nature.

A key dictum underlying the entire Zen tradition is the affirmation that “all sentient beings are endowed with Buddha-nature” (fo-xing in Chinese, busshō in Japanese). The notion of “sentient being” came to be expanded beyond the framework presented in Indian culture. In the latter, sentient beings referred to the six modes of being, from the hell-dwellers up to the heavenly beings. Vegetative life as a whole did not belong to this circle of sentients, and together with mountains and rivers and “the natural world,” plants were considered as belonging to the objective environment. In China however, it came to be asked whether plants were also endowed with Buddha-nature, and this question was given an affirmative answer.

This principle of Buddha-nature inherent in all sentient beings, conjoined with a maxim of Zen, namely, of “seeing into one’s nature” (Chinese: xìng; Japanese: Shō) and thereby becoming a Buddha” (Dumoulin 1988: 85), brought new dimensions in the understanding of nature and of reality as a whole.

The following verbal exchange between a Zen master and student, included in a collection known as the Wu Men Guan (No. 37) serves as an illustration of this new dimension of understanding.

A monk asked Chao-chu: “What is the meaning of the Bodhidharma’s coming from the West?”

Such verbal exchanges in the context of Zen practice, called gong-an (Chinese) or koan (Japanese), contain veiled allusions to that realm of one’s true “nature.” The opening question about the Bodhidharma’s coming from the West is a standard gambit that sets the tone of the exchange, asking: what is the quintessence of the practice of Zen? In other words, “In what consists that true nature, the seeing of which one becomes a Buddha?” Or more succinctly, “Who am I, really?” The answer given in this case, “The oak tree in the courtyard,” is the key that can open the practitioner’s eyes to that realm whereby one becomes enlightened, that is, becomes a Buddha. In short, truly to “see” the oak tree in the courtyard, with the inner eye of the mind, is what the verbal exchange enjoins a practitioner. And this experience of truly seeing can occur in the context of seated meditation, as one is able to overcome the wall of separation that divides what is seen and the subject that sees. In this context, “seeing” is no-other than “becoming.” The oak tree in the courtyard is the locus of the revelation of one’s true nature.

With Dogen (thirteenth-century Japan), the scope of sentient beings expands further, to include not only the vegetative realm, but also the whole universe of ten thousand myriad things, such as mountains and rivers, rocks and stones, the great wide Earth, the sun, the moon, the stars. And what is important in this context is that mountains and rivers are not “things” in the objective world “out there,” but are precisely manifestations of one’s true
nature. Zazen is the locus in which this comes to be realized.

In short, this experience of “seeing into one’s true nature” is the entry into a continuum, a realm whereby the barrier that separates one (as a human subject) from the natural world, the myriad things of the universe (as things “out there,” objects of my perception) is overcome. The view of nature that comes to the fore in the context of Zen practice is the view from within, whereby one sees “mountains and rivers, the great wide Earth,” no longer as objects of the physical world, but as the very manifestation of one’s true nature, one’s true self.

The historical track record of Zen presents an ambivalent answer as to whether Zen practice can foster an ecologically oriented vision and way of life. Many individuals are led to Zen practice in search for answers to existential questions, or in search for inner peace, in search for healing, or in search for a community of spiritual support. The practice of zazen can be and has been indeed a powerful way of seeing through and coming to a resolution of big existential questions in life. It can be and has been an effective way for individuals to find a source of inner peace, to find healing for psychological and other kinds of woundedness, as well as to connect with a community of kindred spirits. But these effects of Zen practice, beneficial as they may be toward the integration of the individual’s personality, are as such not yet necessarily connected with an ecological awareness and way of life.

A phase of Zen practice involves an “inward turn” wherein an individual focuses one’s energy and attention upon spiritual pursuits, in a way that can diminish concern with the events of the everyday world. To engage in this practice can thus initially deflect one from concerns of ecological import. For a viable ecological awareness to arise and become a prominent element in a practitioner’s life, another dimension may need to enter, namely, an actual exposure to the Earth’s woundedness in its many forms, that would call forth a response of com-passion (that is, “suffering-with”).

With such an exposure to the reality of the natural world in a state of woundedness in the background, and as individuals commit themselves to Zen practice and experience the fruits thereof, something may happen that may awaken, enhance, or reconfirm an ecological awareness and commitment. In brief, as one deepens the experience of inner stillness, one comes to an illuminative insight into one’s true nature as inseparable from the trees and the flowers, the mountains and rivers, the great wide Earth. One experiences these as the manifestation of one’s own self, one’s own “home” (oikos in Greek, from which “ecology” is derived). From this vantage point, the pain of the denuded mountains and the polluted rivers and oceans become one’s very own pain, and to care for the Earth is nothing other than to care for one’s own home. A renewed vision and strengthened resolve toward healing the Earth’s wounds can arise as an outflow of the inner stillness that is the hallmark of Zen practice.

Zhuangzi

“Fish thrive in water; humans thrive in the dao. Those who thrive in water dawt about in the pond and find nourishment there; those who thrive in the dao work ‘without doing’ and their nature is realized” (Zhuangzi Chapter 6). For over two millennia, this “second master” in the Lao-Zhuang or “Early Philosophical Daoist” tradition has provided Chinese religion with provocative images of the human within its environment, using such rhetorical devices as fable, fantasy, dialogue, debate, and models of practice.

The superb ambiguity in which the Chinese character often grounds major religious terms has stimulated numerous interpretations in Asian and Western languages about the relationship between Zhuangzi’s ideal Daoist and “nature” itself. Formidable philosophical and aesthetic issues arise with translation from the original Chinese – such as the unarticulated assumptions and prejudices of several generations of Western Romantic individualist translators (that determine the incalculable choices of meaning made at each fork of ambiguity along the textual road). Likewise, additional issues of interpretation occur in target language translations as readers introduce their own preconceived notions and values to supply meaning to the translator’s choices.

Zhuangzi contains no literal Chinese equivalent to the Western term “nature” (“nature” commonly understood as the material, nonhumanmade elements on Earth). Yet the text makes constant lyrical use of actual plant, animal, meteorological, and geographical phenomena, sometimes
as virtual beings, often as metaphorical devices. Usually the obvious linkage or equivalence is made by the reader between Western “nature” and Zhuangzi’s concept of dao (the “Way” or “flow” of reality). Many readers also “read into” Zhuangzi’s dao the entire conceptual structure of Laozi’s Daode-jing (dao, de [individual spiritual capacity], wuwei [“without doing”], ziran [“naturalness”], etc.). The resulting image is a vibrant anti-anthropocentrism that resets the human within nature. Yet “nature” is only accessible in Zhuangzi once the Daoist context for the human and its capacities are understood, because Daoism pushes the ramifications of a true anthropomorphism to a far greater extent than does any Western worldview.

First, in terms of scope, the dao refers to the entire universe as the context for human living – rather than simply the natural Earth as the site of human habitation. Second, given the archaic Chinese acceptance of change (as the neutral basis of reality – rather than as a negative or positive characteristic of it), the entire universe is in constant flux. The appropriate Daoist term is “in transformation” (huā) or what is commonly appropriated from the text’s water imagery, the “flow.” Third, throughout its 33 chapters, the text builds a Daoist ideal, a practitioner or sage who develops a combination of attitudes, actions, and responses. The important attributes of a sage are to be calm (Chapter 32), to see all things equivocally and not to discriminate (2), not to quantify (17), not to think in terms of cause and effect (4), not to make value judgments (17), thus not to separate oneself from the totality of the universe (19), and to be in continual awe at the mystery and sacrality of all things in this totality. (These attitudes are of cause and effect (4), not to make value judgments (17), not to quantify (17), not to think in terms of quantity, causality, values, or varied emotional responses.) These attitudes allow the sage: to respond unthinkingly and to develop only fluid, temporary withers, the text builds a Daoist ideal, a practitioner or sage who neither differentiates in any way among all creatures and things in terms of quantity, causality, values, or varied emotional responses.) These attitudes allow the sage: to respond unthinkingly and to develop only fluid, temporarily emerging goals (13), to adapt to the flow (20), to harmonize the yin and yang energies within oneself (22), to act spontaneously, and to “know how” (rather than to “know what”) by means of one’s intuition (22). Just as a person sits on the bank of a stream and sees the stream flowing by, so a human experiences dao as a flow from one’s own fixed reference point as a single creature. Likewise each anthropocentric human being understands dao as flow because each socially references a universe in which the human is believed to naturally be the center. But from the standpoint of totality and of all the creatures and things that comprise it, a sage experiences the dao by such attitudes and behavior as relaxed fluidity, adaptability, spontaneity, harmonizing, and intuiting, both to participate in the never-ending transformation (of the universe as totality) and to respond to the distinct transformations (of each individual participant).

The goal of the text is to enable the Daoist practitioner to decentralize oneself from ones privileged position as anthropocentric observer and to begin to act in this totality as a “willing, equal” participant. Thus the concept of nature that indirectly pervades much of Zhuangzi serves a number of important purposes instrumental to the Daoist practitioner’s spiritual transformation: 1) it provides many observable everyday examples of the life cycle (birth, growth, aging, death), the seasons, and processes of transformation; 2) it provides the immediate environment of change/flow in which the human must live and act; 3) it continually reveals the sheer complexity and depth of the transformations of creatures and things in this environment that is far beyond the rational comprehension of any human; 4) it provides specific materials or environments that are worked by craftsmen, artists, and athletes who exemplify discovering and acting within the flow of the dao (butcher Ding [3], woodcarver Jing [19], wheelwright Pian [13], carpenter Qiu [19], the tiger trainer [4], etc.); and 5) specific natural phenomena serve as metaphors or examples for Daoist attitudes or “values” – such as unobstructed living [the pheasant, 3], consistency [pine and cypress trees, 5], balance [still waters, 5], the aesthetic appreciation of the “earth’s music” [2], etc.

A surprisingly effective way of discovering how the human relates to nature in Zhuangzi is to examine what the text says and implies about the modern Western issue of ecological activism. Zhuangzi mentions no literal concept of ecology and does not allude to ecological problems (this occurs only in the Confucian text roughly contemporary with Zhuangzi, the Mencius, with its well-known story of the deforestation of Ox Mountain [Book VI, Part 8, Section 8]). Yet it does contain a number of positions and issues both supportive and critical of such activism.

Sympathetic are its general strategies for abandoning anthropocentrism (“within the compass of Heaven and Earth, I am no more than a pebble or a bush on a great mountain” [17]). As an abridgement created by Guo Xiang (who died in 312), the current text is divided by scholars into the philosophically and stylistically consistent “Inner Chapters” (1 through 7) and mixed and fragmentary “Outer Chapters” (8 through 33). The homogeneous sense of nature of the Inner Chapters does not fit well with the more sporadic emphasis of the Outer Chapters that contain textual fragments of contemporary Primitivist (8 through 10) and Agrarianist movements. (The Primitivists advocated an archaic tribal social and political utopianism of humans living by a pre-moral consciousness in accord with nature, while the Agrarianists or “School of the Tillers” [Nong-jia] promoted an archaic utopian classless agrarian economy of fixed prices with minimal or no political leadership). Specific natural phenomena (such as a “tree-of-Heaven” [1], a “sacred” gigantic chestnut-leaved oak [4], and a mountain tree [20]) function as examples
of a major metaphor running throughout the text that suggests the adaptable, ambitionless, non-evaluative Daoist practitioner:

The trees in the mountains ask to be chopped down. Fat added to the fire consumes itself. The cinnamon tree is edible, so it is cut down. The lacquer tree is useful, so it is slashed. Everyone knows the usefulness of the useful, but no one knows the usefulness of the useless (Chapter 4).

An object created from nature is occasionally discredited (how both the libation vessel and the scraps of wood at its making have lost the “nature of wood” [8]); the accretion of wealth that is one great motive for despoiling nature is also condemned [29].

On the other hand, because Zhuangzi’s basic purpose is an advocacy of Daoist practice, it contains much that is antithetical to ecological activism. The aforementioned attitudes that maintain the Daoist’s equilibrium within the dao (both as corporate totality and dynamic flow) repeatedly emphasize that no single perspective or fixed goal is useful (these always lead to value judgments), that trying to mentally process reality by means of discrimination and opposites is absurd [the entire Chapter 2], that attempting to “pattern” or arrange the infinite opposites is absurd [3], that attempting to stop such destruction – because the required motivation and decision-making process uses such intellectual discrimination as isolating specific events, quantification, and cause-effect reasoning, to affect value-laden, fixed-goal-driven acts? 3) Is not the activist just as anthropocentric and selfish-will-imposing toward reality as is the destroyer (and thus is not an activist incapable of acting in a Daoist manner)? 4) Is the living and dying of any species not a “natural” transformation of the dao – or are there “natural” and “unnatural” (i.e., human-initiated exterminatory) livings and dyings? 5) Is the use of nature as raw material only justifiable for the Daoist craftsman, artist or athlete as spiritual practice? 6) Is there enough ambiguity in Zhuangzi to support some directed action toward nature?

The answers can perhaps be found among the craftsmen and artisans who engage the dao in action – the best example furnished by Cook Ding, when he is asked about his technique by the surprised Prince Wen Hui who is touring his kitchen on the morning of a diplomatic banquet.

Cook Ding laid down his cleaver and said, “Technique?” What I really care about is the dao – which is much more important than any technique! When I first began to butcher oxen, I could see only the entire ox before me. But then after three years I no longer saw an entire ox. At present, it is my spirit that apprehends – I do not use my eyes to see; my senses are idle, but my spirit moves where it wants. Guided by the natural grain, I slip through great hollows and travel in broad spaces, making use of things just as they are. Thus I miss the large sinews and I hack into no great bones . . . There are spaces between the joints [of the bones] and this blade is very thin and sharp, so there is more room than anyone ever needs to get through! This is why after nineteen years the blade of this cleaver is as good as when it was brand new and sharpened for the first time.

Yet sometimes there are very tough joints. When I begin to feel difficulty, I slow down and barely move the blade until suddenly there is a plop! and the pieces fall apart as easily as a clump of Earth dropping to the ground. Whenever this happens, I withdraw the blade and I stand still, just letting the joy of the work sink in. Then I wipe the blade and put it away (Chapter 3).
Cook Ding summarizes how he discovered the dao as a practice – early struggles as a beginner (“I could see only the entire ox”), gradual acceptance of the work situation (“after three years I no longer saw an entire ox”), mastery of technique such that his perceptions relaxed (“I do not use my eyes to see; my senses are idle”) and his movements not labored (“guided by the natural grain I slip through . . . and travel . . . making use of things just as they are”). He intuits (“it is my spirit that apprehends”) the situation and where to move moment-by-moment (“my spirit moves where it wants”). His intuition does not involve premeditation, rational choice, or directed awareness – instead it is related to mastery of technique, much learned experience, and relaxed awareness, always open for response (“When I begin to feel difficulty, I slow down and barely move the blade”).

In Zhuangzi, the Daoist discovers the dao and acts within it in four broad stages: 1) to relax and empty the heart (“emptiness, stillness, calmness, serenity” [13]); 2) to be illuminated by Heaven (which is responsible for all things beyond human will) to be able to reflect the total situation; 3) to be filled with this “unpatterned or unsorted” totality (“he does not escort things as they go or welcome them as they come, he responds but does not retain” [7]); and 4) spontaneously to respond as the situation moves one (“he responds like an echo [to a sound]” [33]). One surrenders any need to shape or control the situation or even one’s own action – this is the spontaneity of all creatures but the human. One empties the heart of ambition, of discriminative rationality, causality, and fixed goals. One cannot perceive by surveying with the senses or by processing within one’s mind a stream of information sequentially because the situation (the flow of the dao) is an immediacy, a totality, a gestalt. The only way this can be done is that one’s heart must be as empty of all such “objects” as is a mirror which does not present things but instead reflects what is illuminated (“He is the reflector of Heaven and Earth, the mirror of the myriad things” [13]). What is reflected makes the relationships of its constituents apparent (“and what fills him sorts itself out” [13]). The more minimal one’s self-assertion is while the greater one’s reflecting awareness is, the brighter will be Heaven’s illumination of all things and the more subtle will be the transformations one is aware of and can respond to without obstruction. Thus one spontaneously responds – being inevitably “caused” to act by what fills one instead of choosing what to do oneself; this is termed “Heaven working through the sage” (7). One’s action is successful because one’s own spiritual capacity (de) accommodates the de of all other participants in the flow of totality.

The traditional Chinese term equivalent to the English “nature” is ziran, variously translated by Western scholars of Daoism as “unmediated by rule or principle,” “spontaneity,” “spontaneous activity,” “to follow one’s own de,” self-expressing,” “self-creating,” “self-actualization,” “self-evidencing,” “self-so-ing,” “to be party to transforming things,” “to assist the self-so-ing of each and all things” (Daodejing 64), “naturalness” (Daodejing 25), “natural flourishing.” At first glance, such interpretations seem to span a range of focusing on an individual at one end through that of totality at the other. The individual orientation emphasizes direct and immediate action unique to a person’s qualities, as expression (communication) and as creativity (craft and art), literally producing one’s particularity as action unique, specific and “natural” only to oneself. It is one’s own behavior that establishes one as a participant in totality – it reveals and authenticates oneself in terms of one’s uniqueness. This action can only occur within the ever-changing totality comprised by always-transforming participants, so at the other totality – or holistic end of the spectrum – an individual’s behavior not only occurs simultaneously among the actions of other participants and witnesses what all others do, but is also thoroughly integrated (or “interrelated”) and thus enables the flow. However, no polar model can readily depict how a Daoist sage understands reality, precisely because the Daoist acts within totality and among the actions of all participants. Any emphasis upon only one of its major characteristics of 1) individual participant, 2) totality, 3) all participants, or 4) flow [transforming participants and changing reality] over-emphasizes one at the expense of the others.

The term ziran (which appears earliest in the Zhuangzi and the Daodejing) suggests that these dimensions comprise the dao itself. If the Daoist sense of nature involves a withdrawal of such attendant Western concepts and values as anthropomorphism, separate individuality, linear causality, human capacity to shape, control and dominate, etc., and it emphasizes a cosmological dynamic inherent in the written Chinese character and in Chinese religions in general, then the term could be more accurately translated into English as “naturizing”.

Zimbabwe Spirit Mediums, Guerrillas, and Nature

In Zimbabwe, a loosely interacting and overlapping series of rain-cult networks have existed for centuries. The Portuguese mentioned some of these during the sixteenth and seventeenth centuries. At the other end of the colonial period, the Rhodesia Front paid a great deal of attention to Zimbabwean African Religion. In the mid-1970s one of its ethnographers, C.J.K. Latham, compiled a “Spirit Index” that listed and numbered every major spirit, every medium, every shrine and every sacred place throughout the country. Latham also compiled The Shamanism Book, which described in detail the five major cultic systems.

Most of the spirits recorded by the Portuguese reappear in the “Spirit Index” or The Shamanism Book. The reason that both the Portuguese and the Rhodesians felt the need to make these reports was that they believed the cults were crucial to African politics and to African consciousness. Some of the major spirits are supra-human figures, embodying the forces of nature; others represent founding ancestors, chiefs and kings. It is often hard to separate the two categories. Myths of founding chiefs, “princesses” and “grandmothers” often describe them as creating natural phenomena such as salt-pans or even rivers. Even more often they describe them as being able to control nature: “princesses” are described as having the power to draw wild animals to the hunter or to divide the Zambezi River so that the people could migrate. The possessed spirit mediums, which are their living incarnations, are believed to possess the same powers, enabling them to make rain, cause drought, or strike down enemies with lightning.

In the nineteenth century, white hunters respected the spirit mediums’ control over nature, especially over game. The famous hunter, Frederick Courtney Selous, described how he had paid tribute to the medium of the great spirit of Chaminuka, in order to be able to hunt elephant successfully. African kings paid a similar respect. King Lobengula of the Ndebele state sent tribute to rainmaking mediums to the northeast of his kingdom.

After the colonial conquest in the 1890s, however, the powers of the mediums were curtailed or ignored. Africans were forbidden to hunt and white hunters no longer needed to seek permission from anyone. Chiefs were chosen by the Native Department without the endorsement of the mediums. In the early colonial years, there were direct assaults on the most powerful mediums and shrines. During the African uprising of 1896, one of the priests of the High God, Mwali, was shot dead and other officials of the cult were arrested and put on trial. The female medium of the great rain-spirit, “princess” Nehanda, was arrested, tried and hanged in 1897. The rainmaking cult of Musikavanhu on the eastern border with Mozambique was turned into a secular chiefancy, and when the possessed medium drove out the new chief, the Native Commissioner marched with a small army to reinstate the chief and expel the medium. In the 1920s, the Dzivaguru shrine in the northeast, which had figured largely in Portuguese accounts, was closed down in what was called “The Mount Darwin Ritual Murder Case.”

Gradually these repressions gave way to constant government supervision of the major mediums. It came to be believed that the mediums and their cults were mostly concerned, after all, with nature, with rainmaking, the fertility of crops, etc. Now that nature and political authority had been separated, they were no longer thought to be politically dangerous.

In reality, nature and political authority had not been separated. A major component of white ideology was that they had taken over the land. By this, they not only meant that they had evicted the Africans and created their own farms, they also meant that the whites had become “the people of the land” in the most intimate and essential way. Rhodesians prided themselves on “bushcraft,” and the myth of the “Great White Hunter” and, later, the Game Conserver flourished in Rhodesia, as well as in Kenya.

By contrast, African hunting was stigmatized as cowardly and cruel. In her recent writings, the novelist Doris Lessing powerfully expressed the feeling that white farm children grew up with the idea that the land was theirs. Whites believed that they alone appreciated landscape, and quite often they deliberately set out to create spectacular views. In these senses, not only the physical but also the imaginative ownership of nature was being taken over from Africans.

Missionaries played a major role in these processes. Some of them were critical of colonial evictions and disliked the commercial growing of crops like tobacco, or the bad conditions on the tea plantations. But all of them were involved in the creation of a Christian landscape in the African areas – a landscape of villages, clustered around their church and cemetery, which was very different from huts perched on the hill-tops or the burial of chiefs in the rocks.

For a long time spirit mediums could do little about this. They were still consulted for rain. When possessed, they often articulated with the voice of the spirit its dislike of new methods of tilling the land, or of damming and diverting rivers. But such protest was ineffective. Then there came the rise of mass nationalism; the rediscovery of a heroic past; the invocation of the Nehanda spirit at nationalist meetings; the visits paid by nationalist leaders to senior spirit mediums. By the 1960s, both African nationalists and Rhodesian administrators began to take the mediums much more seriously.

The climax of this new importance was the guerrilla war of the late 1960s and 1970s. There were several
reasons why young guerrillas took mediums seriously. They needed legitimacy in the eyes of the people and they needed spiritual protection. The mediums represented traditional claims to the land. Guerrillas who had been trained by Chinese advisers in Tanzania had been taught the Maoist doctrine that they must respect the beliefs of the peasants. But their needs were a more powerful incentive. It was the mediums of the Dzivaguru “circle,” which overlapped the boundary between Zimbabwe and Mozambique; these exercised some sort of control over the young fighters. Gradually, numbers of mediums settled in special quarters of the guerrilla camps inside Mozambique, who made the first contact with Zimbabwe African National Liberation Army guerrillas on Mozambican soil. Mediums from inside Zimbabwe were called to a meeting across the border and they agreed to give spiritual support to the young fighters. Gradually, numbers of mediums settled in special quarters of the guerrilla camps inside Mozambique; these exercised some sort of control over sexual relations, and tried to predict and warn of Rhodesian raids.

As the guerrillas crossed into Rhodesia they came into contact with the mediums of other “circles.” The best-known account of these interactions is given by the anthropologist, David Lan, who describes how the mediums of the Dande Valley gave legitimacy to the guerrillas. Where Rhodesian propaganda described them as animal-like beings with tails, who prowled the evil bush, the Dande mediums depicted the guerrillas as the descendants of the heroes who had founded kingdoms and chiefdoms and human society itself in the past. The mediums imposed prohibitions and taboos on the young fighters. They revealed to the guerrillas the caves and hiding places and even permitted them to make use of the burial caves of chiefs or the rainmaking shrines sacred to the High God.

Above all, the mediums gave back to the guerrillas and took away from the whites the “ownership” of nature. David Maxwell has described in his study of the northern Nyanga district how it came to be believed that all of nature was mobilized on the side of ZANLA. Eagles flying overhead showed them safe routes; snakes slithered out of their way, only to return to lie in wait for Rhodesian soldiers; lions appeared to convey the support of the senior ancestral lion-spirits; talking baboons carried messages; rivers flooded to prevent Rhodesian soldiers from reaching guerrilla strongholds. During the 1970s, the whites began to realize that they did not after all possess superior “bushcraft.” By contrast, the guerrillas came to believe that they were in every sense “sons of the soil.”

On their side, the Rhodesians tried everything they could to win mediums over and to use them to denounce the spilling of blood on the soil. It became very dangerous to be a medium, the guerrillas killing “sell-outs” and the Rhodesian forces eliminating those who worked with ZANLA. Nevertheless, the mediums emerged from the war with their reputations and influence greatly enhanced. In independent Zimbabwe, their power over nature has been recognized in various ways. In the so-called Campfire schemes, in which African communities receive cash returns from safaris, white hunters once again give gifts to mediums to ensure good hunting. Many mediums in the south of the country have been recruited into schemes for a “second independence” struggle, this time to rescue the environment. A Prophetess, Mbuya Juliana, has endlessly traversed southern Zimbabwe during the last ten years, bearing the message that the water spirits in the streams must be propitiated in order to end drought. The struggle over nature in Zimbabwe continues.

Zimbabwe’s Matopo Hills

The Matopo Hills of western Zimbabwe lie south of the Matabeleland city of Bulawayo and about an hour’s drive away from it. They take the form of a very extensive granite mass, throwing up great domed hills and kopjes fantastically decorated with eroded rock pinnacles. The hills, which today stretch across the borders of three administrative districts, are the source of most of the rivers of southern Matabeleland, and there are many rock pools with perennial water.

Most tourists visiting the hills go to the National Park, an area in the center of the Matopos set aside in 1962 when all its African occupants were evicted. The National Park contains the grave of the founder of the white Rhodesian state, Cecil Rhodes, after whom the country was named. It also contains a Game Park into which giraffe and rhino were imported after 1962. There is a “wilderness” area, which can only be entered on foot, and where one can still see the bases of huts and granaries. But though the Park itself has so recently been made “wild,” the Matopo Hills are still occupied by African farmers to the south and east of it. In the Communal Areas of Kumalo, Gulati, and Matopo, one can still see people living among the rocks, cultivating the alluvials, grazing cattle in the grassy valleys and collecting wild fruits as they have done for centuries.

The successive inhabitants of the hills have all developed contrasting cults of “Nature.” The Matopos
have been occupied by humans for some 40,000 years. For most of this time foraging peoples moved in and out of the hills on a seasonal basis. But some 9000 years ago permanent populations built up at favored sites in the Matopos. These “San” peoples (Khoisan-speaking nomadic tribes in Southern Africa) used grassland and riverine environments, but hunted rock-rabbits on the granite hills and gathered fruit and roots in the woods. There is no doubt that their religious specialists conducted rituals in the great caves of the Matopos which were intended to give success in hunting and to make rain. Rock-art specialists have interpreted many of the thousands of paintings from this period as depicting rainmakers in a state of trance. These paintings did not portray “Nature” but were designed to give control over it. Caves filled with San paintings have continued to be ritual and rainmaking centers ever since.

Sheep and pottery appear in the archeological record some 2200 years ago. It was thought by early Rhodesian students of the Matopos that the “San” hunter-gatherers withdrew when these “Bantu” farmers arrived. Archaeologists today believe that there was considerable interaction between the Late Stone Age “San” communities and the Early Iron Age “Bantu” settlements. Some of the later rock paintings were done by the farmers and their uses of the environment and patterns of residence were very similar to those of their predecessors, with the addition of livestock and cereals. Studies of the interaction of “San” groups with black farming peoples in South Africa and Namibia have shown that the cultivators paid “San” experts to make rain; and that their own rainmakers performed in the painted caves and used the pigments for powerful medicines. It is likely that something like this happened in the Matopos and that there were substantial continuities in the rituals practiced there. It is clear, at any rate, that over the last few centuries, at least, the farming communities living in the hills have used the painted caves for rainmaking. Pre- and post-pubertal women danced in them and threw water in the air.

At an unknown date, however, a more elaborate religion of “Nature” emerged among the farming communities of the Matopos. This religion has become known in the literature as “the Mwali cult.” Mwali is the Bantu name for the Creator God. It implies female fertility – elsewhere in Central Africa, “Mwali” is used to describe a female initiate or a rain divinity. One of the shrines at which the Voice of Mwali was heard was situated in the eastern Matopos. It was called the Zame shrine, Zame meaning “breast,” and people came to it to drink rain just as a baby drinks milk. When there was a particularly heavy drought, old women would enter a cave where a remote female ancestress lay buried and give her water to “drink.” At Zame, shrine priestesses inherited power matrilineally. It seems likely that this female version of creative power represents the earliest form of the Mwali cult.

By the time we have evidence about it, however – in the late nineteenth century – there had built up around the shrines, as at the Apollo shrines in classical antiquity, an apparatus of male control. Male priests interpreted the gnostic utterances of women possessed by Mwali. The various oracular shrines had come to represent the combined spiritual power of men and women. The perennial pools in the caves were thought of as the amniotic fluid; lightning was thought of as the manifestation of male virility. The Matopos, containing as they did these powerful shrines, were regarded far and wide as the very site of creation. Hundreds of miles to the southeast of the hills, creation myths have been collected which hold that the granite rocks were originally rain-clouds come down to Earth at the beginning of the world, and that the rivers had poured forth from the rocks when they were penetrated by the “needle” of lightning.

The Mwali shrines represented “Nature.” No iron tool was used to clear away the bush around the cave. The priest-custodian of the shrine was believed to be instructed in his duties by snakes and leopards, and climbed the mountainside naked but for a leopard skin. This concept of bare “Nature” might have represented – as the first missionaries thought it did – a mere submission to the environment. But for the adepts of the Mwali Cult it was out of “Nature” that culture and cultivation sprang. Cattle were taken to the shrines to be sacrificed; millet seeds were taken to the shrines to be soaked in the water of the caves and then brought back to be planted. Newly selected chiefs were endorsed and blessed at the shrines. At one shrine, Dula, warriors were blessed and later cleansed. The ideology of the shrine was that “Nature” and culture were interdependent. Later colonial environmentalists demanded that everybody be cleared out of the Matopos so that the rivers would not silt up. The priests of the shrine believed that the waters would dry up without people. Rivers were there because people were there – and this was true, too, of animals and fruits and roots.

We can construct this picture of the Mwali Cult from the nineteenth-century evidence. The shrines continued to control agriculture in the Matopos deep into the twentieth century. The shrine priests told their congregations where and when cattle could be grazed; when planting should begin; when the first green crops could be eaten; when harvesting should start; and which groves and streams should be set aside as sacred to Mwali. The Matopos were a ritually controlled environment. The Mwali agricultural cycle was very different from the practices recommended by colonial experts, and, in particular, it allowed controlled use of the sponges and wet places that were fenced off and prohibited by colonial agricultural officers. In the eastern Matopos, the people have continued to use the sponges and to observe the Mwali injunctions to this day.

This was the religious situation in the Matopos when
whites began to arrive in the second half of the nineteenth century. White traders and hunters ignored the Mwali cult. Missionaries regarded it as diabolical. Catholics and Protestants alike believed that the Mwali adepts were terrified “children of Nature,” living out their lives in fear of natural forces and unable to control or exploit them. As the Jesuits passed through the Matopos in the 1870s, they held a Mass in one of the caves, proclaiming that Christianity would liberate humanity and redeem “Nature.” The very hills trembled when the Mass was performed, they claimed.

But traders and missionaries passed through the Matopos. They were not claimed by whites until 1896. In that year there was a great uprising against the recent, brutal, rule of Cecil Rhodes’ British South Africa Company. African warriors fell back into the Matopos and there was fierce fighting from rock to rock, in which many whites died. In this way whites came to know the hills and to feel that they had purchased them with their blood. It was in 1896, too, that Cecil Rhodes stumbled upon the hill where he now lies buried. He at once realized that it was ideal as a pilgrimage site for future white Rhodesians. “World’s View,” as it is now called, was easy to ascend but commanded a huge vista. Rhodes at once ordered that he should be buried there when he died; he also ordered that the site should become a “Rhodesian Valhalla,” where white heroes should be laid to rest. The proper context for the bones of heroes and of his own bones was wilderness, the “grandeur” of the Matopos.

Rhodes died in 1902; his body was brought by train and ox-wagon from Cape Town; on 10 April 1902, he was buried in the Matopos. Little doubt was left that in death Rhodes had taken command of “Nature.” The Bishop of Mashonaland recited by the graveside Rudyard Kipling’s funeral ode, which ended with the lines: “The immense and brooding Spirit still Shall quicken and control. Living he was the land, and dead His soul shall be her soul.” After 1902, white Rhodesians went to Rhodes’ Grave on pilgrimage, just as African pilgrims from all over southern Africa were still going to the Mwali shrines.

Rhodes’ Grave symbolized the dominant white theory of the relation between religion and “Nature” in the Matopos. The hills were thought of as “wilderness.” They were exempt from the general colonial view that “Nature” should be exploited, even though some missionaries taught their converts how to use ploughs to farm in the hills. The general white view was that the Matopos should be reserved as a place for whites to wander and to have solemn religious thoughts. Over the decades after Rhodes’ death, white conservationists argued for the preservation of the hills. In their eyes, this meant getting rid of their black inhabitants. The only humanity that could be tolerated in the Matopos – except for the tourists – were the long-dead “San” hunter-gatherers, who had created the thousands of rock paintings. These men and women, it was held, had coexisted with “Nature,” living in the environment without impacting on it. But cattle grazing and cultivation, though practiced in the Matopos for two thousand years, were held to be destructive and eroding. When the people-less National Park was created in 1962, a sign was erected at one of the painted caves saying: “Agriculture should never be practiced in these hills.” Nor was the present National Park the only area which conservationists wanted to be cleared of people. From the 1940s onwards, there were demands that the inhabitants of the eastern Matopo Reserve, who cultivated the sponges as the Mwali cult had long taught them to do, should be removed from the hills. The several Mwali shrines in Matopo Reserve – Dula, Zame and the rest – were to be closed down. And if conservation meant a triumph over African religion, it also involved a victory over mission Christianity. When the National Park was created, the London Mission Society church at Whitewaters – a center of Christian agriculture – was torn down and its stones used to make the entrance to the Game Park.

There was, then, a “San” ideology of “Nature” in the Matopos, a “Bantu” ideology, and a Rhodesian ideology. In protest against this last, and drawing upon some features of the first, there also arose an African nationalist ideology. At first nationalist opposition to evictions in the Matopos was led by the “progressive” Christians of Whitewaters. But when they failed, nationalists began to turn to the still functioning Mwali shrines, and especially to the senior shrine of Njelele in the southwestern Matopos and to the “war” shrine at Dula in the east.

Before looking at the nationalist alliance with the shrines from the 1950s onwards, it is important to realize that the shrines were not just “traditional survivals.” The priests had lain low under early colonialism. But the shrines had continued to operate and to adapt. They developed their agrarian ideology, extending their support not only to subsistence cultivators but to small peasants, striving to produce a surplus for the colonial market. They absorbed and adapted Christian ideas – Njelele is today widely described as Mount Sinai: the late priestess, Gogo Ncube, used to take her Bible with her into the cave. The priests’ children, and future successors, attended Christian schools and achieved literacy. The Mwali cult has proved to be a dynamic religion.

When the nationalists approached the shrines in the 1950s, the priests were also able to extend their theory of history. The Mwali cult had possessed for several centuries not only a theology of place – of the Matopos as the navel (the soft spot on a baby’s head) of the world – but a theology of time. It taught a theocratic history, narrating how the successive rulers of southwestern Zimbabwe had flourished when they were blessed by Mwali, but also narrating how they had been cursed and overthrown when they
defied Mwali’s commands. Legitimacy could only be gained by submission to the Voice from the Rock. “Nature” itself condemned the illegitimate ruler with drought and locusts. This had happened to all previous African kingdoms and it would now happen to the whites. Thus when Joshua Nkomo, who was to become the leader of mass nationalism in the late 1950s and early 1960s, paid his now famous visit to Dula shrine in 1953, the Voice spent the whole night telling him “history”; the history of how to replace an illegitimate regime and how to establish a legitimate one.

Thereafter, Nkomo came to be thought of as the chosen one of Mwali. At Dula, so it was believed, he had been promised that “Nature” itself would protect him, and that while people died around him in the war that was to come he would be safe. His nationalist pseudonym – little slippery rock – was given to him by the cult. The nationalist claim was that the land belonged to its indigenous people. Such a claim was given a particular resonance at the Mwali shrines where religion and culture and the land were inseparable.

This closeness to the Mwali cult persisted until Nkomo’s death in 1999. During the guerrilla war of the 1970s, his fighting men drew legitimacy and protection from the shrines. When the war ended and Nkomo returned to campaign in the 1980 election, he held his first election rally in the Matopos, at Njelele. “Nature” itself seemed to endorse him as the legitimate leader, as thunder rolled, lightning flashed and rain came down in torrents. Robert Mugabe became the leader of the new Zimbabwe, however. Mugabe is a man who did not come to the Matopos shrines and was thus denied legitimacy by them. Nkomo found himself and his party harassed and threatened by the Mugabe regime. He himself fled the country – disguised, according to myth, in the black robes of a Mwali priest. His closest supporters went secretly to the shrines to seek consolation. After 1987 when Nkomo signed the Unity Accord and rejoined Mugabe’s government, his greatest ambition was to develop Njelele into a great international religious site, like Westminster Abbey or Mecca. During his last years Nkomo used to retreat to one of the smaller Mwali shrines in the southeastern Matopos, Kozi. His son tells a story about “Nature’s” respect for Nkomo in his old age. The old man sat in his chair under a tree; a dust-devil sprang up and leaves and dust piled up all around him; the tree bowed down and with its leaves swept away the mess; when Nkomo died, the tree died.

Yet the Mwali cult has never been captured by kings or presidents or politicians. It has remained constant to its own vision of “Nature.” Local people never warmed to Nkomo’s vision of motels and lavatories and mass pilgrimages. Today, as throughout their history, the shrines remain caves and rocks in the bush.

Zion Christian Church (South Africa)

The Zion Christian Church (ZCC), based in the Pietersburg district, Northern Province, has become the largest of the Zionist independent African Churches in South Africa. Founded about 1910 by a Pedi Christian convert, Engenasi (Ignatius) Lekganyane (born ca. 1885 in Thabakgone, Pietersburg district – died in Moria, 31 May 1948), who had previously experienced healing in the Zion Apostolic Church and membership in the Zion Apostolic Faith Mission, it rapidly evolved into a church appealing across ethnic lines to the rapidly urbanizing African poor. In the 1940s the ZCC bought two farms in the Boyne district, McClean and Kleinfontein, and these, after merging into one parcel of land, were renamed Moria after the biblical Mount Moriah or Jerusalem, and became the administrative and cultic center for the church. Under the founder’s son Edward (born ca. 1923, in Thabakgone, died in Moria, 1967) and then grandson, Barnabas, the church grew from about 25,000 adherents in 1925 to about a quarter million by 1970 to a million in 1990 to a striking five million according to the 1995 census.

In 1928 Lekganyane introduced a badge as a token of membership, the silver star on a black cloth backdrop. His son, Edward was to change this to a five-pointed Star of David with the initials ZCC in the center. This badge still serves as a unifying symbol, as well as an amulet for protection against crime in urban areas. The church is organized on traditional tribal lines with Lekganyane as chief and ministers appointed, ordained, and responsible to him alone. The church emphasizes teaching on purity and thus prohibits pork, tobacco, and alcohol as well as use of African traditional medicines and Western medicines, seeking rather to trust in spiritual healing. There is thus great focus on personal and communal purity that enjoins a strict personal morality, a rigorous code of ethics, abstention from specific foodstuffs, and the avoidance of party politics.

Addressing a different context than other traditional Zionist churches, the ZCC has largely avoided the divisions that rent these other groups and has preserved its membership through a powerful hierarchy that continues to offer its members a sense of meaning, purpose, and
spiritual healing, as well as a strong code for daily living. A significant feature of the ZCC is its emphasis on sacred land. It should be noted that the years of its founding happened to be the years when the Union of South Africa was created and the Native Land Act passed (1913), which forbade individual black ownership of land, though churches were exempt from this law.

The ZCC, like the Zulu Ama Nazariti, have a highly developed sacred geography that combines biblical, traditional, and nature themes. Thus, 25 miles north of Pietersburg, lies Mount Moria where Edward Lekganyane laid out the church headquarters in the midst of vast agricultural holdings, symbolizing the power of black land ownership, until recently restricted by law. Mount Moria serves also as a center for three annual pilgrimages, the most notable being the Easter festival when, over the past twenty years, attendance figures have reached over the three million mark. ZCC members believe that at these Easter celebrations they experience in part the New Jerusalem when the Messiah builds his kingdom. The emphasis on a sacred and thus purified geographic center, as well as personal purity, has also led in the last decade to a greater awareness of environmental degradation, and has evoked a variety of initiatives involving sacred water, tree-planting, and land conservation. All these are understood as flowing from the sacred Mount Moriah and ushering in personal and social peace, healing, and blessing.

Zoroastrianism

Much is unclear about the origin and earliest developments of Zoroastrianism and its community of believers. Religious tradition ascribes the faith’s tenets to Zarathustra, later called Zoroaster by the Greeks. Members of the faith customarily referred to themselves as Mazda-yasna (later Mazdesan) or Mazda worshipper (Mazdean), with the designations Zarathushtri (later Zarthoshti, Zartoshti, Zardoshti) or Zoroastrian and Majus or Magian being subsequent categorizations based on referring to members of the community in terms of their founder – Zarathushtra – or their priesthood – the magi.

Zarathushtra himself appears to have been a devotional poet, trained in the recitations and rites – centered around fire and water (much later noted in the Iranian context by Strabo [lived ca. 64 B.C.E.–25 C.E.], Geography XV, 3:14) – of Indo-Iranian religion. When and where he lived are not definitely known, but linguistic and archeological data suggest a time framework of between the eighteenth and sixteenth centuries B.C.E. (i.e., the late Bronze Age), somewhere in Central Asia. As a community of followers developed around him and his words, Zarathushtra gradually attained the status of a prophet – possibly several centuries after his demise and when Zoroastrians and other Proto-Iranians had resettled on the Iranian plateau.

Gradually Zoroastrianism was spread among the peoples of the Iranian plateau, becoming a widespread faith there from the fifth century B.C.E. onward until it was elevated to the position of state religion under the Sasanians (224–651). By late antiquity, Zoroastrianism also had become a popular faith in Central Asia at cities such as Bukhara and Balkh. The demographic decline of Zoroastrianism in Iran and Central Asia occurred after the Arab Muslim conquest of those regions in the seventh century. Some Zoroastrians migrated from Iran to the Indian sub-continent around the tenth century, to avoid conversion to Islam, and their descendants came to be called Parsis or Persians by other Indians. A smaller group relocated to China but their descendants did not survive past the Middle Ages. In modern times, Zoroastrians diasporas have sprung up in many nations through immigration for religious freedom and economic opportunity. The current demographical distribution of the community, based on national censuses and membership in community organizations, is approximately: 45,000 in Iran; 76,400 in India; 10,000 in Canada; 10,000 in the U.S.; 4000 in England and Scotland; 2000 elsewhere in Europe; 2800 in Pakistan; 1000 in Australia, 1000 in Tajikistan and Uzbekistan; 150 in Hong Kong; 130 in Bahrain; less than 100 per country in South Africa, Sri Lanka, and Zaire; and even smaller groups in other nations. The faith is still practiced mainly by descendants of the original Iranian Zoroastrians, with very few converts – conversion is discouraged by many contemporary Parsis, occasionally accepted by some contemporary Iranians, and periodically encouraged without much success to date by a few Zoroastrian settlers in North America and Europe.

Nature-related Doctrines

Drawing upon the semi-pastoral, semi-agrarian social setting of his community, and reacting to aggression upon the settled people and the environment by nomads, Zarathushtra grounded his words in the concept of Asha or universal Order which was equated to rightousness:
"Order is good, it is best. According to (our) wish it is, according to (our) wish it shall be. Order belongs to best order" (Ashem Vohu prayer, Yasna 27:14).

Order, personified by the masculine spiritual entity Ahura Mazda (later Ohrmazd) or Wise Lord, the creator deity of Zoroastrianism, and his generative hypostasis called Spanta Mainyu (later Spenta Mainyu, Spenog Menog) or Beneficent Spirit, was thought to ensure harmony and completeness, connecting the spiritual world to the corporeal one, linking life to afterlife, and leading from creation to eschaton. Disrupting order was Drug or Confusion. Confusion, supposedly emanating from an independent spiritual locus termed Angra Mainyu (later Ahreman, Ganag Menog) or Destructive Spirit, the devil of Zoroastrianism, was believed to disturb, deceive, and defile the harmony of nature – and therefore was regarded as sinful. Thus, Zarathushtra, perceiving conflicts as upsetting natural order, is said to have chanted in pastures through (correct) authority? (Spenta Mainiu Gatha, Yezidha Haiti, Yasna 48:11). Likewise, speaking on behalf of all animals, especially domesticated species, Zarathushtra is believed to have asked of Ahura Mazda: “The soul of the cow complains to you, ‘For whom did you craft me? Who created me? Wrath, force, oppression, bondage, and violence hold me shackled’” (Ahunauuaiti Gatha, Xvatemaiti Haiti, Yasna 32:10). Moreover, he would entreat: “May Mazda, who remembers precisely, note deeds perpetrated now and in the future by demonic beings and (evil) mortals” (Ahunauuaiti Gatha, Xshmauooia Haiti, Yasna 29:4).

Pronouncements on human interaction with the environment by early Mazda worshippers who followed Zarathushtra, and also lived prior to or around the fifteenth century B.C.E., echoed the founder’s concern with all aspects of nature. They praised “Ahura Mazda who created the cow and order, who created water and good plants, who created light, Earth, and all good things” (Yasna Haptanghaiti, Yasna 37:1). They also venerated Ahura Mazda’s creations including “this Earth” and “the waters” (Yasna Haptanghaiti, Yasna 38:1. 3) plus “the souls of harmless wild animals” (Yasna Haptanghaiti, Yasna 39:2). Most of all, they wished:

Through these best endeavors, we exhort those who listen as well as those who do not listen, those who wield authority, to establish peace and (to provide) pasture for cattle (Yasna Haptanghaiti, Yasna 35:4).

A devotional poem in the Young or Standard Avestan language (based on early, pre-Zoroastrian religiosity, but revised ca. 900–300 B.C.E. for incorporation into the Zoroastrian scripture or Avesta) to the male Yazata or praiseworthy spiritual entity Mithra (later Mihr) further stressed the beneficial links between deity, lesser divinities, humanity, and nature: “I shall audibly worship him, Mithra of the wide pastures, who grants peaceful and good dwellings in Iranian territories” (Mihr Yasht, Yasht 10:4). Another devotional poem, this one to the female Yazata named Aredwi Sura Anahita (later Ardwisur Anahid), commented on that spiritual entity’s major role as Ahura Mazda’s proxy in safeguarding a vital natural resource: “She purifies the waters” (Ardwisur Yasht, Yasht 5:5).

Human Mythology Involving Nature
Myths gradually developed to connect humans, from their very first corporeal existence, to nature. The Zoroastrian story of creation, finally codified in the Pahlavi or Middle Persian language, claimed that when Gayo Maretan (later Gayomard) the primordial androgynous was slain by Angra Mainyu and his demonic forces, his seed was purified by sunlight . . . (then) remained in the Earth for forty years, after which time Mashya and Mashyana (the first human couple) grew out of the Earth in the form of a rhubarb plant . . . (and) developed from plant form into human form (Greater Bundahishn 14:5–6, 10, compiled ninth to thirteenth centuries).

Gradually, Zoroastrian theology in antiquity and medieval times united all beneficial aspects of the world, producing a nexus between corporeality – both animate and inanimate – and spirituality – both ritual and supernatural. So, aspects of material existence such as water, Earth, fire, metals, plants, animals, and human beings were connected symbolically to spiritual beings and through those entities to god. The six interconnecting spirits are called Amesha Spentas or Holy Immortals (Ahura Mazda is regarded as the seventh, in addition to his role as Creator) and are thought to represent various categories of material creation: Vohu Manah (later Wahman) or Good Thought represents animals, Asha Vahishta (later Ardwa-hisht) or Best Righteousness represents fire, Xshathra Vairya (later Shahrewar) or Desirable Dominion represents metal, Spenta Armaiti (later Spendarmad) or Good Disposition (later said to be Holy Devotion) represents Earth; Haurvatat (later Hordad) or Integrity/Wholeness (later thought of as Perfection) represents water, and Ameretat (later Amurday) or Immortality represents plants.

Humans are believed to oversee this belief structure in
the corporeal world. This theological structure bestowed upon humanity a central role – Zoroastrianism holds that humans were created by Ahura Mazda as allies in his cosmic struggle against Angra Mainyu. So it was written, later, in the Greater Bundahishn (3:23–24) that Ahura Mazda deliberated with the immortal souls of humans who realized that the Destructive Spirit would be vanquished forever if they entered the corporeal world. Ahura Mazda, in turn, promised to resurrect all humans and grant them immortality once Angra Mainyu had been defeated. As a result of this covenant, the religious function of each person is thought to lay in aiding the increase of righteousness and combating the forces of evil through every action performed during his or her lifetime. Essentially, Zoroastrians concluded that good deeds – like prevention of pollution, performance of ritual, and reverence for aspects of nature – by people in the material state further individual and cosmic triumph of righteous order over chaotic confusion on the spiritual level and that this maintains harmony in nature. Parthian or Arsacid-era poems lauded the appropriate and full utilization of nature, without waste of natural resources:

That lofty (date palm) tree said . . . “They make ships of me that sail the seas. They make brooms of me to clean houses. They make pestles of me to pound grain . . . Kings stop here for shade in summer. People eat my fruit to fill their stomachs. Small birds nest here and scatter my seeds” (Drast i Asurig, ll 7–16, compiled ca. first century B.C.E.).

Purity and Pollution in Relation to Nature

Word of Zoroastrian concern for nature, not surprisingly, reached members of other cultures. The Greek historian Herodotus (ca. 484–430 B.C.E.) remarked, regarding Iranians living during the Achaemenian dynasty: “They greatly revere rivers. They will not urinate, spit, or wash their heads therein, nor allow anyone else to do so” (History I: 138). Yet, Zoroastrians have always felt that they could not safeguard nature without spiritual assistance. So, even the Achaemenian king of kings Darius or Darayavahush I (ruled 522–486 B.C.E.) implored: “Ahura Mazda is a great god who created this Earth, who created that sky, who created humans . . . May Ahura Mazda protect this land . . . from harm” (Naqsh-e Rostam Inscription A 1–3:51–53).

Zoroastrian concern that nature not be polluted, even in symbolic and ritual ways, resulted in a notion that decaying flesh should not come into contact with soil, water, crops, domestic animals, and humans. So the magian practice of exposing human corpses became popular (Herodotus, History I:140). The original Old Iranian term for a grave or tomb, darma, came to designate another type of funerary locale – places where corpses could be exposed. At first daxmas were established in areas away from settlements such as on mountaintops, but later as population density increased they became walled enclosures or funerary towers. After exposure of a corpse and desiccation of its flesh – often aided by mangling of corpses by wild animals – the bones would be collected and placed within an astadan or ossuary in the belief that rock could prevent any residual religious impurity from spreading through nature. Archeological remains of Parthian-era (ca. 238 B.C.E.–224) and Sasanian-era funerary towers and ossuaries, large and small, ornate and simple, are found throughout the Iranian plateau and Central Asia occasionally together with inscriptions and minor reliefs. Ritual exposure of corpses is still practiced by the Parsis in cities like Mumbai or Bombay (India) and Karachi (Pakistan), where daxmas often are referred to as towers of silence. Such funerary towers attract vultures who strip the flesh off corpses. During the past few years, as urban density transformed cities in the Indian subcontinent into metropolises, the population of vultures has declined – leading to attempts by Parsis in Mumbai to breed those birds and to seek alternate means of speeding up desiccation. Moreover, in India and Pakistan for the past few centuries, bones are no longer collected and entombed but are swept into a lime pit at the center for each tower to dissolve over time. In Iranian daxmas, the bones remained on site, slowly disintegrating. The practice of exposing corpses in funerary towers was phased out by the Zoroastrians of Iran during the 1960s under modernist pressure from the Pahlavi dynasty and so the funerary towers at traditional Zoroastrian settlements such as Sharifabad near Yazd fell into disuse. Zoroastrians in Iran began to wrap each corpse in a white shroud and bury it following Muslim practice. Zoroastrians who have migrated to other countries from Iran and India during the past two hundred years also independently adopted inhumation. Cremation is now gaining popularity among Zoroastrians in Western countries as a means of preventing symbolic pollution of the Earth by decaying, buried, corpses – although cremation leaves unresolved, for many practitioners, the issue of a brief pollution of fire in the crematorium. In most circumstances, whether in Iran, India, or elsewhere, corpses are cleansed prior to exposure, burial, or cremation – again an attempt to limit ritual pollution of the environment. Zoroastrian notions of purity and pollution, and the impacts of those ideas on the world, were assimilated into Shi’i Islam shaping the parameters of najes or uncleanness that structure the religious lives and the relationship to nature for the majority of Iranians.

Historically, however, corpses of ancient Iranian monarchs were embalmed and then entombed (Herodotus, History I:140). There are the archeological remains of the Greek-style tomb of Cyrus or Kurush II (ruled 549–530 B.C.E.) at Pasargadai (also mentioned by Arrian, lived ca. 95–175, Anabasis Alexandri VI, 29, following an account by Aristobulus; Strabo, Geography XV, 3:7–8, following accounts by Aristobulus and Onesicritus; and Plutarch
[lived ca. 45–120], Lives: Alexander 69:4] and the seven rock-cliff tombs of Darius I and his successors at Naqsh-e Rostam and Persepolis (also mentioned by Photius [lived ninth century], Bibliotheca 72:38a–b, following Ctesias [lived mid-fifth to early fourth century B.C.E.], Persica), from Achaemenian times. The tombs of Parthian or Arsacid rulers at Nisa (mentioned by Isidorus Characenus [lived ca. first century B.C.E.–first century C.E.], Mansiones Parthicae 12) and Arbela (mentioned by Dio Cassius [lived ca. 155–235], History of Rome 78:1) were well known. The Sasanian elite praxis of using aspanuran (haspanuran) or tombs is documented in medieval texts (Kar namag i Ardashir Papakan 14; 17; and Pahlavi Texts 55:1–5; both surviving in post-ninth-century redactions). Again, the underlying notion was a religious attempt to safeguard nature from symbolical harm thought to be produced by demonic forces that supposedly cause death and decay.

As safeguarding nature became increasingly important, with the augmentation of ritual purity concerns in medieval times under the Sasanian dynasty and later under the Umayyad and Abbasid Muslim regimes, probably in reaction to increased contact between Zoroastrians and members of other faiths living in Iran, the Zoroastrian clergy or magi issued numerous injunctions to guide the laity. For example, devotees were cautioned: “Do not sin against [i.e., pollute] water, fire, and beneficent creatures . . . so that heaven may not be barred [to you]” (Pahlavi Texts, p. 151, ll 7–9, compiled third to ninth centuries). By the late Middle Ages, magi were counseling: “Whoever teaches cares for all these seven creations (Earth, water, fire, metal, plants, animals, and humans) does well and pleases (Ahura Mazda)” (Supplementary Texts to the Shayest ne Shayest 15:6, compiled ninth through fourteenth centuries). Such advice was not simply religious. It reflected a pragmatic view of the world. Zoroastrian commentators had pointed out that water had to be protected from pollution because impure water could not be used for drinking, cooking, cultivation, or rituals (Denkard, p. 452, ll. 17–21, compiled ninth century).

Opinions, pertaining to religious and practical views of nature, continued into pre-modern times, when Iranian Zoroastrians advised their Indian counterparts, the Parseis, that fire, water, land, and crops should be kept free from pollutants (Persian Revayats, 81–87, compiled fifteenth though eighteenth centuries). Likewise, more recently in 1869, a high magus wrote in a Paris Gujarati language catechism: “Water is one of the finest gifts given by god to humans. We must keep it clean and use it. If we do not keep it clean and use impure water, then it will harm the health of people” (Rehbar-e Din-e Jarhushiti, 108). The tanka system of harvesting rainwater, devised by early Parsi farmers in Gujarat, India, and still utilized at rural locales – as documented by the UNESCO-assisted PARZOR Project – plus the far more ancient quant system of water distribution, still employed by the villagers (now Muslims and Zoroastrians) of Iran, have both been regarded by Zoroastrians as not only serving practical functions but also continuing to be tangible manifestations of the religion’s approach to utilizing natural resources appropriately. Moreover, Zoroastrian concepts have periodically been drawn upon by Muslim regimes in Iran to support environmental causes. So, for example, a publication issued in 1968 by the Iranian Ministry of Information at Tehran during the regime of Mohammed Reza Shah Pahlavi (ruled 1941–1979) justified conservation of forests by claiming:

“The national religion of the Persian Empire until the coming of Islam was firmly based on agriculture. The desert was seen as a work of Evil; God was manifest in the crops, in the fruit and nut-bearing trees, in the abundance of game, in the multiplying herds of cattle and sheep (12 Points for Progress, 35–6).”

Thus in the task of safeguarding Iran’s forests from development, that country’s most recent monarch was presented as adhering to divine will, indirectly the wishes of Ahura Mazda. More recently, in the decades following the Islamic Revolution of 1979, Muslim Iranian intellectuals have turned nostalgically to their country’s heritage, seeking in their national, ancient, past relevant themes of natural harmony and coexistence as counterbalances to theocracy.

Worship and Celebration Connected to Nature

The days of each month of the Zoroastrian calendar are dedicated to Ahura Mazda, the Amesha Spentas, and the Yazatas – thereby uniting spiritual entities and nature to time. Because worship and praise are directed by Zoroastrians through their rituals to the righteous entities that are believed to inhabit the spiritual realm, calendrical-based devotional ceremonies include overt references to the categories of nature associated with those spirits.

Most Zoroastrian rituals are conducted within complexes known as fire temples. Fire, as the aspect of nature considered absolutely pure, became the icon of the Zoroastrian faith. Ritual fires burn in altars at Zoroastrian temples – permanently at some temples in Iran and India, temporarily in other temples in Iran, India, the United States of America, and elsewhere. The central devotional ceremony performed in major fire temples is the Yasna or Worship (originally Sacrifice) where, among other rites, the haoma or ephedra plant is pounded, mixed with water and milk to make a libation, and then symbolically offered by participating priests to Ahura Mazda and other divine spirits. Jashan or Thanksgiving services are performed at fire temples on days such as Nav Ruz or the New Year’s festival (at the vernal equinox), Mihragan or the Feast in
honor of Mithra (at the autumnal equinox), and the Gahanbars (also Gahambars) or Communal Feasts. On those occasions fruits, flowers, and cooked foods made from plants – and now less frequently animals – are consecrated to the divinities and then consumed by the community. Although its origins are not completely clear but may ultimately derive from variations on Sasanian practice, contemporary Iranians of the Zoroastrian and Muslim faiths continue to set up an arrangement of seven items – whose Persian terms begin with the letter sin or s such as garlic, apples, dried fruits, vinegar, vegetables, hyacinth, and coins (plus an oil lamp, prayer book, mirror, and other symbolic items) – called the haft sin on a table in each home. Again, the purpose of those offerings is to unite various aspects of the corporeal world during acts of worship and celebration. Originally, animals were sacrificed by Zoroastrians in both Iran and India on religious and communal festivals. But Hindu vegetarian influences on the Parsis led to the gradual phasing out of animal sacrifice, and Parsi praxis spread from India to Iranian Zoroastrians in the twentieth century as the training of magi came to be conducted in seminaries in India.

Between the ages of seven and fifteen each Zoroastrian boy and girl undergoes initiation into the religion. The ceremony is termed the Navjote or new birth by Parsi Zoroastrians and Sedra-Pushun (also Sedra-Pushi) or donning the sacred undershirt by Iranian Zoroastrians. It symbolizes a spiritual rebirth. After initiation each believer becomes fully responsible for his or her own religious, moral, and communal life. During the ceremony, the initiate – having learned the basic prayers of the religion – dons a white cotton undershirt called the sudra (also sedra), and ties a lamb’s wool cord known as the kusti (also koshti) around the waist and so is yet again linked to other creatures. Flowers, fruits – such as coconuts among the Parsis and pomegranates among Iranians – and rice are incorporated into the ritual actions of the initiation. The same general array of items are present during wedding ceremonies. As with most other aspects of Zoroastrianism, the function of each item is to unite the officiating priest, the devotee undergoing initiation or couple entering into marriage, and the members of the audience with nature and so reaffirm humanity’s central role in the religious universe.

Zulu (amaZulu) Ancestors and Ritual Exchange

One of the fundamental ideas in ancestral-based religions, such as that of the Zulu, or amaZulu (a more accurate term), is that of the life-force, essence or energy which exists in all animate and inanimate phenomenon, including animals, plants, and various geographical or even atmospheric features. This life-force is in constant circulation and although it is indestructible it may be converted, exchanged and utilized in different ways by humans, for good or bad intent. The following account describes these dynamics in the context of Zulu notions of the ancestral and spirit worlds. These are, however, broadly representative of many other African groups’ ideas and concepts on the subject, especially the Nguni-speaking peoples of southern Africa.

According to Harriet Ngubane, the Zulu collective term for all the departed spirits is amathongo. Zulus believe that when a person dies the life-force exits the body in the form of a shadow, or spirit, known as isithunzi. The spirit enters a liminal phase where it is “betwixt and between” the living and the ancestral worlds. Among the Zulu, certain tasks have to be performed by living members of the agnatic (male) kin group to help get these spirits empowered, purified and “cleaned,” in order that they may join the benevolent ancestral body (amadlozi) that has an important role in protecting and guiding descendants. This usually involves a series of sacrificial rituals that should be performed after a certain lapse of time (usually within a year) after physical death. The final ritual of incorporation of a departed spirit, known as ukukuyisa, signifies the return of the ancestor (idlozi) to the home. Departed
individuals who have lived good moral lives and attained the status of elder are regarded as the most active of the amadlozi, as they are the most concerned with the well-being of the living. Typically it is believed that a person’s deceased parents, grandparents, and great-grandparents are more interested in their descendants, although the more remotely distant ancestors are regarded as participating at rituals held in their honor and can still influence and have interest in the affairs of the living. The ancestors are regarded as being present in the homestead and should be treated with respect befitting that of elders. They should be kept informed of any events and changes that have occurred within the homestead, such as a change of family residence, work or fortunes. They should be actively informed of all the “life crisis” stages that require “rites of passage,” such as the birth of children, attainment of adolescence and adulthood, marriage and death. They can be consulted for advice and guidance on any problem facing the family and they are seen to act as a protective force against evil. In their purified state they are seen as being close to God and in the context of Christianity they are often equated with the angels, who have the power to directly appeal to God on behalf of the living. When they are forgotten they are regarded as no longer having adequate strength to protect the living and they withdraw their support, leaving the family vulnerable to attack by hostile forces. However they do not disappear and their potential to intervene always exists, should the appropriate steps be taken by the living to empower them.

The intensified presence of the ancestors is to be found in a number of regions in the domestic domain. These include the cattle byre (isibaya), especially around the central post, and in the sacred ancestral hut (the indlu enkulu or “the great house”). In the latter they are thought to reside in the rafters above the shrine (umsamo) found opposite the doorway of the round hut. These are the sites where sacrificial offerings are placed.

However when questioning Zulu diviner-healers (izangoma) about the locality of the ancestral body (the amadlozi) one gets a more complex response than these spatial domains suggest: they reside in one’s body, they can manifest themselves in animals and plants, and they also exist in the air, under water, and under the Earth (abaphanzim = those down below). In other words they are omnipresent. Regarding the presence of the ancestors within a person’s body, it is believed that they commonly reside in the regions of the reproductive organs. The aim of izangoma training is to activate the amadlozi by bringing them to the head and shoulders so that the healer can hear and see the messages they bring. In addition to the drinking of special herbal medicine (ubulawu), an important aspect of diviner-healer training is to spend long hours dancing and singing to the rhythmic beating of drums, usually in the early hours of the morning (after midnight). It is believed that this helps activate the amadlozi and “brings them up” from the lower reproductive regions to those of higher consciousness, associated with the brain, throat, eyes, ears and heart. In this way the ancestors can empower one with knowledge and foresight by communicating through means of visual (clairvoyant), auditory (clairaudient), mental (dreams and visions) or vocal (glossalia) messages. Another area of the body vulnerable to their presence is in the supra-scapular region at the top of the shoulders and at the base of the neck. This is the area the ancestors stimulate with sharp or scratching pains when they are said to be trying to attract the attention of an individual to be a healer.

The Zulu also identify a more powerful category of ancestral spirits. These are the “great ancestors” or the amakhosi. These are powerful spirit beings that are often associated with those healers that are taken “under water” for their training. The amakhosi communicate directly with such healers via high-pitched whistles that emanate from the rafters of the sacred hut. These whistles are audible to all present, and the healer who has been taken “under water” for training has the ability to translate the messages in this form. In explaining the difference between the amakhosi and amadlozi, diviner-healers say that the amakhosi are powerful amadlozi, but not all amadlozi attain the rank of amakhosi. According to Ngube, whistling spirit divination is regarded as the most powerful and accurate of all the types of divination found among the Zulu.

The ancestral spirits are also capable of manifesting as animals, birds, reptiles and even insects (such as bees). For the Zulu the snake, in the form of the python (inhlwati), is the most potent manifestation of the great ancestors and is often respectfully referred to as “lord” (inkosi). The “great spirits,” or amakhosi, described above, are often said to visit the living in python form. This variety of fauna may manifest in people’s houses, often behaving in ways different to that expected of their species. Their presence serves to alert the living to the fact that the ancestors are trying to draw their attention and acknowledge their presence, usually to perform certain tasks or to call an individual to become a diviner-healer. These are regarded as spirit animals and are viewed as distinct from ordinary creatures and they should never be harmed. The clue to their ancestral/spirit nature lies in their “abnormal” behaviour. Such animals may also appear in a person’s dreams and are regarded as very significant in the training process of healers.

The character, or essence, of all living creatures is believed to adhere to their flesh, especially in fatty tissue. Thus many medicinal mixtures incorporate wild animal fats and these are used to achieve the natural characteristics possessed by the animal. It is also believed that wild plants and animals are imbued with the essence of potential ancestral power. This power is referred to as amandla, and at decomposition, after death, this potential is
absorbed into the soil and is taken in by plants and animals. Certain plants (e.g., various ubulawu species) are regarded as having an affinity to this potential ancestral power, and these are used in izangoma training to connect them with the ancestors via dreams. Animals concentrate this power/essence in certain parts of their bodies when they consume vegetation and/or other animal flesh. The liver, and its by-product, bile, is regarded as possessing especially high concentrations of this power/essence, and hence these both feature strongly in sacrificial rituals. Wild animals and plants are thus seen as a manifestation or a medium to convey the power of the ancestral world to that of the living, and they form part of the complex system of exchange that takes place between the living and the dead. This becomes most obvious in sacrificial ritual.

The Importance of Ritual Exchange in Zulu Sacrifice

Fundamental to the benefits that the living seek from the spirit world, be they for good or bad intent, is the notion of reciprocity and exchange. Benefits can only flow in exchange for something else, invariably another life. Diviner-healers are regarded as having been called from the benevolent ancestral world to help ease the suffering of humankind, and to restore and heal the physical individual as well as the social body, and to overcome the evil forces that prey upon humankind. Usually the healing of the individual is dependent on the healing of the whole kin group. In order to do this they have to clean and feed the ancestors through regular ritual, often involving animal sacrifice, and during such rituals emphasis is placed on resolving any interpersonal conflicts that may be besetting the home. In addition to izangoma developing healing and divinatory abilities, they gain certain personal benefits from the ancestors, especially in the form of mystical protection and warnings about those who may wish to harm them, as well as a certain amount of material comfort for the healer, the living kin, and their descendants in later generations.

The process of Zulu sacrifice demonstrates the immersion of the human body in the natural world. The system of symbolic associations in the exchange is complex and there are multiple meanings attached to the movement of gifts during sacrifice that reveal the cosmological order regarding the division between nature/culture, animal/human, wild/domesticated, female/male, corporeality/non-corporeality, and raw/cooked, as has been noted by scholars such as Lévi-Strauss and Hammond-Tooke. Sacrificial exchange is associated with consumption. In order to gather the energy needed to send messages to the living the spirit world requires sustenance and “food.” The food that is given requires a high level of investment and value for the living. One cannot sacrifice wild animals, but only that which has been reared or cared for by humans. Thus, transformed domesticated plants (sorghum/millet beer) and the blood, bile and flesh of domesticated animals (chickens, goats, sheep and cows) provide the necessary food for the ancestors. These domesticated or transformed products represent the wealth of the supplicant, even if they have to be purchased. As in any system of exchange the means are as important as the end. Gifts have to be transmitted through a form of energy, or a channel of communication. The living open up the channels of communication to the spirit world through the products of culture: domesticated animals and plants, as well as speech, dance and music, while the spirit world opens up the communication channels to the living through nature, the bodies of wild plants (ebulawu) and animals (isilwane).

Zulu ritual sacrifice is a very public, socially affirming event where the bonds of kinship are constantly emphasized. All family members are expected to participate and the event is open to any member of the general public who wishes to attend and consume the beer and meat that is prepared for the occasion. It is overall a celebration of the positive unity that exists between the living and the ancestral world, and the benefits that flow from such a union. It is this that sets it apart from other more secretive and negative forms of mystical empowerment that are associated with commodity exchange and the evils of individual material accumulation and greed.

Obtaining Mystical Power through Commodity Exchange

Diviner-healers are expected to reveal and counteract the activities of evil forces, which ally themselves to those humans who seek power and wealth, and exhibit it through greed, arrogance, malice and envy. It is believed that some spirits that still possess their corporeal identity and character, may linger in the environment for a period of time, especially if they harbor any grudges, had unfinished business to complete, or were too grasping of the material riches in this life. Both the benevolent ancestral forces and the lesser, more negative, spirit forces can influence the way a person thinks or behaves and can affect his/her fortunes. This means that a certain amount of what we would see as individual motivation and self-directed behaviour is sometimes attributed to external forces (although free will is still recognized). The less developed spirits or spirits of malicious people, particularly those who exhibited a vindictiveness or lack of control of desires while alive, or those who were aggrieved by a violence done to them, can also be employed by the living to assist them to do harm to rivals, and to help enrich and empower their benefactors. These spirits are thought to linger around graveyards or the environs that they frequented during their lifetime. They are believed to be able to give people a certain amount of foresight and advanced knowledge, but they are capricious and demanding, and can be dangerous to work with, often taking, in exchange for their services, the life of a close kinsman or child. It is asserted that some izangoma may resort to
engaging the power of these spirits, especially if they have failed to establish or maintain contact with their own ancestors. There are many reasons for this failure: sometimes novice healers, who cannot afford to continue the long and often expensive training that is needed to access their benevolent ancestral power, resort to this less expensive and demanding form of empowerment. Some fail to empower the ancestors because they are weak, while others have been abandoned by their ancestors for transgressing the strict moral norms of spiritual and social behavior, largely through embracing the morals of individuality associated with greed and desire for power. Engaging the power of these lesser spirits is called izizwe nesizwana, and such powers are gathered by working with medicines in the graveyard, which entraps these “lost” spirits and get them to work for their captors. All the representations associated with this form of empowerment are negative. It is done in secret and in the dark, and the spirits are not from the body of ancestral kin. All these serve to threaten the requirements for sociality and healing. Supernatural and mythical animal familiars, such as the ithikoloshe, mamlambo, imfene and inyoni (impundulo) can also be harnessed for these purposes, and it is believed that these can be created and nurtured by witches and sorcerers. Ithikoloshe (the highly sexed dwarf with an enormous penis) and mamlambo (the snake), are veritable shape-shifters, and are used to pursue the pleasures of the flesh, particularly of a sexual nature, but they are also associated with gaining wealth. The imfene is the baboon, on whom the sorcerer rides backwards when he goes on his nightly evil errands, while inyoni (impundulo) is the evil “lightning bird” which is sent to attack those whom a witch or sorcerer bears grudges against. It kicks the victim on his chest, causing haemoptysis (i.e., tuberculosis), or strikes him on his back and head, causing a paralyzing stroke.

Izangoma assert that there are a number of “healers” who engage the services of such familiars. It is believed that these creatures can be manufactured and activated by plant and animal medicines, as well as human body parts, and can be purchased through a Westernized form of commodity exchange. Those individuals that use medicines and familiars to gain immediate wealth are engaging in what is termed ukuthwala, while ukuthweswa (or ukuthwaliswa) refers to those “healers” who engage in the sale of such medicines. It is generally believed that herbalists are more prone to enter into such business enterprises than izangoma, as the latter run the risk of losing ancestral support if they engage in such activities.

Summary
The ancestors are a positive force in the Zulu traditional worldview. They integrate both the natural and the social worlds, provide benefits for the living, and offer an effective means to enforce the moral order. However they are not completely autonomous and they rely as much on the living for their well-being as the living do on them. This relationship is based on a reciprocal flow of goods and services, represented most vividly during ritual sacrifice, and this has strong moral and social binding. As commodity exchange systems and desire for individual accumulation penetrate this relationship, the cosmic and moral basis of the exchange changes, and the spirit power shifts from that of the positive and life-giving amadlozi to the more negative and vindictive lesser or evil spirits.

Underlying these notions is the spiritual potential of the natural world of which the ancestors are an integral part. It is through the natural world that they can manifest and their power can be accessed or activated. Their manifestation may take different forms, be they through plant-induced dreams or via visitations to the living in animal form. Thus the natural world provides more than just resources for consumptive or functional use; it carries potential ancestral power and knowledge that, if used in a socially moral context, is vital for harmonious and balanced living.

Zulu (amaZulu) Culture, Plants, and Spirit Worlds (South Africa)

Imithi or herbal medicines play an important role among the Zulu or amaZulu (a more accurate term for the Zulu-speaking people) of southeastern Africa. An examination of the use of imithi among Zulu izangoma (diviner-healers, often called sangoma in pan-African discourse) suggests a fundamentally different conceptual framework regarding the boundaries and relationship between the social, natural and spiritual worlds compared to those paradigms embraced by Western philosophical and scientific thought. In Zulu thought, the physical and social
well-being of both individuals and groups are a result of the dynamic interplay between the social, the spiritual and the natural worlds. Ill health results when the balance between these dimensions is disrupted or undermined, or when individuals with evil intentions manipulate the spiritual and natural forces in order to bring about social disorder and misfortune on victims. The Zulu are a subcategory of the larger linguistic group known as the Nguni-speaking peoples. These include the Xhosa-speaking groups (such as Xhosa, Gcaleka, Mpondomise, Mfengu, Thembu), the Swazi, the Shangaan and the Ndebele. They share many common cultural features, and have similar concepts to what is described below for the bele. They must, therefore, be understood within the context of a rapidly changing society.

Zulu knowledge of healing plants is extensive. Hutchings and others in Zulu Medicinal Plants (1996) documented some 1032 species of plants that are known and used by healers in KwaZulu Natal. This figure represents approximately 25 percent of the flora that occurs in this province in South Africa, suggesting that there could well be many more species that are used that have not been documented. Moreover, for any one plant identified there are multiple uses, ranging from symptomatic therapies that may cure the physical ailment (with demonstrable pharmacological activities) to mystical and magical uses.

The multiple uses to which plant-based medicines are put can be categorized into three main areas: for physiological curing purposes, for spiritual purposes and for social purposes. This knowledge is flexible and adaptive to changing needs and demands encountered in contemporary society. The following discussion focuses on the conceptual elements of plant-use in Zulu cosmology and on the spiritual and social uses of plant-based medicines.

Plant-use in Training and Healing Activities

Plants are extensively used in both the training and healing activities of izangoma, who believe they are called to their profession by the ancestors through dreams or illness. The spiritual uses of plants fall under three broad categories. They are used as connectors to the spirit world, as spiritual cleansers of both the living and the dead, and for protection against evil forces, including crime and violence. The connecting and cleansing function of plants often overlaps, as do the cleansing and protecting functions. The cleansing and connecting functions are most prominently seen in the use of a certain group of plants collectively known as ubulawu. The primary aim of training for izangoma is to enhance awareness of the various forms of communication received from the ancestral world. Dreams are of particular importance and a variety of plant species are imbibed to enhance the clarity and reception of powerful message dreams. These are collectively referred to as ubulawu and include a range of trees, shrubs, climbers, grasses and small flowering plants from a variety of habitats. Different parts of the plant (roots, stems, bark, bulbs and leaves) are used depending on the species. They are combined into specific mixtures, depending on the individual’s progress and the nature of his/her dreams. A mixture or combination of ubulawu species is used at the commencement of training, during the training process and after the healer has qualified. They are often administered during group rituals, or may be taken daily by novices, when it is accompanied by prayer, invocation and/or singing. Certain species of ubulawu are also associated with different clans and are used as a form of identity during collective clan rituals.

The efficacy of ubulawu is largely dependent on the ritual and cultural context in which it is used. The ubulawu are soaked in cold water and beaten to a thick foam with a

Zulu Culture, Plants, and Spirit Worlds 1819

Plants, whose potencies are often enhanced through combination with wild animal products, provide the medium whereby cures can be achieved, and the power of the spirit world can be accessed, enhanced and modified to suit social and personal needs and desires (be they for good or bad purposes). While some plants have potency in themselves that may help or harm individuals, many require ritual activation through symbolic actions and verbal empowerment. Thus plants are seen as essentially neutral in moral terms, but ultimately become extensions of their users and their ambivalent power is dependent on the purposes to which they are put and the “heart” of the person using them. Izangoma emphasize that they may only use medicines for good purposes. Their powers of divination and healing, and the identification of plant remedies, come to them directly from the benevolent ancestral world that has strict sanctions on the way medicines may be used. A diviner who fails to adhere to these strict moral guidelines runs the risk of losing further ancestral guidance and help. They are aware, however, that there may be practitioners (mainly herbalists who do not rely on ancestral guidance) who have strayed from these moral norms and provide medicines that are used for harming others, and/or for self-enrichment. Social commentary against such forms of accumulation and practice is pervasive among diviner-healers in contemporary South Africa. Those suspected in engaging in such enterprises are seen as engaging in witchcraft and sorcery (ubuthakathi). The forces that have resulted from globalization and modernity, particularly the pressure for individual gain and success within the context of poverty and social fragmentation, have exacerbated these suspicions and have had a profound influence on the ways to which plant-based medicines are used in the present context.

Thus, although the Zulu have a wide range of plants that are used for their physically therapeutic effects on diseased bodies, their understanding of the processes that lead to physical disorder are more complex than the way Western science understands pathogenesis. They must, therefore, be understood within the context of a rapidly changing society.
forked stick (again made of a certain plant species), which is then imbibed. The ritual is often performed at pools, rivers or in forests where the ancestors are thought to reside. This is usually accompanied by singing. The foam is regarded as having a special cleansing ability, in both a physical and a spiritual sense. The *ubulawu* are also said to “clean” the ancestors. The power of a healer is ultimately dependent on the power of the ancestors, and by “cleaning” with *ubulawu* and the periodic sacrifices of goats, chickens and cattle, the ancestors are strengthened, thus enabling the healer to do his or her tasks more effectively. *Ubulawu* is also an important element in ritual animal sacrifice, as it forms a connecting thread between the sacred, the initiate and the ancestors. The use of such plants without spiritual calling and sanction renders them ineffective. *Izangoma* are insistent that if a person has done wrong and offended the ancestors, or if the timing is not right, or if the initiate is in a temporary state of pollution (female menstruation), then the *ubulawu* will not foam despite vigorous beating. The ancestors are thought to be actually present in the foam, and lack of foam signifies their refusal to manifest themselves. It is preferable that healers collect their own *ubulawu* as there is less chance of pollution occurring this way. Although many of the *ubulawu* species are sold on the street markets, these are usually only used when it is not possible to gather them personally. Cultivated species are also regarded as losing much of their spiritual potency and are not a viable alternative.

*Imphepho* (*helichrysum sp.*) is another important connecting plant used in all rituals performed for the ancestors. This is burnt and allowed to smoke profusely as a form of incense, and is used whenever an individual wishes to draw the attention of the ancestors close to hear prayers and appeals, or to receive offerings such as in sacrifice. In addition to its connecting or summoning function it is thought to have a purifying effect as well. *Umphafa* or *umlahlankosi* (*ziziphus mucronata*) is the connecting plant *par excellence* for the Zulu and its importance cannot be underestimated especially within the context of the social and kin fragmentation that have resulted from the migrant labor system and increasing urbanization in South Africa over the last century. After death, the spirit of the deceased enters a form of limbo, a transitional phase between the world of the living and that of the ancestors. Traditionally it was vital that the living kin perform the *ukubuyiswa* ritual a year after the death of an individual, to incorporate him or her into the body of the active benevolent ancestors. Ideally the body of the deceased should be buried at the homestead. However this is a difficult task for families when members have died far away from home, such as in the cities and the mines. A branch from the *umphafa* tree helps resolve this problem since it can be used by the chief mourners to convey the spirit of the deceased back to the homestead where it can then become incorporated with the ancestors at the ancestral shrine or hut. The tree is characterized by branches that have small sharply hooked thorns on their stem, and during the ritual to transport the spirit back home, the chief mourner has to clutch a branch of *umphafa*. With the help of other kin members, or a ritual officiant, they approach the gravesite or the place where the death occurred, be it a hospital or elsewhere, and sweep the branch over the ground or the place where the victim died. For instance, if the victim died in a car accident they would visit the accident site and sweep the branch on the road at the point of the accident. If the person died in hospital they would go to the bed in which the person died. Singing and praying, the ritual party plead with the spirit to grasp hold of the branch and to hold on to it while they convey him/her back to the ancestral home (this may entail covering long distances by car or bus). The chief mourner who holds the branch is forbidden to speak for the whole journey for fear of confusing the spirit, but the accompanying supporters can talk to the spirit constantly informing him/her as to the progress of the journey. Upon reaching the homestead the branch is fed to two goats that are tethered outside the entrance. One is expected to eat the leaves while the other should refuse it, and if this does not happen, then the whole procedure has to be repeated as it indicates that the spirit had failed to grasp hold of the branch. The goat that refuses to eat the leaves on the branch is slaughtered at the gate and its chyme (undigested food) is used to cleanse all the family present, while the one that eats it is now believed to be carrying the spirit within it, and is led into the ancestral hut where it is sacrificed in the name of the ancestors and the meat is placed at the umsamo, the place where the ancestors are thought to reside (opposite the main doorway to the round hut). In this way the spirit is reunited with the ancestors.

**Plant-use and Witchcraft**

The cleansing and protecting functions of plants are often employed together in the ritual removal of witchcraft or umnyama (darkness). Harriet Ngubane has noted the fundamental importance of Zulu color symbolism (black, red and white) in the way medicines are used for spiritual purposes. The order in which different color medicines are administered in these rituals are connected to the cosmic order of night (black), dawn/sunset (red) and daylight (white) and they must be strictly adhered to. The process must always go from black medicine (representing darkness – umnyama – and heat), to red (a transition color between darkness and light – warm), to white (openness, clarity and purity – associated with daylight and coolness). The thermal qualities of the medicines are also observed. Hence dark medicines that are administered to remove umnyama from a victim are usually boiled or steamed, while white medicines are always administered as a cold solution.
Plants that are used to protect against evil, or to deflect evil away from one, are widely used in South Africa. Michelle Cocks and others documented that the most popular category of medicine purchased from amaXhosa (a more accurate term for the Xhosa-speaking people) traditional medicine (amayeza) stores is for protection against evil spirits. These are usually applied to the body as a wash or as an unguent, or worn as a charm around the waist or neck. They can also be used to sprinkle around ones property and possessions. The category of plants known as intelezi refers to a wide variety of plants (usually bulbs and tubers) that have the power to protect evil. A mixture of intelezi species are usually chopped up and soaked in cold water (they are categorized as white medicines) and this is sprinkled around the perimeter of the homestead before any important rituals are performed. This is to minimize any negative mystical intentions, which may be performed by those who harbor witchcraft (umthakathi) or darkness (umnyama) in their hearts. Protection of one's property against criminals is in high demand in contemporary South Africa where crime has escalated alarmingly in the post-apartheid era. The services of izangoma are frequently sought to provide such protection. Known as uku-betela this usually involves a complex series of rituals over several days at the homestead of the client where family members are medicated with protective herbs. In some instances river stones that have been heated and medicated with a variety of plant- and animal-based solutions and substances are buried at strategic places (such as gates and entrances) of the homestead, and the air is stabbed in the four cardinal directions. This is believed to chase away anyone who approaches the homestead with evil or criminal intentions in their heart.

Umncabo is a prophylactic procedure employed whereby complex mixtures of protective medicines that are stored in an oil (animal fat) base are applied to incisions that have been made at points over the clients body (i.e., joints) that are believed to be vulnerable to the entry of evil forces. Ukutshoba is a curative therapy used against mystical invasions of the body. In the latter case the medicines are introduced into the skin through a puncture made with a porcupine quill or a bicycle spoke, according to Frank and Stephen Jolles.

Some plant tubers are used as a decoy to deflect sorcery and witchcraft. A mixture of medicines with the blood or saliva of the potential victim is inserted into the tuber (inkomjefe) and it is then buried in a remote place. The person must leave without looking back. In this way anyone wishing to do harm on the person will fail as the evil familiar will be confused and go to the tuber rather than the potential victim for whom it is intended. Its potential can be further refined with a few more symbolic actions whereby the evil that is being sent to the intended victim actually rebounds and returns to afflict the sender (known as ukucupha). This practice, that is still followed today, was first recorded by Callaway in 1870 and demonstrates the enduring nature of some of this knowledge.

There are a number of other plant-based protective devices that are currently used. A notable example is the use of a special tree, the bark of which is soaked and then ritually thrown over the person's shoulder. It is believed that this will fool aspiring robbers or criminals who approach a treated household. As they approach they will hallucinate and “see” the household members standing at the door of the house. It is hoped that the “presence” of family members will deter the criminals from attempting to rob the house. In addition there are plants and medicines that are believed to make the user become invisible and thus avoid detection by those wishing to harm him/her. This medicine has an ambivalent value, however, as it can also be used by criminals to help them escape detection from the police.

The Social Uses of Plants
The ambivalent nature of plant-based medicines (imithi) is most evident when examining the social uses of plants. (Muti is the pan-African term most commonly used to refer to plant and animals used in potions for healing or other purposes; even human parts can be used, which helps account for the term's sometimes negative connotation in Zulu culture.) Plants that fall under such a category are mainly used for luck, be it in education, business, competitions (i.e., sport), court cases, or, most importantly, love. In the research in the Eastern Cape led by Michelle Cocks and reported in 2000 and 2002, it was found that the second most popular category of plants purchased at amayeza stores were those to achieve luck. The most common profile of the customers for luck-enhancing medicines was young, educated and upwardly mobile individuals. Umayime (clivia sp.) and umlomo mnandi (lit. "mouth that is nice") are plants that are used when one wants to be able to speak with conviction and persuasion, for instance when one is pleading in a court case. There are a number of plants that can be used to attract a lover by making one appear “nice.” These can also be used in beauty competitions to ensure success. Some plants are used to keep a lover faithful or stop him/her from straying to others. Aggrieved women who suspect that their lovers or spouses are seeking sexual favors from others have recourse to a plant-based medicine (typha capensis) that will make the competing lover (female) excessively moist and undesirable. These ideas suggest that achievement is not about individual ability, hard work, or personal attributes, but is something that can be obtained by external interventions via the spirit world or through magical manipulation.

Plants, Wealth, and Power
Although it may be argued that these examples present moral ambiguities, there is one category of medicine that
is regarded by most izangoma as unacceptable and morally reprehensible. These are the medicines used to achieve financial wealth and political power. Those individuals who use such medicines to gain immediate wealth are engaging in what is termed ukuthwala, while ukuthwesa (or ukuthwaliswa) refers to those “healers” that engage in the sale of such medicines. Human body parts may be used in the creation of such medicines. This accounts for antagonistic responses toward those who engage in such trade. Moreover, the use of such medicines always comes at a cost, the death of those who are closest to the purchaser. The literal “consumption of others” (i.e., human body parts and deaths of closest kin) is an appropriate representation of such practices and is a powerful commentary against the disruptive effects of excessive accumulation of wealth and power.

Plants and the Fluid Boundaries between Spiritual and Natural Worlds

It is quite evident that Zulu notions of the boundaries between the social, natural and spiritual worlds are more complex and fluid than those found in the Cartesian worldview. Plants and animals are seen as the manifestation and medium of the spirit world and they are influenced by the intentions of the user. Together, the plant, the spirit and the user occupy a common moral universe. This idea of tapping into the positive healing power of the natural world through right and good moral intentions is illustrated in the way medicines are collected and used by diviners. These should always be collected in a respectful way. Plants are approached in a humble manner with the clapping of the hands, while the gatherer requests permission from the ancestors to be allowed to remove the plant. Thanks offerings, usually in the form of white beads, should always be made after collection. This will ensure the right potency of the plant as well as offer assurance that more plants will always be made available by the ancestral world. The ancestors show the healers the correct plants to use for healing in their dreams and even indicate to them the most suitable places for collection. This is important since plants vary in their potency depending on their habitat and the timing of their collection (diurnally and seasonally). Moreover it is strongly believed that plant-based medicines will be rendered useless (or may become dangerous) if there is lack of harmony in the household. Unfortunately many of these principles and practices have been abandoned in the modern era and plants are now gathered indiscriminately and without ritual observance by entrepreneurs, who have little regard for, and knowledge of the ancestral world.

Despite these problems, the spiritual and social uses of plants by the Zulu izangoma are both enduring and dynamic. They provide a mechanism through which social and spiritual order can be maintained and the means by which the pressures associated with contemporary lifestyles can be commented on and managed.

Zulu (amaZulu) Smelting

Adolphe Delegorgue provides the only detailed eyewitness account of iron-ore smelting in what is now KwaZulu-Natal, South Africa. In 1842 he visited a place he called Zimpy (*insimbi = iron) while hunting in the Zulu Kingdom. He described an enclosure of 25 by 12 paces in which three parallel oval “pits,” the furnaces, were situated. At either end of each pit, pipes of sun-dried clay carried air expelled from twin bellows into the furnace. Four relays of six men operated the bellows continuously throughout the smelt, which lasted four hours from eight till midnight. The following day, the team removed pieces of iron bloom from the still-hot furnaces and amalgamated them into a rough ingot with heat and hammer. Tools such as hoes and spears were later forged from the ingots. With the exception of some details, Delegorgue’s account is consistent with the picture provided by archeological evidence dating to the eighteenth century.

Smelting was not simply a technical skill, but a process
rich in symbolic content. This is because smelting involves the transformation of material from one form (ore) to another (metal). People order and make sense of the world around them by creating discrete classificatory categories. Classifications are arbitrary, however, and the world is chaotic. Aspects of it defy classification, being neither one thing nor another. These anomalies cause anxiety because they threaten order and are consequently considered powerful and dangerous. Similarly, things and beings associated with overlapping boundaries, or the transition from one category to another, may become saturated with danger.

In Zulu belief, this danger is conceptualized as umnyama, meaning darkness. As part of the natural order of things, umnyama is a mystical condition or state of being that is unavoidable in the course of normal living. It opens afflicted people to misfortune and affects cattle and crops, causing milk to dry and plants to shrivel. Umnyama is most strongly associated with birth and death, which involve transitions from one world to another. For instance, in giving birth, women act as a channel between this and a pre-birth world (in fact, the ancestral world). They enter a dangerous state of darkness (umnyama) that threatens both their own health and, when most intense, the health of people and things around them. Through their reproductive capacity, signified not only by pregnancy and birth but also by menstruation, women move constantly toward and away from the margins of this world, into and out of darkness.

Smelting among the Zulu, as throughout much of sub-Saharan Africa, was homologous with procreation. The furnace, its penetrating clay pipes, and the act of its operation were symbolically equivalent to genitalia and the sexual act, ending with the “birth” of iron. A twentieth-century smith worked at his smithy for a few days each month, just after the full moon. He explicitly linked his timing to women’s menstrual cycles, noting that this was when “the iron flows out nicely” (Berglund 1976: 360). Red earth and red iron ore, he said, are the Earth’s blood, specifically her menstrual blood, and the “earth is the mother of iron.” Outcrops of iron ore, as representations of the Earth’s capacity to give birth, were likely charged with umnyama, forcing miners to protect themselves through ritual practice.

Red ochre (ibomvu), a form of iron ore, is associated with the color red (-bomvu) just as darkness (umnyama) is associated with the color black (-umnyama). Black is opposed to white (-mhlopha) in the Zulu color system, and with red they form a color triad. Red is a liminal color, signaling transformation at dusk and dawn. Red’s liminality extends beyond the diurnal rhythm to other areas of transformation and transition. Blood from the fatal wound of an animal sacrificed for the ancestors is referred to as the “wound” (ixebe), and distinguished from the rest of the animal’s blood. The “wound” provides a point of access or bridge to the ancestral world, making it a liminal construct of special significance. Menstrual blood is conceptually similar to the “wound” because it provides evidence of a woman’s reproductive capacity, and reproduction is the domain of the ancestors. Thus, men who worked with the Earth’s blood and delivered her child (the iron bloom), entered a liminal zone where they made contact with the ancestral world. Not surprisingly, smelting was as intensely shrouded with umnyama as the birth of a child; when smelting, men exposed themselves to the same danger faced by parturient women. For this reason, furnaces were generally sited away from homesteads.

If the Earth was the bloom’s mother, then she was also the smelters’ (or head smelter’s) wife, and it was appropriate that they hlonipha (respect) her. This was also true for the ancestors invoked at the furnace. Hlonipha behavior involves the use of ritualized language and action to honor and respect spouses, in-laws, people of seniority and ancestors. Improper and disrespectful behavior can disrupt family harmony so severely that a sacrifice may be required to restore peace. Such behavior at the furnace would have angered the ancestors and resulted in the failure of the smelt. Smelters therefore, acted in formal ritualized ways during the smelt and used hlonipha words for the furnace and their tools. Respect for the ancestors was also manifested in a prohibition on sex before and during a smelt. Men are affected by umnyama after sexual intercourse, and although this weakened condition does not last long, they should not approach their ancestors in a state of impurity. Smelters who ignored the sanction risked the displeasure of ancestors, who caused the smell to fail.

The site of the furnace was a place dark with umnyama, a place of transformation where worlds and categories overlapped and intersected. When smelting, men invoked their ancestors, had sex with the Earth, and were both father to her child and midwives during its birth. The men at Zimpy worked at night, when no ordinary work occurs. As a result, a dangerously contagious umnyama settled on the smelters from which they needed release, both for their own protection and in order to reenter society. This involved washing, treatment with medicines, and in at least some cases, the slaughter of cattle. These rites released smelters from their liminality back into normal daily life.

Zulu (amaZulu) War Rituals

The Zulu believed in an overlap that existed between this world and the world of the spirits. This was expressed by a mystical force, umnyama, which was darkness or evil influence, and was represented by the color black. It could be contagious in its most virulent forms. Because such pollution was a mystical rather than organic illness, it could be cured only by symbolic medicines. Death by violence, expressed as umkhoka, was an especially powerful form of umnyama, as the killer himself was polluted. Thus warriors of the nineteenth-century Zulu kingdom, when about to go to war, were in especial spiritual danger, and needed to be ritually purified of evil influences and strengthened against them.

Members of an ibutho (age-grade regiment) caught and killed bare-handed a black bull from the royal herds upon which all the evil influences in the land had been ritually cast. Izangoma – who were not herbalists but diviners, possessed by the spirits of the ancestors (amadlozi), which made them a link between this and the spirit world – cut strips of meat from the bull, and treated them with black medicines to strengthen the warriors and bind them together in loyalty to their king. The strips of meat were then roasted on a fire of wood collected by the warriors the previous day. The izangoma threw the strips up into the air and the warriors, who were drawn up in a great circle, caught and sucked them. Meanwhile the izangoma burned more medicines and the warriors breathed in the smoke and were sprinkled with the cinders. Then, in order finally to expel all evil influences, each warrior drank a pot of medicine, and a few at a time took turns to vomit into a great pit. The ritual vomiting was also intended to bind the warriors in their loyalty to their king. Some of the vomit was added to the great inkatha of the Zulu nation, the sacred grass coil that was the symbol of the nation’s unity and strength. The following day the warriors went down to any running stream to wash, but not to rub off the medicines with which they had been sprinkled.

With the completion of these rituals the warriors (who had undergone a symbolic death) could no longer sleep at home nor have anything to do with girls or women since they themselves had now taken on a dangerous state of umnyama.

While the warriors were thus setting themselves apart from ordinary life and dedicating themselves to war, the king called pairs of favored amabutho (age-grade regiments) into the royal cattle enclosure to boast of their courage and to issue ritual challenges to outdo one another in the coming campaign.

For the Zulu, good fortune in an enterprise depended on the approval of the amadlozi who lived under the ground and were interested in every aspect of their descendants’ lives. Because the spirits maintained the status they had enjoyed while alive, it was particularly necessary before proceeding on campaign to secure the favor of the amadlozi of the king’s royal forebears since they were necessarily concerned with the welfare of the entire Zulu nation. The way the living propitiated the amadlozi was through cattle sacrifice when the spirits partook of the burnt offerings and “licked” the meat set aside for them. The Zulu were essentially pastoralists, living in a land of mixed grazing ideally suited to raising livestock. Cattle were especially prized as the prime indicator of wealth and also for their ritual importance in communicating with the amadlozi. Before it marched away to war, therefore, it was vital that the army satisfy the royal amadlozi with a generous sacrifice from the royal herds so that the spirits were induced to accompany the warriors and deploy their powers against the enemy.

In battle a ritual the Zulu followed was to hlomula, or for many warriors to stab an enemy who had already died courageously. This practice was connected with the hunt, and was observed only when a fierce and dangerous animal like a lion had been overcome. Killing a foe in battle, as well as participating in the hlomula ritual, severely contaminated the warrior with umnyama. It was thus necessary to undertake many ceremonies to achieve ritual purification. One was to slit open the belly of a slain foe so that umnyama would not affect the killer and make him swell up like the dead. The killer would also put on items of the dead man’s apparel in place of his own – which would have been contaminated by the harmful influences of the victim’s blood – in order that he might zila, or observe the customary abstentions after a death until ritually cleansed.

Ritually contaminated warriors returning from campaign could not immediately report to the king, nor resume normal domestic life because they were highly contagious. They were separated for four days from their

companions in special homesteads and fed on cattle captured in battle. Daily, they washed ritually in a river and returned to ncinda, or to suck medicine from their fingertips and spit it in the direction of their enemies in order to gain occult ascendancy over the vengeful spirits of their victims, the blood from whose fatal wounds formed a dangerous bridge between the living and the spirit world. On the final day the izangoma completed the warriors’ ritual purification by sprinkling them with medicines before they presented themselves in the royal cattle enclosure before the king. There they exchanged accounts of the fighting, and repeated the ritual challenges made before setting out to war. The king duly praised some individuals for bravery, humiliated others for cowardice and honored and rewarded the ibutho that had most distinguished itself.

**Index**

Due to the unique organization of this encyclopedia, the index begins with a list of all the “practitioner” and “scholarly perspectives” articles, as described in the “Reader’s Guide” (pp. xix), which is a good place for readers to learn effective ways to use this reference work. The alphabetized index follows these two lists. In the index entry titles are in bold font wherever they appear. The entry titles appear both alphabetically and regionally, and their contributions are listed below their names. Where readers can find a comprehensive list of items that relate to a specific area of the world. Some items in the regional groupings are not indexed elsewhere. Countries and topics related to individual nations have been organized according to the United Nations’ system of categorization used when reporting global statistics. The regional categories illustrate the interrelationships found among many of the people and topics discussed in the encyclopedia. These relationships demonstrate both the encyclopedia’s interdisciplinary scholarship and reflect the exchange of ideas occurring through processes currently labeled “globalization.” The regions organized and alphabetized are: Africa, Asia, Caribbean, Europe, Meso-America, North America, Oceania, South America. This encyclopedia has 520 contributors from around the world. The name of each contributor is indexed alphabetically, and their contributions are listed below their names.

Editors’ Note: the main entries on Christianity are organized historically and by a numbered outline, and these begin after the first indexed Christianity entry, “Eastern versus Western”, which appears immediately below this note. After this outline of the main entries is indexed, a subsequent index section beginning with “Christianity” provides details.

Christianity – Eastern versus Western 314–315
Christianity (1) – Introduction 316–317
Christianity (2) – Jesus 317–319 (see also adjacent, What Would Jesus Drive?)
Christianity (3) – New Testament 319–323
Christianity (4) – Early Church (Fathers & Councils) 324–326 (see also adjacent, Contemptus Mundi)
Christianity (5) – Medieval Period 326–328
Christianity (6a) – Roman Catholicism 328–332
Christianity (6b1) – Christian Orthodoxy 333–337 (see also adjacent, Eastern Orthodox Monasticism; Orthodox Spirituality; Common Declaration on the Environment: Common Declaration of John Paul II and the Ecumenical Patriarch His Holiness Bartholomew I)
Christianity (6b2) – Greek Orthodox 338–340
Christianity (6c1) – Reformation Traditions (Lutheranism and Calvinism) 340–343
Christianity (6c2) – Calvin, John – and the Reformed Tradition 344–348 (see also adjacent entry Reformed Tradition it its Own Words, The)
Christianity (6c3) – Anabaptist/Mennonite Traditions (Reformation Traditions) 348–351 (see also adjacent, David Kline on Amish Agriculture)
Christianity (6c4) – Anglicanism (Reformation Traditions) 351–352
Christianity (6c5) – Methodism (Reformation Traditions) 352–353
Christianity (7a) – Theology and Ecology (contemporary introduction) 354–355
Christianity (7b) – Political Theology 355–357
Christianity (7c) – Liberation Theology 357–360
Christianity (7d) – Feminist Theology 360–362
Christianity (7e) – Creation Spirituality 363
Christianity (7f) – Process Theology 364–365

Christianity (7g) – Womanism 367
Christianity (7h) – Natural Theology 368–369
Christianity (7i) – An Evangelical Perspective on Faith and Nature 369–371
Christianity (8) – Ecumenical Movement International 371–372
